1909.

NEW ZEALAND.

TIMBER AND TIMBER-BUILDING INDUSTRIES

(REPORT OF COMMISSION ON THE); TOGETHER WITH MINUTES OF PROCEEDINGS AND OF EVIDENCE.

Presented to both Houses of the General Assembly by Command of His Excellency.

COMMISSION.

PLUNKET, Governor.

To all to whom these presents shall come, and to James Frederick Arnold, Esquire, M.P., of Dunedin; William Henry Peter Barber, Esquire, of Wellington; Samuel Isaac Clarke, Esquire, of Auckland; Hon. Thomas Young Duncan, M.P., of Oamaru; Henry George Ell, Esquire, M.P., of Christchurch; William Hughes Field, Esquire, M.P., of Wellington; Josiah Alfred Hanan, Esquire, M.P., of Invercargill; William Thomas Jennings, Esquire, M.P., of New Plymouth; William Brack Leyland, Esquire, of Auckland; Francis Mander, Esquire, M.P., of Whangarei; William Morris, Esquire, of Greymouth; and John Stallworthy, Esquire, M.P., of Dargaville: Greeting.

WHEREAS it has been alleged that the conditions under which the timber and timber-building industries are carried on in New Zealand are unsatisfactory, and it is expedient that inquiry should be made with a view to improving the same and generally promoting the development of those industries:

Now know ye that, in exercise of the powers conferred by "The Commissions of Inquiry Act, 1908," and of all other powers and authorities enabling me in this behalf, I, William Lee, Baron Plunket, Governor of the Dominion of New Zealand, acting by and with the advice and consent of the Executive Council thereof, do hereby appoint you, the said

JAMES FREDERICK ARNOLD,
WILLIAM HENRY PETER BARBER,
SAMUEL ISAAC CLARKE,
THOMAS YOUNG DUNCAN,
HENRY GEORGE ELL,
WILLIAM HUGHES FIELD,
JOSIAH ALFRED HANAN,
WILLIAM THOMAS JENNINGS,
WILLIAM BRACK LEYLAND,
FRANCIS MANDER,
WILLIAM MORRIS, and
JOHN STALLWORTHY

to be a Commission for the purpose of inquiring by all lawful means into the conditions affecting the timber and timber-building industries, including the matters following, that is to say,—

With respect to New Zealand timber,—

(1.) The cost of felling;

(2.) The cost of cutting at the mill;

(3.) The price when sold by the mill to—

(*a.*) The consumer,

(*b.*) The middleman, and

(*c.*) The retailer;

(4.) The price when sold by the middleman to—

(*d.*) The consumer, and

(*e.*) The retailer;

(5.) The areas of Crown land held for sawmilling purposes under the Land Act or the State Forests Act, showing in each case the name of the licensee and the acreage held;

(6.) The estimated area of Crown land still available for sawmilling purposes but not taken up, showing the districts in which the areas are situate and the total area in each district.

With respect to Oregon timber,—

(7.) The extent to which it is imported, and the effect of these importations on the local timber and timber-building industries;

(8.) Its landed cost (showing freight and charges separately from cost-price);

(9.) Its price when sold by the importer to—

(*a.*) The consumer,

(*b.*) The middleman, and

(*c.*) The retailer.

And generally any matters which in your opinion injuriously affect the timber and timber-building industries, or would tend to promote their development, including the necessity or expediency of any legislation in the premises.

For the purposes of your inquiry you are hereby authorised and empowered to have before you and examine all books, papers, documents, and writings you deem necessary, and also to have before you and examine on oath or otherwise as allowed by law all witnesses or other persons whom you think capable of affording you any information in the premises. The said Thomas Young Duncan shall be your Chairman, and you are hereby empowered and directed to conduct your inquiry at Invercargill, Dunedin, Christchurch, Greymouth, Wellington, Taihape, and Auckland, in such manner, at such times, and with such adjournments as you think fit. And, using all diligence, you are hereby required to report to me under your hands the result of your inquiry, with any recommendations you think fit to make in the premises, on or before the thirty-first day of May, one thousand nine hundred and nine.

Given under the hand of His Excellency the Right Honourable William Lee, Baron Plunket, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Knight Commander of the Royal Victorian Order, Governor and Commander-in-Chief in and over His Majesty's Dominion of New Zealand and its Dependencies; and issued under the Seal of the said Dominion, at the Government House, at Wellington, this ninth day of March, in the year of our Lord one thousand nine hundred and nine.

(L.S.)

J. G. WARD.

In Executive Council.

ALEX. WILLIS,
Clerk of the Executive Council

EXTENDING PERIOD WITHIN WHICH THE TIMBER COMMISSIONERS SHALL REPORT.

PLUNKET, Governor.

To all to whom these presents shall come, and to James Frederick Arnold, Esquire, M.P., of Dunedin; William Henry Peter Barber, Esquire, of Wellington; Samuel Isaac Clarke, Esquire, of Auckland; Hon. Thomas Young Duncan, M.P., of Oamaru; Henry George Ell, Esquire, M.P., of Christchurch; William Hughes Field, Esquire, M.P., of Wellington; Josiah Alfred Hanan, Esquire, M.P., of Invercargill; William Thomas Jennings, Esquire, M.P., of New Plymouth; William Brack Leyland, Esquire, of Auckland; Francis Mander, Esquire, M.P., of Whangarei; William Morris, Esquire, of Greymouth; and John Stallworthy, Esquire, M.P., of Dargaville: Greeting.

WHEREAS by a commission bearing date the ninth day of March, one thousand nine hundred and nine, you, the said

JAMES FREDERICK ARNOLD,
WILLIAM HENRY PETER BARBER,
SAMUEL ISAAC CLARKE,
THOMAS YOUNG DUNCAN,
HENRY GEORGE ELL,
WILLIAM HUGHES FIELD,
JOSIAH ALFRED HANAN,
WILLIAM THOMAS JENNINGS,
WILLIAM BRACK LEYLAND,
FRANCIS MANDER,
WILLIAM MORRIS, and
JOHN STALLWORTHY

were appointed to be Commissioners, with the powers mentioned therein, for the purpose of making inquiry into matters affecting the timber and timber-building industries:

And whereas by the said commission you were directed and required to transmit to me your report and recommendations in respect to the several matters inquired into not later than the thirty-first day of May, one thousand nine hundred and nine:

And whereas it is expedient that the said period should be extended as hereinafter provided:

Now, therefore, I, William Lee, Baron Plunket, the Governor of the Dominion of New Zealand, acting by and with the advice and consent of the Executive Council thereof, and in exercise and pursuance of every power and authority enabling me in this behalf, do hereby extend the period within which you shall (using all diligence) report to me, as by the said commission provided, to the tenth day of June, one thousand nine hundred and nine.

And with the like advice and consent, and in further pursuance of the said power and authority, I do hereby confirm the said commission, except as altered by these presents.

Given under the hand of His Excellency the Right Honourable William Lee, Baron Plunket, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Knight Commander of the Royal Victorian Order, Governor and Commander-
(L.S.) in-Chief in and over His Majesty's Dominion of New Zealand and its Dependencies; and issued under the Seal of the said Dominion, at the Government Buildings, at Wellington, this thirty-first day of May, in the year of our Lord one thousand nine hundred and nine.

J. G. WARD.

Approved in Council.

J. HISLOP,
Acting Clerk of the Executive Council.

EXTENDING PERIOD WITHIN WHICH THE TIMBER COMMISSIONERS SHALL REPORT.

PLUNKET, Governor.

To all to whom these presents shall come, and to James Frederick Arnold, Esquire, M.P., of Dunedin; William Henry Peter Barber, Esquire, of Wellington; Samuel Isaac Clarke, Esquire, of Auckland; Hon. Thomas Young Duncan, M.P., of Oamaru; Henry George Ell, Esquire, M.P., of Christchurch; William Hughes Field, Esquire, M.P., of Wellington; Josiah Alfred Hanan, Esquire, M.P., of Invercargill; William Thomas Jennings, Esquire, M.P., of New Plymouth; William Brack Leyland, Esquire, of Auckland; Francis Mander, Esquire, M.P., of Whangarei; William Morris, Esquire, of Greymouth; and John Stallworthy, Esquire, M.P., of Dargaville: Greeting.

WHEREAS by a commission bearing date the ninth day of March, one thousand nine hundred and nine, you, the said

JAMES FREDERICK ARNOLD,
WILLIAM HENRY PETER BARBER,
SAMUEL ISAAC CLARKE,
THOMAS YOUNG DUNCAN,
HENRY GEORGE ELL,
WILLIAM HUGHES FIELD,
JOSIAH ALFRED HANAN,
WILLIAM THOMAS JENNINGS,
WILLIAM BRACK LEYLAND,
FRANCIS MANDER,
WILLIAM MORRIS, and
JOHN STALLWORTHY

were appointed to be Commissioners, with the powers mentioned therein, for the purpose of making inquiry into matters affecting the timber and timber-building industries:

And whereas by the said commission you were directed and required to transmit to me your report and recommendations in respect to the several matters inquired into not later than the thirty-first day of May, one thousand nine hundred and nine:

And whereas the time within which you were required to report was extended to the tenth day of June, one thousand nine hundred and nine:

And whereas it is expedient that the said period should be extended as hereinafter provided:

Now, therefore, I, William Lee, Baron Plunket, the Governor of the Dominion of New Zealand, acting by and with the advice and consent of the Executive Council thereof, and in exercise and pursuance of every power and authority enabling me in this behalf, do hereby further extend the period within which you shall (using all diligence) report to me to the thirtieth day of June, one thousand nine hundred and nine.

And with the like advice and consent, and in further pursuance of the said power and authority, I hereby confirm the said commission, except as altered by these presents.

Given under the hand of His Excellency the Right Honourable William Lee, Baron Plunket, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Knight Commander of the Royal Victorian Order, Governor and Commander-
(L.S.) in-Chief in and over His Majesty's Dominion of New Zealand and its Dependencies; and issued under the Seal of the said Dominion, at the Government House, at Wellington, this eleventh day of June, in the year of our Lord one thousand nine hundred and nine.

J. G. WARD.

Approved in Council.

ALEX. WILLIS,
Clerk of the Executive Council.

REPORT.

To His Excellency the Right Honourable William Lee, Baron Plunket, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Knight Commander of the Royal Victorian Order, Governor and Commander-in-Chief in and over His Majesty's Dominion of New Zealand and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the Commissioners appointed by Your Excellency on the 9th day of March, 1909, to inquire into the several matters and things mentioned and referred to in the commission, copy of which is attached, have the honour to report to Your Excellency as follows :—

Owing to the volume of evidence adduced before us, and to the fact that the taking of evidence only closed on the evening of Thursday, the 27th May, it was found impossible to properly consider and analyse the same to enable the report to be prepared and submitted by the date fixed in the commission—viz., the 31st May—and we were therefore reluctantly compelled to ask for an extension of time within which to present the report. This was sanctioned, and the period of the commission extended, first to the 10th June, and subsequently to the 30th June. The instruments so extending the commission are attached hereto.

We first assembled at Invercargill on the 24th day of March, and held our first meeting on the 25th. As the subjects of our inquiry were of so much public interest, it was decided to admit the public and Press to all meetings of the Commission, taking, where necessary, matters of a confidential nature in committee, and the dates of the meetings were duly advertised in the local newspapers beforehand. Although the scope of the commission only permitted evidence being taken at Auckland, Taihape, Wellington, Greymouth, Christchurch, Dunedin, and Invercargill, it was nevertheless deemed advisable to visit and inspect the sawmills and forests in the principal milling districts of the Dominion. Though the limited time at our disposal prevented any lengthy inspection of the condition of the sawmilling industry in those localities, yet valuable information was gathered as to the conditions under which the trees are felled, taken from the bush to the mill, sawn into marketable timber, and eventually placed on the market. Every effort was made to see all phases of the industry, and through the willing co-operation of the sawmillers in every district, and the efforts of all interested in the industry to afford necessary information, we were enabled to form a fairly full and correct idea of the present position.

In pursuance of this object, the Commission visited twenty-three sawmills in the Southland, Westland, Taihape, Waimarino, Northern Wairoa, Auckland, and Wellington districts, and also inspected wood-preservative works at Rangataua, creosote-works at Invercargill, the State nurseries and plantations at Hanmer, Rotorua, Whakarewarewa, and Waiotapu, carriage-building works, and a number of other woodworking factories.

The travelling done by the Commission amounted to 3,125 miles, and occupied fifteen days; whilst it took nine and a half days to inspect the sawmills, &c., and twenty-eight days to hear evidence.

One hundred and fifty-four witnesses were examined on oath, their respective occupations being,—

Sawmillers	36
Builders	20
Timber-merchants	18
Workers' representatives	11
Architects	10
Furniture-makers	5
Engineers	4
Bush contractors	3

Blindmakers	2
Merchants	2
Settlers	2
Building Inspector	1
Staircase-maker	1
Canadian import agent	1
Auditor	1
Sleeper-getter	1
Secretary to dairy company	1
Lawyer	1
Manager of wood-preservative works	1
Iron-founder	1
Clerk of works	1
Coachbuilder	1
Harbour Board foreman	1
Lands Department's officers	13
Railway Department's officers	13
Public Works Department's officer	1
Customs Department's officers	2
Total	154

The examinations of these witnesses occupied 162 hours, and it is satisfactory to state that in every case they came forward willingly. No expenses were paid to any witness, and every facility was afforded the Commission to obtain information regarding the subjects of its inquiry.

The Commission is glad to record the cordial relations which are found to exist throughout the Dominion generally between sawmillers and sawmill-workers, it being shown that in many sawmilling districts the wages paid are in excess of those prescribed by the Arbitration Court.

Sittings at the places named in the order of reference were held as follows:—

Invercargill	March 25, 27, 29, 30, and 31.
Dunedin	April 1, 2, and 3.
Christchurch	April 6, 7, and 8.
Greymouth	April 15, 18, 19, and 20.
Taihape	April 27 and 28.
Auckland	May 7, 8, 10, 11, 12, and 13.
Wellington	May 20, 21, 22, 25, 26, and 27.

Every effort was made to thoroughly carry out the duties intrusted to us. The limited period, however, within which this could be done, and a report submitted to Your Excellency by the date originally fixed, necessitated the greatest expedition being used to accomplish this object. We frequently sat from 9 a.m. to 6 p.m. to take evidence, and in some places also held evening sittings. The evidence so taken is now being printed, and will be duly submitted to Your Excellency, together with statistics and returns alluded to in this report and not accompanying it.

Passing to the several matters we were specially instructed to inquire into, we beg to report as follows:—

With respect to New Zealand Timber.

(1.) *The Cost of Felling.*

Careful and thorough investigation of the methods adopted at the mills, and in the bush workings we visited, which were regarded as typical of the conditions prevailing in the various parts of New Zealand, has proved that the nature of the country where a mill is working, and its distance from a railway siding, materially affects the cost in each case. The system generally in vogue in districts south of Auckland is for a log to be hauled by a wire rope, connected with a stationary engine, from the place where it is felled to the tramway running from the sawmill into the forest. Arrived at the tramway, the log is

then placed on a truck, and drawn by an engine (or, in some cases, a team of horses or bullocks) to the mill, where the log is converted into sawn timber.

In the Auckland Province, where kauri is worked, different methods obtain. Formerly a large proportion of the logs were hauled to the mills or to tidal waters by locomotives or horses over tramways, or by bullocks over "skidded roads." By these means logs were delivered at the mills green, and in long lengths. Now nearly all the forest accessible by tram or "skidded road" has been worked out, and logs are hauled, "jacked," or delivered by means of "shutes" into a suitable creek, usually into a branch or tributary of some large stream, where they remain until by means of specially erected dams, "tripped" (or opened) when the streams are in flood, they are "driven" to booms erected in tidal waters. In large watersheds a number of dams on branch creeks are necessary, and often a very large dam is required in the main stream to "drive" the logs from the branch creeks.

We found that in many cases, particularly in the Westland and Southland Districts, where the bulk of available timber is on Crown land or in State forests, the recently repealed Forest Regulations under the Land Act and State Forests Act were unsatisfactory, as they limited the forest land that could be allotted to one mill to a sawmill area of 200 acres, and three reserved areas of 200 acres each, or 800 acres in all. This proved detrimental to cheap production and profitable working of the timber, as, with such limited areas to mill, it did not pay the sawmiller to erect expensive and up-to-date machinery. Further north, particularly in the Waimarino Forest, where large areas of native and private freehold land can be secured by a sawmiller, larger and better-equipped mills have been erected, and the industry established on more economical lines. It is, however, satisfactory to note that the new regulations, which came into force on the 15th April last, have permitted areas of Crown land being allotted to sawmillers in proportion to the respective horse-power of their mills, and this is undoubtedly a step in the right direction, and will do much to improve the conditions under which bush can be worked. A recommendation dealing with this question is set forth under clause (5) of the report.

Kauri timber, being sold in large quantities for cash, is not subject to the above restrictions, and has generally been felled and milled in a fairly economical manner. There is no doubt but that the machinery in many of the existing sawmills (which the census of 1906 returned as 444, including sash and door factories, employing 9,098 hands) is not up to date, and tends to hamper the efficient working of the mills. The chief reason for this, however, as already pointed out, no longer exists, and it is hoped that in a comparatively short time modern methods and machinery will be generally employed. In some cases the millers might with advantage to themselves visit other localities, and ascertain how larger and more recently erected mills are worked, and thereby improve their present methods.

Speaking generally, however, we can confidently report that, although the cost of felling the trees and delivering the logs at the mill varies considerably in the different localities, owing to the causes enumerated above, yet it cannot be considered unreasonable under existing conditions.

(2.) *The Cost of Cutting at the Mill.*

In considering this phase of the question, the remarks just made apply with greater force to the cost of cutting at the mill, and must be taken into account when considering this point. Bearing in mind, however, the character of the plant now generally employed, and the reasons that in many cases restricted the construction of more expensive and efficient plant, we are of opinion that the cost of cutting has not been unreasonable, but consider that in many cases a reduction in the cost could be brought about, and much waste of timber in cutting prevented, by the adoption of more modern machinery, better methods, and more economical working in bringing it to, and dealing with it at, the mill.

(3.) *The Price when sold by the Mill to*—(a) *the Consumer*, (b) *the Middleman, and* (c) *the Retailer.*

This was a very complicated and difficult problem to solve, and every effort was made to arrive at reliable conclusions.

Owing to the fact that prices vary so greatly in the different towns of New Zealand according to local causes, and that they have advanced during the past decade, it is impossible to say that prices have ruled as low as they might have, in each town, and during any particular year.

Judging from the evidence that was given, as bearing on the cost of production, and already dealt with in clauses (1) and (2), we have come to the conclusion that the average prices now obtaining for the great bulk of the timber are not unreasonable, but that, as regards past prices, in certain localities, there is evidence to show that attempts were made to unduly raise and maintain the price of timber by combination amongst millers and middlemen not in the public interest. This undesirable practice has been, however, checked to a large extent by the recent trade depression, and other conditions affecting the sawmilling industry generally.

(4.) *The Price when sold by the Middleman to*—(a) *the Consumer and* (b) *the Retailer.*

Bearing in mind the conclusions just arrived at, and the grounds for same, we consider that, having regard to the prices obtained by the producing miller, the prices charged by the middlemen and retailers to the consumer in certain districts, where it has been the rule to class anything as low as 20 ft. or 22 ft. in length as "long lengths," have been unduly high. We regret that this seems to have been the case, and do not think that it has been a general practice throughout the Dominion, but undoubtedly the middlemen have in certain instances taken undue advantage of the late demand for timber, caused by an unusual expansion of the building trade, and have in some cases charged and obtained prices in excess of a fair trade profit. The said high prices seem to have been maintained by combined action on the part of a number of timber-merchants in some districts. This condition, however, does not appear to exist at the present time.

Railway freights add largely to the cost of timber in the chief centres of the Dominion, and in the interests of the sawmilling industry and the public generally we recommend that sawn timber be carried at the lowest payable rate.

With the view of utilising a class of timber which is largely wanted, and known as "shorts" (lengths 6 ft. and under), we recommend the Government to reduce the railway freight on this class of timber.

We are of opinion that the whole railway tariff on timber requires reconsideration, and would draw attention to the evidence given before the Commission by Mr. R. A. Wilson, of Bull's, and supported by compiled tables embodied in his evidence, alleging that timber is charged higher rates of freight than many other classes of goods, and also to the statement made by the General Manager of New Zealand Railways (Mr. T. Ronayne) in reply thereto.

(5.) *The Areas of Crown Land held for Sawmilling Purposes under the Land Act or the State Forests Act, showing in each Case the Name of the Licensee and the Acreage held.*

These are given in detail in Appendix A, and show that a total area of 151,607 acres is held for sawmilling purposes, under 255 licenses. This area is also shown on the map attached to the appendix.

In this connection it is recommended that the royalties throughout the Dominion should be uniformly charged on the log-measurement, as so doing will tend to the prevention of waste in dealing with our native forests; whilst, in order to encourage the erection of a better class of mill, and the adoption of improved methods of working, so as to reduce the cost of production, sawmilling areas should be allotted to each mill, and fixed on the quantity basis, taking into account the cutting-capacity of the mill as well as horse-power.

Under the present and past regulations the waste of timber in sawmilling operations was very apparent in some of the forests visited. Trees 16 in. and 18 in. diameter were frequently left standing, although, in other forests inspected, trees of 12 in. and even less in diameter were felled and milled, thus doing away with waste. It is desirable that such needless waste should be prevented, and it is therefore suggested that Forest Rangers should be empowered to inspect sawmilling areas with the object of insuring that all milling-timber is cut out by the licensee, and not left standing to be subsequently destroyed by fire. It is felt that the time has now arrived when stricter regulations should be framed and enforced with regard to the felling and milling of timber on Crown land.

(6.) *The Estimated Area of Crown Land still available for Sawmilling Purposes but not taken up, showing the Districts in which the Areas are situate and the Total Area in each District.*

The total area is 4,042,280 acres, and it is set forth in detail in Appendix B, and also on the map attached to the appendix.

Although this large amount of forest land is available for sawmilling purposes, it is well to point out that a great part of it is not at the present time in close-enough proximity to existing means of transport to render the utilisation of the timber a profitable undertaking for the sawmiller.

In many cases, too, the proportion of milling-timber of good quality and in sufficient quantity is not large enough to induce milling operations on a payable basis. For these and other reasons we desire to represent that it is not in the interests of the public that a sawmiller should be invited to purchase unmarketable timber when tendering at Crown sales, and every effort should be made to conserve the same until a market is available for it.

WITH RESPECT TO OREGON TIMBER.

(7.) *The Extent to which it is imported, and the Effect of these Importations on the Local Timber and Timber-building Industries.*

For the period between the 1st day of January, 1907, and the 30th day of April, 1909, a total of 10,332,371 laths and shingles were imported into Auckland, Wellington, Wanganui, Nelson, Christchurch, Timaru, and Dunedin; 30 round logs into Wellington; 4,500 palings into Christchurch; and 21,188,506 sup. ft. of rough sawn timber into Auckland, New Plymouth, Wanganui, Wellington, Napier, Nelson, Hokitika, Christchurch, Timaru, Oamaru, Dunedin, and Invercargill. Full details thereof are given in Appendix C.

The sudden and enormous increase in importations of Oregon is shown by the fact that in 1907 only 270,000 sup. ft. came in, whilst in 1908 and the first four months of 1909 a total of about 21,000,000 ft. came into this country.

After full consideration of the somewhat diverse opinions and varied evidence given by numerous witnesses who testified on this point, we have come to the conclusion that the effect of the importation of Oregon pine on the timber-building industries has been of a beneficial character, and in the interests of the public in meeting the requirements of the building trade, as it has furnished a ready and efficient supply of timber for building purposes of a class which would otherwise have been difficult to obtain in suitable sizes and lengths. Although this has been the case as regards building requirements, yet there appears to be little doubt but that this importation has helped to intensify the recent depression in the sawmilling industry, particularly in certain localities.

In view of the large quantity of Oregon timber being used for other purposes than joists and long beams, it is recommended that a duty of three shillings (3s.) per hundred (100) superficial feet be imposed on sizes under twelve (12) inches by two (2) inches, or equivalent, in any lengths; other sizes under twenty-five (25) feet in length to remain as at present, subject to a duty of two shillings (2s.) per one hundred superficial feet; lengths from twenty-five (25) to thirty-five (35) feet to be reduced to a duty of one shilling (1s.) per one hundred (100) superficial feet; and lengths above thirty-five (35) feet to be admitted duty-free.

In Appendix J will be found a return of Customs duty received on imports and exports of timber for the past fifteen years.

(8.) *Its Landed Cost (showing Freight and Charges separately from Cost-price).*

Investigations and evidence given before the Commission have supplied the following particulars, which appear to be fairly accurate, and typical of the recent importations of Oregon timber. The figures relate to "rough Douglas fir" (Oregon pine) of merchantable quality :—

Auckland Landed Cost (per 100 sup. ft.).—A shipment purchased on the 16th June, 1908, and subsequently landed in New Zealand, gave the following details :—

	s.	d.
C.i.f. at Auckland	7	6
Customs duty	2	0
Wharfage and cartage	0	9
Labour at wharf, handling, and stacking in yard ...	1	6
	11	9

The rates in May, 1909, were about 2s. per 100 sup. ft. higher, whilst a further extra charge (equal to 10 per cent. on c.i.f. prices) is required to be added when ordering long lengths.

The base price of Oregon pine seems to have fluctuated considerably between March, 1908, and May, 1909, and to have increased from about $10 per 1,000 sup. ft. (or about 4s. per 100 sup. ft.) to $13½ per 1,000 sup. ft. (or about 5s. 3d. per 100 sup. ft.), and at the present time Oregon timber 4 in. by 10 in. in lengths of from 16 ft. to 32 ft., would be invoiced at $13½ per 1,000 sup. ft., whilst timber 5 in. by 18 in. in the same lengths, would be $16 per 1,000 sup. ft., and timber 4 in. by 6 in. in lengths of from 10 ft. to 15 ft. would be $12½ per 1,000 sup. ft.

To arrive at the landed cost, the freight and duty must be added. Freight has varied from 25s. to 37s. 6d. per 1,000 sup. ft., the last quotation being 30s. per 1,000 sup. ft. to Auckland or Wellington, and 35s. to Napier, Christchurch, and Dunedin. A bank charge of 1¾ per cent. must also be added.

The present cost in Auckland, taking as base $13½ per 1,000 sup. ft., would be about 5s. 6d. per 100 sup. ft., and 10 per cent. must be added for long lengths, whilst the freight is 3s. per 100 sup. ft., exchange amounts to about 2d., the Customs duty is 2s. per 100 sup. ft., and landing-charges, wharfage, cartage, stacking, and handling in the yard require to be added. The figures just given apply to full cargoes of not less than 1,500,000 sup. ft.

Wellington Landed Cost (on timber 16 ft. to 32 ft. in length, and from 2 in. by 3 in. to 6 in. by 8 in. in size).—

	s.	d.	
In January, 1908, the c.i.f.e. base price was	11	0	per 100 sup. ft.
„ August, „ „	8	0	„
„ October, „ „	7	2	„
„ November, „ „	7	6	„
„ January, 1909, „	7	5	„

NOTE.—On an average specification, the addition in cost on base price is about 12½ per cent.

The freight charged and included in the above figures ranged from 2s. 6d. to 3s. 6d. per 100 sup. ft., whilst insurance and exchange averaged 3½ per cent. of the base price.

The wharfage charges in Wellington are, without labour, 3d. per 100 sup. ft., the charge for labour being an additional 3d.

Lyttelton Landed Cost.—The cost f.o.b. Vancouver, per 1,000 sup. ft., has ranged from $10 to $15, whilst exchange has varied from 4·60 cents to 4·90 cents, and the freight to Lyttelton from 25s. 6d. to 35s. per 1,000 sup. ft., but other charges are not available. The landed cost appears to have been as follows :—

C.i.f. price	From 7s. to 8s. per 100 sup. ft.
Customs duty	2s. per 100 sup. ft.
Haulage and wharfage ..	1s. 6d. per 100 sup. ft.

Or a total of about 11s. 6d. per 100 sup. ft.

Dunedin Landed Cost appears to have been the same as Lyttelton.

(9.) *Its Price when sold by the Importer to* (a) *the Consumer*, (b) *the Middleman, and* (c) *the Retailer.*

Auckland Selling-price.—(*a.*) Retail price in small lots (under 20,000 ft.), 17s., less 10 per cent. discount = 15s. 3d. net per 100 sup. ft. In lots of 20,000 ft. and over = 14s. net. On long lengths over 32 ft. a further average charge of 3d. per 100 sup. ft. is made for every additional foot in length.

The following extra costs are entailed before selling: Rehandling, resawing, loss in conversion, loss in measuring out, 1s. 3d. per 100 sup. ft. on large lots; 1s. 9d. per 100 sup. ft. on small lots. Together with interest, rents, rates, taxes, insurance, and management, say, an average of 6d. per 100 sup. ft. But no allowance has been made for "bad debts."

(*b*) and (*c*). Same as above, except that an additional discount of 10 per cent. is allowed.

Wellington Selling-price.—The following prices were fixed by the Wellington Timber-merchants' Association in April, 1908, but at the present time merchants are selling independently at lower rates :—

	Per 100 sup. ft. £ s. d.	
Building, sawn	0 17 6	Subject to a discount of 7½ per cent.
Building, ½ in. out of 1 in. ...	0 11 0	
Selected, sawn	1 0 0	
To 12 in. by 1 in., dressed ...	1 1 6	
Rustic, and T. and G. ...	1 1 6	
¾ in T. and G., and B. or V ...	0 18 0	

These prices are for lengths up to and including 24 ft., as it rises from the stack; resawing extra.

Oregon over 24 ft. long and under 33 ft. to be charged 3d. per foot per 100 ft. extra; and lengths over 32ft. and under 41 ft., 6d. per foot per 100 ft. extra; over 40 ft. by special arrangement.

"And generally any Matters which in your Opinion injuriously affect the Timber and Timber-building Industries, or would tend to promote their Development, including the Necessity or Expediency of any Legislation in the Premises."

New Zealand Timbers.

Although it is generally recognised that we have a great variety of trees growing in the forests of the Dominion, it is not widely known that no less than eighty-six different species are stated to exist. Included, however, in this list are, in some cases, more than one variety of the same tree, so that it is perhaps more accurate to state that about eighty different trees grow in our forests. Many of them are suitable for commercial utilisation, but, although attempts have been made from time to time to disseminate a wide knowledge of their properties and possible uses, it is to be regretted that at the present time the majority of our timbers are not made use of, but are permitted to be destroyed either in the course of settlement, or through accidental fires. The chief varieties of our milling-trees are as follow :—

Kauri, which grows in the Auckland District only. This is our finest timber, combining strength with durability, and being easy to work. It is used primarily for building purposes, and for shingles, weatherboards, lining, joists, studs, doors, sashes, bridge-decking, ship and boat building, carriage-building, furniture-making, mining purposes, and almost any purpose needed in the building or timber trades.

Totara, once so prevalent, has been milled to such an extent in the past that the present supplies are very limited, and are chiefly to be found in the Auckland and Wellington Districts, although certain quantities remain in the Hawke's Bay and Westland Districts. It is an exceedingly durable timber, superior even to kauri, and is largely used for house-blocks, verandah-posts, sleepers, fencing, wharf-piles, bridge-building, window and door frames, telegraph-poles, &c., whilst the mottled variety is much in request for ornamental furniture.

Rimu (red-pine) is next in popular use to kauri, and is consumed in greater quantities than any other timber. It grows universally over New Zealand, and is used principally for house and carriage building, furniture-making, &c. Figured boards are highly valued for panelling, mantelpieces, skirting-boards, and doors.

Kahikatea (white-pine) is also found all over the Dominion. It is particularly valued for butter-boxes, packing-cases, boxing for concrete, and for temporary work generally.

Manoao (silver-pine) grows in many districts, and has been used for sleepers, house-blocks, and posts, with excellent results. It is a very durable timber, and suitable for many ordinary purposes for which these qualities are essential.

Matai (black-pine) is found is most localities. It is a timber of great durability, and is largely used for flooring, framing, joists, house-blocks, bridge-building, sleepers, verandah-posts, and fencing purposes.

Puriri is one of the strongest and most durable timbers in the world. Its chief use is for railway sleepers, for which purpose it is unsurpassed, and it is also used for posts, house-blocks, culverts, carriage and bridge building. Mottled puriri is largely used in Auckland for ornamental furniture.

Tawa, although plentiful in certain localities, is not much in demand. It has been used for making casks and furniture, and is now used to a small extent for the inside lining of houses.

Beech (or "birch," as it is popularly called in New Zealand), is gradually coming into use in many districts, particularly Canterbury, Southland, Nelson, and Westland. The chief variety milled is *Fagus fusca*, known locally as "red-birch," "brown-birch," and "black-birch." It is used principally for fencing and mining purposes, house-blocks, bridge-building, &c. Prior to an import duty being placed upon it by the Commonwealth of Australia, a remunerative business in its export was done by Southland sawmillers. Mills that were specially erected in that district for sawing this timber for the Australian trade have been forced to close down in consequence of the imposition of the duty, which amounts to 2s. 6d. per 100 sup. ft.

The other timbers used, though not to any great extent, comprise pohutukawa, mangeao, maire, rata, miro, pukatea, rewarewa (honeysuckle), hinau, and tanekaha (celery-pine). The remainder of our trees are seldom used for commercial purposes.

It is a fact which does not appear to be sufficiently known that this country is well supplied with cabinetmaking woods of a superior quality, but it is a matter for regret that they are not known or utilised by furniture-makers to the extent they deserve.

Handbook.

It is desirable that something should be done to encourage a greater local consumption of our native timbers. Undoubtedly, ignorance of their properties is mainly responsible for lack of their use. It is therefore recommended that a complete and reliable handbook on New Zealand timbers should be prepared by the Government and published for general information, giving particulars as to their characteristics, qualities, strength, and durability, and the varied purposes for which they are suitable. If such particulars are disseminated amongst the furniture-makers of this Dominion, and also in Australia, it is thought that a greater demand might be created.

