W. T. L. TRAVERS,
Hon. Treasurer.

MEMORANDUM REGARDING THE NEW ZEALAND INSTITUTE.

THE first scientific society in New Zealand was founded in 1851, the first President being Sir George Grey, K.C.B., D.C.L. It was named "The New Zealand Society," and was located in Wellington.

In 1862 a second society was established in Christchurch as the Philosophical Institute of Canterbury, the first President being Mr. Julius Haast (since Sir Julius von Haast, K.C.M.G., Ph. D.). Much useful work was done by these societies, but they met at very irregular intervals, and the funds collected were inadequate for the proper publication of the papers that were communicated by the members. They therefore languished, owing to their being merely local societies, not having the sympathy of the colony,

The Exhibition held in Dunedin in 1865 brought prominently before the public the advantage of a more general organization for the development of the resources of the colony, and soon after the establishment of a scientific department by the General Government the New Zealand Institute Act was passed in 1867, and its administration was placed under the present Director of the Geological and Natural History Survey.

The New Zealand Institute has now been in operation for twenty-four years, which is a sufficient period in the history of a new country to indicate how far the practical results obtained by the working of one of its institutions have fulfilled the anticipations of its original promoters.

The object sought was to foster public interest in the collection and discussion of original observations respecting the resources and natural history of the country. This is done to best effect by the organization of a scientific society; but it was obvious that the geographical circumstances of the colony precluded the formation of any strong central society capable of stimulating and directing such investigations by frequent meetings of its members, as can be done in other colonies possessing a chief centre of population, where all social institutions become naturally concentrated. The constitution of the New Zealand Institute was therefore intended to provide for the combination of local efforts in this direction by enabling the joint publication of the papers read and discussed before local societies.

Experience has shown that in old countries the subscribed funds are generally insufficient for the proper publication of the transactions of small societies; and this drawback is still more felt in the countries where the number of members is few, while the field for original research is large, so that in a few years such societies languish after accumulating much information in manuscripts that, if published, would be of great assistance in advancing the interests of the community.

Each member of the scientific societies affiliated to the New Zealand Institute receives a share of the Parliamentary grant in the form of an annual volume of the Transactions for the year of all the various societies. The presentation of this volume is regarded as a substantial equivalent for the subscriptions, and the fund which is created by the subscriptions is applied locally towards the maintenance of public museums and libraries in the different centres of population. In the case of Auckland, for instance, the public museum is almost wholly dependent on this source of revenue for its maintenance; and, if the vote which enables the annual volume to be distributed gratis is withdrawn, the Museum must either be closed or some other provision made for its support.

The educational effect of this organization can hardly be over estimated as a means of cultivating a love of knowledge and in disseminating information. To the influence of the Institute must in some degree be attributed the demand which is now expressed throughout the colony for elementary instruction in science, and the general recognition in New Zealand on the part of the public that it is necessary to obtain, as a branch of elementary education, the qualifications required for the comprehension and utilisation of the scientific literature that is so characteristic a feature of the present age.

The Institute commenced with four branch societies in 1869 and only 258 members, but there are now eight societies affiliated, and the number of members increased to 1,327 in 1881, but has since fallen off to about 950, each of whom pays one guinea a year, which may be considered as a voluntary tax for an educational purpose.

There have now been 1,623 original communications published in twenty-three volumes of the Transactions of the Institute, nearly all of which relate directly to the colony, and place on record matters of fact and observation that otherwise might not have been published. Of these papers, 378 are on miscellaneous subjects, chiefly relating to the ethnology of the aboriginal races, or connected with the industrial resources of the colony; 613 are descriptive of the zoology of New Zealand; 203 refer to its botany; 113 are on metallurgy and chemistry in its relation to the colony; and 216 are on its geology and physical geography. In addition to these papers, which are published at length, abstracts of about 970 different communications are given in the Proceedings of the societies. The total number of the communications to the Institute have thus been 2,593. Besides which, a number of popular lectures are given each year under the auspices of the various societies of which no record is kept. The average size of the annual volume of Transactions and Proceedings is 640 pages and about 40 plates.