Evidence has been given as to the respective durability and strength of our timbers as compared with Australian, Canadian, and American woods, but, as the evidence was of a conflicting character, we recommend that a series of tests be conducted by responsible officers in order that reliable information and records dealing with the matter may be available to the public. Similar tests with regard to timber in other countries have been made from time to time, and have proved very useful in determining how far they are suitable for foreign requirements.

Seasoning of Timber.

Another point that was emphasized by many witnesses was the great amount of unseasoned timber used for building purposes, with unsatisfactory results both as regards the "life" of the house constructed therewith and its internal comfort, and it is strongly recommended that more attention be paid to the felling of trees at the proper time of the year, and the seasoning of timber before being used for building or other purposes, in order that the public may be protected against having to purchase or live in houses that will not remain in a thoroughly habitable condition for a reasonable period of time. The use of unseasoned timber naturally tends to create a prejudice against our native timbers. This difficulty could be got over if merchants would purchase and stock them in large quantities for a sufficient period of time.

It was prominently brought forward in the course of our inquiry that various processes for artificially seasoning timber are now being established in this Dominion, and in particular the use of creosoting in several forms, and "Powellising" woods. Under present conditions it is difficult to form an accurate idea of the value of preservatives to our soft woods, and, although the evidence that was taken does not warrant us in making any specific recommendations in this respect with regard to any particular process, it appears desirable that full investigation should be made by the Government into the many processes of artificially seasoning and preserving timber, and that such investigations should include inquiry into—

(*a.*) The extra length of life of timber after being so treated;
(*b.*) The extra strength imparted to timbers in this manner;
(*c.*) The extra cost of timber after undergoing treatment by each process.

As one of the causes tending to lessen the use of our own timbers is the general impression, not altogether erroneous, that few kinds will endure for any length of time when exposed to the weather or brought into permanent contact with the ground, there appears to be an increasing demand for Australian hardwoods, and a diminishing order for New Zealand woods for certain purposes, and if any process of artificially seasoning wood will enable our timbers to compare favourably with imported timbers, it is essential that such process should be brought into general use.

Australian Hardwoods.

In the meantime we are of opinion that consideration should be given to the question of admitting free of duty such sizes and descriptions of Australian hardwoods as are actually necessary to the Dominion, and the importation of which will not materially affect our own timber industry.

Kauri.

Although kauri has long been recognised as our most valuable timber, and it is in constant request all over New Zealand, it has been shown beyond all doubt that the supply of kauri to many parts of the Dominion is far from equal to the demand, though an extensive export trade to Australia has been carried on for years past. The evidence with reference to the building and furniture trades proves that there is great difficulty in obtaining supplies in certain lines. This is specially noticeable in southern centres, where the best grades of kauri are demanded and cannot be obtained.

Rimu.

There is also a constant demand for first-class heart of rimu, which exceeds the supply, and much difficulty has been experienced in obtaining rimu joisting of the 75-per-cent.-heart grade.

Sawmilling Industry.

From the evidence adduced during the course of our inquiry, we are of opinion that the sawmilling industry is not in a satisfactory condition at the present time, and that the main causes responsible therefore are—

(*a.*) General trade depression, and local financial stringency;
(*b.*) Over-production.

The long period of prosperity enjoyed by the Dominion caused the demand for sawn timber to exceed the supply. To cope with this exceptional demand new mills were erected, and many of the existing plants enlarged, with the result that in ten years the sawn output more than doubled. Then, for the reasons stated above, the high-pressure demand ceased, and sawmillers were faced with a glutted market.

The following table shows approximately the increase of the sawmilling industry in New Zealand :—

Year.	Number of Mills.	Hands employed.	Quantity of Timber sawn per Annum.	Cutting-capacity per Annum.
			Sup. ft.	Sup ft.
1895 ..	299	4,055	191,053,466	..
1900 ..	334	6,085	261,583,518	..
1905 ..	414	6,912	413,289,742	704,930,600
1907 ..	411	7,139	432,031,611	718,940,000

Greater Use of New Zealand Timber.

With the view of assisting to relieve the present depression in the timber industry, it is suggested that the Government should endeavour to make a more extensive use of New Zealand timber in its public works and other operations wherever suitable; and, as the evidence of Railway officials has shown that, during the last twelve months forming the past financial year, no less than 198,244 out of 292,549 sleepers used by the Railway Department were of Australian timber, it is felt that puriri and others of our native timbers can be used to a much greater extent than at present for this purpose alone. When it is borne in mind that in the year 1898–99 no less than 327,938 out of 331,301 sleepers were of New Zealand wood, it cannot be denied that the replacement of New Zealand by Australian timber has been extremely great, and apparently more than is justifiable. Details are given in Appendix E.

Conservation of our Native Forests.

More consideration requires to be given to the preservation of forest in rough country, and on mountain-sides, particularly within the watersheds of rivers liable to periodical floods, as, unless the surface soil is sufficiently protected by vegetation, considerable damage and destruction to valuable land along river-banks and lower-lying country is naturally caused. Due consideration should also be paid to the conservation of rainfall and the maintenance of climatic conditions.

Judging from the reserves that have already been made in some districts by the Department of Lands for such purposes, it would seem that this matter has been kept in view; but, if increased attention is given to it in the future, more satisfactory results would follow. It is therefore recommended that, in future alienation of Crown lands, provision be made for a reservation of forest on the high lands, and heads of watersheds, &c.

Many farmers do not seem to be aware of the importance of conserving suitable belts of forest on their holdings, or, indeed, to know how best to preserve native trees. Advice might be disseminated on this subject, and public attention called to the beneficial results that attend the maintenance of a certain proportion of agricultural and pastoral lands in forest, whilst particulars of the most suitable kinds of trees to grow in place of the indigenous bush that formerly clothed so large a portion of the Dominion might accompany such advice.

With regard to the prevalence of bush-fires, and annual destruction caused to our forests by preventable causes, we would urge that the provisions of No. 9 of the new Forest Regulations, which impose a penalty on persons who light fires within Crown or State forests, or who permit fires lit outside the boundaries of such forests to spread within, be widely advertised and make known, and that Government officers be instructed to do all in their power to prevent such

fires, and to report immediately all cases where fires have occurred, and damage has been caused thereby. Rewards might be offered to all persons who give information tending to secure the conviction of offenders.

Prevention of Noxious Weeds.

We have noticed in different parts of the country that many of the areas used for milling purposes are being overrun with noxious weeds, and think that steps should be taken to protect these areas, and to insure that the land is laid down in grass as soon as the milling-timber has been taken therefrom.

In this connection we approve the principle adopted by the Westland and other Land Boards, who, when a sawmill area has been cut out, and grassed by the miller, load the land on its reversion to the Crown with part value of such grassing, in order that the amount shall be paid by the incoming tenant to the sawmiller who grassed the land.

Forest Lands and Settlement.

The remarks made by Mr. H. C. L. Anderson, M.A., Director of the Intelligence Department and Bureau of Statistics, and Under-Secretary of the Department of Agriculture, in his evidence before the Royal Commission on Forestry, New South Wales, 1908, are worthy of consideration. He says, *inter alia*,—

"I am clearly of opinion that, while doing everything necessary and expedient to safeguard our timber wealth, and to perpetuate our timber industry, there is not the slightest need to curtail the policy of settling every acre of land that is better adapted for agriculture than for forestry. If it is more profitable, in producing wealth and in supporting men and women, to clear the land for agriculture and dairying, than to leave it in its primitive state for the production of timber, then economic laws demand that the former course be pursued; and when, conversely, it can be clearly shown that large areas can be more profitably used for the production of timber for its various purposes than for crops or grass, then reason dictates that forestry, in this case, is preferable from the national point of view to agriculture or dairying."

In the past it has often happened that large areas of forest land, containing timber suitable for milling, have been opened for selection by the Department of Lands, and, in consequence of the conditions of the Land Act that prescribe the felling of bush and clearing of land within a comparatively short period, valuable timber has been destroyed that might otherwise have been used for commercial purposes. We therefore recommend that, wherever practicable, sawmilling on Crown land should precede settlement, and that Crown land should not be opened for selection until it is cleared of milling-timber. By this means the State would profit by the receipt of royalty from the sawmiller, and the settler would have cleared land to farm instead of having to spend money and time in felling and burning the bush.

It is also desirable that a stricter supervision should be exercised over the conditions which apply to the preservation of timber on lands held under different forms of lease from the Crown.

State Requirements.

The Commission approves of the setting-apart of certain forest-areas for the future requirements of the State, and recommends that the policy be extended so as to make adequate provision for public works throughout the Dominion. Every year there is an increasing call upon our timber resources for such purposes, particularly in the vicinity of large works, such as the construction of lines of railways, and, judging from the operations of the State sawmill at Kakahi, which we visited and were favourably impressed with, both as regards its methods of working and the satisfactory results obtained, and also from the working of the sawmill attached to the State Coal-mine at Runanga, there appears to be every ground for believing that the policy that has been adopted at these two places might be extended with advantage, and that other areas of suitable forest lands might be reserved for the future needs of

the Public Works, Railways, and other Departments of the State, and that the timber thereon might be cut and milled under Government supervision and management.

Use of Timber for Wood-pulp.

The increasing demand for wood-pulp for papermaking is one of the features of the timber industry in other countries, and it is highly desirable that this phase of the question should be considered by the Government.

Under the provisions of section 141 of "The Land Act, 1908," areas of Crown land aggregating 50,000 acres may be set aside and leased under special conditions for wood-pulp-making purposes, and regulations published in the *Gazette* of the 8th April, 1909, prescribed the terms and conditions on which the lands might be leased. Some time ago a company was formed to lease the lands in Westland that have been set aside under the Act, and we are informed that arrangements are now being made to commence operations at an early date; but we are of opinion that the establishment of the industry should be assisted in other parts of the Dominion. It is suggested that much of the timber that is left by sawmillers, both in the bush and at the mill, might be utilised for wood-pulp making. We think that greater efforts should be made to use the vast supplies of timber that exist in New Zealand for pulp-making, together with the manufacture of wood-spirit, potash, charcoal, and other commercial products. With the foregoing object in view we recommend that the Government should have our various timbers tested, so as to discover which of them are suitable for this purpose.

Sale of Timber in Mining Districts.

This is a matter which was brought under the notice of the Commission, and merits consideration.

The present position appears to be that, by "The Mining Act, 1908" (sections 147 to 152), timber on Crown land within mining districts is divided into two classes. Certain timber areas are set aside as "Land Board areas" and administered by the Land Board of the district, who allot licenses for sawmilling on same to applicants who pay royalty for the timber they use, according to the scale prescribed by the Forest Regulations. Of the royalty so received, one-half (less all expenses of collection, inspection of areas, and administration) is treated as territorial revenue, and paid into the Consolidated Fund, whilst the other half (subject to no deductions) is paid over to the local body in whose district the area is situated. The remaining timber areas are set aside as "Warden's areas," and licenses to cut timber thereon for mining purposes are issued by the Warden of the mining district, to applicants approved by him. The whole of the revenue so obtained is treated as goldfields revenue, and paid over to the local bodies.

Moreover, if thought advisable, the Warden may deal with any Land Board area, but there is no provision by which a Land Board may deal with a Warden's area.

The Land Board has a staff of Rangers and surveyors at its disposal for inspection purposes, and is thus in a position to obtain the fullest information relative to the value and quantity of trees on any area, and the advisability of milling same; but the Warden has no such staff, and, if he desires to obtain details of his areas, has to request the Land Board to supply him with a report made by its officers. This dual control does not seem to have been satisfactory, and we are of opinion that the sale of timber within mining districts would be better dealt with by the Land Board alone, and that the present partial control by the Warden is not in the best interests of the community. For example, it was stated that in some cases the Wardens have granted licenses to persons who have felled, milled, and exported the timber from New Zealand in direct contravention of the spirit of the Mining Act, which is to the effect that timber on Warden's areas is to be used for mining purposes only.

Planting of Willow-trees.

As public attention has been drawn to what is becoming a widespread nuisance in many parts of the Dominion, it may be well to place on record the

indiscriminate manner in which willow-trees have been planted on the banks of rivers and streams; and, owing to the luxuriance of their growth, and their disposition to spread into the beds of the streams and block up the water-way, many local bodies have experienced considerable difficulty in keeping them in check. The ill-advised action of persons who plant in this manner without due forethought has led to much unnecessary expense, and occasioned considerable trouble in the subsequent eradication of the willows, and we are of opinion that the practice of planting willows near watercourses should be discouraged except under strict supervision, and with due regard to the requirements of each case.

Afforestation.

In the evidence of the Under-Secretary of Lands (Mr. W. C. Kensington) it was estimated that about 34,000,000,000 sup. ft. of milling-timber remains available from all sources for the future timber-supply of the Dominion (*vide* Appendix F); and, as a large proportion of this is not likely to be available for sawmilling purposes for a long time to come on account of its inaccessibility, whilst in other cases milling-timber is so scattered as to render sawmilling unprofitable, it was considered by him that the supply of timber from our own forests is not likely to last for a longer period than about fifty years. Attention is therefore called to the urgent necessity of dealing with the matter of afforestation on a more vigorous and extensive plan, so that the planting of trees in this country may counterbalance the annual timber-destruction sufficiently to prevent a future timber-famine. All over the world the forestry question has become a most serious problem, engaging the minds of statesmen and experts to an increasing degree, and the need for educating the people of New Zealand to the necessity of adequately preserving our timber-supplies appears very pressing.

In order that we might become acquainted with the scheme of afforestation hitherto pursued by the State, we visited and carefully inspected the nurseries and plantations at Hanmer, Rotorua, Whakarewarewa, and Waiotapu, and viewed with satisfaction the operations now in progress. Judging from the encouraging results which have been obtained, we are strongly of opinion that the work of planting for the future needs of the Dominion should be extended, and recommend that plantations be established in the several land districts to meet the requirements of each locality.

As it is most necessary to provide timber for the constant needs of the State, we recommend that, in addition to the larch and pines that now form the bulk of the plantations, supplies of Australian hardwoods and other trees suitable for conversion into railway-sleepers should also be planted. In the past the Railway Department established plantations of trees alongside railway-lines, mostly in Canterbury, for the dual purpose of providing shelter for trains in open, wind-swept localities, and of growing timber that might be suitable for the future needs of the Department; but, as such plantations have not been continued for many years past, we consider that the whole of the work of afforestation for State purposes should be under the control of one Department.

After inspecting the methods and operations of the Forestry Branch of the Department of Lands, we are of opinion that the administration of that Department appears to have been economical and efficient, tending to excellent practical results. Details thereof are given in Appendices H and I, the latter of which contains extracts from the Report on State Nurseries and Plantations for the year 1907–8 (C.–1B).

We understand, however, that the annual cost of maintaining the nurseries and plantations on the present basis, and of raising and planting trees on a scale commensurate with the future requirements of the State, is from £20,000 to £25,000, and as we understand that the statutory source from which this expenditure can be met is rapidly shrinking, so that it will be impossible to continue operations on a sufficient scale unless further provision is made for requisite funds, we strongly recommend that a special vote be placed on the estimates to insure that a sum of at least £25,000 be annually available for afforestation purposes. We consider that this amount is the minimum that should be provided.

We think that afforestation should be vigorously prosecuted on poor lands unfitted for settlement but adapted for tree-growing, and that planting should be commenced and carried on over the extensive sand-dunes and wastes existing on the west coast of the North Island, particularly near Rangitikei, Waitotara, Kawhia, and north of Auckland, whilst large tracts of river-beds now infested with noxious weeds might also be planted in this manner. This latter suggestion specially applies to the Canterbury District.

The planting of trees along the upper regions of rivers and watercourses, where such areas are open and exposed, is also very desirable, as this planting would have the effect of mitigating disastrous erosion, and the gradual silting-up of adjacent streams.

The policy of supplying settlers with tree-plants might, with advantage, be continued where there is a *bona fide* intention to plant and care for such trees. Many settlers, however, are unaware of the kind of trees best suited for their holdings, and an indiscriminate distribution of tree-plants is often wasteful. If settlers are to be supplied in this manner, extra quantities of plants must be raised to meet the demand, and special funds should be provided for this purpose. It has been found, however, that the best results have been attained when a small charge is made for plants, and that free distribution is not a success.

And this, our report, we have the honour to respectfully submit to Your Excellency's consideration in obedience to the commission to us addressed.

Given under our hands at Wellington, this 23rd day of June, 1909.

NOTE.—No information is available for 1900 and 1903, as the original entries have by now all been destroyed. The total importations for these periods, obtained from the statistics published yearly, appended hereto. Further, no information regarding sizes of timber can be obtained from our figures, as we receive them in quantity only in superficial feet. Also, returns of staves are not kept separately, and figures for these are not available.

RICHARD CARTER,
Secretary and Inspector.

Department of Trade and Customs, Wellington, 29th June, 1909.

COMPARISON WITH NEW ZEALAND.

Country.	Total Area.	Wooded Area.	Per Cent. under Wood
	Acres.	Acres.	
New Zealand	66,606,162	14,131,933*	21·2

* Included in this area are the forests on national parks, scenic reserves, and permanent reserves, as well as the forests shown in Appendix F.

FOREST RESOURCES OF AUSTRALIA FOR PERIOD ENDING 1905.

(Extract from Minutes of Evidence taken by the New South Wales Royal Commission of Inquiry on Forestry, 1908, page 796.)

State.	Population.	Area in Acres.	Estimated Wooded Area in Acres.	Area in Acres reserved or set apart for Forestry.
New South Wales	1,496,050	198,634,880	20,000,000	7,749,579
Victoria	1,218,571	56,245,760	12,000,000	5,525,000
Queensland	528,048	427,838,080	40,000,000	3,606,709
South Australia	378,208	578,361,600	4,000,000	190,657
West Australia	254,779	624,588,800	20,000,000	212,480
Tasmania	181,105	16,777,600	11,000,000	95,000
	4,056,761	1,902,446,720	107,000 000	17,379,425

Mr. Hay, Acting Chief Forester, New South Wales, stated that an analysis of these figures showed that, in comparison with its total area, Australia had an average of about 1 wooded acre in every 18, and 1 acre reserved or set apart for forestry in every 109. In comparison with its population, there was for each unit 469 acres available for occupation, 26 acres wooded, and 4·2 acres reserved or set apart for forestry purposes.

In comparison with the total area of the continent, the area reserved or set apart for forestry was about 0·9 per cent. In European countries, with their dense populations, the percentage ranged from 5·6 per cent. in France to 14 per cent. in Italy, and 26 per cent. in Germany, Hungary, and Sweden.

The commercial value of its forests had yet to be appreciated. Although not extensively wooded, Australia possessed timbers of rare merit and great utility. Increase of population and internal development would enhance the value of forest resources and create great demands for timber.

APPENDIX H.

RETURN SHOWING NET RECEIPTS FROM STATE FORESTS.

Department of Lands, Wellington, May, 1909.

WM. C. KENSINGTON,
Under-Secretary.

APPENDIX I.

EXTRACTS FROM THE REPORT ON STATE NURSERIES AND PLANTATIONS BY THE UNDER-SECRETARY OF LANDS, FOR THE YEAR ENDED 31ST MARCH, 1908 (C.–1B).

FUTURE REQUIREMENTS.

The trees already planted by the Forestry Branch will not all be available in the years to come, as it must be remembered that they will need very extensive thinning and trimming to enable a satisfactory crop of timber to result. In fact, it is probable that out of the five or six million trees planted annually at the present time no more than a third will eventually survive the repeated thinning processes and reach maturity. Moreover, long before they reach an age at which the best results can be expected, the scarcity of timber in New Zealand is likely to be such that there will be a general demand for the utilisation of the trees for immediate use so soon as they are in any way suitable for the requirements of our trades. Bearing in mind, therefore, only the industrial requirements of the Dominion, the present rate of planting is only barely sufficient for our future needs, and, although the greatest efforts are made to plant trees which will yield the best results in the shortest space of time, there are very few trees fit for milling under forty or fifty years, and even these will be much more profitable if allowed to remain in the ground another ten or twenty years. Planting for posterity, though admirable in theory, is inevitably attended by pressing and irresistible drawbacks in practice, and all that can be done is to harmonize the needs of the present day as far as practicable with the requirements of future generations. It is almost impossible to lay too great stress upon the importance of the work of reforestation in this country, and each year sees its importance in other lands more and more recognised by far-sighted statesmen, and greater efforts made to insure the permanent timber-supply of the nation.

NECESSITY FOR AFFORESTATION.

The general principles underlying the modern system of forest-conservation and reforestation in all other countries apply equally to New Zealand as to the older civilisations. The more this subject is studied, the more one is impressed with the fact that judicious afforestation is the backbone of success in the important industries of every nation. As has been frequently pointed out, the cutting and utilisation of the indigenous forests by the sawmillers is proceeding at such a rapid rate in New Zealand that it is only the matter of a very few years (comparatively) when the greater bulk of our timber-supply must be obtained from abroad. Each year sees the output larger and the resources of the Dominion smaller, and, although the Government has taken the matter in hand with commendable foresight by the establishment of State plantations of timber-trees, yet it must be at least from thirty to forty years before any great supply can be calculated on from this source. Under these circumstances it appears imperative to restrict the present indiscriminate sawmilling of all available forests to such moderate extent as will insure their gradual disappearance synchronous with the development and growth of the State plantations, so that as the one fails the other may take its place. Unless some such steps as these are immediately taken, it follows that, although for a few years the demand can be fairly well satisfied, before long there would be no reserve of native timber, and the price would rise to a figure which would seriously embarrass many of the growing industries of New Zealand.

PRODUCTION OF ARTIFICIAL FORESTS.

Although there is a vast disproportion between the areas annually cut down in our native forests for sawmilling purposes and the areas planted by the Forestry Branch, yet it may be well to point out that an average acre of milling-bush contains a large number of trees unsuitable for sawmilling, and probably only from 10,000 to 20,000 superficial feet of timber is eventually extracted from the area. On the other hand, in our plantations, by successive thinnings, only the

best specimens are allowed to remain, and, if a systematic supervision is exercised in the future, the final result will be the production of perhaps six hundred suitable milling-trees, which in forty years' time will each contain on an average 1,000 superficial feet of timber, so that the artificial forest will yield no less than 600,000 superficial feet of timber against the indigenous forest's return of from 10,000 to 20,000 superficial feet. In this comparison no account is taken of the kauri forest, which gives an exceptional yield, for, as the kauri is rapidly disappearing and only forms a small proportion of our native forests, its comparison would be somewhat misleading.

Revenue and Expenditure.

Up to the present time the expenditure and requirements of the State nurseries and plantations has been met by the revenue derived from the sale of timber in State forests, and of these the kauri forests in the Auckland District have contributed most of the receipts. Owing to the rapid disappearance of the kauri, the State forest revenue is quickly shrinking, and it is no longer possible to maintain and develop the tree-planting operations of the Department from this source. It will consequently be necessary to draw on the Consolidated Fund for future requirements, and, although generations to come will reap a rich return from present expenditure, yet forestry operations must of necessity be unremunerative for a considerable period, though a small revenue may be derived from our plantations by the sale of "thinnings" and surplus tree-plants from time to time, and the sale of timber in State forests will still enable a portion of the required revenue to be provided for many years to come.

Conservation of "Worked-out" Areas.

With reference to the kauri forests, it may be well to mention the rule adopted when the millable timber is taken out. The greatest care is taken that no unnecessary damage is caused to the remaining trees in the forest by sawmilling operations, and as soon as the kauri has been extracted the remaining forest is protected from any further destruction and, as far as possible, allowed to reproduce itself, so that for climatic and soil-denudation purposes the land is as adequately conserved as before the kauri had been taken out. In several cases it has been found that a remarkably brief period has been sufficient to enable young growth to spring up and obliterate the ravages wrought by milling operations. Not only in the above-mentioned forests, but also in those of the Nelson, Westland, and Southland Districts, this has been found to be the case, and the officers of the Department have always received strict instructions to endeavour to insure that the millers leave untouched, as far as practicable, the non-milling trees in the forest. From even a close view it is difficult to discover after the lapse of a few years whether many of our native forests have been the subject of sawmilling operations, and the climatic effect is retained in an admirable manner.

Best Localities for Afforestation.

Experiments have been made to see whether it is possible to replace the gaps in the forests caused by sawmilling operations with the planting of foreign trees ultimately suitable for milling, but it is found that such a matter would be very expensive and the results hardly worth the time expended, as the rapid growth of native scrub and young trees would retard the development of exotic plants. It is therefore proposed to continue to devote the whole of the efforts of the afforestation branch to raising forest plantations in treeless localities, where land is in the hands of the Crown, and is almost wholly unfitted for agricultural or grazing purposes. Some tracts are found in the vast Kaingaroa Plains, between Rotorua and Taupo, where some 600,000 acres of Crown land are available for planting purposes, and the Waimarino Plains, to the west of Tongariro (in the North Island), which, now that the railway has been completed, can readily be supplied with plants from the central nursery at Rotorua; whilst in the South Island the chief localities needing attention are South Marlborough and North Canterbury, which can be supplied with trees from the Hanmer Springs Nursery, and South Canterbury and parts of Otago, which can be supplied from Tapanui Nursery. By acting in this manner, expenditure is lessened and forests will gradually grow in localities where they are needed for climatic purposes, and from which they can ultimately be worked at a profit owing to their easy access to the principal markets of New Zealand. In a few cases, however, it has been noticed that the unusual dryness of certain areas prevents any successful attempt at afforestation being undertaken at the present time, and consequently care has been taken to avoid all such localities in future operations.

Duties of Forestry Branch.

As has been stated, there are two distinct divisions of the Forests Branch of this Department. The older or *forest-conservation* division is that whose duty it is to care for, inspect, and deal with our remaining indigenous forests. These include (*a*) Crown forests reserved under the Land Acts, administered under the personal direction of the Minister of Lands through the Local Commissioners of Crown Lands and their staffs of timber experts, Crown Lands Rangers, &c.; and (*b*) State forests reserved under "The New Zealand State Forests Act, 1885," dealt with by the Commissioner of State Forests (*i.e.*, the Minister of Lands) and Conservators of State Forests (otherwise known as Commissioners of Crown Lands) under special regulations. It may be necessary later on to appoint a special officer to supervise the cutting and milling operations in these forests somewhat after the scheme adopted in the Indian Empire, and in France and Germany, &c., where only systematic and limited cutting is sanctioned under rigid safeguards for the protection of all trees not authorised to be felled. But at the present time the system of preliminary inspection by special officers, public notification of the sale of certain specific areas of bush, and careful supervision of the milling operations, is considered to be sufficient for our requirements, and a more elaborate system of dealing with our forests may not be needed for some time to come. The second or *afforestation* division is under the charge of a superintendent of forest nurseries and plantations (designated for departmental purposes as "the Chief Forester"), assisted by a staff of assistant foresters and nurserymen, and its results are embodied in the following report.

REPORT BY CHIEF FORESTER.

Seedling Trees.

Notwithstanding the adverse climatic conditions experienced, the results obtained at the various nurseries have been successful beyond expectation, although the officers in charge had an anxious time during the prolonged drought. Not only has a much larger proportion of seedling trees been raised from a given amount of seeds, but the plants generally are much larger and better-rooted than those of any previous crop.

This success is principally due to the excellent germinative qualities of the tree-seeds obtained, and to a lesser extent to the systematic method of seed-raising adopted at the nurseries, which may be briefly referred to in detail.

(1.) The seed-bed grounds at all stations have now been brought into a high state of cultivation, and are of sufficient area to allow of either a definite rotation of crops with systematic manuring, or to lie fallow for one or two seasons—thus limiting the exhaustive tree-crop to one area every third year.

(2.) The adoption of the roller system in sowing and covering the seeds to a defined depth, depending on the class of seeds dealt with.

(3.) The sowing of seeds at the proper time—not at any given date, but depending on the season. In other words, the Nurserymen in Charge have now the necessary experience to enable them to judge at what particular period this work should be undertaken to attain the best results.

(4.) The method of shading and protecting the seed-beds from drying winds and bright sunshine during the critical period of germination by properly constructed seed-frames.

(5.) The judgment of the officers in knowing the exact amount of seed required to a given area, so that the resultant crop will not be too thick to crowd one another, and thus promote conditions favourable to disease, but will allow ample space for further development of each individual.

Selection of Trees limited by Climatic Conditions.

The question is frequently asked, Is the Department raising and planting the best species of trees suitable for the future timber-supply of the Dominion? The answer is partly in the negative and partly in the affirmative, as I will endeavour to explain.

(1.) There are many species of trees which produce excellent timbers that could be grown in the Dominion, but none of our stations are suitable for their best development, chiefly on account of unseasonable frosts. In this class may be mentioned puriri and pohutukawa amongst native trees, and jarrah, sugar-gum, red ironbark, spotted gum, &c., from Australia.

(2.) Another class may be mentioned which comprises most valuable timber-trees, but their slow growth renders them unprofitable from a commercial point of view—kauri, rimu, kahikatea, matai, tanekaha, kawaka, northern manaoa, southern manaoa, silver-pine, yellow-pine, maire species, and many others.

(3.) The third class comprises exotic trees producing various timbers suitable for all technical purposes, but, owing either to the high cost of the seeds or the uncertainty of procuring annual supplies, their general cultivation is not considered expedient. The common English beech, for instance, is a valuable timber-tree, but there are few trees in the Dominion of sufficient age to produce seeds. The crop is not an annual one (generally every third or fourth year), and all attempts to import it in a sound condition have failed. Other species comprise the English elm, hickory in variety, many of the American oaks, maples, pines, piceas, and abies, seeds of which are either difficult to procure in quantity, do not carry well, or are too expensive for general plantation purposes.

It is confidently asserted that so far as is possible the Department is raising and planting the most suitable classes of timber-trees available for the varied soils and climatic conditions obtaining at the stations at present in operation.

As mentioned in the foregoing remarks on temperature and rainfall, we are restricted to a very narrow limit in our selection, but nevertheless any suggestion or recommendation in regard to this subject will gladly receive every consideration.

Prison Labour.

Thanks to the continued co-operation of the Inspector of Prisons and his officers, I have again pleasure in stating that this system has worked very satisfactorily. The average number of prisoners employed was 75·07, against 78·90 for the previous year. The average value of work done per man for the year is £79 17s. The Foresters in charge of tree-planting camps are unanimous in their reports as to the excellent work done by the prisoners, the majority of whom take a considerable interest in the various duties assigned them; and, from personal observation during several months of the past year whilst located at prison camps, I confirm this opinion, and assert that with few exceptions the prisoners are obedient, willing, industrious, and careful.

In order to enable well-behaved, industrious prisoners to make a fresh start in life on the expiry of their sentences, a special tree-planting camp has been commenced four miles from the Waiotapu Prison. Here discharged prisoners are offered remunerative employment either at contract rates or at day-wages, and during the few months this camp has been in operation the results have been entirely satisfactory.

A similar system might well be adopted near Hanmer Springs with beneficial results both to the State and to unfortunate men who are discharged from prison frequently without friends and without money.

The whole of the available area reserved for planting purposes at Hanmer Springs having been planted a new block of some 600 acres, situated two miles distant towards Jollie's Pass, was taken in hand. The prison huts and other movable structures were transferred to this site during February. A new cookhouse, mess-room, and store have been erected, an efficient supply of excellent water laid on, and special precautions taken in regard to drainage and other sanitary arrangements. The permanent buildings at the old camp have been altered and renovated for occupation by the Nurseryman in Charge. It is anticipated that sufficient land is available within easy distance of the new camp to keep forty prisoners employed for the next five years.

At Waiotapu arrangements are in progress for the removal of the prison camp to the centre of a new block of some 5,000 acres to the north-east of the present area. The site for the new camp (three miles distant from the old one) is in a most favourable position, with an excellent water-supply available, and every facility for good drainage. When this camp is completed and occupied, a great deal of time will be saved by the men in going to and from their work. It is proposed to plant this new area as far as possible in wedge-shaped blocks radiating from a common centre at the camp. The walking-distance to and from work will thus be evenly distributed for each year's planting.

Convalescent Camp.

In order to provide suitable employment for discharged patients from the sanatorium at Cambridge, it is proposed to establish a movable camp on the Whakarewarewa Plantation, some distance beyond the Waipa Prison Camp. This will to some extent overcome the difficulty with which the medical authorities are now faced in having to discharge convalescent patients who in many cases are compelled to resume their ordinary indoor occupations, thus lessening the possibilities of a complete restoration to health. It is not intended that each patient shall do a certain amount of work or plant a given number of trees, as payment will be made by results on the co-operative system. The State will thus be providing healthy employment for the needy without paying more for the work than it is at present costing by ordinary labour.

The following summaries show the result of the year's operations and present position:—

Department of Trade and Customs,
Wellington, 21st June, 1909.

RICHARD CARTER,
Secretary and Inspector.

MINUTES OF PROCEEDINGS.

INVERCARGILL, THURSDAY, 25TH MARCH, 1909.

The first meeting of the Commission was held in the Ministerial Room of the Post-office, Invercargill, on Thursday, the 25th March, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan, M.P. (in the chair), Messrs. J. A. Hanan, M.P., H. G. Ell, M.P., J. F. Arnold, M.P., J. Stallworthy, M.P., W. H. P. Barber, J. B. Leyland, S. I. Clarke, and W. Morris.

The Commission, dated the 9th day of March, 1909, was read from His Excellency the Governor, appointing the above gentlemen and Messrs. W. H. Field, M.P., W. T. Jennings, M.P., and F. Mander, M.P., to be Commissioners for the purpose of inquiring by all lawful means into the conditions affecting the timber and timber-building industries, including the matters specified in the Order of Reference.

The Chairman opened the proceedings by stating the object of the inquiry, and invited the views of members of the Commission as to the procedure to be adopted and the best manner of securing and taking evidence.

An informal discussion then took place, after which it was unanimously resolved :—

Hours of Meeting.

That the Commission would meet at 9.30 a.m., and be open for public business at 10 a.m., sitting until 1 p.m., when it would adjourn for an hour, resume at 2 p.m., and continue until 5.30 p.m., when it would adjourn for the day, unless circumstances rendered an evening sitting necessary.

Evidence.

That all evidence be taken on oath.

That a typewritten transcript of the reporters' shorthand verbatim notes be supplied to each member of the Commission as soon as possible after the taking of each day's notes.

That, as far as possible, each witness give evidence in the same order of subjects as is set forth in the Commission.

Proceedings to be Public.

That the proceedings of the Commission be open to the public and to the Press.

That when the Commission goes into committee the public and the Press be excluded.

Witnesses for Invercargill.

It was resolved, That the following persons, suggested by Mr. Hanan, be asked to attend and give evidence :—

W. H. Brent, president, Sawmillers' Association.
E. C. Leary, secretary, Sawmillers' Association.
H. A. Massey, sawmiller, Esk Street, Invercargill.
E. R. Wilson, architect, Invercargill.
Hugh Mair, contractor, Liddel Street, Invercargill.
William Ashley, builder, Don Street, Invercargill.
James More, sawmiller, Riverton.
Andrew Bain, chairman, Builders' Association, Georgetown.
F. L. Vickery, secretary, Builders' Association, Bowmont Street, Invercargill.
James Leggatt, sawmiller, Ness Street, Invercargill.
Joseph Hensley, sawmiller, Esk Street, Invercargill.
Jacob Alsweiler, president, Sawmill-workers' Union, Esk Street, Invercargill.
T. O'Byrne, secretary, Sawmill-workers' Union, Esk Street, Invercargill.
W. R. Riddel, c/o Smith's factory, Nith Street, Invercargill.
William Stead, c/o Stead and Dewar, furniture-maker, Tay Street, Invercargill.
Charles Lambert, Earn Street, Invercargill.
C. A. Piper, Traffic Manager, New Zealand Railways, Invercargill.
J. P. Ridings, Collector of Customs, Invercargill.
E. H. Wilmot, Commissioner of Crown Lands, Invercargill.
James Collins, Timber Expert, Lands Office, Invercargill.
And another witness to be selected, to give evidence as to prices, quantities, &c., of butter-boxes used in Southland.

Railway-sleepers.

It was also decided that the New Zealand Railways Department be requested to furnish information as to the varieties and quantities of timber used as railway-sleepers, the information to be ready by the time the Commission sits in Wellington.

Correspondence.

Apologies from Messrs. Jennings, Field, and Mander, M.P.s, for their unavoidable absence were received.

1. Letter, dated 17th March, 1909, from Mr. J. C. Thomson, M.P., Riverton, inquiring if the Commission can visit Longwood Forest and inspect the sawmills.

Resolved, That the Commission visit the forest the following day, Friday, 26th March, 1909.

2. Telegram, dated 16th March, from E. A. Wickes, secretary, Sawmillers' Association, Greymouth, suggesting that a representative of the association might be present at meetings of Commission to assist in eliciting information.

Resolved, That the Commission cannot see its way to accede to the request.

3. Telegram, dated 11th March, from E. A. Wickes, secretary, Greymouth, to the Premier, inquiring if matters regarding transit, railway, and steamer freights, or titles and areas under Mining Act come within the scope of the Commission.

Also reply by the Right Hon. the Prime Minister, dated 11th March, stating that all matters referred to come within the scope of the Commission, and will be dealt with by them.

Received.

4. Letter, dated 20th March, from D. H. Roberts, on behalf of Sawmillers' Committee, Greymouth, asking whether all balance-sheets and other statements of like nature will be treated as private and confidential by the Commission.

Resolved, That the Commission is willing to consider all matters of a confidential nature in committee.

Admission of Public.

At this stage the public were admitted, and the Chairman stated the objects of the Commission, and that evidence would not be taken until the 27th instant.

Moved by Mr. Arnold, and carried, That the Commission goes into committee.

The public then withdrew.

Proposed Itinerary.

The Secretary submitted a draft itinerary for the consideration of members.

The Commission then adjourned until 10 a.m. on Saturday, the 27th March, 1909.

On Friday, 26th March, the Commission inspected Longwood Forest, and Messrs. More, Traill, and Smythies' sawmills therein.

INVERCARGILL, SATURDAY, 27TH MARCH, 1909.

The second meeting of the Commission was held in the Ministerial Room of the Post-office, Invercargill, on Saturday, the 27th March, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (in the chair), and Messrs. Arnold, Barber, Clarke, Ell, Field, Hanan, Jennings, Leyland, Mander, Morris, and Stallworthy.

The minutes of the first meeting were read and confirmed.

An informal discussion took place until 10 a.m., when the public were admitted.

Witnesses called.

The first witness called was Mr. W. H. Brent (president of the Sawmillers' Association), who asked to be allowed to give his evidence on Monday instead, as he had been absent from Invercargill, and had only returned the previous night.

This was agreed to.

The next witness called was Mr. E. C. Leary (secretary of the Sawmillers' Association).

Mr. J. Hensley was then called, and after him Mr. H. A. Massey (sawmiller, Riverton).

The Commission adjourned at 1 p.m. and resumed at 2 p.m., when Mr. Massey's evidence was continued.

On the conclusion of Mr. Massey's evidence, the Chairman thanked him for the clear, full, and straightforward manner in which he had given his evidence.

The Commission then adjourned at 4.45 p.m.

INVERCARGILL, MONDAY, 29TH MARCH, 1909.

The third meeting of the Commission was held in the Ministerial Room of the Post-office, Invercargill, on Monday, the 29th March, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan and all the members.

The minutes of the previous meeting were read and confirmed.

An informal meeting was held until 10 a.m., when the public were admitted.

Evidence.

Mr. McCall (of Mataura) was called for, but, not being present, Mr. W. H. Brent (president, Sawmillers' Association) was examined from 10 a.m. to 12.10 p.m.

Mr. A. Bain (chairman, Builders' Association) was examined at 12.10 p.m.

The Commission adjourned from 1 to 2 p.m.

On resuming,—

Mr. A. Bain's examination was continued till 3 p.m.

Mr. E. R. Wilson (architect) was examined from 3 to 4.25 p.m.

Mr. F. L. Vickery (secretary, Builders' Association) was examined from 4.25 to 5.20 p.m.

Mr. William Stead (furniture-maker) was examined from 5.20 to 5.50 p.m.

It was decided to call Mr. James More as the first witness on Tuesday.

Information required.

Moved by Mr. Field, That information be obtained from the Department in charge of the building of workers' homes as to the various items of cost in the construction of the cottages.

Moved by Mr. Barber, That information be also obtained giving a comparison of the difference of cost between erecting cottages in wood, brick, and concrete.

Agreed to.

The Commission adjourned at 6 p.m.

INVERCARGILL, TUESDAY, 30TH MARCH, 1909.

The fourth meeting of the Commission was held in the Ministerial Room of the Post-office, Invercargill, on Tuesday, the 30th March, 1909, at 9.50 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

The following witnesses gave evidence:—

Mr. James More was called, but was not present.

Mr. C. A. Piper (Railway Traffic Manager), 10 a.m. to 11 a.m.

Mr. James Leggatt, builder, 11 a.m. to 12.55 p.m.

Mr. E. H. Wilmot, Commissioner of Crown Lands, 12.55 to 1.10 p.m.

The Commission adjourned from 1.10 to 2 p.m.

On resuming, Mr. James Collins, timber expert, from 2 to 3.5 p.m.

Mr. T. O'Byrne, secretary, Sawmill-workers' Union, 3.5 to 4.15 p.m.

Mr. W. R. Riddel, furniture-maker, 4.15 to 4.55 p.m.

Mr. J. P. Ridings, Collector of Customs, 4.55 to 5 p.m.

Mr. E. J. Broad, timber-merchant and sawmiller, 5.5 to 5.35 p.m.

The Commission then adjourned.

INVERCARGILL, WEDNESDAY, 31ST MARCH, 1909.

On the morning of Wednesday, the 31st March, the Commission inspected the creosote-works belonging to the Railway Department.

The fifth meeting of the Commission was held in the Ministerial Room of the Post-office, Invercargill, on Wednesday, the 31st March, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. A. J. McCredie, District Railway Engineer, was examined from 10.15 a.m. to 11 a.m.

Mr. C. A. Piper, re-examined from 11.5 to 11.15 a.m.

Thanks.

Moved by Mr. Field, seconded by Mr. Leyland, That members of the Commission desire to convey their sincere thanks to all those who have so kindly extended hospitality to them during their stay in Invercargill.—Carried.

The Chairman expressed the appreciation of the Commission of the free and fair manner in which the witnesses at Invercargill had given their evidence.

The Commission then adjourned to Dunedin.

DUNEDIN, THURSDAY, 1ST APRIL, 1909.

The sixth meeting of this Commission was held in the City Council Chamber, Dunedin, on Thursday, the 1st April, 1909, at 9.45 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. T. Scott, blindmaker, examined from 10 a.m. to 10.50 a.m.
Mr. James Crawford, president, Builders and Contractors' Association, 10.50 a.m. to 12.5 p.m.
Mr. Alexander Macpherson, sawmiller, 12.5 to 1 p.m.
The Commission adjourned from 1 to 2 p.m.
Mr. Gabriel Hodges, examined from 2 to 3.15 p.m.
Mr. H. V. Haddock, manager for Messrs. Murdoch and Co., examined from 3.15 to 4.10 p.m.
Mr. A. McCallum, sawmiller, examined from 4.10 to 4.35 p.m.
The Commission then went into committee.

Meeting at Greymouth.

Telegram dated 1st April from the Hon. A. R. Guinness, M.P., asking, on behalf of the Greymouth sawmillers, that the Commission sit at Greymouth last in order to allow time to collect evidence.
Moved by Mr. Jennings, seconded by Mr. Mander, That the itinerary as drafted be adhered to.—Carried unanimously.

Otago Club.

A card of honorary membership of the above club from the 1st April to 1st May was received with thanks.

Further Information.

Moved by Mr. Stallworthy, That Messrs. Murdoch and Co. be asked to state the total production of each of their mills, together with the cost of putting the timber through the mill on to the truck, the information so supplied to be treated as confidential, and not to be published in the report of the Commission, but to be for the information of members only.—Carried.
It was also resolved that similar information be obtained from Mr. A. McCallum respecting the output of each of his four mills.
The Commission then adjourned at 4.50 p.m.

DUNEDIN, FRIDAY, 2ND APRIL, 1909.

The seventh meeting of the Commission was held in the Council Chamber, Dunedin, on Friday, the 2nd April, 1909, at 10 a.m.
Present: The Hon. T. Y. Duncan (Chairman), and all the members.
The minutes of the previous meeting were read and confirmed.

Evidence.

The following witnesses were examined:—
Edwin Broad, manager, Dunedin Timber Company, 10 a.m. to 11.15 a.m.
Robert Crawford, builder, 11.15 to 12.15 a.m.
A. R. Wallis, sawmiller, 12.15 p.m. to 1 p.m.
The Commission adjourned from 1 to 2 p.m.
A. R. Wallis (continued), from 2 p.m. to 2.45 p.m.
F. W. Petre, architect, 2.45 p.m to 4.15 p.m.
A vote of thanks was accorded to Mr. Petre for his clear and straightforward evidence.
George Clarke, builder, from 4.15 to 4.35 p.m.
Frank Wilkinson, secretary to Builders and Contractors' Association, 4.35 to 4.55 p.m.
Mr. H. A. Massey, of Invercargill, having presented the Commission with a panel containing specimens of five milling-timber woods of Southland, it was decided to thank him for his kind donation.
The Commission then adjourned at 5 p.m.

DUNEDIN, SATURDAY, 3RD APRIL, 1909.

The eighth meeting of the Commission was held at the City Council Chambers, Dunedin, on Saturday, the 3rd April, 1909, at 10 a.m.
Present: The Hon. T. Y. Duncan (Chairman), and all the members.
The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. David Barron, Commissioner of Crown Lands, 10 a.m. to 10.25 a.m.
Mr. Edward O'Neill, Crown Lands Ranger, 10.25 to 10.40 a.m.
Mr. A. Hogg, of Messrs. Hogg and Co., timber-merchants, 10.40 a.m. to 11.40 a.m.
Mr. Hunter Macandrew, District Railway Engineer, 11.40 a.m. to 12.15 p.m.
Mr. Robert Chisholm, of Messrs. Scoullar and Chisholm, 12.5 to 12.30 p.m.

Correspondence.

Letter dated 1st April, from H. A. Massey, Invercargill, explaining certain matters stated by him when being examined.—Received.

Thanks.

A hearty vote of thanks was unanimously passed to the Dunedin City Council for the use of the City Council Chambers during the Commission's stay in Dunedin.

A vote of thanks was also passed to those witnesses who have given evidence in Dunedin.

The Commission then adjourned at 12.35 p.m. to Christchurch, the next meeting to be on Tuesday, 6th April, at 9.30 a.m.

CHRISTCHURCH, TUESDAY, 6TH APRIL, 1909.

The ninth meeting of the Commission was held in the old Provincial Council Chamber, Christchurch, on Tuesday, the 6th April, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. S. Hurst Seager, architect, examined from 10.5 a.m. to 12 noon.
Mr. C. E. Page, of Messrs. Edmonds and Page, timber-merchants, 12 noon to 1 p.m.
The Commission adjourned from 1 to 2 p.m.
Mr. C. E. Page (examination continued), 2 to 3 p.m.
Mr. C. Taylor, builder, from 3 to 4 p.m.
Mr. William Goss, timber-merchant, 4 to 4.50 p.m.

Meeting at Greymouth.

In response to a telegram from the Commissioner of Crown Lands, Hokitika, inquiring on what date the Commission will arrive in Greymouth,—

Resolved, That he be informed that the Commission will commence sitting on Wednesday, the 14th instant.

Correspondence.

Letter dated 6th April, from S. Hurst Seager, correcting certain figures stated by him in his evidence that morning.—**Received.**

The Commission adjourned at 5 p.m.

CHRISTCHURCH, WEDNESDAY, 7TH APRIL, 1909.

The tenth meeting of the Commission was held in the old Provincial Chamber, Christchurch, on Wednesday, the 7th April, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. William Goss, examination continued from 10.5 a.m. to 11.25 a.m.
Mr. Edwin Henshall, timber-merchant, from 11.25 a.m. to 12.30 p.m.
Mr. E. C. Gold Smith, Commissioner of Crown Lands, from 12.35 p.m. to 12.40 p.m.
The Commission then adjourned till 2 p.m.
Mr. James Rowe, president, Builders' Association, examined 2 p.m. to 3.25 p.m.
Mr. William Allen Jewell, joinery-works, 3.25 p.m. to 4.30 p.m.
Mr. Edmund Gee, venetian-blind maker, 4.30 p.m. to 4.35 p.m.
Mr. Ralph Davison, foreman of timber-yard, Messrs. Strange and Co., 4.35 to 4.45 p.m.
The Commission adjourned at 4.45 p.m.

CHRISTCHURCH, THURSDAY, 8TH APRIL, 1909.

The eleventh meeting of the Commission was held in the old Provincial Chamber, Christchurch, on Thursday, the 8th day of April, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. Alfred Elliott, Collector of Customs, examined from 10.5 to 10.10 a.m.
Mr. W. Jacques, secretary to Builders' Association, 10.10 a.m. to 11.5 a.m.
Mr. Robert Ellison, secretary, Central Dairy Company, 11.5 a.m. to 11.25 a.m.
Mr. C. H. Biss, District Railway Engineer, 11.25 a.m. to 11.50 a.m.
Mr. Harold Lightband, representative of Messrs. Lemcke and Co., of New York, 11.50 a.m. to 12.5 p.m.
Mr. G. E. Richardson, Manager, Railway Workshops, Addington, 12.5 p.m. to 12.20 p.m.
The Commission adjourned till 2 p.m.
Mr. E. W. Waller, timber-merchant, examined from 2.10 p.m. to 3.5 p.m.
Mr. William Cook, timber-merchant, 3.5 p.m. to 3.25 p.m.
Mr. H. J. Nightingale, builder, 3.25 p.m. to 3.35 p.m.
Mr. E. C. Gold Smith (re-examined), 3.35 p.m. to 3.45 p.m.

Mr. W. Goss (explanation), 3.45 p.m. to 3.50 p.m.

Moved by Mr. Ell and carried, That a hearty vote of thanks be accorded the Christchurch witnesses for the willing and straightforward manner in which their evidence was given.

Mr. Goss thanked the Commission for their kindly reference to the witnesses.

The Commission adjourned at 4 p.m. to Greymouth.

GREYMOUTH, WEDNESDAY, 14TH APRIL, 1909.

On Wednesday, the 14th April, 1909, the Commission, accompanied by the Hon. A. R. Guinness, M.P., proceeded by train to Moana, and there inspected the sawmill of Messrs. Church and Peat. *En route*, the Commission stopped at Patara and inspected the mill of Messrs. Stratford, Blair, and Co. In the afternoon they proceeded by launch over Lake Brunner down the Arnold River to Kotuku, where an inspection was made of Messrs. Jack Bros.' mill, and, by going along the tramway leading into the bush, the method in vogue of cutting the trees and dragging them by means of a wire rope and a "hauler" engine to the tram-line was carefully viewed, and the conditions under which the trees are converted into sawn timber were thoroughly examined.

GREYMOUTH, THURSDAY, 15TH APRIL, 1909.

The twelfth meeting of the Commission was held in the Borough Council Chambers, Greymouth, on Thursday, the 15th April, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. F. W. Flanagan, Commissioner of Crown Lands, Nelson, examined from 10.5 to 11.50 a.m.

Mr. W. H. Bowater, sawmiller, Westport, 11.50 a.m. to 1 p.m.

The Commission adjourned from 1 p.m. to 2 p.m.

Mr. Bowater, examination continued from 2 p.m. to 4 p.m.

The Commission then went into committee to hear further evidence from Mr. Bowater.

The Commission adjourned at 4.20 p.m.

GREYMOUTH, FRIDAY, 16TH APRIL, 1909.

The thirteenth meeting of the Commission was held in the Borough Council Chamber, Greymouth, on Friday, the 16th April, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. Arthur Fletcher, sawmiller, Westport, examined from 10 a.m. to 10.30 a.m.

Mr. G. J. Roberts, Commissioner of Crown Lands, Westland, 10.30 a.m. to 12.20 p.m.

Mr. William Butler, sawmiller, Ruatapu, Hokitika, 12.20 p.m. to 1 p.m.

The Commission then went into committee.

At the invitation of the Mayor, it was decided to adjourn for the day at 4.30 p.m. in order that the Commission might inspect the harbour-works at Greymouth that afternoon.

A discussion then took place as to the dates of meetings in the North Island.

Resolved, That after leaving Greymouth, the Commission stay at Wellington to inspect mills, &c., for a day or two, and proceed to Taihape on Monday, the 26th April.

Telegrams from T. Y. Seddon, M.P., Joseph Grimmond (Ross), and James Murdoch (Hokitika), welcoming the Commission to Westland, and inviting it to visit Ross and Kumara, were received.

Resolved, That the Commission visit Ross on Saturday, the 17th April, in order to inspect the forest in the locality.

The Commission adjourned for lunch at 1.15 p.m., and resumed at 2 p.m.

Mr. William Butler, examination continued from 2 p.m. to 4.30 p.m.

The Commission adjourned at 4.30 p.m. till 10 a.m. on Monday, the 19th April, 1909.

SATURDAY, 17TH APRIL, 1909.

On Saturday, the 17th April, the Commission proceeded to Ross by train, inspected the timber *en route* and the forest in the locality, and inquired into the needs of the mining industry for various kinds of timber.

A formal welcome was tendered the Commission by T. Y. Seddon (M.P. for Westland) and Mr. S. G. Ferguson (Chairman of the Westland County Council), whilst the Hon. A. R. Guinness, M.P., and Mr. H. L. Michel (Mayor of Hokitika) accompanied the Commission.

GREYMOUTH, MONDAY, 19TH APRIL, 1909.

The fourteenth meeting of the Commission was held in the Borough Council Chambers, Greymouth, on Monday, the 19th April, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. William Butler, examination continued from 10 a.m. to 11 a.m.

At the conclusion of Mr. Butler's evidence he was complimented by the Chairman on the clear and complete manner in which it had been given.

Mr. John Jackson, secretary, Wharf Labourers' Union, examined from 11 a.m. to 12.30 p.m.

Mr. Andrew Dalziell, sleeper-getter, Greymouth, 12.30 p.m. to 12.55 p.m.

The Commission adjourned till 2 p.m.

Mr. E. A. Wickes, secretary, West Coast Trading Company, Greymouth, 2 to 4.25 p.m.

Mr. J. D. Gillies, engineer and sawmiller, Greymouth, 4.25 p.m. to 5.5 p.m.

Mr. James Jack, sawmiller, Kotuku, from 5.5 p.m. to 5.55 p.m.

The Commission then adjourned till 9 a.m. on the 20th instant.

GREYMOUTH, TUESDAY, 20TH APRIL, 1909.

The fifteenth meeting of the Commission was held in the Borough Council Chambers, Greymouth, on Tuesday, the 20th April, 1909, at 9 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. James Ashley, District Traffic Manager, Greymouth, examined from 9 a.m. to 9.45 a.m.

Mr. David Tennent, manager for Stratford, Blair, and Co., sawmillers, Greymouth, 9.45 to 12 noon.

Mr. H. L. Michel, merchant, Hokitika, 12 noon to 1 p.m.

The Commission adjourned from 1 to 2 p.m.

Mr. J. Bishop, manager, State Coal-mine and Sawmill, Runanga, 2 p.m. to 2.10 p.m.

Mr. J. H. Lewis, Resident Engineer, Public Works Department, examined 2.10 p.m. to 2.30 p.m.

Mr. Campbell Bell, representative, sawmill-workers, 2.30 p.m. to 3.7 p.m.

Hon. A. R. Guinness, M.P., Greymouth, 3.7 p.m. to 3.20 p.m.

Mr. C. M. Benzoni, District Railway Engineer, 3.20 p.m. to 3.50 p.m.

Mr. E. J. Lord, Town Clerk and Borough Engineer, 3.50 p.m. to 4.12 p.m.

Mr. J. W. Callwell, auditor, Greymouth (information to be given in committee).

Mr. Osmond Butler, sawmiller, Greymouth, 4.15 p.m. to 4.55 p.m.

Votes of Thanks.

Moved by Mr. Morris and seconded by Mr. Leyland, That a vote of thanks be passed to the witnesses who have given such valuable evidence in Greymouth.—Carried.

Moved by Mr. Field and seconded by Mr. Mander, That a hearty vote of thanks be passed to those gentlemen who have assisted to entertain the Commission during their stay in Greymouth.—Carried.

Moved by the Hon. T. Y. Duncan and carried, That a letter be sent to the Hon. Mr. Guinness, thanking him for the kindness and assistance he gave to the Commission during the time it has been in Westland.

Moved by the Hon. T. Y. Duncan and seconded by Mr. Clarke, That the Mayor and Borough Council be thanked for the use of the Borough Council Chambers and committee-rooms, and assistance rendered by their staff to the Commission.—Carried.

In Committee.

The Commission then went into committee at 5.5 p.m., when confidential particulars regarding the expenditure and profits made by Messrs. Stratford and Blair during the past three years were submitted to the Commission by the manager, Mr. Tennent.

At 5.25 p.m. Mr. Callwell gave some confidential particulars regarding the profit and loss made by Messrs. Baxter Bros. during the preceding two years.

A confidential return was also furnished by the Manager of the Runanga State Sawmill.

The Commission adjourned at 5.55 p.m. to Taihape on Tuesday, the 27th April.

TAIHAPE, TUESDAY, 27TH APRIL, 1909.

The sixteenth meeting of the Commission was held in the Courthouse, Taihape, on Tuesday, the 27th day of April, 1909, at 9.15 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members except Mr. Hanan, who was unavoidably detained in Wellington and took his seat at 7.30 p.m.

The minutes of the previous meeting were read and confirmed.

Oregon-pine Importation.

Moved by Mr. Field, and seconded by Mr. Barber, That the Customs Department be requested to furnish a return showing the importation of Oregon pine at each port in the Dominion during each month from the 1st January, 1907, to the 30th April, 1909.—Carried.

Evidence.

Mr. F. W. T. Saunders, manager, New Zealand Powell Wood Process (Limited), examined from 9.30 to 10.30 a.m.

Mr. John Punch, sawmiller, Rangataua, 10.30 a.m. to 11.30 a.m.

Mr. G. A. Gamman, sawmiller, Ohakune, 11.30 a.m. to 12.40 p.m.

The Commission adjourned till 7.30 p.m., and in the afternoon inspected the mills and workings of Mr. H. D. Bennett at Pukenaua, and the mill of Mr. Robert Smith.

On resuming at 7.30 p.m. Mr. Gammon's examination was continued to 8.20 p.m.

Mr. Alex. Laird, sawmiller, Taumarunui, examined from 8.20 p.m. to 10 p.m.

Mr. R. A. Wilson, timber-merchant, Bull's, 10 p.m. to 10.30 p.m.

The Commission then adjourned.

TAIHAPE, WEDNESDAY, 28TH APRIL, 1909.

The seventeenth meeting of the Commission was held in the Courthouse, Taihape, on Wednesday, the 28th April, 1909, at 9 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Letters.

Letter, dated 19th April, 1909, from the District Traffic Manager, Invercargill, correcting certain figures in returns of Southland timber.—Received.

Letter, dated 21st April, 1909, from the secretary of the West Coast Timber Trading Company, forwarding return of the company's exports of timber to the various New Zealand ports during 1908 and 1909.—Received.

Letter, dated 23rd April, 1909, from Mr. H. A. Massey, of Invercargill, regarding evidence given by Mr. Wallis in Dunedin, and Ranger Collins, of Invercargill.—Received.

Evidence.

Mr. G. J. Neill, representative of sawmill-workers, Taumarunui, examined from 9.15 a.m. to 10.15 a.m.

Mr. H. Lundius, Crown Lands Ranger, Wanganui, 10.5 to 11.15 a.m.

Mr. John Ammunson, Crown Lands Ranger and timber expert, Ohakune, 11.15 a.m. to 11.30 a.m.

Mr. W. A. L. Bailey, sawmiller, Taihape, 11.30 a.m. to 1 p.m.

Itinerary.

On the motion of Mr. Jennings, seconded by Mr. Stallworthy, it was resolved, That the itinerary as drafted for the North Island be adopted.

The Commission then adjourned from 1 to 2 p.m.

Evidence.

Mr. H. G. Mackintosh, contractor, Taihape, examined from 2 p.m. to 2.25 p.m.

Mr. C. Hutton, bush contractor for Egmont Box Company, Utiku, 2.25 to 3.5 p.m.

Mr. H. D. Bennett, merchant, Taihape, 3.5 p.m. to 5.10 p.m.

Mr. J. A. Anderson, sawmiller, Turangarere, 5.25 p.m. to 5.30 p.m.

The Commission adjourned till 7.30 p.m.

Mr. Henry Brown, sawmiller and timber-merchant, Inglewood, examined from 7.30 p.m. to 7.55 p.m.

Mr. G. Wrightson, chairman, Builders' Association, Taihape, 7.55 to 8.10 p.m.

Vote of Thanks.

Moved by Mr. Jennings, and seconded by Mr. Mander, That a hearty vote of thanks be tendered to those gentlemen who had given evidence at Taihape.—Carried.

Mr. H. D. Bennett acknowledged the resolution, and thanked the Commission for the impartial manner in which examination had been conducted.

The Commission then adjourned to Auckland on Friday the 7th May, 1909.

On the morning of Thursday, the 29th April, 1909, the Commission proceeded by train to Rangataua, where an inspection was made of the new mill of the Powell Wood Process Company and the treatment of timber by the process thoroughly examined. After driving to Ohakune, an inspection was made in the afternoon of Mr. G. A. Gamman's mill, close to the Ohakune Railway-station, and the bush-workings visited.

On Friday, the 30th April, 1909, the Commission drove from Ohakune to Raetihi and Horopito, and closely viewed the forest in the vicinity. In the afternoon a return was made to Ohakune, and the train taken to Taumarunui.

On Saturday, the 1st May, the Commission took the train from Taumarunui to Kakahi, where an inspection, under the guidance of Mr. Weir, the manager, was made of the Government sawmill and the bush-workings. The Commission then drove to Manunui, and inspected the mill of Messrs. Ellis, Burnand, and Valder, and in the afternoon went up their tramway to visit the bush-workings. A return was then made to Taumarunui and the train to Auckland caught in the evening.

On Monday, the 3rd May, the Commission proceeded in the afternoon by train to Helensville from Auckland, and on arrival took the steamer to Dargaville, reaching Te Kopuru at 6 a.m. on the 4th, when they landed and drove to Dargaville. At 8 a.m. they took the train to Kaihu, and

on arrival inspected the sawmill of J. Trounson, and went up the cable tram belonging to the Siberian mill to see the method of bringing down the logs. In the afternoon the Commission drove to the Kauri Park, Waima, at the head of the Kaihu Valley, and inspected the fine specimens of kauri-trees growing therein and in the adjoining bush belonging to Mr. Trounson. A return was made to Dargaville by the 5 p.m. train, and at 6 a.m. on the morning of the 5th May the Commission returned by steamer to Helensville, stopping at Te Kopuru *en route* and inspecting the Kauri Timber Company's mill there. On arriving at Helensville at 3.45 p.m. the train to Auckland was caught and Auckland reached at 6.30 p.m.

On Thursday, the 6th May, the Commission inspected the following mills in the City of Auckland:—

Millar's West Australian Hardware Company (Limited).
Messrs. Macklow Bros.
Messrs. Leyland, O'Brien, and Co.'s sawmill, Mechanics' Bay.
Mr. D. Goldie.
Waitemata Sawmilling Company.
Parker, Lamb, and Co.
Leyland and O'Brien's mill in Customs Street.
Kauri Timber Company (Limited).
And also the new Cemetery Bridge, in course of construction.

AUCKLAND, FRIDAY, 7TH MAY, 1909.

The eighteenth meeting of the Commission was held in the Land Board Room, Government Buildings, Auckland, on Friday, the 7th day of May, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Correspondence.

Letter, dated 21st April, 1909, from J. Lomas, Chief Advisory Officer, Department of Labour, giving the information required by the Commission as to the cost of workers' homes.—Received.

Evidence.

Mr. Edward Phelan, general secretary to the Auckland Timber-workers' Union, examined from 9.55 a.m. to 12.40 p.m.

Mr. Th. de Schryver, Imperial Export Company of Canada, 12.40 p.m. to 1 p.m.

The Commission adjourned from 1 to 2 p.m.

On resuming, Mr. de Schryver's examination was continued from 2 p.m. to 3.25 p.m.

Mr. W. C. Johns, builder, of Ponsonby, Auckland, 3.25 to 4.35 p.m.

Mr. George Stevenson, staircase-maker, Auckland, 4.35 to 5.35 p.m.

The Commission then adjourned.

AUCKLAND, SATURDAY, 8TH MAY, 1909.

The nineteenth meeting of the Commission was held in the Land Board Room, Government Buildings, Auckland, on Saturday, the 8th May, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. J. McGill, bush contractor, Mercury Bay, examined from 9.40 a.m. to 9.45 a.m.

Mr. Charles Cowan, sawmill-worker, Mangapeehi, 9.45 a.m. to 11.5 a.m.

Mr. G. A. Pearce, sawmiller, Mamaku, 11.5 a.m. to 12.55 p.m.

Mr. H. Valder, sawmiller (Ellis, Burnand, and Valder), Hamilton, 12.55 p.m. to 1 p.m.

It was decided to adjourn the hearing of Mr. Valder's evidence until Tuesday, 11th May.

The Commission then adjourned.

AUCKLAND, MONDAY, 10TH MAY, 1909.

The twentieth meeting of the Commission was held in the Land Board Room, Government Buildings, Auckland, on Monday, the 10th May, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. H. B. Coupe, sawmiller, Mamaku, examined from 9.40 a.m. to 12.30 p.m.

Mr. W. Steele, sawmiller, Mamaku, 12.30 p.m. to 1 p.m.

The Commission adjourned from 1 to 2.15 p.m.

Mr. David Goldie, timber-merchant, Auckland, 2.20 p.m. to 3.45 p.m.

Mr. W. F. Mason, secretary, South Auckland Sawmillers' Association, 3.45 p.m. to 4.20 p.m.

Mr. George Fraser, Phœnix Foundry, Auckland, 4.20 p.m. to 4.40 p.m.

Mr. John Mitchell, architect, Auckland, 4.40 p.m. to 5.50 p.m.

The Commission then adjourned.

AUCKLAND, TUESDAY, 11TH MAY, 1909.

The twenty-first meeting of the Commission was held in the Land Board Room, Government Buildings, Auckland, on Tuesday, the 11th May, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Correspondence.

Letter, dated the 7th May, from the Secretary of Customs, forwarding a return showing the importation of Oregon pine into New Zealand from the 1st January, 1907, to the 30th April, 1909.—Received.

Letter, dated the 7th May, from the Commissioner of Crown Lands, Invercargill, covering a statement as to the area of land in Southland denuded of forest by sawmilling during the last twenty years.—Received.

Letter, dated the 4th May, from the Warden, Greymouth, forwarding information respecting sawmill areas and royalties in the Greymouth District.—Received.

Evidence.

Mr. H. Valder, sawmiller, Manunui (examination continued), from 9.35 a.m. to 12.10 p.m.

Mr. R. J. Roberts, architect, Devonport, Auckland, examined from 12.10 p.m. to 12.25 p.m.

Mr. G. H. Norie, Railway Storekeeper, Newmarket, 12.25 p.m. to 12.50 p.m.

The Commission adjourned till 2 p.m.

Mr. Stanley Milroy, secretary to the Kauri Timber Company, Auckland, from 2.5 p.m. to 4.55 p.m.

Mr. William McArthur, sawmiller, Putaruru, 4.55 p.m. to 5.30 p.m.

The Commission then adjourned.

AUCKLAND, WEDNESDAY, 12TH MAY, 1909.

The twenty-second meeting of the Commission was held in the Land Board Room, Government Buildings, Auckland, on Wednesday, the 12th May, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Hon. Edwin Mitchelson, timber-merchant, Auckland, examined from 9.35 a.m. to 11.30 a.m.

Mr. G. H. Norie (explanation regarding evidence given by him on the previous day), 11.30 to 11.35 a.m.

Mr. John Strauchon, Commissioner of Crown Lands, Auckland, 11.35 a.m. to 11.55 a.m.

Mr. James Trounson, sawmiller, Kaihu, 11.55 a.m. to 12.45 p.m.

Mr. H. P. Kavanagh, Timber Expert, Lands Department, 12.45 p.m. to 1 p.m.

Information required.

It was resolved, That the Commissioner of Crown Lands be asked to supply in his return of areas held for sawmilling purposes in the Auckland District information showing—(*a*) upset price fixed by the Department for each area, at per 100 sup. ft.; (*b*) price agreed to be paid by the successful tenderer.

The Commission adjourned from 1 to 2 p.m.

Evidence.

Mr. H. P. Kavanagh (examination continued), from 2 p.m. to 3.50 p.m.

Mr. John Jenkins, builder, Arch Hill, 3.50 p.m. to 5 p.m.

Mr. D. T. McIntosh, District Railway Engineer, 5 p.m. to 5.15 p.m.

The Commission then adjourned.

AUCKLAND, THURSDAY, 13TH MAY, 1909.

At 8.45 a.m. on Thursday, the 13th May, the Commission visited the workshop of Messrs. Cousins and Atkin, coach and tram-car builders, in Lorne Street, and the furniture-factory of the Direct Supply Company.

The twenty-third meeting of the Commission was held in the Land Board Room, Government Buildings, Auckland, on Thursday, the 13th May, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. W. J. Cousins, coachbuilder, Auckland, examined from 9.35 a.m. to 9.45 a.m.

Mr. T. H. White, mill-manager, Kauri Timber Company, and president, Auckland Sawmillers' Association, 9.45 a.m. to 12.25 p.m.

Mr. Thomas Mahoney, architect, Auckland, 12.25 p.m. to 1 p.m.

The Commission adjourned from 1 to 2 p.m.

Mr. Edward Bartley, architect, Auckland, from 2 p.m. to 3.5 p.m.

Mr. Alfred McKenzie, Foreman of Works, Harbour Board, 3.5 p.m. to 3.15 p.m.

Mr. Theodore Jacobsen, architect, Auckland, 3.15 p.m. to 3.30 p.m.

Mr. W. A. Holman, architect, Auckland, 3.30 p.m. to 3.50 p.m.

Mr. A. Grayson, president, Builders' Association, 3.50 p.m. to 4.25 p.m.

Votes of Thanks.

Moved by Mr. Mander, and seconded by Mr. Leyland, That a hearty vote of thanks be tendered to those witnesses who have given evidence in Auckland, many of whom have come long distances to do so.—Carried.

Mr. T. H. White thanked the Commission on behalf of the witnesses.

Moved by Mr. Field, and carried, That a hearty vote of thanks be extended to those gentlemen, both in the Kaipara and in Auckland, who assisted to entertain the Commission during its stay in those localities.

The Commission then went into Committee.

It was decided to proceed to Rotorua on Friday, the 14th May, visit the Rotorua Nursery, and Waiotapu, Whakarewarewa, and Waipa Plantations, after which the Commission will go to Wellington and commence taking evidence on Thursday, the 20th May, at 2 p.m.

The Commission then adjourned.

On Friday, the 14th May, the Commission proceeded at 10 a.m. by train from Auckland to Rotorua, arriving at 5.50 p.m.

On Saturday, the 15th May, the Commission drove to Whakarewarewa and inspected the State nursery and plantation there. They then proceeded to the Waipa Prison Camp, and afterwards visited the new prison camp at Rotokakahi and the site of the new plantation.

On Monday, the 17th May, the Commission drove from Rotorua to Waiotapu and inspected the prison camp and large plantation of 3,000 acres, chiefly planted by prison-labour. They then continued their journey to Lake Taupo, arriving at 5.45 p.m.

On Tuesday, the 18th May, the Commission crossed Lake Taupo to Tokaanu in a steamer, and drove by coach from Tokaanu to Waiouru, arriving at 6.10 p.m.

On Wednesday, the 19th May, the Commission took the train from Waiouru to Wellington, arriving at 4.25 p.m.

WELLINGTON, THURSDAY, 20TH MAY, 1909.

On Thursday, the 20th May, the Commission visited some of the local mills and timber-yards in the morning, inspecting the premises of the Stewart Timber Company, the Prouse Lumber Company, and Messrs. C. and A. Odlin (Limited).

The twenty-fourth meeting of the Commission was held in the Museum Buildings, Wellington, on Thursday, the 20th May, 1909, at 2 p.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Affidavit.

It was resolved to receive as evidence an affidavit dated the 15th May, 1909, by Henry Brown, of Inglewood, sawmiller, correcting a statement made by him at Taihape when undergoing examination.

Evidence.

Mr. Clem. Knight, representative of Hawke's Bay timber-workers, Dannevirke, examined from 2.25 p.m. to 4.10 p.m.

Mr. Henry Smith, of Eketahuna, timber-worker, 4.15 to 5.30 p.m.

The Commission then adjourned.

WELLINGTON, FRIDAY, 21ST MAY, 1909.

The twenty-fifth meeting of the Commission was held in the Museum Building, Wellington, on Friday, the 21st May, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman) and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. Andrew Quinlan, sawmiller, Nireaha, examined from 9.45 a.m. to 12.40 p.m.

Mr. James Malcolm, Horowhenua County Engineer, Levin, 12.40 p.m. to 1 p.m.

The Commission adjourned from 1 to 2 p.m.

Mr. James Malcolm (examination continued), from 2.5 to 2.20 p.m.

Mr. John Anderson, sawmiller, Masterton, 2.20 p.m. to 2.50 p.m.

Mr. W. H. Bennett, builder and contractor, chairman of the New Zealand Federated Builders, Wellington, 2.50 p.m. to 4.55 p.m.

Mr. W. L. Thompson, builder, Wellington, 4.55 p.m. to 5.50 p.m.

Correspondence.

Letter, dated the 14th May, 1909, from the Collector of Customs, Auckland, explaining details of a return furnished by him.—Received.

The Commission then adjourned.

WELLINGTON, SATURDAY, 22ND MAY, 1909.

The twenty-sixth meeting of the Commission was held in the Museum Building, Wellington, on Saturday, the 22nd May, 1909, at 9 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Correspondence.

Letter, dated the 18th May, 1909, from H. Valder, managing director of Messrs. Ellis Burnand, submitting particulars regarding the firm's profits for the past five years (confidential).—Received.

Evidence.

Mr. Charles Hutton (previously examined in Taihape), representative of the sawmill workers at Taihape, examined from 9.5 a.m. to 10.20 a.m.

Mr. Henry Donovan, sawyer, Taihape, 10.20 a.m. to 11.25 a.m.

Mr. J. S. Hutchinson, Railway Storekeeper, Petone, 11.25 a.m. to 12 noon.

Mr. Alex. Campbell, builder, Wellington, 12 noon to 1 p.m.

Adjournment.

Moved by Mr. Ell, and seconded by Mr. Hanan, That the Commission adjourn till 9 a.m. on Tuesday, the 25th May.—Carried.

The Commission then adjourned.

WELLINGTON, TUESDAY, 25TH MAY, 1909.

The twenty-seventh meeting of the Commission was held in the Museum Building, Wellington, on Tuesday, the 25th May, 1909, at 9 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. Alex. Campbell (examination continued), from 9.5 a.m. to 9.55 a.m.

Mr. J. P. Maxwell, C.E., consulting engineer, 9.55 a.m. to 10.30 a.m.

Mr. W. H. Bennett (previous witness) read figures from census, 10.30 to 10.35 a.m.

Mr. F. de J. Clere, architect, Wellington, 10.35 a.m. to 11.45 a.m.

Mr. W. D. Murdoch, Building Inspector for City Council, 11.45 a.m. to 12.25 p.m.

Mr. G. H. Chapman, West Coast Timber Trading Company, Wellington, 12.25 p.m. to 1 p.m.

The Commission adjourned till 2.30 p.m.

Mr. G. H. Chapman (examination continued), from 2.30 p.m. to 3.15 p.m.

Mr. C. T. Nordell, farmer, Eketahuna, 3.15 p.m. to 3.40 p.m.

Mr. F. T. Moore, settler, Johnsonville, 3.40 p.m. to 4.25 p.m.

Mr. David Robertson, engineer, Wellington, 4.25 p.m. to 4.45 p.m.

Mr. G. E. Humphries, builder and contractor, sash and door factory, Wellington, 4.45 p.m. to 6.5 p.m.

The Commission then adjourned.

WELLINGTON, WEDNESDAY, 26TH MAY, 1909.

The twenty-eighth meeting of the Commission was held in the Museum Building, Wellington, on Wednesday, the 26th May, 1909, at 9 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

Evidence.

Mr. A. C. Koch, District Railway Engineer, Wellington, examined from 9.15 a.m. to 9.50 a.m.

Mr. Ronayne (examination continued), from 2 p.m. to 3.45 p.m.

Mr. J. T. Waterhouse, Clerk of Works, Wellington, 3.45 p.m. to 4.30 p.m.

Mr. Fritz Jenssen, formerly manager, Hawke's Bay Timber Company, Dannevirke, 4.30 p.m. to 5 p.m.

Mr. Joseph Butler, sawmiller, Hokitika, 5 p.m. to 6 p.m.

Moved by Mr. Hanan, and seconded by Mr. Clarke, That the taking of evidence in Wellington be now closed.—Carried.

Moved by Mr. Field, and seconded by Mr. Arnold, That the thanks of the Commission be conveyed to those witnesses who have attended in Wellington and given valuable evidence.—Carried.

Moved by Mr. Leyland, and seconded by Mr. Clarke, That a vote of thanks be passed to all those who have assisted to entertain the Commission whilst in Wellington.—Carried.

The Commission then adjourned.

WELLINGTON, FRIDAY, 28TH MAY, 1909.

The thirtieth meeting of the Commission was held in the Museum Building, Wellington, on Friday, the 28th May, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

The Commission then went into committee to consider the report.

An adjournment was made from 1 to 2 p.m. and from 6 p.m. to 7.30 p.m.

The Commission rose at 10 p.m.

WELLINGTON, SATURDAY, 29TH MAY, 1909.

The thirty-first meeting of the Commission was held in the Museum Building, Wellington, on Saturday, the 29th May, 1909, at 9.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

In Committee.

After further discussion of the report, it was moved by Mr. Ell, and seconded by Mr. Jennings, That, owing to the volume of evidence adduced during the limited period of the Commission, the taking of which only closed on the evening of the 27th May, and to the necessity for properly considering and analysing the same before reporting thereon, His Excellency the Governor be respectfully requested to extend the Commission for an additional thirty days, so as to enable the report to be prepared and presented.—Carried.

It was decided to adjourn until Monday, the 7th June, 1909, at Wellington, when those members of Parliament on the Commission, together with Mr. Barber, should meet as a sub-committee to draft the report, and that the Secretary should, in the meantime, have the resolutions previously passed in committee incorporated in a preliminary draft for consideration.

The Commission then waited for the Government's approval of the extension, and, this having been received, adjourned at 1 p.m.

Meetings of the sub-committee appointed to draft the report were held at the Museum Building, Wellington, on Monday, the 7th June, 1909; Tuesday, the 8th June, 1909; Wednesday, the 9th June, 1909; Thursday, the 10th June, 1909.

WELLINGTON, THURSDAY, 17TH JUNE, 1909.

The thirty-second meeting of the Commission was held in the Old Parliamentary Buildings, Wellington, on Thursday, the 17th June, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members except Mr. Morris.

The minutes of the previous meeting were read and confirmed.

The draft report was further considered in committee.

The Commission adjourned at noon.

WELLINGTON, FRIDAY, 18TH JUNE, 1909.

The thirty-third meeting of the Commission was held in the Parliamentary Buildings, Wellington, on Friday, the 18th day of June, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

The draft report was further considered in committee.

The Commission adjourned from noon to 2 p.m.

It was decided to obtain further particulars from the Customs Department as to the landed cost of Oregon timber.

The Commission adjourned at 4.15 p.m.

WELLINGTON, SATURDAY, 19TH JUNE, 1909.

The thirty-fourth meeting of the Commission was held in the Parliamentary Buildings, Wellington, on Saturday, the 19th June, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

The draft report was further considered in committee.

It was decided to obtain further particulars of importations and exports of timber from the Customs Department.

It was also decided that the Under-Secretary of Lands be asked to revise the information contained in Appendix B.

The Committee adjourned at 1 p.m.

WELLINGTON, MONDAY, 21ST JUNE, 1909.

The thirty-fifth meeting of the Commission was held in the Parliamentary Buildings, Wellington, on Monday, the 21st June, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

The draft report was further considered, and ordered to be retyped for final revision.

The Commission adjourned at 4.45 p.m.

WELLINGTON, TUESDAY, 22ND JUNE, 1909.

The thirty-sixth meeting of the Commission was held in the Parliamentary Buildings, Wellington, on Tuesday, the 22nd June, 1909, at 10.30 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members.

The minutes of the previous meeting were read and confirmed.

The revised report was further considered in committee, and adopted for final consideration.

It was decided that typewritten copies of resolutions be supplied to members for their information.

The Commission adjourned at 4.15 p.m.

WELLINGTON, WEDNESDAY, 23RD JUNE, 1909.

The thirty-seventh meeting of the Commission was held in the Parliamentary Buildings, Wellington, on Wednesday, the 23rd June, 1909, at 10 a.m.

Present: The Hon. T. Y. Duncan (Chairman), and all the members except Messrs. Hanan and Jennings.

The minutes of the previous meeting were read and confirmed.

Adoption of Report.

It was decided to adopt the report, as revised, and transmit the same to His Excellency the Governor at the earliest opportunity.

Votes of Thanks.

Moved by Mr. Mander, and seconded by Mr. Morris, That a hearty vote of thanks be accorded to the Chairman for so ably conducting the business of the Commission, and in doing so the Commission desires to place on record its appreciation of the patience, tact, and skill with which he presided over its meetings.

The resolution was supported by the other members, and carried with acclamation.

The Chairman feelingly acknowledged the resolution.

Moved by Mr. Mander, and seconded by Mr. Morris, That a hearty vote of thanks be accorded to the Secretary, Mr. W. R. Jourdain, for the able manner in which he carried out the responsible duties intrusted to him, the Commission recognising that he performed his work with much energy, discretion, and business ability.—Carried.

The Secretary expressed his thanks for the compliment paid to him.

The Commission then terminated at 11 a.m.

MINUTES OF EVIDENCE.

INVERCARGILL, 27TH MARCH, 1909.

WALTER HORACE BRENT sworn and examined. (No. 1.)

Witness: I am not prepared to make a statement, but I am in a position to answer questions. I have only just returned from the north. I could make a statement on Monday morning next.

Hon. the Chairman: Is it the wish of the Commission that we excuse Mr. Brent for the present? —Agreed to.

EDWARD COOPER LEARY sworn and examined. (No. 2.)

Witness: I am secretary of the association of a few sawmillers, but it is not a registered association. We call it the Otago and Southland Sawmillers' Association.

Hon. the Chairman: We require you to make a statement, and questions will be asked you later.

Mr. Leary: As far as practical sawmilling goes, I can say nothing. I can only tell you about the association. It was formed about July, 1907.

1. *Hon. the Chairman:* How many members were there at that time?—There were eighteen.

2. Will you kindly give their names?—I think it is confidential.

3. It depends upon what the Commission may consider confidential, and I do not think it is breaking any confidence to know the names of the men in the association?—I have no authority from them to give the names, and it might be considered by them as confidential. I have been out of town, and have had no meeting of the association. I have no authority to give this information, but I have not been told not to give it.

4. We will waive that in the meantime?—If called on I may be able to give it later. I may state that they represent about twenty-one mills, and there were seventy-three mills altogether. They represent about twenty-one or twenty-two out of the seventy-three—about one-third. I think there are seventy-three in the Southland District altogether, but I think that includes Catlin's River as well.

5. *Mr. Field:* There are not seventy-three in Southland?—No, I do not think so. The exact information could be got for the Commission without any difficulty. I am not speaking from any list I have had, but merely from memory and from conversations I have had.

6. *Hon. the Chairman:* Are you prepared to answer any questions with regard to the workings of this association?—Yes, I think so.

7. What were the special features for which it was formed—that is, when they formed the association there were some rules and regulations laid down with regard to the disposal of timber and many other things?—Yes, in the notification I got from your secretary last night I was asked to produce the memorandum. There is not a great deal in it, and it is in the same position, because I do not think I should be justified in producing it without the authority of my association unless it was given in committee.

8. I do not want to commit you to anything that would be injurious to your association in any way. We want to get all information possible, and you will be prepared to give it later, I suppose?—Yes, with the authority of the association I am quite prepared to give it.

9. We have power to call for it, but we do not want that?—I am pretty sure the association will agree to it. Of course, I can give it now in committee.

Mr. Barber: We must not allow this to be established as a precedent, because, if we do, it will hamper us throughout the Dominion. Those who constitute the association are well known in the district, and their names should be made public. If we agree to what is suggested, every other association will claim a similar privilege. Of course, I am aware there may be confidential matters which we should regard as confidential. The position of the association is well known, just as there is in Wellington an association, and there is nothing confidential about it.

Mr. Mander: The secretary has come here before he is quite ready. The association is not refusing to give any information we require, but the secretary has not got the authority to do so. We do not want to get the secretary into any difficulty. We had better let it stand over until he gets the authority.

Mr. Brent: I give him my authority. I will take the responsibility on behalf of the association on my shoulders.

Mr. Leary: In that case I will read the memorandum of association.

"*Memorandum of Association, Otago and Southland Sawmillers and Timber Merchants.*

"It is hereby agreed that the undersigned are associated for the purpose of generally promoting and fostering their mutual interests, and to establish and maintain a uniform price for timber, and for the purpose of giving and receiving information which may tend to the general benefit.

"The business of the association shall be conducted by a secretary, who shall keep minutes of all meetings and carry out instructions as may be given by the association in general meeting. The secretary shall have power to investigate any alleged breaches of the rules, and shall report the result of his investigations to a general meeting.

"The minutes of the association as passed from time to time by general meetings shall be binding on all members.

"The first price-lists and trade discounts of the association shall be as per attached printed lists, and shall remain in force until altered by the association in general meeting. Such first lists to come into force as from the 15th July, 1907.

"The cost of administration shall be borne in proportion to the number of mills owned and [or] controlled by each member by levies to be made quarterly. For this purpose each member will be deemed to own or control at least one mill.

"Dated this 14th day of July, 1907.

10. *Hon. the Chairman:* The names you have just read are the signatures ?—Yes.

11. There were therefore fifteen firms or companies who signed when the association was formed ?—Yes.

12. Has there been any alteration in the association since that ?—From memory I think two others joined since that, but I am not quite sure, and I have taken a note of it. I do not think my evidence can be of any value to you in the matter of timber, as I am merely the scribe for the association.

13. Is your association prepared—that is, the millers—to submit all the information required by the Commission ?—I am quite sure that the millers are prepared to give all the information possible. Any one who knows could give more reliable information than I can.

14. *Mr. Field.*] There is nothing to keep back ?—No, nothing to keep back. In fact, I think they welcome the fullest inquiry.

15. *Mr. Barber.*] What penalties are there for breaches of the rules ?—None.

16. You said there was a price-list placed before the association ?—Yes.

17. Has there been any subsequent price-list since the association was formed ?—No, but the prices have been varied from time to time, although there have not been any material alterations.

18. Will you put in a copy of the price-list ?—Yes. [Price-list produced.]

19. That embodies the prices at the time the association was formed, and the variations up to date ?—No, it does not embody the variations—I will put them in.

20. You say there is no penalty for any breach of the rules of the association ?—No. There has been no alteration in the memorandum.

21. As secretary of the association you state that there is no penalty to be inflicted ?—We look upon it as a matter of honour and stick to it.

22. *Mr. Arnold.*] What action has your association taken to get the remainder of the seventy-odd mills to join the association ?—As an association they have not done anything. I believe the members have spoken to outsiders about it, and mentioned the desirability of joining the association, but the association itself has not taken any action.

23. The majority of them have declined to become members ?—I do not know whether they have declined, but the fact remains that they are not members.

24. The mills throughout the whole district of Otago and Southland have increased in number considerably since the formation of the association ?—I think they have, but I cannot speak definitely on those matters.

25. The association should be able to speak better than the individual miller ?—Well, the association keeps no record of that sort at all.

26. Has the association any record or any figures as to the output ?—No, none whatever.

27. Has the association passed any resolution with regard to limiting the output of various mills ?—Yes, there have been resolutions.

28. To what extent has it been limited ?—I think the output has been cut down by one-third. They cut it down more than that by extending the Christmas holidays.

29. Why was that done ?—Because the millers were creating enormous stocks, and we could not dispose of the timber.

30. It was not done for the purpose of raising the prices ?—No.

31. As a matter of fact, have the prices been increased to any great extent since the formation of the association ?—No, they have not.

32. *Mr. Stallworthy.*] I should like to know whether the members of the association are the smaller millers or the larger concerns only ?—I think mostly the larger concerns are in it.

33. Do those outside the association sell their output to members of the association ?—I cannot say that. I do not know anything about that.

34. Can you give us any idea as to how this uniform price is fixed by the association: what guides the association in arriving at these uniform prices ?—I presume the cost of production would guide them.

35. Is there not some basis on which it is fixed ?—The price-list was fixed at the time the association was formed, and has practically remained the same ever since, except for slight variations and discounts.

36. Have there been any fresh awards in regard to the timber-workers' wages in the Arbitration Court since the fixing of the prices ?—Yes, there has been an alteration. I do not know the extent of it, but I know there was one made.

37. And after that award was there an increase in the price of timber ?—No.

38. Does your association act in unity or in conference with other associations throughout the colony in the fixing of prices ?—No.

39. *Mr. Mander.*] Has the cost of production gone up at all since the association was formed ?—I really could not say—I am not a practical man.

40. *Hon. the Chairman :* How often does the association meet to discuss matters ?—Once a month.

41. And you are present then ?—Yes.

42. And minutes of the proceedings are taken ?—Yes.

43. Could they be submitted to the Commission ?—Yes, I think they could. I do not think the millers wish to hide anything.

44. Have you any further statement you wish to make ?—No, except this : that from the questions that have been asked one might think the association is in existence purely for the purpose of maintaining the price ; but the minutes will show that there are many other things gone into, such as the relationship of the employee and employer, and so on. The fact that the prices have remained stationary since 1897 shows that they do not meet only for the purpose of discussing prices.

JOSEPH HENSLEY sworn and examined. (No. 3.)

1. *Hon. the Chairman.*] What are you ?—A sawmiller and managing director of the Southland Timber Company (Limited).

2. Will you make a statement with regard to the production of the timber, and how it is controlled by your company ?—I might say that the company is associated with the association. Dealing with the cost of production, I do not know whether it would be necessary for me to give you an analysis of the cost : the various mills, of course, differ. In each mill the cost of production differs slightly perhaps from the other according to the nature of the country, and probably the various millers arrive at different results as to the cost of production.

3. What is the experience of your company ?—Well, roughly, the net cost of production for all timbers, taking them on the average, is from 8s. to 8s. 6d.

4. *Mr. Field.*] That is landed at the nearest railway-station ?—Yes ; landed on the trucks. That is the net cost, including office charges and everything. Included in that 8s. 6d. is 50 per cent. for wages for the mill, and then there is maintenance, chaff, royalty, depreciation, interest on capital, the cost of laying tramways, and half a dozen other items.

5. *Hon. the Chairman.*] State them separately ?—I can supply a memorandum. The items I have enumerated—depreciation, maintenance, blacksmith's work, tramway work, chaff, oats, and harness—contribute to make from 8s. to 8s. 6d., and included in that is office expenses, accident insurance, fire insurance, oils, belts, files, saws, &c., bad debts, discounts, interest on capital, and foundry-work. That is all included in the 8s. 6d. roughly. In dealing with this point, I will speak from the standpoint of our own mills. That is the average cost of production which our company finds existing at our present mills. Those mills work in the western district—the Otautau district—and a third of the production of those mills is second-class timber, and a fourth of the total production is beech. Of course you are acquainted with the mode of cutting the timber out, and you will have seen the difficulties. One mill is almost similar to the other ; but in some mills the difficulty is intensified with hilly country and bridges, and the cost of production is more. The difficulty the millers in the Longwood have to deal with is that the life of the bush is very short. The cost of production is very high, and it increases every year. As the trams go back into the bush the cost of production gets higher.

6. What do you mean when you say the life of the bush is very short ?—The life of the mill, I should have said. As the tramways get further back into the bush the production, so far as the cost is concerned, is increased, and it becomes a very difficult matter year by year to log the mills. One point in dealing with the cost of production is the forest regulations. We are allowed 800 acres, 200 acres of an area, and 600 acres reserve for each mill. In the Longwood and Western Ranges this only gives an average mill about six years' life, and, of course, to get back our capital, the depreciation on that is very considerable. The cost of the mills is in some respects similar ; a mill getting from 100,000 ft. a month would cost approximately £3,000 to £3,500 ; but, of course, it depends on the size of the mill. Under the present regulations, of course, this mill is exhausted in six years. The bush is practically cut out, and the sawmiller has to meet this capital in the matter of depreciation. I think that is all I have to say on the cost of production.

7. The life of the plant is only six years ?—Yes. There is a value at the end of that time, of course ; but it requires heavy writing-off to get your money back.

8. Can you give us any indication of what that might be ?—I think if the plant was kept in good repair, and was good plant in the first instance, costing the amount I stated, you would probably get £750 to £800 for it at the end of that time. It would cost you £3,000.

9. You do not anticipate that the timber in the vicinity would be cut out in six years ?—No. Of course there is always the probability of your getting another area ; but at the present time the areas are so scarce that it is very often the case that the miller is shutting up his plant on account of there being no more bush in the vicinity.

10. You are aware, I suppose, that after a miller has cut out 200 acres he can apply for another 200 ?—Yes, that is so ; but there are cases where that is not possible.

11. Because other people have already engaged it, I suppose ?—Yes.

12. How do you generally work : do you contract for the bushfelling ?—No, we pay all wages.

13. And you have made out an estimate of what the average cost of the logs at the mill would be ?—We know, of course, in the cost of production what the logging comes to, and what the sawing comes to, and we can take that out and tell pretty well to a halfpenny ; but that is all embodied in the 8s. 6d. In these mills the logging averages from 1s. 8d. to 2s. a hundred feet. The mill-sawing would cost from 1s. 5d. to 1s. 6d. a hundred feet ; the yard-work costs 6d., and the trollying costs another 6d.

14. That is in connection with the logs—in getting the timber to the yards ?—Yes, to the yards. That is sawn timber from the mill to the yards. Then the yard-work costs 6d. a hundred feet to load on to the trucks. Those items constitute the wages practically, which amount, roughly, to about 7s. 6d., and sometimes more. I have here the wages-sheet [produced].

15. Have the prices gone up during the last ten or fifteen years : the cost of production ?—Yes, they have gone up very considerably.

16. Can you state how much ?—I could not say exactly. Of course, it has varied from year to year. It has gone up by anything from 50 per cent. during the last ten years.

17. That is in wages ?—Yes.

18. Can you state what the average selling-price of timber was ten years ago ?—We were not in existence ten years ago, and I do not remember, myself ; but I could get the information for you.

19. Regarding the selling-price of timber, we had a printed price-list setting forth the prices of the various sizes of timber ?—This price-list is only a basis on which the prices are gauged ; they are subject to various trade discounts, which reduce the list price very considerably.

20. The price charged all depends on who you sell to ?—Yes. Take, for instance, the Invercargill price-list. The timber delivered in a yard or on the job is 10s. 6d. We allow 5 per cent. off, bringing it down to 10s. But to bring the timber here it costs 2s. Altogether, we get for that timber from 7s. 6d. to 7s. 9d.

21. You get that at the mill ?—Yes, at the mill.

22. *Mr. Field.*] What is the 2s. for ?—Freight and cartage.

23. *Mr. Ell :* At the railway-siding, 10s. 6d. ?—Speaking of Invercargill Town, we deliver for 10s. We pay freight and railage, and we really only get from 7s. 6d. to 7s. 9d. at the mill. Of course, the price is correspondingly less for second-class timber. Of course, the price varies according to the town in which the timber is sold and the customer to whom it is sold. We sell timber in Ashburton, and we allow as much as 25 per cent. off the wholesale list.

24. *Mr. Leyland.*] The price is different ?—Yes, we have to meet the competition at a large port like Timaru, and we allow anything from 25 to 35 per cent. off the 9s. 6d.

25. *Mr. Mander.*] What for second-class ?—From 5s. to 6s. 6d. or 7s.

26. *Hon. the Chairman.*] In the case of any one taking the risk of sending from Ashburton, Timaru, or Oamaru, would your company load it at the railway here at 7s. 6d. ?—No ; we load it at the mill. We charge our railage from Riverton. We charge, say, a contractor from Ashburton 9s. 6d. wholesale, and we allow a contractor anything from 20 to 25 per cent. off the 9s. 6d.

27. *Mr. Leyland.*] Delivered at Ashburton ?—No ; of course he pays the railway freight.

28. *Mr. Ell.*] You charge 9s. 6d. at Riverton ?—Yes, less various trade discounts.

29. *Hon. the Chairman.*] Is your company in the association ?—Yes.

30. And that would be general ?—This is the price we all stick to. I do not think that the average we get, taking all our timbers, is more than 9s. to 9s. 6d. for the net selling-price.

31. *Mr. Field.*] For timber of all classes ?—Totara, matai, and all classes.

32. *Hon. the Chairman.*] What is the difference between the prices ?—About 4s. difference. Matai is 12s. and totara 16s.

33. *Mr. Field.*] What class of timber is that ?—First class.

34. *Mr. Mander.*] That is your selling-price ?—Yes, less trade discounts. That is the basis. All these prices are subject to trade discounts. That is all I can say about the selling-prices.

35. *Hon. the Chairman.*] Have you anything else you would wish to say ?—I would like to say, about the birch-millers in the Longwood country : The birch in very many areas comprises 25 to 40 per cent. of the whole. That birch or beech is not so saleable as the red-pine, and a large majority of millers, especially in the western district, have to contend with it. The timber has not come into very general use ; the sale is very small ; there is only one grade ; but the production is great. That is a difficulty the birch-millers have to contend with, and it is a very grave one. There are a few orders for first-class beech or birch ; but practically no orders for second-class or second-grade. It is all clean stuff that is wanted, which reduces the price of this timber very considerably.

36. *Mr. Hanan.*] When was your company formed ?—1902.

37. What is your nominal capital ?—£5,000.

38. Your paid-up capital ?—£5,000.

39. Have you any objection to stating whether your company has been a payable concern or not ?—Oh, it has been a payable concern.

40. Have you any objection to say what your dividends have been ?—Well, I would mention it in private.

41. On the whole your company has been a prosperous one ?—Not altogether prosperous. I have to look ahead and get bush to feed our plants.

42. It has shown a fair interest on the amount invested ?—Yes ; fair.

43. How many timber areas have you not worked out in Southland ?—Two.

44. How many have you worked out ?—Four.
45. What have been the prices paid in royalties in regard to what you worked out or which you now hold ?—The price per 200 acres ?
46. Yes ?—I have it here. They vary very considerably. This is one area, 462: £84 10s. royalty.
47. Where is that situated ?—Aparima.
48. How many miles from here ?—Twenty-six.
49. How many from the railway-station ?—Four miles.
50. What others have you got ?—There is an area, 441: £127 10s. royalty.
51. *Mr. Mander.*] Two hundred acres ?—Yes.
52. *Mr. Hanan.*] When was that bought ?—1900.
53. Is that worked out ?—Yes. Then there is an area, 441c: £144 10s.
54. Worked out ?—No.
55. How many miles from the railway ?—At the same place: they are all part of the reserve.
56. How many mills do you own or control ?—Three.
57. Are they all working now ?—Two.
58. Why is the other not ?—The timber is almost cut out.
59. Where is that ?—Makarewa.
60. How many hands do you employ altogether at the three mills ?—When fully working, from forty-two to forty-five.
61. What has been the class of timber you have been obtaining in this bush ?—In Aparima, principally beech.
62. And the others ?—White-pine and mixed timbers.
63. Since your company has been formed, what increases in regard to the sale of timber have taken place ?—They have undergone one or two changes. The last rise in the selling-price was in 1907. I do not remember the one prior to that.
64. Can you give the percentage of the increase ?—The last rise was, I think, about an average of 9d. a hundred feet on the timber.
65. All around, what percentage would you say ?—Somewhere about 10 per cent.
66. Comparing the wages with that, what percentage in proportion ?—The wages are very much higher.
67. What is the proportion of increase of wages as compared with the increase in prices ?—The wages would be very much higher than that.
68. To what do you attribute the increase in the price of timber during the last five years ?—The selling-price ?
69. Yes ?—Of course, what has caused that has been the cost of production.
70. How do you make it up ? Give me the main items ?—The main items in the cost of production are the wages.
71. Is that the first ?—That is the chief point. That comes to from 4s. 6d. to 5s., as I mentioned before. Then, of course, there are other items I have enumerated.
72. Will you state same ?—Royalty and survey fees, tramway-material, horse-feed, horses, and harness, blacksmiths' work, blocks, &c., foundry-work, oils, saws, files, and the replacement of horses that get killed occasionally, rents, taxes, fire and accident insurance, office and travelling expenses, management, bad debts, discounts, interest, depreciation, &c.
73. You have followed up the sawmilling trade and taken an interest in it ?—Yes.
74. To what do you attribute the slump, from your standpoint, in regard to prices ? Or, what is the increase due to ?—The increase in prices is certainly due to the cost of production entirely.
75. Is it due to the importation of any timber into this country ?—No, I am speaking for Southland.
76. So far as Southland is concerned the increase of prices or shutting-down of mills has not been due to the importation of any timber to this country ?—I dare say it has been a factor in it, because every hundred feet of foreign timber that comes into Southland means a corresponding reduction in the quantity of red-pine disposed of here.
77. To what extent has the imported timber come into Southland ?—I do not think that it has affected Southland to any appreciable extent.
78. It would not affect the successful working of the mills in Southland ?—I do not think so.
79. There has never been a complaint from your association in regard to Oregon pine ?—No, except on account of Dunedin, because Oregon pine is a factor against red-pine.
80. On what do you base that ?—The fact that we know that the timber comes in.
81. To what extent ?—I am not prepared to say to what extent the jarrah and the Oregon pine affect it.
82. Have you passed any resolution to protest against the importation of Oregon pine ?—I am not sure; I could not say.
83. Was it at the suggestion of any outside people you made this complaint you have referred to ?—I could not say.
84. So far as you are concerned, you are not affected to any appreciable extent ?—Not in Southland, but we are in Dunedin. Dunedin is a big centre for all our timber, and every thousand feet of jarrah or Oregon pine that comes in affects our red-pine.
85. You cannot give us any direct information ?—No, I am not up in the Oregon business. Mr. Massey will be able to tell you.
86. You referred to birch. I understand there is a complaint that in consequence of the new Federal tariff New Zealand birch is practically excluded ?—That is so.

87. Do you think the matter is sufficiently important to have representations made on the subject to the Federal Government ?—Yes, if the Federal Government would take off the tariff it would help the beech-millers.

88. Would you suggest some system of reciprocity—remove the timber duties, or just request to have the timber duty removed so far as it affects birch ?—That is so.

89. Do you know how the Federal tariff affects New Zealand timber ? Has it been for the export of New Zealand timber, or has it kept the timber out ?—The Federal tariff has certainly kept the beech out, because we have hundreds of acres of it, and we must find a market for it. The trade was a bit lively on the other side, but the tariff has killed it.

90. There is very little export ?—Yes. I was doing a fair amount, and other millers also.

91. How far do you rail the timber from your mill ?—Ashburton and sometimes Christchurch.

92. Have you any complaint to make against the present railway freights on timber; are you satisfied that they are fair and reasonable ?—Yes. I would like to give a little more consideration to that matter. I could not answer that very well.

93. How far has the reduction recently made by the Government in railway rates affected your industry ?—It has not affected it at all—it has not affected the Southland sawmillers to any extent.

94. Do you think you would be justified in coming to that conclusion, seeing that it is only a short time in operation ?—Yes, it only affects the Christchurch market.

95. Does the consumer or the buyer benefit ?—The buyer benefits. It does not matter one penny to the sawmiller what the reduction has been.

96. Do you supply dairy associations ?—No.

97. Mining associations ?—Occasionally.

98. To any extent ?—Yes, a fair amount now and again.

99. What is your opinion as regards the wages paid to the men. Are they fair and reasonable ?—Yes, they are good wages.

100. Are the hours reasonable ?—Yes.

101. Can you say if there is any tendency to increase the prices ?—No tendency at all.

102. Have you any knowledge of the timber-areas in Southland ?—A fair knowledge.

103. How long do you think it will be before our pine and totara are cut out ?—I would have to make a calculation.

104. Roughly speaking, how many years would elapse before the pine is worked out ?—I would have to give that a little more thought.

105. Have you any knowledge of the bush in other parts of this country outside of Southland ?—No.

106. Have you any knowledge of the plant and machinery in other mills ?—Not outside of Southland.

107. Can you say if our machinery is up to date ?—Yes, so far as Southland is concerned.

108. Do you not think that the tightness of money has something so do with the alleged trouble in the sawmills ?—Undoubtedly it has something to do with the lessened sales. That is one of the items affected.

109. Do you not consider that the prices of timber are high ?—No, when you consider the cost of production, and the cost in other places, they are not too high.

110. Will you produce your company's balance-sheet in a confidential way ?—I do not mind.

111. Can you give us any particulars as to the award recently made in the case of the workers and the sawmillers ?—No, you could get the report of that.

112. *Mr. Jennings.*] What is the output of your chief mill in the district ?—One mill produces about 100,000 ft. per month.

113. With regard to royalties, they go to the Crown ?—Yes.

114. Do you deal with Maori bush land at all ?—No, we do not.

115. You say the Oregon pine has not affected you at all ?—Not in Southland. It has in Dunedin.

116. Is there any connection between your association and the other associations throughout the Dominion ?—No, none whatever.

117. You do not attribute the decrease to the stringency in the money-market. Are building operations as great here to-day as twelve months ago ?—Oh, no ! They have slackened off considerably. I should say they are one-third less, and more than 50 per cent. in other instances.

118. You say that the increased cost of timber is based to a very large extent on the payment of wages ?—Yes.

119. Can you give us any information as to what was paid ten years ago as compared with to-day ?—Not unless I look it up.

120. Will you kindly furnish it ?—I will endeavour to do so.

121. *Mr. Field.*] I should be glad if you would look through this list [handing witness printed list] and say whether it is complete, or whether it includes too much—it was prepared by a well-known sawmiller up north, and the Commission wants to know whether it meets with your views as a practical man ?—You mean the items ?

122. Have you anything to add to it, or is there anything you think ought not to be there ?—It is practically what I mentioned to you in the analysis. It is almost a similar statement to what I have given you. There is one thing that he has put in which I omitted to mention—he allows 33⅓ per cent. for loss in regard to the timber actually cut. Out of every 1,000 ft. of logs we only get 600 ft. of sawn timber. In other respects it is absolutely similar to my analysis. I do not think I have left out one of these headings.

123. You think that would be safe to go upon ?—I do.

124. Is it all Crown land that you are milling upon ?—All Crown land.

125. Regarding the royalty paid on timber, what are you paying ?—The rate is 2s. per hundred on totara and black-pine, 6d. on rimu and white-pine, and beech 6d., which is the minimum.

126. Do you not think that is rather a heavy royalty ?—Yes, it is.

127. Now, with regard to the increased cost of production, what have you to say ?—Everything has gone up in price.

128. You told us that the cost of wages, as far as production was concerned, is about 4s. 6d. ?—Yes.

129. What do the other items amount to. I want to get at the gross profit ?—This gives the whole of the items. It shows the gross cost of production at about 8s. to 8s. 6d. We get an average of about 9s. or 9s. 6d. That is, roughly, about 1s.

130. Do you think that a fair profit for millers ?—No. We have risks. I think it should be fully 2s.

131. Would it be overestimated at 3s. ?—I would not say that it would be overestimated at 3s.

132. Regarding this question of railway freight, are there not some anomalies existing ?—Yes.

133. Is it not a fact that the railway freight to Dunedin from here is or has been less than the railway freight from here to a station nearer than Dunedin ?—Yes, there is a special rate to Dunedin, the rate being less than that to Mosgiel by about 4d. per hundred.

134. Do you know the railway freight from the Baltic and also from Puget Sound to here ?—I understand it was about 3s. or 3s. 6d.

135. What is the railway freight from here to Dunedin ?—2s. 10d., which is the special rate.

136. The railway freight from here to Mosgiel is about the same as from the Baltic ?—Yes, something about the same.

137. The distance is only about a hundred and fifty miles from Riverton, whereas from the Baltic to here the distance is about fifteen thousand ?—Yes, but I do not know much about Oregon pine.

138. Have you any fear of Oregon pine here ?—I do not know. I am not sure, although it looks as if they could sell a lot of it if they get cheap cargoes in and it is pushed. We cannot sell our timber at a lower price and live.

139. If Oregon pine comes in in increased quantities and competes successfully, what would be the result ?—We should have to close down.

140. For how long would you have to close down ?—I cannot say. I may say I have had cargoes of Oregon offered me at considerably less price than I could supply red-pine in Dunedin.

141. Would it be fair to ask either the Crown or private individuals to hold timber areas indefinitely—perhaps a hundred years or more ?—I do not know about that. I do not think the timber areas in Southland will be opened by new mills. There is no reason for opening those areas.

142. Suppose you are the owner of an area of timbered ground here which was fit for growing grass, and you were faced with this position : viz., that you were likely to have to hold on to it as timber land for perhaps fifty years : what would you do with it ?—I cannot say.

143. Would you not put it into grass ?—I would mill the timber. I would not burn the timber, because I have got too much respect for the use and value of timber.

144. From a commercial aspect, what would you do ?—I would keep it. I would not burn it.

145. About this difficulty in beech, what is the area in the Longwood district covered with this timber ?—There must be, roughly, five or six thousand acres of it. It may be more ; I am making a rough guess.

146. We were told yesterday there was a very much larger area than that ?—Yes.

147. You have not any suggestion to make to get over that difficulty ?—No. I cannot help the Commission in the matter.

148. I suppose you have not given any attention to our afforestation. You do not know what would be good trees to plant ?—No. Of course the main thing is in respect to the kind of timber to plant—that is, the timber that will grow rapidly. I cannot give an opinion as to the best timber because I am not a forester.

149. We see here large areas covered with Canadian thistle and ragwort, and we are told that it will cost more to clear the weed than the land is worth. Could this land not be planted in trees ?—Yes, if they could get the right kind of trees. I do not think it is possible to grow pine-trees on it.

150. Do you know anything about the threatened decrease in our butter-box-timber industry owing to a composition that may come into use in Australia ?—I heard something about it ; but I do not attach much importance to it. I think the butter-box timber can be sold just as readily as it has been.

151. You say that any reduction in railage that has been made has gone to the benefit of the consumer and not to the sawmiller ?—Yes.

152. You said that the railage might fairly be reduced ?—No. The Government has already made a slight reduction benefiting the consumer.

153. Have you had any occasion to compare the railage on timber with that charged on other classes of goods upon New Zealand railways ?—No.

154. You cannot tell whether it is true that, in proportion to the minimum trouble and risk to the Railway Department in the matter of timber, the freight thereon is very much higher than on other goods ?—No, I cannot say that.

155. Is it true that millers in this district have been paying more than the award rate of wages ?—Yes, it is customary, and has been for some years, to pay an average of 50 per cent. over the award wages.

156. Then, the millers are generous employers of labour ?—Yes, that is so.

157. You talked about the dividends made by your company. Were any such dividends unreasonably large ?—No ; they are not unreasonably large.

158. *Mr. Leyland.*] In fixing the cost of production, which you say is from 8s. to 8s. 6d., I take it that that is an average of the whole cost of the log ?—Yes, irrespective of classification.

159. Although you did not mention the fact that you had 40 per cent. less in conversion, that has been allowed for ?—Yes, that is right.

160. Your production is 1s. 3d. second class: what is the price of first-class beech ?—First-class beech is 1s. less than first-class red-pine, which is 8s. 6d.

161. And yet it costs more to produce ?—They have no sale for the second class, and consequently the loss in conversion must be greater than in rimu.

162. Can you tell us the percentage of first-class heart of rimu fit for joinery, &c. ?—In Southland here we do not pay any attention to the heart, except in rare cases. We very rarely have an order for heart-wood. We just cut the log up.

163. Do you find a difficulty in supplying heart ?—Yes.

164. Have you allowed for the whole of depreciation in the estimate ?—Yes, we have. We have allowed a sinking fund at the rate of 6d. per hundred for depreciation.

165. I think you would find it difficult to tell the Commission what would be a fair proportion of interest for depreciation in the matter of maintenance, accidents, for felling as distinct from cutting or sawing, &c. You do not keep your books so as to give that information ?—No, we could not give you that.

166. With reference to the importation of timber, do you know the amount of Oregon pine that has been delivered at Dunedin ?—No.

167. Do you know the amount of New Zealand timber sent into Dunedin ?—No, I have no idea.

168. Do you think it is 5 per cent ?—I could not say.

169. Now, there is the tariff: if we adopt the policy of reciprocation shall we not be losers ?—The New Zealand Government imposes a tariff of 2s. per hundred: would it be beneficial to New Zealand to do away with the 2s. duty imposed in order to get federal duty removed from beech ?—I would not like to say that the birch is of such importance as that.

170. In reference to the falling-off in the demand for timber, do you not think that this is chiefly due to the falling-off of our exports, and not to the importation of timber ?—I would not like to say that. It is due, I think, to half a dozen causes.

171. Bearing in mind that the importation of timber is less than 5 per cent. of our output, how do you think it affects the millers ?—Speaking personally, it does affect them.

172. It cannot affect them more than proportionately ?—Yes, that is so.

173. Do you not think it is a small factor ?—Yes.

174. So you think it is infinitesimal as a factor in producing the present falling-off ?—I am not prepared to say, as I have not made a study of Oregon. It does not seriously affect us in Southland.

175. Will you tell the members of the Commission what you were offered Oregon pine at ?—I think it was 7s. 9d. f.o.b. Dunedin.

176. Suppose you had a yard in Dunedin, it would have to be taken to your yard ?—Yes.

177. The first cost would be wharfage ?—Yes; which is 6d., I think.

178. That brings it up to 8s. 3d. Then there is 2s. duty, together with the cartage and stacking, which would cost another 1s. or 1s. 6d., bringing the total up to 11s. 9d. ?—Yes. We sell red-pine in Dunedin at 11s. 4d., less 2½ per cent.

179. It is not quite correct then that you had it offered at less than you were prepared to supply rimu in Dunedin ?—In Oregon there are big widths.

180. Coming to the butter-box question, do you think the importation of Oregon has had any affect on that ?—I could not say, because there is no analogy between the two timbers.

181. You stated that the capital of your company was £5,000, and the cost of one of your mills was £3,000; consequently the item of interest is an important point ?—Yes, that is so.

182. Therefore, although your output has fallen off, the item of interest is continual ?—Yes.

183. You say you paid a dividend ?—No, I did not say so. We reserved our dividends.

184. Would it be criminal to pay a dividend ?—No; it would delight their hearts.

185. *Mr. Clarke.*] I should like to ask you with regard to your orders: do they come mainly from timber-merchants or from builders ?—Both.

186. Do you charge exactly the same price to builders as you do to timber-merchants ?—No; there is a considerably bigger discount given to them.

187. Then, supposing your customer, who is a builder, is sound in finance, does he pay more than the timber-merchant ?—Yes.

188. With regard to the item of decreased freight, you thought the customer got the benefit of that ?—Yes.

189. Has the retail price been reduced to the general public ?—No; prices are the same.

190. In what way then does the consumer get the benefit ?—The freight three months ago was 5s.; probably it would be 6d. or 4d. less now.

191. Is that 4d. taken off the retail price ?—No.

192. Then it is simply the middleman who gets it ?—No; the customer at the other end gets it.

193. Roughly, could you give the Commission any idea how much per hundred the cost of machining and moulding runs into ?—I should think it would run from 9d. to 1s., ordinary dressing, per hundred feet.

194. Can you supply long lengths of timber for such purposes as beams, &c., at short notice ?—What would you call "long lengths" ?

195. Anything up to 30 ft. ?—Yes, we can supply them.

196. *Mr. Morris.*] You mentioned that the cost of logging is from 1s. 6d. to 2s. ?—Yes.

197. Does that cover the total cost of putting logs into the mill ?—Yes, but not tramways.

198. It struck me that your estimate of 1s. 6d. to 2s. did not cover all the items ?—The tram is separate.

199. You mentioned that the reduction in the tariff has not benefited you ?—No.

200. Have you not received any increased orders ?—No ; we received one or two small orders, but nothing to speak about.

201. Have you any timber in this district suitable for railway-sleepers, as I notice that there is a tremendous quantity of imported sleepers here ?—The Government, of course, take white-pine creosoted.

202. I think we ought to keep the money in our own country and spend it here for the benefit of our own industry ?—Yes ; I agree with you. I should like to say that the Government charge us 2s. for matai ; but it is difficult to sell. We did cut a few sleepers, but the Government refused to take matai as sleepers, and yet they charge us 2s. a hundred for it.

203. Do you think the area allowed the miller is sufficient for a first-class plant ?—No, I do not. I think the area should be increased according to the horse-power of the mill, on the Tasmanian principle. A mill with 20-horse-power plant should receive so many acres of bush, and correspondingly increased as the horse-power of the plant is greater. Eight hundred acres is inadequate for a mill.

204. *Mr. Barber.*] With regard to the timber areas, you said you considered the area allowed was too small. You say you are allowed 200 acres, and then a reserve of 600 acres ?—Yes.

205. And that it lasts six years ?—The whole thing lasts six years.

206. That is by utilising the reserve as well ?—Yes.

207. Now, with regard to the price, you say the timber costs you 8s. 6d., and that includes everything ?—Yes.

208. And you mentioned a certain price at which you sell the timber ?—Yes.

209. You charge a different price to the builder as compared with the timber-merchant ?—Yes.

210. You say the average net selling-price is 9s. to 9s. 6d. : is that to the merchant or builder ?—That is the average price to builders and merchants.

211. And do you classify the timber before you sell it ?—Yes ; we have graders.

212. That is the total average for the lot ?—Yes.

213. In getting 9s. 6d. for the timber you say there is a very small profit ?—Yes.

214. And then you told us that in fixing your prices you have provided for a dividend in the 8s. 6d. ?—I do not think so.

215. You said it included the interest and capital ?—Yes, that is right.

216. So that the 1s. is over and above the net cost ?—Yes.

217. Can you tell us the price you are charging for ordinary red-pine to the merchant, for instance ?—We sell it to the merchant at about 7s. to 7s. 6d.

218. And have you any idea what he is charging ?—No ; he has to charge in respect to the towns. Dunedin rates are something similar to Invercargill rates.

219. Is that on the train ?—On the truck at Riverton.

220. You mentioned 7s. 9d.—Yes.

221. That is to the timber-merchant ?—No, not to the timber-merchant. The timber-merchant averages from 7s. to 7s. 6d. We can give the timber-merchant any discount ; he gets very often 25 per cent. off the list.

222. Can you tell me at what price this timber that you are selling to the merchant at 7s. is being disposed of to the consumer in Invercargill ?—The merchant in Invercargill sells timber for 10s. 6d. less 5 per cent.

223. So that he is making a very much larger profit than the miller according to your figures ?—We get 7s. 9d. on the trucks—that is, to the Invercargill builder, not the merchant. From the Invercargill merchant we get considerably less, because we have to give him a considerably larger trade discount. We supply to the merchant at 10½ to 12½ per cent. off the price-list. That is the basis, and we pay railage and cartage on that.

224. Do you consider the timber-merchant is justified in charging from 14s. 6d. for ordinary building red-pine, and for selected red-pine up to £1 6s. ?—Of course, if a builder sells timber at 14s. he does not get any bigger profit, because he has to pay the miller an increased price. The price I gave was for rough timber—for scantlings.

225. That does not apply here ?—No.

226. You charge 10s. 6d. delivered in Invercargill ?—Yes.

227. Have you had an order for timber to be delivered at Wellington : have you ever sent any to Wellington ?—I have sent beech to Wellington.

228. And you are not confined only to timber-yards ?—We will supply anybody who gives us an order.

229. Really, your association is not altogether a close corporation—not a tied house ?—Oh, no !

230. You supply any one ?—Yes.

231. *Mr. Ell.*] What is the railway freight per hundred to Christchurch ?—5s. 8d. That is the new rate.

232. And you are prepared to supply timber to anybody in Christchurch whether a builder or a timber-merchant at the same rate at which you supply anybody here ?—Yes.

233. And they pay railage ?—Yes.

234. You have no restrictions in regard to your customers ?—Oh, no !

235. Have you any restrictions with regard to supplying people in Invercargill ?—No.

236. Anybody can get the timber ?—Yes.

237. At those rates ?—A builder can get the timber at 5 per cent., and a merchant will get it at from 12 to 15 per cent., discount, but the private person does not get the benefit of the 5 per cent.

238. But supposing a builder in Christchurch is not in any builders' association, will you supply him with timber ?—Yes.

239. At the discount rate ?—Christchurch is a free port for us. We can give him, I dare say, 10 per cent.

240. Supposing a builder in Christchurch is not in the builders' association, will you give him the same discount as a builder in the builders' association ?—In Christchurch ?

241. Yes ?—Our association does not extend to Christchurch, and neither does our trade discount. We do not make any distinction between the builders in Christchurch and the builders in Dunedin—we have no trade discount. We can make our own bargain with the men in Christchurch.

242. Then, in regard to the timber-merchants in Christchurch ?—It is the same way. We can give the timber-merchants in Christchurch 40 per cent. discount if we wish.

243. Now, you have a builders' association here ?—Yes.

244. If there is a builder outside the association, and he is a good mark and prepared to pay you cash, would you give him the same discount you would give to a builder in the association ?—We are supposed to acknowledge the builders' association and just give them the discount, but I do not know whether that association is in existince now.

245. What I wish to understand is this: Are you prepared to supply timber to a builder outside the builders' association, giving him the same discount as you would to a man in the association ?—Yes, we are.

246. What objections do you find to the sale of beech or the use of beech ?—The objection they have, of course, is that it twists, and it is not so suitable for framing and for general housework as red-pine. They certainly think very highly of it for manufacturing work—chair-work and cabinetwork.

247. Are you aware it is very largely used in New Zealand for manufacturing into furniture ?—The use of it is growing.

248. Have you known it used in building houses ?—Yes, to a small extent.

249. Have you any evidence to show it is durable ?—We have the evidence of Kirk's "Fauna and Flora of New Zealand." It all depends on the class of the timber. There are different classes, and one is diametrically opposite to the other.

250. I understand, if beech is cut in the summer-time it is more likely to warp than if cut in the winter ?—Yes.

251. Is your beech cut in winter ?—No, we cut every month.

252. Is not that creating a certain amount of loss in cutting it at a time not suitable ?—We cannot stop the mill. If we did that we should have to close the mill up.

253. Then you are not restricted by the Forestry Department as to the time of the year you should cut the timber ?—No.

254. And they allow you to cut it at a time when it does damage to the timber ?—Yes.

255. It certainly does damage it to cut it in the summer-time ?—Yes.

256. And there would be less loss if cut at the proper time ?—Yes.

257. And you would get a better price ?—Yes; and it would not warp so much.

258. And it would get a good character in the market ?—Yes. It has only a good character in the market according to the grade, and there are men who know how to cut it and stack it. The market has been shut out in Australia.

259. Have you found that if it has been seasoned and properly cared for it is liable to warp ?—No, not if seasoned properly.

260. If it is properly cared for and properly seasoned then it is a useful timber ?—Yes, it is a splendid timber—as good as any timbers we sell.

261. Do you not think it means a national loss if it is not properly cared for and seasoned ?—Yes, certainly.

262. You say the sale of timber in Invercargill has fallen off considerably ?—Yes.

263. Is that due to the falling-off in building operations ?—Yes, not only in Invercargill, but in Canterbury and Otago. It has fallen off considerably—there is absolutely nothing doing.

264. And the shutting-down of your mills is owing to your not being able to get a market for your timber ?—Yes. There is a further falling-off, and if it gets as bad as it was weeks ago we shall have to close again.

265. *Mr. Arnold.*] With regard to the last statement you have made, that the cessation of building operations has caused a falling-off in the sale of timber, may it not be the other way about—that the increased price now for sawn timber has been the cause of the falling-off in building operations ?—I do not think for one moment that that is so. The price-list has been in force for nearly two years, and it is rather late nowadays to talk about the price of timber. And then, supposing the price were increased by 1s., the difference in the price of building a cottage is not an appreciable one: it would not stop a man from building a cottage. The difference would be only about £12 or £14 in a small cottage, and if a man was anxious to build a home for himself that would not stop him from building. The other requirements in a house are much dearer than sawn timber. People talk about a house containing 250 pounds' worth of timber, whereas the timber only costs perhaps £100, and the ironmongery, &c., considerably more.

266. So that, while the price of other requisites may have increased, and have something to do with the present cessation of building operations, the increase in the price of timber has not ?—It certainly has not.

267. *Mr. Stallworthy.*] Your firm is one of the largest timber-merchants in Southland ?—No, not by any means.

268. You had a hand in fixing the price of timber in connection with the association ?—Yes.

269. Are the prices satisfactory to you ?—Yes.

270. Have the prices been complained of by other millers as being too low ?—Yes, there is a general complaint now and again when a depression comes on, and when prices are not satisfactory; but there is no possibility of getting a rise in prices—we are not anticipating that.

271. In framing that uniform list of prices, were there not some members of the association who thought the prices fixed were rather high ?—I do not think so. I dare say some lines when under discussion would be remarked on, but the prices were agreed to by the associated millers as satisfactory.

272. Have you adopted any improved methods of bush-working which would reduce the cost of production in recent years ?—No. Had improved methods been used it would have led to a lessening in the cost of production ; but it has not done so.

273. You say that your mill, which cost £3,000, at the end of six years is reduced in value to £750 ? —Roughly, £750.

274. In allowing for depreciation do you wipe off entirely the cost of that mill ?—Oh, no ! We wipe off in that mill from £300 to £350 a year ; it is very necessary to do that.

275. How are the trade discounts regulated ?—By the association.

276. In what way—by what system ?—The system is that the various towns are considered, and the question of position is considered with those towns, and we make the trade discount, which is satisfactory to the builders in those parts of the district. In ports like Oamaru, Timaru, and Christchurch, where other timbers come in, we leave it open.

277. Do the Southland millers outside your association cut your prices at all ?—Yes, very considerably so.

278. They keep you in check as it were ?—Yes, keep us in a state of irritation.

279. What was the extent of your beech-export before the Federal tariff ?—Per year ?

280. Yes ?—Of course it was not much. I should say we sent away three trucks a week. It is a very small quantity, but you cannot get a bottom for it—you must put it into the Union Company's boats.

281. What is the value of the year's export ?—It is worth about £40 a week—about £2,000 a year.

282. Can you supply us with a list of the wages paid to the different sawyers and workers in your mills ?—Yes, I have a list here.

283. How much timber do you get off an acre ?—About 7,000 ft. to 8,000 ft.

284. And you allow 6d. per hundred feet for depreciation ?—Yes, it averages that.

285. And on the 800 acres there would be £40 ?—Yes. It comes to an average of £300 for the six years.

286. Do you think there are too many sawmillers in Southland ?—I do, at the present time.

287. Have there been any failures amongst them ?—No. One or two small men have failed.

288. Have you any idea as to how many mills are now idle in this district ?—There are about eight or nine associated mills idle, and a considerable number of unassociated mills.

289. *Mr. Mander.*] How much timber does it take to build an ordinary workman's cottage—a five- or six-roomed cottage ?—From 15,000 ft. to 16,000 ft.

290. And at 1s. a hundred that amounts to what ?—£7 10s.

291. Do you think an extra shilling a hundred would prevent people from building cottages ?—Certainly not.

292. Then you do not attribute the stagnation in the building trade to that ?—No.

293. The principal cost you think is in the other details ?—It is in the contractor's price and the ironmongery.

294. You spoke of 800 acres altogether not being sufficient to build a mill for ?—Yes, it is not sufficient.

295. Would it not be sufficient in some cases where the timber stood very thickly ?—It would be sufficient in clean bush.

296. But in some instances it requires a great deal more ?—In country such as we were looking at yesterday in the Riverton district it would be too little.

297. Do you not think the Government should extend the area ?—It was proposed to be extended. We approached the Government, and made a representation to them to give us larger areas, and it is under consideration now.

298. You spoke of your mill being worth £700 when your bush is cut out. Do you mean to say that the mill is worth that on the ground ?—Yes, on the ground.

299. Without any cost of labour at all ?—Yes.

300. Do you think it would be so at the present time ?—Yes, the main thing is the engines. They practically cover the greater part of the cost, and if they are good engines they are generally saleable. As to the other part of the gear there is not much in it.

301. *Mr. Ell.*] You say you think the timber areas ought to be allotted according to the value of the mill and plant ?—Yes, the horse-power and the value of the mill plant.

302. If a man put up a very large and costly mill plant he could claim a considerable area ?—Yes.

303. That would give a monopoly to the man with the large amount of capital ?—It would not be in the nature of a monopoly, because a man would not be foolish enough to put up a large plant in hilly country such as we were looking at in the Riverton district. That would be a matter for the Government. I do not think the regulations provide for an excessive amount to begin with.

304. You say you have supplied a considerable amount of timber from time to time for mining purposes. What for ?—For flooring, stoping, and shafting work.

305. What kind of timber ?—Beech.

306. What mines have you working in this district ? — The Nightcaps — that is the principal mine.

307. Any others ?—Kaitangata.

308. And those mines need an annual supply ?—Yes, all coal-mines do.

309. All beech ?—Or some suitable timber.

310. And if the suitable timber is not obtainable in the district it would have to be imported ?—Yes. Sometimes they use blue-gum.

311. Is it not desirable to have some permanent supply of timber for the use of the mines ?—Well, there is nothing to prevent miners taking beech, matai, and red-pine. The coal-mines vary : one man will swear by beech and another will want pine.

312. What about getting it without having to import it ?—They can get it at ten days' notice.

313. How long will it take you to cut out your timber in the Longwood district ?—It would take us about six years for 800 acres.

314. Different mills ?—Different mills. Of course I could not tell you how long. I do not know the areas. I should say an 800-acre block at any mill would not last longer than six years.

315. So that we are within measureable distance of cutting out our timber ?—Yes, in the western beech district.

316. *Mr. Hanan.*] I should like to ask in regard to mills shut down. There are eight or nine closed now ?—Yes.

317. Recently ?—Some since December.

318. Where are they situated ?—On Longwood, Orepuki, Otautau, and other parts, and in Stewart Island, I think.

319. Can you give names ?—McCallum's, Glenburn. The other members can give their own mills. I do not know the names ; but I believe the Sawmilling Company has got one closed down.

320. What have been the main reasons for their having been shut down ?—The trade has fallen off—over-production.

321. Are any mills flourishing in the neighbourhood where these others have been shut down ?—No, no. All are in a struggling condition.

322. Is it on account of the class of timber they have been producing or unable to produce ?—It is on account of the hardships in getting timber, and the difficulty in selling when you get it.

323. When were these mills started that were shut down ?—Some had been in existence several years.

324. Can you say if the owners are in good positions financially.—Yes.

325. Are there any other mills in the neighbourhood working successfully ?—No ; the mills all work under reduced production.

326. Referring to the mills in the Longwood district cutting beech that are supposed to be affected seriously by the Federal tariff, are there any others closed ?—Yes, five altogether.

327. Are they larger mills ?—No, the same size.

328. Do you know the mills that the Commission visited yesterday ?—Yes.

329. Are there any mills close to these mills ?—Yes.

330. No larger mills ?—No ; all smaller adjoining those.

331. Do you know if they are complaining in respect to this beech, too ?—Yes ; all are complaining.

332. Can you say if it is the intention of the other mills to close down ?—Yes, I think some will close very shortly. Judging by what they say regarding orders, there are absolutely no orders to be had.

333. Taking things as they are in regard to the timber-supply, there is every probability of the price of timber being increased in the next five years ?—No probability at the present time.

334. How long will that obtain ?—I do not think there will be an increase for several years.

335. *Mr. Field.*] How many workers are employed in the sawmilling industry in Southland ?—About seven hundred—roughly, seven to eight hundred.

336. *Mr. Arnold.*] Following up that question, can you give us an idea of what is the aggregate amount of wages paid ?—About £7,000 a month : more than that—£7,000 to £7,500.

337. *Mr. Barber.*] Give us the number of mills in Southland District—associated mills, and those not connected with the association. These will practically absorb the whole milling area available in Southland ?—About seventy-odd in the district, and perhaps twenty in the association.

338. Considering that each will work out an area in six years, at the end of that time the milling will cease ?—No, because there is other bush available.

339. According to the returns on the table, these will absorb all the Crown lands available ?—No ; there are Crown lands in the vicinity not taken up.

340. There cannot be very much ?—Not very much ; but still there are areas.

341. If there are the number of mills, and each have 800 hundred acres, there will be practically nothing left ?—Yes.

342. So that in six years the timber industry in this district will not be a material consideration ?—No, it will not.

343. *Mr. Leyland.*] Do you think, as a national policy, it would be wise to prohibit the importation of Oregon pine in view of the fact that in six years we should have very little timber left ?—I should like to see what the Government would have to say.

344. In view of the fact that we are within measurable distance of exhausting our milling resources—as they will not last more than ten years—do you think it is wise to stop the importation of Oregon pine, from a national point of view ?—Of course, ten years is a good way to look ahead.

345. Do you not think it is wise to encourage it—to take the duty off altogether ?—No, I do not say that. You look upon it, I suppose, in the way that " Sufficient for the day is the evil thereof."

346. *Mr. Jennings.*] Would you favour having timber from the North Island, where almost inexhaustible supplies exist, in preference to timber from another country ?—I should prefer to take it from the Dominion.

HORATIO ARTHUR MASSEY sworn and examined. (No. 4.)

Hon. the Chairman.] You are a sawmiller ?—Yes, living in Invercargill.

1. *Mr. Barber.*] You are a sawmiller and timber-merchant combined ?—Yes.

2. *Hon. the Chairman.*] Will you make your statement similar to the last witness ?—With regard to the cost of felling, we have divided ours into the cost of—tramway first (tramway-construction precedes everything)—I would put down 5d.; bushfelling and log-hauling, say 1s. 3d.; trolly, excluding horse-feed, 5d.; mills, 1s. 5d.; yard, 6d.; horse-feed, 2d.

3. Do you base that on 1,000 ft. of timber ?—On 100 ft. Perhaps I should exclude horse-feed, which is not labour. I have got 4s. for labour.

4. These other figures are above that ?—Yes. Royalty and survey fees, 6¾d. to 7d. Tram-material, 1d.; horse-feed, horse-losses, harness, &c., 6d.

5. *Hon. the Chairman.*] How many hundred feet would you cut in the day ?—Every mill is different. One mill would cut nearly seven thousand feet, another five thousand, another four and a half thousand, another four thousand, another three, another one and a half thousand.

6. You do not mean to say that it would cost 2d. per hundred feet on 5,000 ft. to feed your horses ?—Yes, and more. It is only 8s. 4d. per day.

7. *Mr. Arnold.*] How many horses would you have ?—Thirteen or fourteen. Then there is blacksmithing, dogs for the logs, blocks, chains, and sundry things, 2d. per hundred feet. Foundry-work, breakages, &c., 2d.; oil, belts, files, saws, and sundries, 2d.; rents, taxes, &c., ½d.; fire insurance, 1d.; accident insurance, 1d.; office expenses, 3½d.; travelling, 6d.; management, 2d.; bad debts, 1½d.; discounts, 3½d.; interest, 7d.; depreciation, 2d.; sundries, 1½d. That is all that I have got.

8. *Mr. Leyland.*] What is the total ?—About 8s. 1½d.

9. *Hon. the Chairman.*] That is roughly the cost of the timber ?—On trucks, I have got the face selling-price and the inch selling-price. It is about 8s. per face, and 9s. 9d. for inch timber.

10. *Mr. Leyland.*] You call that actual measurement ?—Yes, actual. With regard to the selling-price, supposing we sell to a builder, we take 7½ per cent. off, and the consumer gets the benefit of that, because the builders compete with each other, and reckon upon getting 7½ or 10 per cent. off the price. The consumer gets that difference. Of course, now we have different prices in different districts. Say, for Invercargill, we get 10s. 6d. delivered on the job; but we take 7½ per cent. off that, and then we cart it. That costs about 6d. from the railway-station on to the job, and the average railage costs from about 2s. 2d. to 1s.—say, 1s. 6d. on an average—leaving 9s. 9d. Therefore, the customer pays 7s. 9d. to the sawmiller. In the case of the merchant in the town, we take about 12½ per cent. off; but the merchant has to compete with the sawmiller, so that he gets no more for his timber than the sawmiller gets. If a man has a yard in a town he has to sell timber on the job at the same price as the sawmiller; but we give him an increased discount. The merchant gets no more for his timber than the sawmiller gets; he sells at the same price. With regard to Dunedin, we take 10 per cent and 2½ per cent. off the list price to the builder in Dunedin. The same thing happens there. The consumer gets the benefit of that. Twenty, we will say, compete for a job; they each compete with the other; they know they get that off the list price, so that in making up their tender they calculate that.

11. *Mr. Jennings.*] They have no combination ?—They are supposed to have a combination; but it is something like ours—more honoured in the breach than in the observance. We do not at all distinguish between the ordinary builder and one in the combination.

12. You sell to all ?—Yes, regardless of what he is. I know they had an association in Dunedin, and I think they had one here; but I know there are plenty outside the association in both towns. With regard to the merchant in Dunedin, we can sell to the merchant at any price we like. I am now speaking of the association; but the non-associated sawmillers sell at the best price they can get. We have to compete on the mainland here with the sawmillers of Stewart's Island and Waikawa. Our average railway rate to Dunedin is 2s. 10d. The freight from Stewart Island and Waikawa is 1s. 9d. to 2s. They have an advantage of about 10d. per hundred feet. The merchant in Dunedin is not going to give us any more than to them, so that we have to allow that. With regard to the selling-price down here, the merchant sells at exactly the same price as the sawmiller. Of course, he can get no more. No man going to build a house will give any more. And the same applies to Dunedin. He buys from Dunedin yards at exactly the same price that he pays to the sawmiller. The price to the middleman and consumer is exactly as Mr. Hensley gave you. The further we get up north, the less we have to take for our timber, because we come into competition with the West Coast. In Ashburton and Rakaia we sell for anything we can get. We are selling for 6s. 6d. per hundred feet in Ashburton, Timaru, and Rakaia.

13. *Mr. Mander.*] Not delivered ?—No; the railage costs 5s.

14. *Hon. the Chairman.*] Instead of 2s. 10d. ?—To Dunedin, yes. That is 6s. 6d. we are selling at, and we are selling at the same to the merchants in Dunedin.

15. *Mr. Field.*] What is the railage to Ashburton ?—I think it is 5s. 4d. Over a quarter of a century ago, when I started, we got 5s. for our timber, with the timber right at the mill.

16. *Hon. the Chairman.*] And sometimes 4s. 6d. only ?—It fell even less than that—to 4s. and 3s. 9d.—and half the sawmillers in Southland were ruined.

17. *Mr. Field.*] How long ago is that ?—Twenty-five years ago. With respect to the wages, I cannot really tell you what the increase is. I know that twenty-five years ago they fell in consequence of the depression, and since then they have risen considerably. We have an award now; but I should think that in about 33 per cent. of instances we pay more than the award. There is the same competition for labour which applies everywhere; but we may not pay less than the award. I heard one gentleman speak in regard to improvements in machinery. I think, in our little way we have improved as much as we can. I have been all through the United States and Canada, and undoubtedly in very many instances they are ahead of us, because there is no limit to the area of bush they have got there,

and it pays them to spend from £50,000 to £100,000 on machinery. Our bush is very limited. It pays them to put up machinery to save even a penny per hundred feet. They can produce timber, I am quite satisfied, at less than half what it costs us to produce it here.

18. *Mr. Hanan.*] As to Oregon pine ?—I am inclined to think that Oregon pine has come to New Zealand to stay. It will always be here, and I am inclined to think also that it always should be here. Of course, I know that if you increased the duty to-morrow it would benefit me enormously. If you remove the duty it will injure us. We are buying Oregon in Dunedin now, and we are buying it largely in place of kauri, and for long lengths. It is difficult to get long lengths, 50 ft. and upwards, in red-pine; still we have got lengths of 50 ft. in rimu, and we could get them to-morrow, but it costs very much more to get those lengths. Oregon is lighter to handle, but I do not think it is more durable. Where we have seven or eight thousand feet of timber per acre, I have seen 250,000 ft. of Oregon timber per acre. With regard to the wages paid on the Pacific Coast, I have here an American journal, which, they say, is the biggest journal on earth. It describes the wages paid in British Columbia, and states, "From one-half to nine-tenths of the entire pay-roll is made up of Orientals. Graphic demonstrations of this fact may be found in another column, where pictures are shown of Hindoos and Japanese at work in Canadian mills. But it is not necessary to depend upon pictures. The evidence of those who are familiar with British Columbia and who visit the province frequently is in the same direction. There are some mills that use no Orientals; but there are many others who employ a majority of Orientals, and comparatively few that do not employ some of them. These men are Chinese, Japanese, and Hindoos chiefly. They all work for less wages than the native labourer of either the United States or Canada." The same journal points out that on the 26th December last a cargo of 3,000,000 ft. was being loaded for New Zealand. This is from Portland, Oregon. I may say that the average-sized mill over there will cut 200,000 ft. a day. Here is a picture of a train-load of logs coming in, which perhaps the Commission would like to see. I dare say it is not generally known that they work longer hours over there.

19. *Mr. Jennings.*] What is the difference ?—They work from nine to ten hours—ten is the general thing. The freight is 3s. per hundred feet from Puget Sound to New Zealand, and similarly from British Columbia. It varies, however, very rapidly. We had a cargo of Baltic landed in Dunedin the other day from Sweden. It came fifteen thousand miles, and the freight was 3s. 6d. in a sailing-vessel with a million feet on board. The total freight was about £1,750, and I understand it paid them very well. Now, our railage from Orepuki to Dunedin is 3s., a distance of about 170-odd miles, so that the freight on timber from Puget Sound is about the same as railage from Orepuki to Dunedin. Several millions of Oregon have been coming into Lyttelton, and it is also coming into Timaru. Not much as yet has come into Dunedin—probably only half a million or so: but if the Oregon displaces red-pine in Lyttelton it follows that the West Coast will suffer. Then the West Coast will look for markets in Timaru and Oamaru, and also in Dunedin, so that our competition will be increased very largely, and we shall inevitably suffer because of the pressure from up there. Again, if this should eventuate, the wages on the West Coast will fall for a certainty. I think that is all I have to say with regard to Oregon. I should like to say that red-pine—rimu—is cheaper here than in any other town in New Zealand. The railage from here to Mosgiel is more than to Dunedin, although Mosgiel is nearer, the reason being that the railways have to compete with shipping at Dunedin. There are about seventy sawmills from the Catlin's southward. I think there are about twenty-three mills in our association—or so-termed association. Catlin's is in Otago. We have no difficulty in good times when there are plenty of orders in adhering to our price-list, but immediately there is a depreciation in trade you will see that it is extremely difficult to get even our members to adhere to a stated price. I may say that the last advance that took place was about eighteen months ago, and it applied only to certain places. From the Dunedin merchants we got the same price four or five years ago. We are selling now to Canterbury at about the same price as three or four years ago. We send timber to Christchurch from here, and also to Oamaru and Timaru by boats, which is cheaper than by rail. The rate to Christchurch has recently been reduced I think. It is about 5s. 8d. now. We could send it much cheaper by water than that, but the difficulty is to put it on board, which costs about 2s. At Colac we had a mill, and we had a large jetty. The jetty cost £1,800 to £2,000, and we have abandoned it. That money is gone. With regard to timber per acre down here, the average bush will run about seven or eight thousand, but I have some that will not go more than four thousand. I have seen in the North Island fully a hundred thousand per acre. Our best bush down here has been cut out. Here is a sawmiller's list in competition with us delivered in Dunedin. His price is 7s. 6d. He lives at Orepuki. Our mills are in different localities.

20. *Hon. the Chairman.*] How many mills are you interested in ?—Six.

21. Where do they range from ?—Woodend, Gorge Road, Mabel Bush, Waianiwa, Colac, Grove Bush. One was burned down twelve months ago at Ruahine.

22. What about the output on the average at present when working full time ?—We have never worked any of our mills full time.

23. You are always ahead of your orders ?—Yes, always. Our biggest production is about 8,000 a day at one mill, another about 6,000, another 4,500, another 4,000, and another 3,000.

24. Then, what is your production just now—is it much less than that ?—Yes. I only gave you there an average production. It has been much greater than that at times. Now, it is about, in one mill, 7,000, and in the others respectively 4,500, 4,000, 3,000, and in one 1,500.

25. Have you received orders sufficient to consume your present output ?—Yes.

26. *Mr. Hanan.*] Do I understand you to say that it would be in the interests of the individual sawmillers of New Zealand, but not in the true interests of the Dominion that Oregon timber should have a duty on it ?—That is a very big question, Mr. Hanan. If I were a Free-trader I should oppose the duty, but if a Protectionist I should say, Put the duty upon it.

27. What is your opinion ?—I am inclined to free-trade.

28. I take it that you think it is in the interests of the Dominion that Oregon should come into New Zealand free ?—I am inclined in that direction. It would injure me enormously. I am speaking from the standpoint of the Dominion and the future needs.

29. You would not favour it coming in the bulk free and a duty being put on the sawn timber ?—I think that would be very much better, as it would employ labour in cutting it up.

30. Can you give us any information of the number of hours worked by men engaged in milling Oregon timber ?—Nine or ten hours—some run two shifts a day.

31. Can you say what are the wages paid to the men ?—I have printed evidence. The Hindoos, Japanese, and Chinese get about 3s. 4d. per day.

32. In New Zealand what are the wages paid to the men ?—From 8s. to 12s. a day.

33. And what are the average hours worked ?—Eight hours.

34. As to getting the timber to market at sea-ports, how do we compare as regards the cost with Oregon pine ?—I am satisfied they can put it on board ship at half the price we can put it on the truck—in fact, at less than half the price.

35. Do you export timber ?—We send perhaps a truck a month away.

36. What is the class of that timber ?—For making broom-handles—white-pine.

37. You did do a big trade in exporting timber at one time ?—We did once, but not very much—we are handicapped here by our railage to the Bluff. The North Island people can put it straight on to the boat, but we cannot.

38. What has been the effect of the duty imposed by the Federal Government on New Zealand timber ?—It has very much injured our birch trade.

39. And as to the red-pine ?—Well, we have never exported red-pine, but they have done so from the West Coast.

40. And totara ?—We have never exported any—we have none to export. Not 1 per cent. of our timber is totara.

41. What timber do you obtain from other places that is imported into New Zealand ?—Jarrah, ironbark, blue-gum, Baltic, Oregon, yellow-pine, sugar-pine, and several others.

42. In respect to what class of timber is imported timber displacing New Zealand timber ?—I dare say you saw yesterday a great many jarrah sleepers stacked up alongside the railway, and for every jarrah sleeper that is used it means a creosoted sleeper less. The Government have up to last year bought considerable quantities of white-pine, red-pine, and miro for creosoting. Of course, if they use jarrah in its place it means so much less native timber, but I do not say that they should not import jarrah sleepers, because jarrah sleepers hold the dog much better than our red-pine, or white-pine, or miro. I do not think it costs much more than a creosoted sleeper.

43. *Mr. Jennings.*] Is that after creosoting ?—Yes.

44. They do not hold so well then ?—Yes. I think on the straight it is not so bad, but on the curves you can see the momentum of the locomotives and trucks, and it is apt to displace the dog.

45. *Mr. Hanan.*] You do not urge any export duty on jarrah sleepers ?—No.

46. Or on any other imported timber ?—I cannot do that.

47. Or on anything else so far as timber is concerned ?—No.

48. Are your mills paying ?—Yes, but there is one that is losing money every day.

49. Where is that situated ?—I prefer not to mention it.

50. What is the cause of it ?—Bad trade, extraordinary depression, and difficult country to work.

51. You find the conditions vary considerably in your mills in regard to the cost of production ?—Enormously.

52. You have seen the mills in the North Island ?—I have.

53. How does the cost of production compare there with that in the South Island ?—You are speaking apart from kauri, I presume.

54. Yes ?—With new mills starting, if they are alongside the railway they can produce for much less than we can. Many of us are a great distance from the railway and we are handicapped in consequence.

55. Can you produce timber here cheaper than they can ?—I do not think we can, because their bush is infinitely better than ours.

56. As to the machinery and plant, how does that in the North Island compare with that in the South ?—In the North Island so many of them have larger areas than we have that they can afford to put in a better plant, which enables them to produce cheaper. Our areas are in many instances so limited that it will not pay us to do so. Then, again, our bush is so sparse that mills have to be put down that are capable of being removed after one place is cut out. The mills have to be moved a mile or a mile and a half further on. For instance, the mills you saw yesterday at Riverton are larger than some of them, but in rough country a portable engine would be more suitable, where they can move it two miles or so. Of course, that all means expense, but still you have to adapt the machinery to your areas and the topography of your country.

57. Now, in regard to the West Coast ?—I know the West Coast fairly well.

58. How does the cost of production compare there with that here ?—They have many disadvantages on the West Coast. They have in some places very rough country, but perhaps not as rough as ours. Against that they have better bush than we have and very much cleaner timber. By "cleaner timber" I mean there is more timber that you can dress; and they produce nothing like the amount of second-class timber that we do. Their timber is grown in a milder climate—a warmer climate with more moisture, and it is grown more rapidly than ours. Therefore it is cleaner and softer. I mean by "cleaner" that it is freer from knots, and it is taller than ours, and more regular in size and more even. Of course, they are very much handicapped there on account of not having the regular trade that we have. When I say "regular trade" I am speaking of Dunedin as being in our locality, and all along the line. They have to ship five-sixths of their timber, if not more, to Wellington, or Christchurch, or Timaru; so if they have some advantages they also have their disadvantages.

59. Do they sell cheaper than you do for the same class of timber ?—Not to the same people. We are selling to the Canterbury merchants at about the same price that they are selling.

60. Would you say they have a greater profit than you have down here ?—No, I should not say that. I think many of the mills on the West Coast are like many of the mills here—they are existing only. I am quite satisfied of that.

61. It has been said that our timber will be cut out in Southland in about six years' time : do you agree with that statement ?—Certainly not.

62. How long would you give it, in your opinion ?—I think there will be timber cut down here in thirty-five years' time.

63. What do you base that opinion upon ?—My knowledge of the country.

64. Is not the red-pine rapidly diminishing ?—To the extent of the cutting, yes, but not anything like so rapidly as it was twelve months ago.

65. Is there anything like the amount of red-pine obtainable here now ?—Yes. Immediately you increase the price even 6d. it brings other areas to the market and increases the means of communication. Boats will go to a place to-morrow, figuratively speaking, but they will not go to-day, and the railway is being extended. The Catlin's Railway is being extended straight through the bush now, and it will go right through the Tokonui and other bushes.

66. Taking the Tokonui Bush, what class of timber is to be obtained there for milling purposes ? —Red-pine and miro. There are about 3,000 acres in that.

67. And you give the life at about thirty-five years ?—I think it is a most difficult thing to say. I can only tell you that twenty-five years ago Professor Kirk told me that kauri would be cut out in fifteen years. My opinion is that they will be cutting kauri in thirty years, and I think it will be the same with red-pine. When I started down here red-pine was to have been cut out in fifteen years, and I have been here for over a quarter of a century now. I shall never see it cut out if I live an average life. The hauling-engine has trebled the life of the sawmilling bush. Then, the Government are constantly removing their forest reserves, taking the reserves off areas which, when I started, could never be opened to the public for sawmilling purposes, otherwise I should have been out of the timber business ten years ago. They are extending the railway up the Waiau district, and there is a large area of timber west of the Waiau River which would be tapped.

68. What did you pay for the bush to private owners twenty years ago ?—I paid up to £2 10s. an acre twenty years ago, and also £1 an acre, and some I bought including the land and bush at something like 12s. 6d. an acre twenty-four years ago.

69. What have you been paying during the last three years ?—Well, I bought very little land three years ago.

70. Do you know what prices have been paid ?—I think some as high as £3, £4, and £5 an acre. It depends upon the situation so much. Some bush is cheap if it is alongside the railway at £6 an acre, and other bush would be dear at £1 an acre—it depends on the quality as well as the locality.

71. Do you send much timber to Christchurch and Dunedin ?—Yes. Six times as much to Dunedin as to Christchurch.

72. Is the demand decreasing or increasing ?—Decreasing in Dunedin enormously.

73. Are you being put out of the market there ?—There is hardly any market. I do not think it is due to increased competition, but due to the extraordinary depression. There is not half the building going on in Dunedin that there was nine or twelve months ago.

74. So far as Southland is concerned, what is the position here ?—A great falling-off, but not to the extent up yonder.

75. Do you expect there will be an increase in the price ?—No ; I do not anticipate any increase in the price in the next ten years.

76. Do you think there well be any decrease, from what you can see ?—I think there will be.

77. What do you base that on ?—Because of the increased competition—there are so many more mills. Nine or twelve months ago we had a very good time, and many more mills were put up in consequence. The demand has fallen off enormously now, and we are now faced with the increased number of mills.

78. Do you think the tendency will be for prices to go down ?—I do. Indeed, if they go down, as one gentleman remarked, what can you expect when we get £4,000,000 less for our exports ?

79. Can you say who is getting the benefit of the reduced freights on timber recently made by the Government ?—The consumer, of course. We have nothing to do with the freights—the consumer at the other end pays that. If he can get it at 1s. a hundred less he benefits. Competition reduces all those things.

80. Do you advocate that the freights on the railway should be reduced ?—I do not think so. I do not think it is more than paying now. I do not see that it is paying them ; because the trucks go from here loaded with timber, and two out of three come back empty, because there is no return freight.

81. Can you tell us why these other millers have not come into your association that were referred to ?—I think our association is an association and it is not an association.

82. Do you find that the association stands to the price ?—Yes, when there is a good demand.

83. But at times there are failures to observe the agreement ?—At all times.

84. Why did you form that association ?—Because a contractor would come into our office and ask us the price of timber, and we would say, for instance, the price was 6s. He would then go to another sawmiller and ask what was the price, and they would probably also say 6s., and the contractor would then say, " I have just left So-and-so and he has offered it to us at 5s. 6d.," and we could not prove he had not, and in self-defence we were bound to have some understanding amongst ourselves.

85. Would you say that a cutting-down of the price of timber would lead to a reduction in the wages of the men ?—It would inevitably have that tendency.

86. Would you say that the sawmilling industry of Southland is in a satisfactory and prosperous condition ?—Certainly not now.

87. Are the majority of millers paying their way or losing money ?—At present ?

88. For the last twelve months ?—They did twelve months ago—many of them; but even some of them would find a great difficulty to live.

89. Some of them lost money ?—I think twelve months ago several of them would make no money at all. The idea was that you only had to get into the timber business to make money, and many of them have gone out of it in sorrow.

90. Would you say the majority of them are losing money ?—I am sure some of them are losing money now.

91. But the majority ?—I cannot say. I do not know the working-conditions of all the mills, and I know that so many of them never allow sufficient. The end of the year comes and they do not know how it is they have not done better, and not one out of a dozen of them allows sufficient for depreciation and accidents and all sorts of things of that character.

92. Have the mills increased in Southland in the last four years ?—Tremendously.

93. To what do you attribute that increase ?—The general prosperity. Things were very good some years ago, and there was more demand for timber, and timber was at a better price.

94. Do you look forward to more mills being shut down during the next three or four years ?—I certainly do.

95. For the want of orders ?—Nothing else, or for the want of a better price.

96. *Mr. Jennings.*] You have been engaged in sawmilling in this part of the Dominion for a number of years ?—Yes.

97. And you know the country thoroughly ?—I think so.

98. And you are quite satisfied with your answer given to Mr. Hanan about the non-cutting-out of the bush for a long number of years ?—Yes, quite satisfied.

99. Have you any idea of the available bush lands in the district, roughly speaking ?—It is all timber district.

100. In regard to the destruction of bush by fire, have you had any experience of that ?—Yes, I have, to my sorrow.

101. Are you familiar with the Waimarino district ?—Yes; I have been through it.

102. There is one mill there that turns out about 34,000 ft. per day—that is a million feet per month; and their cost of production is very much less than that of a mill turning out 4,000 ft. a day ?—Yes; look at their production and their life!

103. Are you acquainted with the Powell process of preserving the timber ?—I was reading about it with great interest.

104. Would it not be a valuable process for your birch and other soft-wood timbers here ?—I think it would. Using it afterwards for furniture purposes.

105. No, for building purposes ?—But would not the cost be too great for building ? That is what occurred to me. The majority of people, if they can save 1s. a hundred will do so.

106. What is the average per acre paid to the Crown down here ?—From 10s. to £1 per acre, or something like that.

107. That is considered in the royalty ?—Yes.

108. That is cheap as compared with Maori land at £10 an acre ?—Yes, but look at the land. We have not 1 per cent. of totara. Look at the hardwood they have, and we have none here.

109. If you follow out your opinion of free-trade importation of timbers, what would be the result of the Manchurian timbers coming here ?—I am frightened of the Manchurian timbers coming in here.

110. I assume your are a Britisher ?—I am.

111. If a tax be imposed against us in regard to sending our products to America and other countries, is it fair to let them dump their timber here ?—I see no reason why we should injure ourselves. They are injuring themselves if they attempt to injure us. If we can get an article cheaper from abroad I think we should do so, and the labour that would be absorbed in producing that article here could be directed in some other channel which would benefit us all the more.

112. *Mr. Field.*] I judge from what you say that you are a Free-trader by conviction ?—Yes, I think so.

113. In everything ?—Yes.

114. On all classes of goods ?—Yes.

115. But assuming you are running a country with a protective policy and we are protecting some of our industries in this country, do you not think it logical that we should protect our other industries ?—You mean, if we do wrong in one thing, why not do wrong in other things. It is a very big question.

116. At any rate, if it is logical to protect one industry it would be logical to protect another ?—It would appear to be logical.

117. In reference to the questions put by Mr. Jennings as to the treatment of our goods by the Americans: They, of course, put a heavy tax on our wool, a very severe tax on our best quality, and naturally one which completely shuts out our inferior wools. Then, notwithstanding that, you would not adopt a policy of retaliation ?—I think not.

118. You have travelled pretty extensively in Canada and the United States ?—Yes, I have lived there.

119. You have seen the timber produced there ?—Yes.

120. And seen the timber forests themselves ?—Yes.

121. Are you quite satisfied that their timber is practically inexhaustible ?—Yes. The Douglas fir, which we call "Oregon" here, I should certainly think to be inexhaustible.

122. Is it not true that they mill only their larger trees ?—Yes.

123. And leave their smaller ones, which mature much faster than our trees ?—Yes, long before they go to any other forest they will be ready for milling.

124. From that you claim that their Oregon timber is inexhaustible ?—Yes.

125. So that it is useless waiting for their export to this country to cease ?—Oh, yes !

126. There would be no sense in that ?—No sense.

127. Supposing you were the owner, as you probably are, of a piece of land here or in the North Island which was carrying good milling-timber and which would be also fit for farming, and you had no hope of milling it profitably for thirty or forty years to come, what would you do ?—I think I should clear it and put it into grass. You would be losing fifty years' profit, and that with compound interest would be an enormous amount

128. It would pay you to put it into grass at once ?—Yes.

129. With regard to these railway freights, you say you do not think the Government can very well afford to carry timber at a lower rate ?—No; I think the rate is very reasonable. Of course, I am not speaking as a customer, but I do not think we have any reason to grumble.

130. You do not think they are charging more on timber than on any other goods ?—I do not think they are. As I say, two-thirds of the trucks that go away full of timber have to come back empty; they cannot get return freight.

131. Is that so throughout the Dominion ?—The timber is so bulky they cannot get goods to fill the trucks in which it is sent away.

132. You have taken into consideration that the railway people have not to handle it at all ?—I have taken that into consideration, and they have recently reduced the rates to a small extent—to Ashburton, 1s. 8d.—perhaps from 6s. to 4s. 4d.

133. There is no reason, if it is true, as I understand it is, why we should pay more on timber than on any other class of goods ?—No reason whatever. Indeed, I trust we are not doing so.

134. Do you know anything of the class of Oregon pine that comes here ?—It is the ordinary merchantable timber.

135. Does the first-class come here ?—Some first, some second, and some third. The ordinary building-timber is what we call merchantable—floor-joists and suchlike. They have two classes below that again. From what I have seen in Wellington, Christchurch, Lyttelton, and Dunedin, it is the ordinary.

136. Have you seen any first-class landed in Wellington ?—I think I did. The bulk was ordinary merchantable timber. I think I saw some in Stewart's yard.

137. You did not see shipments on the wharf ?—Yes.

138. Did you examine them ?—Yes.

139. How did they strike you ?—As ordinary.

140. As compared with New Zealand timber, how did they strike you ?—Do you mean in houses or in the ground.

141. I mean above ground ?—I am quite sure that rimu will last at least as long as Oregon pine for flooring, and make a very much better floor—it is not so rough.

142. Do you know how much Oregon has come into the country recently ?—I think, within the last twelve months, from fifteen to seventeen millions of feet.

143. And what is our total output in the colony, roughly ?—I think it is getting on for 400,000,000 ft. of all classes.

144. You say that the Oregon is affecting Southland as far as the trade with Christchurch and Timaru, and to some extent Dunedin, is concerned ?—The Southland sawmillers are affected if it comes into Dunedin. A cargo of inferior Oregon was landed in Timaru, and was sold as low as our red-pine, and West Coast red-pine at the same price.

145. You anticipate that the importation of Oregon is going to affect our ordinary trade down in South Canterbury ?—I say, "down to here."

146. The immediate result would be that the West Coast timbers would have to come further south, and affect you. Will not the continued importation result in driving you out altogether ?—We are in hopes that Oregon will increase in price. I am in hopes that it will. But that was a very selfish expression, because the increase in price will affect the Dominion.

147. Then it will not come at all ?—That will be to the disadvantage of the people, will it not ?

148. You admit it is good to have it in large pieces ?—Yes, very long lengths and large sizes. We are importing Oregon into Dunedin now, because the kauri we bought formerly at 8s. 6d. is 18s. 6d. now. It has gone up 10s. in fourteen years.

149. If you were building an ordinary building, and you could get rimu and Oregon at the same price, which would you take ?—I produce rimu.

150. Putting yourself outside that fact—assume that you were an ordinary individual for once ?—I do not think that you should ask me a question of that sort. If I put it in the paper it might influence people.

151. I do not put it offensively ?—I know that you do not. I pulled down a portion of my house last year; it has been up forty-five years, and the rimu in it was as sound as the day it was put up, but some white-pine I pulled down had got the borer in it. There were some rimu scantlings all sap-wood, and they were as sound as those of all heart.

152. How long have you been importing Oregon into the country ?—The Government imported Oregon sleepers twenty or twenty-five years ago, but they abandoned that because they did not stand in the ground.

153. How long have you been using Oregon timber in the ground ?

Hon. the Chairman: I used some of it over forty years ago.

154. *Mr. Field.*] Did you have experience in Australia as to the life of Oregon there ?—No.

155. I was informed that they found there, from the point of view of durability, that Oregon was not equal to our white-pine ?—I wish they had. I do not believe it.

156. *Hon. the Chairman.*] I do not think the borer would affect it as soon ?—I do not think so.

157. Have you given thought to the question of afforestation ?—Yes, I have.

158. Do you think anything would be gained by planting with timber-trees any of our land ?—I told some gentleman yesterday that I had seen in Germany a forest planted eighty years ago, and I am sure they could not have produced a larger piece than an eleven-by-three out of the largest tree. I am sure it will pay us if we get 1s. per acre rent for land. Take that at compound interest for, say, eighty years. Then the question arises, if Oregon reproduces itself, and there are such tremendous forests in Siberia and other countries, as to whether it would pay us. Then, the rabbits would destroy the young timber. Then, the great risk of fire. I am under the impression that it would not pay us. I think it would pay us to import timber. It depends upon the land. If you can get land that will produce timber and nothing else, such as the pumice country in the North Island, or that cold kauri land, then it might pay.

159. Do you think it would pay to plant those areas infected with noxious weeds ?—Are you speaking of bush or of open country ? Open country can get rid of weeds.

160. *Hon. the Chairman.*] It is doubtful whether you can get rid of Californian thistle ?—If they do not let it above ground for a couple of years they weaken it.

161. *Mr. Field.*] What do you say is the increase in price to the sawmiller of ordinary milling-timber ?—Perhaps it might be 1s. 6d. ; but I could not say.

162. Is that more than would be justified by the increased difficulties of getting timber and increased cost of labour ?—I do not think so.

163. You think, in view of these facts, that it is a pretty moderate increase ?—Yes, I think competition has reduced it to that.

164. What do you think would be a fair thing for the miller, in view of all the risks he runs—a fair profit for him to make on his timber over and above the cost of production ?—I should think 3s. per hundred feet.

165. You think that would not be out of the way ?—Yes, because it is only one crop, and he runs such risks, and there is such extraordinary depreciation in plants. If it runs to 8s. in cost, I think 11s. for him would not be out of the way.

166. I suppose you would not think it would be fair to subsidise steamers that run timber from Oregon to here ? That is what we are doing now ?—Are we ?

167. We are giving them £10,000 a year ?—But that is not to bring over Oregon timber. We are establishing a trade that will pay us more than £10,000. If that is so, it will pay us to do so.

168. If it does not—if the stuff that comes back is Oregon timber, and very little goes from us ?—That is another matter.

169. About losses by fires : I want to ask about insurance ?—We have got an average clause. They compel us to insure to the full extent, for they suffer so much through fires ; and unless we pay right up they only pay proportionately. If a mill costs £1,200 and we only insure £800 on it, they only give us two-thirds of our loss.

170. What about their premiums ?—Seven per cent. per annum.

171. When you were asked as to whether the mills were paying, and you said that some were losing money, it is quite certain, I should think, that those gentlemen who closed those two beech-mills must have been losing money ?—Of course they were.

172. What did those cost ?—Does that include any tramway ?

173. Yes, a fair proportion of tramway ?—I should think that first mill—of course, this is only a rough statement—cost £3,000, and the other mill, I should say roughly, about the same. That has nothing to do with that long tramway to the railway. That is only for bush tramway.

174. And all that money is lying idle and their machinery is depreciating ?—Yes.

175. About the relative cost of producing here and in the North : you said the cost was about the same, speaking generally, because of the better class of bush there ?—Yes.

176. Did you see the millers working there and the difficulties they had to overcome ?—When I came through, there were very few working. I saw a mill at Taihape, and one at Taumarunui. Then at Kakahi there was a Government mill, where they were cutting sleepers, &c.

177. *Mr. Leyland.*] In you evidence you said that timber-merchants were allowed discounts of from 12 to 12½ per cent. That would mean a difference of 7½ per cent. in favour of the timber-merchant ?—Yes.

178. The timber-merchant has to cart the timber to his yard ?—Yes.

179. And measure it out again ?—Yes.

180. And apart from the cost of labour, rent, taxes, &c., our experience is that it takes 5 per cent. to measure a cargo out ?—I quite believe it.

181. That is 5 per cent. gone ?—Yes.

182. The cartage would be 5 per cent. : then there would be nothing left ?—Yes. Invercargill cannot do it for 25 per cent., but the merchant here cannot help himself, as he has to compete with the sawmillers in the district. I want to correct some of your impressions with reference to the cost in America. As you are aware, I have been to many of the places before your visit and since your visit, and I may say that, apart from wages, the cost of production in the mills, from evidence given before the United States Commission, owing to the rate war makes it considerably less. This letter I hold is a letter from the New Zealand Government Agents at Vancouver. There was another sawmiller who came, and who had very different impressions from my own, and I sent to the New Zealand Agents. They say that at the recent freight-rate fight in the United States, before the Inter-state

Commerce Commission, it was shown by figures from 400-odd mills that the average cost of producing lumber was, I think, $4·22. I think this is the exact figure: any way, it was something over $4.

183. That will be per thousand?—That is about 1s. 9d. Do you mean putting it on truck?

184. I mean the cost of sawing?—That includes the timber and sawing.

185. No. In cases they pay $9 for logs at the mills?—That includes royalty.

186. With reference to wages, you quoted from the *American Lumber Journal*, published in Chicago?—Yes.

187. They are competitors in our markets, and in other markets with the British Columbia people?—Of course they are.

188. The evidence they produce may be taken with a grain of salt as to the wages. This letter is dated the 20th January, 1909—the last mail before we left Auckland. That includes wages?—Yes. He goes on to say, "Quite a lot has been said about the low cost of labour in Canadian and American mills, but the following may interest your readers. Sawyers receive £1 0s. 10d. per day, and the wages per day run down to 10s. 5d. for all white men, with the exception of one or two labourers. Loggers supplying timber from the bush receive £1 0s. 10d. per day, and the head camp-men as much as £1 9s. 2d. and £1 13s. 4d. per day. Shingle-cutters are paid by piecework, and make 11s. 2d. per day and upwards. It is to be noted that the latter are Asiatics. In Canadian mills the majority of yardmen are Orientals, and you will find Chinese, Japs, and Hindoos working alongside each other. Their pay runs from 4s. 2d. to 6s. 3d. per day; but, then, they do not get through the same amount of work as white men. Let no person run away with the idea that the mills wish to employ Oriental labour: they are forced to do so. The question naturally arises, why are they employed in Canadian mills? The reason is simple. It all rests upon the unreliability of the white man. The miller wants white men, but when trade-conditions improve, and larger wages are available in the country districts, they will go out in a body and leave the mills without labour. It is, therefore, a matter of the mills choosing the lesser of two evils. They know it would be more to their advantage to employ white labour; but the white man will make use of the mill only so long as it suits him. The Asiatic, on the other hand, although not such a good worker—which fact necessitates about double the number being employed than in the case of his white friend—will stand by the mills in and out of season. I may say that our Chinese labour runs from $1·35 up to as high as $4 a day. We have no white labour in our employ at less than $2·25, and our average wage-list is a fraction over $30." I also wrote and sent paper-cuttings to the gentleman who was President of the Board of Trade, Mr. William D. Wheelwright, a man who is respected on the whole of the Pacific Slope. He is President of the Pacific Export Lumber Company. He says, "It is true that a good many Japanese are employed in the British Columbia mills, but very few on this side of the line, and low wages, even for Orientals, is a thing of the past. In this country the price of available stumpage is generally $2½ per M ft., and the cost of labour averages about $3 per day for ten hours." It was my privilege to meet a good many of these American lumbermen. I examined the wage-books, and found that to Orientals the wages paid were from $4½ per day upwards, which is really about the same as stated in the letter quoted. But they would prefer to pay 10s. 5d. a day to white men. They found that they saved a considerable number of cents in the cost of labour thereby. Two white men would do as much work as four Orientals.

189. From the paper your quoted it would appear that there was a cargo of three million loading for New Zealand?—That is quite true.

190. That was not handled by Oriental labour: it was not carried on the bottom of subsidised steamers either?—No.

191. The hard woods imported here are imported for purposes for which our timbers are not very suitable. Do you not think it necessary to allow hard woods to come here?—Yes.

192. Are you aware that there has been an increase in the price of timber throughout the world?—Yes; I think timber, on the whole, has increased; but there has been a decrease in Oregon. That is exceptional. It has decreased very much in the Baltic.

193. Do you know the cost of Siberian timber delivered in the log in Australia?—I heard from a Melbourne timber-merchant who was over here a fortnight ago that it was 8s.

194. Do you know the quality of it?—It did not impress me very much.

195. You do not contemplate any serious competition, if it costs 8s. to Australia and it is inferior timber?—No.

196. You know the United States is a country that follows a high tariff?—I do, well; and I am aware that Oregon and Washington compete with British Columbia.

197. Do you know the duty imposed by the United States against British Columbia on sawn timber?—I saw that the other day. I have it in some of these journals.

198. Well, the duty is $2 a thousand. We already impose a duty of £1. With reference to the larger trees, did you visit any of the forests they were working?—I did.

199. Did you notice that it was cutting on the face?—Yes, I did. I saw them cutting it on the face there. It was nearly all large timber.

200. They took it on the face there?—No; they left some of the small timber.

201. Did you notice the logs in the booms? They went down to very small logs, did they not?—No; in one bush I was in I do not think I saw anything there under about 2 ft. in diameter. On the Mississippi I saw them take logs down to 15 in. in diameter.

202. Would it surprise you to learn that in evidence given before the British Royal Commission, just published, by the United States Department of Agriculture it is stated that the annual consumption of timber is three or four times as great as the annual increment to their forests?—It would surprise me, because you must take into consideration the area of British Columbia.

203. I am speaking of the United States?—That still would surprise me, and I should doubt it.

204. Would you be surprised to know that prior to 1904 the United States paid to Canada, for ten years, $13,000,000 per annum for timber ?—No; because in certain districts it pays them to bring it over the border.

205. Would it surprise you to know that, whilst, twenty years ago, of the timber exported by Canada to the United States and England, 40 per cent. went to the States and 60 per cent. to England, to-day these figures are reversed ?—No, it seems reasonable.

206. A few years ago, your output was 25,500 ft.: to-day it is 20,500 ft. I have arrived at this by adding up the different mills. So that the falling-off in your output is not so very great ?—Our red-pine has fallen off 20 per cent.; but, then, half of our mills are cutting red-pine entirely.

207. There is depreciation in white-pine also ?—Yes, there is. We are selling it now for less than we sold it ten years ago.

208. Do you not think that this is owing to overproduction ?—Of course it is.

209. Have you seen the Customs returns as to white-pine export ?—We do not export a foot of butter-box timber here. Everything is the same. It is no wonder. I, for one, may say I never expected for a moment that the state of things obtaining last year would continue. I expected this to come long ago.

210. Seeing that our imports of Oregon have been seventeen million, and comparing this with our output, do you think it has anything to do, or has it very much to do, with the present depression ?—It has not very much to do with it. It certainly has something, but not very much.

211. Can you tell us the price of Oregon to-day if you wish to buy ?—I should think, about 81s. c.i.f.

212. Eighty-one shillings as a basis ?—Yes.

213. Then, if you made out a specification, including long lengths and different sizes, how much would you exceed 81s. ? Would you be 20 per cent. higher ?—No.

214. Would it be 15 per cent. ?—I do not think it would be 10 per cent.

215. I have worked it out, and it works out at 15 per cent. on the basis of the E list ?—So that would bring it over 90s.

216. There are exceptional reasons why Oregon pine was so very cheap ?—We get it in Dunedin at about 70s.

217. There was a financial crisis ?—Yes.

218. The only revenue open was the export ?—Yes.

219. They had to cut it and sell it for what they could get; and is it not almost impossible that these prices can be maintained ?—I think so.

220. Now, in reference to the kauri at 8s. 6d.: there are special reasons for that ?—Yes, I know.

221. An effort was made by Mr. Broad to crush the other mills ?—I do not know that.

222. You know that logs are costing 10s. per hundred feet ?—I cannot understand them costing 10s.

223. It is exceptional to say that it is sold at that price ?—I know it was exceptional. I may say we bought it for two years at that price. We bought it from Mitchelson, from the Kauri Timber Company, and from Matthews.

224. You think 3s. is a fair profit for a miller ?—I think we ought to have 3s. down here. It should be 50 per cent.

225. Then, idle mills in Southland are not due to the importation of Oregon pine ?—I do not think so. It is a factor, but a very small factor.

226. *Mr. Clarke.*] I think, Mr. Massey, you stated you considered the supply of Oregon was practically inexhaustible in North America ?—Yes, of Oregon.

227. Do you consider that this is so in view of the fact that the United States have reported very much in the opposite direction—would that influence your view ?—Yes, it would certainly influence me, because they should know more about it than I. Of course, I spoke of the whole of the Pacific Slope, and not of the United States only.

228. I should like to ask you, as a man who has had large practical experience in bush-work throughout the Dominion, whether you do not think that considerable harm would be done to the country by the complete denudation of the forest, in the way of injury to the country from climatic and other points of view ?—Certainly. All experience proves that, when hillsides are denuded of their timber, very great damage is done. France, Sweden, Norway, and other countries are suffering from that. In regard to the question as to whether it affects the climate in the way of rainfall, that is an unsettled question which is very much in dispute.

229. With regard to the larger amount of timber that may be expected, or that may be available, from Manchuria, is there any good evidence that there is such a large quantity there ?—I think there is. You may remember reading before the war that the Russian Grand Dukes had acquired very large interests in timber land on the Yalu River, dividing Korea from southern Manchuria. I understand that was one of the causes of the war. Of course, I do not altogether accept that as an authority, and I should require confirmation before I attached much importance to it. There are, nevertheless, large areas of timber in eastern Siberia. I should think, and I believe, that it will cost a very considerable sum to get it on board to compete with us.

230. You know that China is suffering a great deal from the complete denudation of her forests ?—Yes, I know that.

231. Relating to local matters: In respect to one of the reasons for establishing a Sawmillers' Association here, I think that about the only answer that was given was that a man would come and say, "What is the price of timber ?" and he would be told 6s., and he would then go somewhere else and say, "I have just been quoted 5s." Is that not the main reason for the association ?—I would not say it was the main reason. I am quite satisfied it was one. I think the object in starting it was that timber was very, very low at the time, and I am satisfied that that largely promoted the association by three or four of us. It is, as a matter of fact, a very harmless association.

232. *Mr. Morris.*] I want your opinion as a sawmiller whether you consider it in the interests of this Dominion that cheap foreign timber should be allowed to flood the market ?—Looking no further than my personal interests as a sawmiller—not looking at it in a general and comprehensive way—I can only say that I should like decidedly to increase the duty. I am quite sure that the West Coast is suffering from the Oregon.

233. You must bear in mind the great amount of capital involved in the industry, and also recognise the large source of employment resulting from it ?—I do, indeed. You have my sympathy in that matter.

234. Generally as to the question of area allowed to sawmillers, I should like to have your opinion ?—Eight hundred acres is allowed here in one lot, but I think they are increasing it to 1,200 acres. I think there are new regulations about to be issued allowing a sawmiller to take up an area in proportion to his horse-power. I have not seen the regulations, but I understand they are about to be issued.

235. I take it that you recognise that if we had more liberal conditions in regard to the area of bush timber in some cases it would enable a man to produce cheaper goods ?—Yes, undoubtedly I do. That would lessen the cost of the timber to the consumer.

236. There are only some twenty-three mills here in what you call the nominal association ?—Yes.

237. I presume that the forty-seven mills outside that association practically control the price ?—Of course they determine the price.

238. Seeing that, they are in a big majority ?—They are.

239. Then, the association cannot be accused of increasing the price to the public ?—Oh, no ! How can they ? We try to get the highest price we can, and but for the forty-seven outside mills I have no doubt we should get a better price. That is just our trouble at this moment.

240. Do you export much timber from here ?—No—if you mean, export out of the colony.

241. I think your policy for years back has been to conserve your timber ?—Myself, personally ?

242. Yes ?—No, not at all. I should be glad to cut my timber in six months and get out of it. It would be the greatest mistake to spend my life here.

243. You have got a number of mills in which you are interested, and I presume you are able to keep them working at a small margin of profit owing to the fact that you are a merchant ?—Yes.

244. Otherwise they would be closed up ?—Most certainly one would be, or we should reduce the output immediately.

245. *Mr. Barber.*] You stated that the Southland mills were supplying cheaper than any other mills in the colony ?—I think so.

246. And yet you are milling under very great disadvantages—you have very inferior bush in the first place, and yet you are able to supply timber cheaper than those who have fair bush to mill in. Can you explain the reason of that ?—No. I dare say some of the other mills in the North Island are further away from the railway, or they may have some other disadvantages. I think it is the competition down here, for one thing.

247. With regard to the association, you said there were twenty-three mills in the association, but there are a larger number outside ?—Yes.

248. And you said just now that the price of timber was controlled by the non-associated millers. Well, in your opinion, if a legally formed association were established in the district, with penalties for breaches of the rules and no one outside the association, would that be, in your opinion, a reason for keeping the price of timber up ?—I think they could keep it up that way ; but I do not say it would be a good reason.

249. If they had not the conditions which you have here it would increase the price of timber ?—I think so.

250. As to the quantity of milling-timber available in this district, you said you were sure that milling would go on in this district for over thirty years ?—I think so.

251. The Crown Lands Department in their report stated that the milling-timber on Crown lands, State forests, and forest reserves in the Southland District only amounted to 102,000 acres ?—Yes.

252. So that if you divide that by 800, and the life of a mill in one of these areas is only six years, and if these reports are correct, the life of the bush in this district cannot last more than six years, and the whole timber area will disappear. That is in the report of 1906-7. In a later report it is said with regard to Southland that as there is not a very large supply of standing timber remaining in the district it is probable that the sawmill trade will gradually decrease, and at a not very distant date, judging from the present output, will cease to be an important factor in the industries of the province. Had you read that ?—No, I had not.

253. You said that as a sawmiller you thought it was not a good thing that this Dominion should be swamped by cheap foreign timber ?—Speaking as a sawmiller.

254. Now, do you consider that ordinary building sawn timber, undressed, sold at 17s. 6d. is a cheap foreign timber ?—No, I certainly do not.

255. You think that a very fair price to pay for building-timber ?—I think it is a very big price.

256. You said you did not think that it was fair that this colony should be swamped with cheap foreign timber ?—Only as a sawmiller.

257. Now you say as a sawmiller that you do not think timber sold at 17s. 6d. is a cheap timber ?—You did not mention Oregon.

258. The man who wants to build a house has to pay 17s. 6d. for this foreign timber, which is called cheap timber, and some millers are afraid it will come into competition with our home product ?—If they get 17s. 6d. for it, I do not think they need be frightened.

259. *Hon. the Chairman.*] But is any one getting that for it ?—We in New Zealand use it for the factory or for very long lengths.

260. But are you getting 17s. 6d. for it ?—Yes.

261. *Mr. Ell.*] With respect to the supply of New Zealand timber for milling purposes to which Mr. Barber referred, the report of 1906-7 says that, as a result of systematic inquiries made by the various Commissioners of Crown Lands, timber experts, and Crown Lands Rangers belonging to the Department of Lands, they have been able to supply certain information: do you not think they are now in a better position to judge—seeing that they made a survey and investigation—than the late Mr. Kirk could possibly be in?—Yes, I think so.

262. So that the information obtained by the Lands Department is more reliable than the report of Mr. Kirk?—I should certainly think so.

263. It covers the quantities of milling-timber on private and Native land and Crown land in New Zealand, and they say it will not last more than seventy years at the outside from the year 1907. Do you think we should be justified in accepting that as fairly reliable?—Yes, I think so: that is the best way we can get at it.

264. The report further states that in Taranaki and Hawke's Bay the mills have gone out of work, and that they are diminishing in this district?—I do not think the mills are.

265. According to the report they are?—I do not think they take into account the mills on private property.

266. Yes, the report says so. I should like to know whether you think it advisable that the export of timber should be limited, seeing that we are dependent on the outside world for our timber-supply?—It is such an immense question. It is too big a question, and I should have to consider it well, and I have not sufficient data to go upon, and I do not know the conditions prevailing. I know exactly what you mean, and quite recognise it.

267. The whole point is whether we should preserve a supply for our local needs?—I should certainly say not if we can produce it at anything like as cheap as we can import it.

268. *Mr. Arnold.*] Of course, you know that this Commission has been set up in consequence of the unsatisfactory condition of the timber industry at the present time?—I do.

269. You recognise that the condition is very unsatisfactory?—Yes.

270. Especially from a milling point of view?—Yes, and from the merchant's point of view also.

271. We have had evidence to show that the millers are paying a higher wage than that set out in the arbitration award?—That is so, absolutely.

272. So that you do not suggest that any improvement can be made by a reduction of wages?—I do not suggest that.

273. And neither do you suggest, I think, an increased import duty: you do not think that would remedy the conditions?—As a sawmiller it would perhaps benefit me; but I am looking at it in a more liberal light.

274. But that would relieve the conditions to some extent?—It would somewhat, because I know they must be suffering on the West Coast. If they suffer there it will inevitably react here, and we must suffer. We shall have more men coming from the West Coast to this district.

275. Do you think it would be possible for the Government to relieve the position by offering a bonus on the production of timber—giving the sawmillers a bonus on so-many thousand feet?—I could not say at all.

276. Would you suggest that?—No. That is an idea that has never occurred to me, and I could not say.

277. I understand you to say that you do not think it possible to increase the price of timber for many years?—I do not think we shall get an increase for many years.

278. So that from your evidence I gather that you think the position might be relieved slightly by a duty, and that, if the area of 800 acres per mill was increased, that also would be something towards it?—Certainly.

279. Now, as a practical miller and as a practical timber-merchant and expert in every way, have you any other suggestion you can give this Commission which will enable them to come to some decision for the purpose of relieving the present position?—I think the present position is almost entirely due to the depression. I think that is 95 per cent. of the whole trouble.

280. The Commission cannot relieve the depression?—No.

281. And you have no other suggestion?—No.

282. *Mr. Stallworthy.*] You told us that the cost of production was 8s. 1½d.?—Yes.

283. And that a fair selling-price would be 11s.?—Yes.

284. Yet I understand that you are selling timber in Ashburton at 6s. 6d.?—Yes; that is ordinary building-timber.

285. It refers to the same timber which costs you 8s. 1½d.?—8s. 1½d. is the average price of all sorts of timber.

286. Is not 6s. 6d. the average price, too?—No, that is for big lines—not for dressed timber or totara.

287. It pays you to sell in Ashburton at 6s. 6d.?—We do; but there is not much in the 6s. 6d. We are selling some at Timaru at less than that—at 4s. 6d., and so on. It is a very difficult thing, and seems very confusing. There are so many descriptions of timber; but that is one of our big lines—the ordinary inch timber.

288. I think you said that you did not consider the wages too high, or that the wages now being paid were harassing the industry in any way?—I do not think they are harassing the industry. Good men always deserve their money.

289. You gave us a statement in reference to the wages in America being very low?—Yes.

290. You agree that if you employ the cheap labour—the Orientals—you have to employ more of them to get the same amount of work?—Yes, and I do not advise it.

291. So that the low wage is really not a low wage?—Yes.

292. Do you import Oregon timber ?—Yes.

293. And sell it in Dunedin ?—Yes.

294. What is the price landed in Dunedin ?—I think a number of merchants in Dunedin divide up the cargo. It was 7s. 8d. a hundred feet, and the duty is 2s. That is the one quality, like ordinary timber I am speaking of at 6s. 6d. Then, the harbour dues are 6d. ; putting it into the yard will cost another 6d. ; and stacking it, something more. Most of the Oregon we had in Dunedin we used in the factory, substituting it for kauri largely.

295. What did it cost landed, or, say, put into the yard ?—11s. 9d. perhaps, roughly. That is for the ordinary quality, not the selected quality.

296. What does it range up to for higher qualities ?—I thould think two or three shillings more.

297. And is 17s. the highest price you get for long lengths ?—No, we get more than that. The greater the length the more it costs.

298. What is the selling-price of Oregon in Dunedin—from what to what ?—I think about 17s. upwards.

299. Is 17s. the lowest price ?—No, it is not the lowest.

300. What is the lowest ?—Perhaps 15s.

301. Up to what ?—I should think up to £1 3s., or £1 2s. perhaps.

302. You pictured a somewhat depressing consequence to the West Coast if Oregon importation increases. Have you any remedy to suggest ?—No.

303. Do you know of anything to prevent such a disaster ?—I do not.

304. Is there anything that you know of in America that would prevent the importation : is there anything to prevent the export of bulk Oregon ?—I do not think so. I distinguish between balk and log—I mean squared.

305. Is there anything in the freight or otherwise to deter a New Zealand merchant importing Oregon in the large size rather than the small ?—I do not think so. We used to bring kauri down from the North in balk.

306. Is there any advantage in importing it sawn ?—Not in freight.

307. In any way at all ?—No, because we can saw it up to the desired sizes.

308. The present position is that New Zealand is importing Oregon in sawn ?—Yes.

309. What is it prevents the New Zealand merchant getting it in the balk ?—He would have to pay for the sawing, and there would be the waste in the sawdust and conversion.

310. You think the wages in this country would be dearer than the wages in America ?—I am sure they would be.

311. There was an importation into Australia of beech, which has ceased on account of the tariff ?—Very largely indeed.

312. What is taking the place of the beech in Australia ?—I cannot say.

213. Are they doing without it altogether ?—I do not think they are doing without it altogether. I think the depression over there has affected matters over here, too; but I have no doubt that the increased duty on beech has affected it, and probably they are using home-grown timbers.

314. I notice that the branch lines in this district are rather numerous ?—They are.

315. Do you not think that the extraordinary development of the railways has tended to bring the bush to the market perhaps faster than is really a good thing to do ?—Well, I do not know ; but it has certainly tended to bring it into the market sooner than otherwise.

316. A reduction in price, you said, would tend to lower wages ?—It would do, undoubtedly.

317. Would it also cause you to give your horses less feed ?—No ; that would not pay. It does not pay to starve the horses.

318. A man could have less feed, but not a horse ?—I would not say that for a moment.

319. Where have the new millers come from that have increased the number so much in Southland recently ?—I think, round the district, like every other business.

320. Men who have been workers have become millers ?—A few of them, not many; but many others want something to do.

321. Have these come from the capitalist class for a speculation more than anything else, or are they those who have desire to find better employment ?—I think there are all classes.

322. *Mr. Mander.*] You consider it good business on our part, considering that the Dominion is suffering from a rather severe depression at the present time, to allow our difficulties to be increased in that direction by allowing Oregon timber to come here free ?—There is a 2s. duty.

323. Considering that there is a severe depression at the present time, and that the millers are suffering severely in consequence, do you not think it is wise to protect ourselves, and not allow America to make a dumping-ground of our country ?—I think it would benefit the people.

324. Do you not think it would be better for the general public to give a little more for material and have enought to pay for it than have cheap timber and no money to pay for it ?—It is the same old question of free-trade and protection.

325. We put our railways through the country to get out our timber. One of our principal arguments was to get the timber out ?—I remember it well.

326. Do you think it is wise, considering that we have opened up that vast area of country, to allow the industry to suffer and the timber to be destroyed ?—I think it would be very hard upon the sawmillers after you have given them to believe that there would be no reduction in the duty on Oregon —I think it would be a very serious thing to remove the duty from Oregon. I think it would be very wrong indeed.

327. Then, there is the question of fire. Of necessity the timber has to be cleared off the land, and it would not be right to allow it to be cleared in consequence of other timbers coming in ?—If the timber-supply was inexhaustible, I think it would be justified ; if limited, I think it would not.

328. Do you not think it would be far better to conserve our timber while we have got it, considering we can get all we want from outside ?—I think it would be very wise.

329. According to reports, it is estimated to last seventy years ?—I suppose that applies to the whole colony ?

330. *Hon. the Chairman.*] That is problematical, because increasing population will shorten the time ?—Yes; that is, at the present output.

331. I always think it is impossible to get at these estimates ?—I know it is impossible, because you cannot survey this country, and I am in hopes, and believe, that the quantity in New Zealand will be very much greater than the estimate.

332. There is just one point here about what you think is little enough for the sawmiller for profit. You said 3s. over and above what it costs to produce the timber ?—Yes; and contingencies, and bush-fires, and one thing and another.

333. But you provide in your estimates for insurance ?—You cannot provide for bush-fires, extraordinary accidents, &c.

334. If you go by your evidence you will think so. It appears so to me. In your enumeration of what the sawmiller has to charge before coming down to horse-feed, it includes insurance for fire and suchlike ?—Yes.

335. Do you not think 3s. is rather too high for profit ?—No, because you only get one crop of timber.

336. But that was not used till you purchased it ?—A bush-fire comes and sweeps away a lot of our timber. You cannot provide against that. Then, you make perhaps an enormous bad debt, or kill two or three men.

337. I do not think there would be many debts lately ?—I think nowadays it would be greater.

338. Your output from one of these mills is 7,000 ft. a day ?—Yes.

339. And from the others 5,000 ft., 4,500 ft., and 3,500 ?—Yes.

340. Putting that all together, it would be about 12,000 ft.—say, 14,000 ft. per day ?—Yes.

341. To give you 3s. on that every day, you would be a millionaire very soon ?—But what about the big depreciation that comes ? I have two mills that will be cut out very soon, and 21½ miles of tramway that will not be worth a snap of your fingers. I shall feel it badly as I have got the largest number of mills down here.

342. *Mr. Hanan.*] How much have you sunk ?—Thousands.

343. *Mr. Clarke.*] With regard to future supply, you think there will be more than the Government returns here. Is that based on actual experience of Government land you have taken up ?—Yes; I know that in bushes where they thought there was very little available timber more has been discovered since, and they have turned out better than was expected. I do not think that in that estimate they have reckoned upon lots of places I know of where with better means of communication they will find timber they have not reckoned upon.

344. *Mr. Field.*] Take our timber that is growing: assuming that it cannot be milled profitably, what is the inevitable result ?—They are burning it, and grassing the land.

345. By so doing we are losing railway freights, capital, milling, and labour ?—If that land produces a crop every year it does not matter. If it is capable of feeding sheep or lambs you are getting something.

346. But take the sawmiller: he has to close his mill up, and he loses his mill; the men are thrown out of employment, and the railway loses its revenue ?—Yes.

347. Then we are thrown entirely on the foreigner for timber ?—Not for seventy years.

348. But assuming that this is done ?—Yes.

349. What I want to know is this: We hear of Harvester Trust monopolies—if we destroy our timber, are we not in the hands of monopolists again ?—No, that cannot arise, because you are in the hands of the whole world. There is the whole world to draw supplies from, and it is beyond the most remote possibility. I do not think there is the slightest reason for apprehension on that point. They have discovered immense areas in the Philippine Islands and Java, and I am convinced that there are millions of acres in Siberia.

350. *Mr. Morris.*] Is there any land being disposed of for settlement containing milling-timber ?—Some has been disposed of.

351. At the present time, I mean ?—I do not know of any now. But I think that where land is very sparsely timbered, and would not pay for a sawmill, it should be disposed of.

352. The reason I mentioned this matter is that in our district during the last twelve months timber lands that contain very good milling-timber were advertised for settlement under the lease in perpetuity. I wrote to the Crown Lands Commissioner, and he went and visited it, and it was withdrawn, and he wrote me a very nice letter thanking me for the information I had given him ?—If he discovered there was milling-timber upon it he would sell it to the sawmiller.

353. They had no sawmiller very convenient ?—That is what they do here.

Hon. the Chairman: I gave general instructions not to sell any bush that was fit for sawmilling in any part of New Zealand, and if there was any bush land advertised for settlement it was overlooked in some way. When they opened land without being surveyed, a man that was pretty knowing might include a portion of bush land in his application.

Mr. Jennings: If that was carried out in its entirety it would block settlement in these Islands.

Hon. the Chairman: I must compliment you, Mr. Massey, on the straightforward way in which you have given your evidence to this Commission. On behalf of the Commission I beg to thank you.

INVERCARGILL, MONDAY, 29TH MARCH, 1909.

WALTER HORACE BRENT sworn and examined. (No. 5.)

1. *Hon. the Chairman.*] Are you prepared to-day to give evidence and make a statement regarding matters you consider of importance in connection with this inquiry?—Yes. The position of trade in Southland, so far as timber is concerned, is this: Some twenty or twenty-five years ago the timber trade was in a very bad state. Then, following that, owing to the prosperity of the country, the timber trade improved as well. At present, I am sorry to say, the timber trade is in a very bad state, and naturally we look to find the causes. The chief cause of the present depression is the tightness of finance—viz., the want of money in the Dominion. Of course, the importation of timber has always been a factor, and when, added to that, money becomes tight we feel more than ever any timber that comes in. I am aware that Oregon has been coming in for a long time, and lately it has been on the increase. When it takes the place of red-pine, in times of depression, we feel it very acutely. Another factor is that the cost of production has been going up all the time. Wages have increased: the bush has got farther back, has become more inaccessible, and therefore necessitates large and more expensive tramways. It is true the areas we have to work are of the same dimensions they were years ago, but then the bush was much better, on practically level country, and we had the same area to work on. We now want the *quantity* of bush, and that is the thing I should like to impress on the Commission. In granting sawmill areas to sawmillers the quantity of bush should be the factor, and not the number of acres. My company took up 200 acres with a reserve of 600 acres, but we found we could only work out 150 acres, for the reason that the remainder was inaccessible and we had to leave it. That class of thing did not exist at all in the old days; then you could work every square yard of it. The cost of tramways in the early days was much less than at present. At that time one could map out his lines in the office, but now experienced surveyors have to be employed in the construction of our tram-lines. Mill articles are generally more expensive at present: for example, saws, files, and many other things have gone up in price. There is a general rise all round, which, of course, affects the price of timber. When the cost of production is greater and the selling-price of timber has only advanced proportionately the miller receives no additional advantage. As a matter of fact the sawmiller was better off ten years ago than he is to-day. Indeed, there was much more profit in the earlier days. Then I would like to point out that depreciation is a very great factor in the cost of production. In the early days you could get an area which would last you ten years, and therefore you would have that ten years in which to write off your depreciation. Now, where an area may not last more than five years, there is only five years to cover the depreciation, which is consequently doubled. We acquired some bush about five or six miles from the railway-station. We had to put a tramway across a swamp to get at the bush, which tramway cost us £1,200, because the swamp had to be ditched. I would now take half-a-crown for that tramway as it stands, and yet it cost us £1,200, and that amount has to be written off before we can show any profit at all. Where we are working now the same principle holds good. In one place we have had to get a private siding from the Railway people, in connection with which we had a huge amount of difficulty with the Department before they would move. It cost us £250. The Department allows you to pay for it, but when you are done with it they will not permit you to take the rails away. So the whole of that amount has to be written off. They charge us rent for the stacking-accommodation. I think these are the chief items that have gone to increase the cost. One thing that I want to lay special emphasis on is that the Government should be induced to grant extended areas to sawmillers, which would give a longer life. We do not care in the least how many acres we get. We merely want a certain life for a certain mill, because if we get a long life we can reduce the cost. Depreciation is a big item We have to put up accommodation for the workmen, construct mill, shed, stables, blacksmith's shop, and moulding-sheds. These things are worth nothing after the area is cut out. Sometimes they rot, and sometimes the settlers offer us a trifle for them. On Saturday, whilst listening to the evidence, I noticed that the question of conserving our forests down here was discussed. I would like to point out that the sawmiller is benefiting the country, because unless the mill goes ahead of settlement the settler must cut down the bush and burn it. In the absence of the miller, and if we wish to settle the land, the timber must be burned down altogether. Some of the finest bush in Southland has been destroyed by the settlers. I remonstrated with them, and they replied, "What can we do? We must live." We have got a good deal of bush from settlers, and they are only too glad to sell it. Immediately they get the money they put it into improvements. At one time here the Commissioner of Crown Lands would not allow a settler to sell his timber, but he could burn it. I made representations to Wellington on the subject: they saw the absurdity of the position, and either the law or the regulations were altered in that respect. Since then we have had no trouble, and the Commissioner of Crown Lands grants us a good title. We pointed out to him the benefit it would be to the settler and to settlement to have the sawmiller cut off the big timber instead of the settler sending it up in smoke. It would be absurd to try to conserve our bush here at the present time, because we cannot live without the farmer, who is the backbone of the country. To have the farmer cultivating his land, producing crops from year to year and increasing the value of his land, is surely better than to lock up that bush for an indefinite time. The bush must be sold some time, and if we can import timber now we can do so just as well ten or twenty years hence. I say, use the timber you have and let the farmer get on to the land. Then there is the question of sleepers, of which there is an immense quantity coming into this country. I can supply any quantity of them. I would like to get an

order for 10,000 kamahi sleepers. This wood ranks amongst the best of sleepers, and there was a great quantity of this timber at Seaward Bush. It would pay the whole of the Dominion better to use our own timbers for railway sleepers rather than to import them even if they are not quite so durable. We are all prepared to admit that probably jarrah is a better-standing timber, but every penny paid for jarrah goes out of the country. So also in respect to Oregon, which can be laid down here at a cheaper price than we can produce red-pine for; but we should not forget that every penny paid for Oregon goes to another country, and it can be shown that more than half the cost of the production of red-pine goes to labour here. Indeed, I should say the bulk of it goes to labour in some form or other. Surely that is for the benefit of the country. The production of timber here benefits the farmer in the way of horse-feed, whilst it employs all forms of labour, either directly or indirectly. As to the figures supplied regarding the cost of production, I have checked them with ours, and I find the evidence given by Mr. Massey in this respect fairly correct. I have some trollying that costs me 3d., and I have some that costs me 2s. 6d., so that it is difficult to give an average. Mr. Massey, however, was very correct in his figures—as an average he was near the mark. If the Commission would like any information with regard to the association, I shall be glad to give it, as I am the chairman. In that connection I should like to say that this is a complete list of all the mills working in Otago and Southland. They were cited before the Arbitration Court. There are fifty-two millers, and only thirteen of these are in the association. These were cited before the Arbitration Court on the 2nd September, 1908. [Copy of the award handed in to the Commission.]

2. *Mr. Field.*] We heard there were seventy-odd mills?—Some have more than one. There are only thirteen millers in the association, but they have more than thirteen mills. The association was formed to arrange for uniformity of price; but the price is merely a standard, more than anything else, just as they have in ironmongery establishments. I am honest in telling you that we get as high a price for our timber as we can, and I would be quite willing to take a shilling more if it were possible to get it. The price, however, has decreased since the association was formed, owing to trade discounts. The builders get from 5 per cent. up to 17½ per cent. All builders get a trade discount. We make no distinction whatever, and the members of the association will supply to any one no matter who they are or what they are. If a farmer comes for timber to build a house he gets it at wholesale price (no trade discount), but less 2½ per cent. cash discount.

3. *Hon. the Chairman.*] What discount would the farmer get?—The farmer would get no discount, because he is not in trade.

4. *Mr. Jennings.*] Have you building societies here?—Yes, but we do not deal with them at all.

5. If a member of a building society wanted to build, would he get from you the same as a farmer?—A building-society man would have to pay the list price. We only give a discount to the trade. We recognise that a builder should get some concessions. The merchant gets a greater discount because he has to cart and stack it. We allow a discount for cash to every one, the farmer included. The farmer very often lives close to the mill, and if he does so he can back his cart in and take it away at wholesale price. Very often, however, there is some timber about the mill that is not first-class, and when the farmer comes along he will ask, "How much do you want for that?" and he is very often enabled to take it away at a very great reduction. I am satisfied that the tightness of money is the chief factor in the present depression. When money is tight the building trade falls away, and then there is overproduction. The mills have increased very largely in number, although when things were good there was plenty for them to do. I would like to point out how the present condition of things affects the cost of production. The cost of production goes up with the slackness of trade, and the reason is that we have to reduce our output. After Christmas we held a second meeting, and it was arranged that we should all reduce our production, because we had no orders. It was reduced by one-third. It is much cheaper to work a mill full-handed than with reduced hands—that is, proportionately cheaper. The trollyman, for example, has to attend to his horses whether he is idle or working, and his pay remains. Also rents and other charges run on. These are the chief factors which go to show how the cost of timber has gone up steadily. We are in hopes that the demand will increase a bit now that the harvest is over. As far as I am personally concerned, I do not think we have any reason to fear a slump of long duration. I think we shall get out of our troubles soon, and meantime, when there is depression on, as there is, the best way to meet it is by public and private economy. If I were asked, as a sawmiller only, how to meet the depression I would say, "Borrow two or three million," because that would give us temporary relief; but if I was asked as a citizen of the Dominion, I would say that borrowing in such a case was not a wise course. I do not believe in borrowing in the colony, because I fancy that a good deal of the depression is in consequence of borrowing in the colony. The money that would have been lent to trade and business concerns has been borrowed, and it is not available. The private man cannot go to the London market the same as a Government can.

6. *The Chairman.*] I see here that the discount allowed Timaru is less than that allowed to Ashburton and Geraldine?—Yes, that is so. The reason for that is, we have to arrange our discounts according to competition to a great extent. Timaru is a seaport town. When the Government make a concession in railage the customer reaps all the benefit, and not the sawmiller. We naturally want to make as large a market as we can for our timber.

7. And there is a seaport at Oamaru, too?—But Oamaru is a free port for merchants—we do not do much there. McCallum and Co. have a yard there.

8. They really do most of the trade?—Yes. You will notice on the discount-list that the further we get from Invercargill the higher the discount. That equalises the railage, but they do not get the timber cheaper. In fact, I do not suppose any one would get it cheaper than Invercargill.

9. *Mr. Field.* You meet them a little way to equalise the railage?—Yes. There is no doubt we sell timber at a loss sometimes, but the other places make up for it.

10. *Mr. Hanan.*] What would you say would be the difference in the cost of production per hundred feet between level and hilly country?—From about 1s. 6d. to 2s.: it depends on the hilly country.

11. The nearest mill in cut bush in Southland is how far situated from Invercargill?—It is a good distance from where the actual mill is cutting.

12. I should say the bush where they are cutting. I want to get at how far they have cut out in the radius from Invercargill?—I should say within twenty miles, at any rate.

13. What percentage of the Southland mills is sold here, and what percentage goes out of the district?—That is a difficult question. By far the greater output goes out of Southland—there is no doubt about that.

14. Would you say 75 per cent.?—I should say quite that.

15. Have you any information as to the railway returns?—Am I correct in saying that the output of the Southland mills, according to the railway returns, was for the year to 31st March, 1904, 29,443,500 ft.; 1905, 29,364,300 ft.; 1906, 28,244,250 ft.; 1907, 27,805,950 ft.; 1908, 27,520,100 ft., showing a falling off since 1904 of two million feet?—I am satisfied that is correct, because I looked that up the last time the Arbitration Court was sitting here.

16. And notwithstanding the production has been falling off there has been a substantial increase in the number of mills?—Mills have increased and the production has decreased.

17. Do you know anything about the conditions of the working on the West Coast?—Well, no. I have been through the West Coast mills, but I have not made a special study of them. I have seen them working.

18. You have seen a good deal of the machinery used in the sawmilling?—Yes, throughout New Zealand.

19. So far as being up to date in advanced principles, how do you compare in Southland?—I am quite satisfied we are equal to anything in the Dominion. I have learned nothing. They have some different methods, but the question is whether there is any advance.

20. Now, in regard to the size and quality of the bush here as compared with places in the North Island, what is the position?—The bush here is very inferior in quantity to what it is in the North Island, and also on the West Coast. The West Coast carries far more timber to the acre.

21. Well, am I right in saying that your machinery is as good as that which obtains elsewhere?—Yes.

22. But so far as the bush and quality is concerned, it is better elsewhere than in Southland?—It is better elsewhere.

23. Am I also right in saying that in so far as Southland is concerned the rate of wages paid is better than in other parts?—I cannot answer for that. I think they are as high, and probably higher, bacause, although we have an award, we pay a higher wage than the award provides for. We have never stuck to the award at all: we have always given good men the highest wage we can.

24. Have you formed any opinion as to what percentage of the number of mills in Southland there are compared to the bush areas not worked out?—When you say the number of areas not worked out you mean not touched at all.

25. Yes. In other words, how many mills have we now?—We have got seventy mills now.

26. Are they likely to increase?—You mean, are there seventy mills untouched?

27. Yes?—That would be impossible to say, because there is a lot of bush not opened up at all. Take Waiau District: there is a lot of bush over there which may be opened some day. We are told about the illimitable bush in the Catlin's District. I cannot say from personal knowledge, but I have heard statements made that there is enough timber there to last seventy years.

28. But they want the railway?—Yes.

29. Now, comparing the price of Oregon with the price of red-pine in Southland, what is the position?—Oregon does not come into competition in Southland, but it does come into competition in Dunedin, which is one of Southland's best markets.

30. Do you know anything about the quality of Oregon timber?—Oregon is more durable than red-pine.

31. What is the Oregon used for mostly?—For large beams chiefly. It is lighter than red-pine to handle, and stronger. Contractors much prefer to use it for heavy beams.

32. Does it shrink?—No, it is very light and durable.

33. It is used very largely for door-sashes and window-sashes?—Yes, very largely for that, and I have also seen it used for scantlings in houses. I have been told by our representative that he has seen a number of houses in which it is used for scantlings, and it is supplanting red-pine.

34. For certain purposes you would say we cannot very well do without Oregon pine?—Certainly—we must have it for some purposes.

35. It is desirable to have it for certain purposes?—Yes.

36. Do you suggest an increased duty on Oregon pine?—It would certainly be an advantage to the sawmiller.

37. But take it from a national standpoint?—Yes, from a national standpoint I think it would be an advantage, and for this reason: that if by increasing the duty we can stimulate our own industry, then we are spending more money in producing more of our own article, in wages, and in having more artisans and workers, and there would be more settlement.

38. But are you not increasing the price of the building to the worker who wants timber?—To a very small extent. A workman's home as a rule is a five-roomed house which takes about 15,000 ft., and at 1s. a hundred feet that only amounts to £7 10s., and timber cannot come down more than that. It is a very small item.

39. From 1901 am I correct in saying that the millers' prices have increased by something like 300 per cent.?—Certainly not.

40. Well, 30 per cent.?—No, not even that.

41. Well, what percentage?—I should think about 20 per cent., although I am not quite certain what the prices were in 1901. I should say about 25 per cent.

42. As regards the wages of the workers, what has been the increase since 1901?—The wages of the workmen have gone up about 15 per cent. I should say 20 per cent. probably, because we are giving more than the award.

43. At what mill do you pay the highest wages in Southland?—No mill pays higher than another that I know of.

44. What price did you pay for bush that you have bought from private persons within the last five years?—We pay equal to the Government royalty of 6d. It comes to about £1 15s. an acre. We generally estimate it on the quantity.

45. Do you find it difficult to obtain bush?—Yes, very great. It is very very difficult to get bush now.

46. Something has been said in regard to increasing the areas of bush—what is your opinion on that point?—I think it is most important from the sawmillers' point of view. We cannot get enough area, and we should have at least from 1,200 to 1,500 acres, instead of 800. They really want double the area, or more than that.

47. Are you aware of any reason that is likely to increase the price of timber?—I am sorry to say it is the other way about. In fact, the tendency has been to reduce it. The prices have been reduced since the last price-list came out.

48. As regards the wages of the men, would you say the tendency would be the same?—It should be so, of course. That should follow suit, there is no doubt about that.

49. *Mr. Jennings.*] What is the length of the lease granted by the Crown to the sawmillers in this district?—Two years for every 200 acres.

50. That is the time given for cutting it?—Yes.

51. Then does it revert back to the Crown?—Yes.

52. Who re-lease it again or sell to the farmer?—Yes. The sawmiller has no right at all to the land. He has a surface right only to remove timber during a specified time.

53. You never sublease?—No.

54. Have you any knowledge of the amount of bush that has been destroyed by fire?—No, it is impossible to get a record of that. I have been through great quantities of it

55. You have seen where the timber has been destroyed?—It is visible to-day—beautiful logs charred up and destroyed.

56. *Mr. Field.*] We have heard a great deal at Riverton and also here about the loss some millers were being put to on account of the duty of 2s. 6d. on beech timber in Australia: will you give us your opinion on that?—There is no doubt it is a real grievance. From the point of view of the sawmillers it would be very advisable if reciprocity could be arranged with the Federal Government; but from the point of view of the Dominion it seems to me we should lose by it.

57. The fact remains that a number of mills have been built for the purpose of pushing this trade, and they are now idle?—Yes, it is a serious hardship for them. I think they have built these mills on the understanding that they were sure of a market for birch.

58. What do you say about beech for the purpose of manufacturing furniture?—It is a splendid thing.

59. Does it take the grain and polish?—Yes, a beautiful polish.

60. Assuming this trade with Australia ceases, what is going to become of this beech timber?—It seems to me to be absolutely useless. It will probably be burnt and the ground cleared.

61. Except for the small quantity used here?—Yes, for broom-handles; but the demand is very small. It would mean a big loss.

62. You say you were paying about £1 15s. per acre for timber—you are buying timber only?—Yes, timber only.

63. How many feet to the acre is such land as that?—Say, about 6,000 probably, or slightly over. It varies, sometimes only 4,000. We have bought it from 10s. up to a few years ago. Say, from £1 5s. to £1 15s.

64. How is it that the association here does not rule the prices for timber in this part of the country?—They cannot.

65. From that we are to understand that the competition from outside is keeping the prices down?—Yes, competition from our own millers themselves, and also from outside. There is a heap of competition.

66. Even if more mills joined the association, would it be possible to fix the prices?—No.

67. Have you had any experience of Oregon pine?—Very little. We have never dealt in it at all. I have seen it in the yards and in buildings.

68. It does not affect you seriously here?—Yes, it does most decidedly. I have just returned from up north, and the question I asked our representative was why he did not get more orders, and he gave the reason that the Oregon was the cause of it, and that if the Oregon was not here the red-pine would have been used.

69. What is the indication—that Oregon is on the increase or decrease?—On the increase.

70. Do you know as to whether the supply is very large and inexhaustible?—Only from hearsay. I have been told it is inexhaustible.

71. Assuming that Oregon pine largely supplants our timber, what is going to be the result to our rimu-timber bush?—Then we cannot afford to cut our timber, and it would have to be destroyed, because I presume the land would have to be cleared. In twenty years' time Oregon may be just as cheap as it is now.

72. What would you say as a practical business man, assuming you had an area covered with rimu timber which was not capable of being felled at a payable price and you wanted the land for farming?—Undoubtedly, I should burn it.

73. Do you think that would be the result with the whole of the privately owned land?—Absolutely no doubt at all.

74. What is to become of the sawmillers' capital put into this class of bush?—Absolutely lost.

75. What about the men employed in the mill?—They would have to find work elsewhere or emigrate.

76. Would you consider the loss to the railways heavy also?—Most decidedly. That is a very big factor. All the timber produced here is carried by our railways, and they make a good profit on it, and I understand some lines here pay chiefly on that account, such as the Orepuki line. All the other timber goes by vessels.

77. There is the further factor that the money goes out of the country?—Yes, that is another big factor.

78. How do you compare the cost of ordinary-building rimu and ordinary-building Oregon pine as landed, say, in Dunedin?—I saw a quotation for ordinary Oregon landed in Dunedin of 8s., c.i.f., and there is 2s. duty and 6d. landing-charges, which comes to about 10s. 6d.

79. What could you land rimu in Dunedin at?—About the same price. The cost of rimu, roughly, is about 8s. 3d. to 8s. 6d., and 2s. 10d. railage.

80. Assuming that the Oregon came in by ship at one price and you could put your rimu in at the same price, which would get the market first?—In one way the Oregon, as it is in wider boards and longer lengths, which we cannot look at at the same price.

81. You admit you must have Oregon in long pieces?—Yes.

82. Do you think it would be a fair thing to put a heavier duty on small pieces and lighten the duty on large pieces?—Yes, I think so.

83. How many feet of timber would there be in an ordinary five-roomed workman's cottage?—About 15,000.

84. And an increase of 1s. per hundred would be £7 10s.?—Yes.

85. What proportion does timber bear to the total cost of a house—about one-fifth?—Yes, about that. The timber would come to about £75, and, I suppose, the cottage would cost, say, £350.

86. In regard to the increased cost of building a house, is it only the timber that has increased in price?—No, everything has increased.

87. And at the same ratio as timber?—Yes, I think quite as much, if not more; everything in the house has increased, including labour.

88. The increase in the cost of timber is only a fraction?—It is a mere bagatelle. They talk about a wooden house and think it is all wood, but the wood is a very small proportion.

89. In regard to the timber-merchants in the cities, do you know whether there is any fraud practised on the consuming public by the timber-merchants buying at a certain price a lot of timber and then proceeding to grade it, selling the lower grades at a full price, and the higher grades at too high a rate. Do you know anything about that being done?—No, I do not. When a merchant buys timber it is graded before he buys it: he pays for the first-class or second-class.

90. And, so far as you know, he sells it as it is graded?—Yes.

91. What is a fair advance on price for the timber-merchant to get over the price he pays the sawmiller for the yarding, handling, carting, and so forth?—He would want 20 or 25 per cent. The trouble of the timber is the handling—it is most expensive to handle it. A retailer very often wants it resawn. I have seen a contractor come in and want, say, 18-feets of 4 by 2, and the timber-merchant says, "I have no 18's; I have only 20's," and if the retailer takes them he will only pay the price of the 18's. In some towns there is a great deal of thieving going on in the yards.

92. Splitting by the sun?—Yes. I had some experience in timber-yards some years ago, but not lately. There is a great loss in that way, and 25 per cent. is not an unreasonable profit at all.

93. If a timber merchant paid 10s., he would not be charging too much at 12s. 6d.?—He would not, after having stacked it in his yard.

94. What do you think would be a fair thing for you to get over and above the actual cost of production?—From 2s. 6d. to 3s. would be little enough considering all the risks, and not only that, but we are cutting out our assets all the time.

95. What, as a matter of fact, do you get?—About 1s. 6d. or 1s. 9d. It varies, sometimes going as high as 2s.; but it would never touch 2s. 6d. We cannot look at it as over 1s. 6d. to 1s. 9d.

96. *Mr. Leyland.*] Speaking of wages, and the statement that higher wages are paid here, I suppose you are guided by the award?—I mentioned that it was a difficult question to answer, because so many of the workers get more than is provided under the award.

97. The same obtains all over the country?—Yes, it is difficult to know.

98. A good man is paid good wages?—Exactly.

99. In fact, it is the last thing to economize with a good man?—Yes.

100. Are there any working under the award of the Court?—Yes, I have the award here.

101. That is not an award mutually arranged?—No, that was contested.

102. Speaking of the cost of timber in 1901, do you think that the sawmillers in this district are now getting a larger net profit than in 1901?—I think that they are getting a smaller net profit. The selling-price has increased, but the net profit is not larger.

103. You mentioned that the wages had increased 15 per cent., but the cost of everything else in connection with the mills had also increased?—Largely.

104. So that if the selling-price has increased 25 per cent., the cost of production has also increased 25 per cent.?—More than that.

105. With reference to the importation of Oregon pine, you think the amount will be larger this year?—I am judging by the shipments that are coming in. They seem to be coming in much more frequently than a year ago.

106. But the shipments are for orders that were given months ago, before the depression set in. They are not likely to be repeated?—No, the depression would have the effect of reducing them.

107. As a matter of fact many merchants are trying to get out of their obligations. The banks are holding about 1,500,000 ft. now in Wellington, and timber-merchants are unable to meet their obligations?—Yes.

108. Do you not think that the depression that has affected the rimu will affect Oregon pine?—It should.

109. And that Oregon-pine owners have a drug in the market just like the others?—Yes.

110. We have been fixing up giants in order to knock them down as far as Oregon pine is concerned?—I said that the general opinion was that when a general depression comes it will affect red-pine as well as roof-iron and everything else in connection with the building trade.

111. But the impression was conveyed that Oregon pine was being brought in in larger shipments?—What I intended to convey was that Oregon pine had been increasing all the time.

112. There was an exceptionally low rate from America, and now that that has been altered it will probably be prohibitive?—Yes.

113. Now, with reference to grading, is it not a fact that the timber-merchant loses in the grading? He buys at one rate and has to sell at a lower?—It depreciates in the yard, but when he buys he gets the grade he buys.

114. But he frequently finds timber that should be graded a little lower?—Still, if he were a smart man he would reject it straight away.

115. If he has not got the grading he has asked for he loses?—Exactly.

116. In making out the estimates of the cost of production the item "Insurance" appears, but that only refers to sawn stocks in the mill?—To insurance on the mill plant also.

117. It does not refer to standing timber in the bush?—No, we cannot insure that, yet it is a very important item.

118. *Mr. Clarke.*] There is one little matter that wants clearing up: With regard to increased cost in the price of production, you said the increase in the value of a house was a mere bagatelle. Can you tell us to what extent the selling-price has increased in the last twenty years? What was the price then and now?—That was before my time. I think Mr. Massey answered that. I was not in the timber business twenty years ago, and I could only speak from hearsay. It has fluctuated a good deal during that time—sometimes up and sometimes down.

119. You said that the cost of labour had gone up 15 or 20 per cent. since 1901?—Yes.

120. Then, as labour has been estimated to have increased about 15 per cent. in the cost of production, only the increase in the price equal to 15 per cent. must be put down to increased cost of labour?—I do not think that was said.

121. Assuming the statement was correct that 50 per cent. of the cost of the timber landed on the trucks is for labour: if labour has gone up 15 per cent., then has your price increased by that amount only during that time, or have the prices increased by more than 15 per cent. during that time?—Yes, the cost of the timber has increased, and wages is one of the factors; but fully half the cost is outside labour altogether. We will say one-half for practical purposes, and one-half for other charges. If labour has gone up 15 per cent., other charges have gone up, too. What I would like to show is this: that, although wages have gone up 15 per cent., it does not follow that wages are only 15 per cent. more than then, because the country is so very much rougher that more men have to be employed. If you could get ten men to produce a certain quantity ten years ago, it might take fifteen men now to produce the same quantity at higher wages.

122. With regard to the proposed increase of area, that is a very important matter for Southland?—It is very important for Southland.

123. Would not that have a tendency to reduce competition and therefore to place existing holders more in the position of commanding the situation?—I do not think so. It would encourage sawmillers to put up better plants. What we want is, when the depression is on, to produce as cheaply as possible, and if we can get larger areas we can put up better plant.

124. You instanced the case of a tramway that cost £1,200 that you would be glad to sell for 2s. 6d. I presume you have allowed for all that under depreciation?—Yes, we allowed for all that.

125. With regard to the question of the conservation of timber, your evidence amounts to this: that it would be the best thing to clear the bush?—Most decidedly.

126. If that were carried to its logical conclusion it would mean all the bush. Have you considered what the effect would be on your own business if we cleared off the bush?—Yes.

127. Would there be any sawmilling in New Zealand in twenty-five years? There would be no bush to cut?—We could import Oregon. We have a splendid farming community to follow on the sawmilling.

128. Then, in fact, the policy advocated there would be to hurry on to a finish?—You might just as well say that gold-mining would stop the production of gold because it would work out the mines very soon, and there would be nothing for the miners to do.

129. *Mr. Morris.*] What basis would you work upon in asking for an increased area for the millers? Would it be on the increased cost of the mill or horse-power?—On the life of the mill. If you put up a small mill that could only cut 2,000 ft. a day, I would give it a very much smaller area than the mill that would cut a very much larger amount.

130. Probably that is regulated by the demand?—Probably. That is another matter. With the present regulations a man can put up a little mill costing £200 or £300 and he will have the

same area as a miller whose mill cost £2,000 or £3,000. That is the point I put to the Commissioner of Crown Lands. The small miller can hold the same as the man working on a business-like system. It seems very unfair that the small mill should hold the same area as the large one. But I would limit the area that any miller could hold to a certain number of acres. For instance, I would not allow a man to hold 10,000 acres. I would limit it to, say, 1,500 acres.

131. *Mr. Jennings.*] It is only the Maoris who can give unlimited areas?—That is so. As it is now, the life of a mill is too short. It is only five or six years. I had a mill working on 1,600 acres, and it cut it out in that time. Owing to the configuration of the country it is impossible to know what the life of a mill is. There is no land surveyed, and you often find places that you cannot work by reason of their inaccessibility. It would cost 9s. or 10s. to produce the timber at all.

132. *Mr. Morris.*] Do you think 1,500 acres would be enough for a mill that would cost £5,000?—I am sure it would not be.

133. You are satisfied that the miller would never recoup himself?—I am certain he would not be able to.

134. Are there mills that cost that much?—Yes, but they were erected when there were larger areas—private bush and larger Crown areas, and they were able to secure both.

135. Do you not think it would be better to grant an area according to the money expended?—That is practically what I suggested; but there ought to be a limit: I think there should be a maximum area.

136. You mentioned in your evidence that Oregon was more durable than red-pine?—Yes.

137. Have you had experience of that?—I have seen it in buildings, and it seems to be a very sound timber, and to stand better than the red-pine.

138. Have you had any experience of red-pine in buildings exposed to the weather?—It all depends upon when it was cut. If it is cut in the winter it will last, but, unfortuntely, a great deal of it is cut in the summer, and gets dry-rot. The advantage of Oregon is that it all comes here seasoned.

139. *Mr. Mander.*] Is it all cut in the winter, too?—I do not think so.

140. *Mr. Morris.*] I do not think your experience is the same as that of the country it comes from. They only give it a life of four years?—I have seen it here for over four years: that is our own experience.

141. You can obtain that information from the Canadian Handbook?—We know that that is not correct. If it were correct, I would be very glad to have that fact advertised.

142. Do you not think that the increased cost of building is largely due to the improved style of the buildings erected recently compared with the buildings of twenty years ago?—Of course there is no doubt about that.

143. Has not our style of architecture improved in the last few years?—Take two buildings of similar construction, and at a rise of 1s. per 100 ft., it would be an increase of £7 10s. in that house.

144. As a matter of fact, your reply is altogether on the question of rough timber used in the building?—Yes.

145. I suppose to-day there is five times as much fine work put into buildings?—There is very much more. Mouldings were conspicuous by their absence in the old days.

146. *Mr. Barber.*] How long has the depression been experienced?—It has been experienced now for, I suppose, nine months at least. It has been coming all the time, but seems to be more acute now than before. We do not feel the depression in the timber trade immediately, but it is when we accumulate stocks and they become unsaleable that the depression is felt.

147. You think it has come on simultaneously with the financial depression?—I think there is no doubt about that.

148. Would you be surprised to hear that people with capital say they refrain from spending on account of the very high price of timber?—I should be very much surprised to hear it. I have made inquiry from business people and solicitors lending money—that is the best criterion—and I would take that a long way before a newspaper report.

149. With regard to arriving at the retail price, you have not told us that?—The average price is, I think, about 10s., taken all the way round.

150. If you were selling it, is that after being stacked in the yard or straight from the mill?—Straight from the mill.

151. Your secretary said 8s. 6d. for providing the cost of production and interest on the capital?—Yes, about that.

152. So that if you are getting 10s. at the mill you are getting 1s. 6d. over and above the outlay?—That is an estimate. Of course, every mill varies. You have got two or three mills, and every one is different. As far as we are concerned, we are getting about 1s. 9d. without interest. We do not charge them any interest at all. There are really no solely-timber merchants in Invercargill. All the timber-yards here are owned by people who have mills of their own, and they combine both the occupations of timber millers and merchants. We ran a yard here for some years, and I closed it up because we were losing money on it.

153. Does any one want red-pine run up to £1 6s. a hundred feet?—I am sorry to say No.

154. Do you think that is an exorbitant price for red-pine?—I could not tell you, because I have no idea what it costs in Wellington. They may have to grade it there.

155. Could you deliver red-pine in Wellington?—What size?

156. 4 by 10 by 1, all heart?—I could not supply it at all. It takes the best of our log.

157. You do not think £1 6s. per hundred feet is too dear?—Very likely not. It is a very special timber, and takes very special getting.

158. What about 8 by 1 ordinary building-timber?—I could supply that a great deal under £1 6s., and would be very glad to get an order for it.

159. Would you think 18s. an exorbitant price for it?—Of course, I do not know anything about the Wellington market. It seems a very good price, but they have to store and grade it. If they are selling it for that I do not see how it is, seeing it is such an open port, and there is such competition; but I do not know anything about Wellington.

160. You said that 1s. per hundred feet in the price of timber would mean a difference of about £7 10s, in a small cottage?—Yes.

161. Considering that it has gone up over 100 per cent., the cost in the erection of a building is very considerable?—It has gone up very little here. If it has gone up that much in Wellington it is news to me.

162. That is one reason why the argument has gone out, because timber has increased the cost of building, you cannot calculate it on a building?—You can here. I do not know anything about Wellington.

163. *Mr. Field.*] These are timber-merchants' prices?—I can only say if the timber people can get these prices they are in a very fortunate position, if the cost is no greater than ours. Is not that subject to a trade discount?

164. Only a very small discount?—Do they deliver at that price?

165. No?—I am not aware of any of these figures, so I cannot answer that question.

166. With regard to timber-milling in this district, how many men are employed?—It all depends. Say, an average of twenty men to a mill. I suppose that would be the average, and there are about seventy mills.

167. If this land were used for farming, it would not employ as many?—Twenty men to 600 acres?

168. Not small farms?—But they would be small farms. A farmer would never employ anything like that. An ordinary farm, I suppose, of 600 acres would employ half a dozen, except at harvesting.

169. The bush area is pretty well taken up in this district, according to the Crown Lands Report?—The open bush is taken up, but there is a lot not taken up.

170. If the area allowed to timber-millers is increased, as has been suggested, by a very large number of acres, is that not likely to create a monopoly, considering there is such a small area of timber land available in this district?—No. The position now is that millers are compelled to take up two or three acres, and they have therefore to put a mill on each.

171. Under existing conditions an individual can get more than 600 acres?—Yes. You can take up another area—that is, three or four people in partnership can each take up a separate area.

172. I do not quite understand?—Suppose I am in partnership with two other men, each may obtain 600 acres, and work it as a partnership. The rules and regulations compel you to put up a mill on each of them. We want to produce timber cheaper, and that is against us. Our mill would be quite sufficient for the 1,800 acres. What is going on is an entire waste of capital.

173. If you did that, the area would last longer?—Yes.

174. You would postpone agriculture for a number of years?—Yes.

175. You say that you would not conserve the forests?—Yes. It is all a question of demand in the matter of timber.

176. You want the life of the mill extended?—Yes, to make cost of production cheaper.

177. You are delaying the time in which that land would be brought into profitable occupation for farmers?—No, not at all.

178. You delay it for fourteen years?—Only that particular area. If the demand in any year is ten million, whether you cut that ten million with twenty mills or one mill is immaterial from a point of settlement, because you are not delaying the land being opened up. You can only cut the amount of the demand. It does not matter how many mills you cut it with, for the reason the quantity of timber taken off is exactly the same.

179. *Mr. Ell.*] You say you are opposed, as a matter of public policy, to have any forest reserves at all?—Yes.

180. Then, you consider all the other countries of the world, ages older than this, are entirely wrong in their policy of providing national forest reserves as a constant supply of timber for local needs?—I think other countries are in a different position to us. We are a young country. We want to turn our assets into cash. Put the cash into the land, which has the effect of increasing our national assets.

181. But you said just now, in answer to Mr. Field, that if there was not a market for, say, a lot of rimu growing in a certain area of land, sooner than wait ten or fifteen years you would burn it?—Certainly I would do so, as a practical man.

182. You would leave the industries of the country entirely upon foreign importation?—Yes, we are doing that now, and, in any case, it is only a question of ten years' time.

183. You urge the destruction of the timber if we cannot use it in ten or fifteen years?—No; I would not urge it from a national standpoint. Personally, from a private standpoint, I would not keep timber for that time as a business man. I would turn the land into profitable use.

184. Then, you do not deny that the State is right in preventing the destruction of valuable timber?—Quite the contrary. I think they are right in conserving it.

185. I entirely agree with you. The policy of the Land Department should be to prevent the destruction of timber?—Most decidedly. I have made many complaints about farmers destroying timber.

186. Such a policy of destruction has been a national loss?—Yes.

187. With regard to kamahi, you say that it is good for sleepers?—Yes.

188. Can you give me any idea of its life?—I understand the Railway people regard it as satisfactory.

189. I examined some of these trees in the bush, and I was told that it was useless for ordinary building purposes?—That is so. It is good enough cut in short lengths for sleepers. It is very good. There are great quantities of it, and it would provide for a good deal of labour. Although it is not illimitable, we are always coming across it.

190. With regard to the time allowed in the matter of timber areas, if you take up, say, 600 acres, are you allowed two years if the market should be glutted and you have no sale?—The Lands Department have discretionary power. They do not turn you out of the mill. They have power to do it, but they have not done so. They are very reasonable. We have no complaint.

191. With regard to land covered with timber and put into the hands of settlers beyond your mills, is that a policy carried out in your district?—Yes, it has been carried out for a long time past. It is still being carried out.

192. You say that land containing timber is placed in the hands of settlers, and they have no option but to destroy it?—Yes, up to quite recently. It may be so now, but I do not know. I consider it wasteful in the extreme.

193. When you have secured land from settlers for the mill, have you found the Lands Department reasonable?—The limit the Department gives us is ten years. That is time enough in some cases; but if you want to look ahead it is not sufficient, because the farmer may want to sell, requiring the money to buy cattle, and the mill might not actually want the timber for a considerable time.

194. If it means ten years before the timber can be cut off the land, would it not be better to retain that land rather than give it to the settlers for farming purposes?—Yes, certainly.

195. With regard to beech, we have considerable quantities of it, and it is used for furniture-making in Germany?—Yes.

196. Has it been used for any other purposes?—I cannot say.

197. Some time ago I asked an experienced builder in Christchurch to tell me the cost of building a four-roomed house, including scullery, 12 by 12 passage, and 12 ft. stud, based on the price-list of 1897 and 1907, and I was supplied with the following particulars, and I want to know if you consider it a fair valuation: 1897, match-lined, £79 16s.; 1907, £91 14s. If rough-lined in 1897 cost £72 18s., and in 1907 £84 3s., in your experience, as a supplier of timber, what do you think of the difference in the cost?—It seems a big proportion.

198. You told Mr. Leyland that the Oregon found a ready market because it was of wider boards and of greater length?—No, I did not exactly say that. The question I was asked was, if Oregon could be laid down at the same price as red-pine the competition would not be so great. I answered that Oregon had wide boards, although the prices were the same.

199. I have here a statement of Mr. W. H. Bennett, President of the Builders and Contractors' Association, Wellington, in which it is stated with regard to Oregon that 32 ft. lengths cost 19s. 6d., and that rimu of similar lengths cost £1 14s. 3d?—That may be quite correct, because the handling of that rimu is very expensive.

200. In the interests of the building industry of this country, do you think the Commission would be justified in imposing a heavy duty on Oregon?—Yes, on the small sizes.

201. Notwithstanding that it is necessary to our building operations?—I would advocate no increase of duty on the longer lengths.

202. *Mr. Arnold.*] With regard to this importation of Oregon, if an order was required for some heavy timbers now to be seasoned, how long would it be before the millers here could supply red-pine?—Almost at once. The large beams do not require much seasoning. The shrinkage of a beam is in width, and red-pine does not shrink so much in length.

203. You think it is not a fact that in connection with one of the buildings that is now being erected in Invercargill it was found impossible to get this timber within six months, whereas Oregon could be procured at once?—I do not think so. It might possibly be so. It is not to my knowledge. I have been out of town for a fortnight.

204. You spoke of the Catlin's River bush—have you been through it?—I do not know the bush. I only mention it as an example. It has been mentioned that our timber-supply is nearly exhausted.

205. If the timber found in Catlin's was without much birch and chiefly pine, would it not be more valuable?—Yes. That would be the most valuable timber we have.

206. With regard to your association, I suppose you confirm what the secretary said on Saturday: you do not really fix the price of the timber, and you are not a close corporation?—We fix a basis and that is all, and we vary the discounts. We want to get uniformity in selling.

207. You have no penalty?—No, there is none whatever, beyond the moral obligation. There is nothing to hinder any member from retiring to-day.

208. We were told a few moments ago that there is no competition in Wellington. You have it here?—Yes, very strong and very big.

209. I understand you have a builders' association. Is there any relationship?—None whatever. Absolutely none.

210. It has not instructed you with regard to the supply of a certain builder?—There was some proposal which fell through. I do not discriminate in any way. I do not know if my customers are in the association.

211. You do not think any millers here discriminate?—I am sure they do not.

212. *Mr. Stallworthy.*] As regards varying discounts, I am not quite clear about that. What are your discounts?—This list will explain it. [List handed in.]

213. What are the discounts in Invercargill?—Five per cent. and 2½ per cent. for cash.

214. I mean trade discounts?—There is a trade discount allowed to merchants of about 12½ per cent., and there are practically no merchants here. If they call themselves "merchants" they are entitled to 12½ per cent.

215. You mentioned that in laying down a siding the Railway Department will not allow you to remove your rails after you cease to have further use for the siding: is any use made by the Government of these sidings afterwards—do they become railways?—They probably use them. We had one at Orepuki, and they laughed at me when I asked for the rails. I suppose they used them for shunting purposes. Certainly, the rails would be worth lifting.

216. In view of the depression you stated that both public and private economies should be practised: would that not throw a lot of men out of work?—Not necessarily. I mean, when speaking privately, in the matter of luxury. Of course, a public policy of economy might throw men out of work.

217. Would that not increase the real depression of the country?—On the other hand, by borrowing money we might temporarily relieve the depression, but I do not think it would do any permanent good.

218. You advised from a national point of view the increase of duty on Oregon: are you sure that this would not lead to an increase in price in local timbers?—Quite certain of it—absolutely no chance of local timbers being increased.

219. Taking out the competition of Oregon, you say it would not tend to raise the price of local timber?—All the mills now are working shorthanded. There is too much competition amongst ourselves.

220. You advised the granting of larger areas up to 1,500 acres to a mill on the ground of utility: would it not be advisable to make one area, one management, and that the State?—That is socialism.

221. No. I am asking you the question following on your own lines—one area, one management, and that the State. Is that not the logical sequence of your own proposal?—It is a big question.

222. It is logical?—Yes, there is a certain amount of logic in it.

223. *Mr. Mander.*] Have you seen this list of the cost of production [handing it to the witness]?—Yes, I have seen that. Mr. Massey produced one somewhat similar.

224. Does that item include bank interest only, or interest on capital invested in the concern?—In our case it does not include interest on capital. Our profit, whatever we show, is profit of business without any interest on capital at all.

225. Would you suggest any reduction in railway freights as a means of reducing the price of timber?—I think so. I was a little disappointed in the last reduction. Anything that tends to reduce the cost of timber tends to increase the demand.

226. In estimating the quantity of timber a mill should have, do you not think it would be wiser to base the estimate on quantity rather than on area?—I do. I have always advocated that.

227. Are there not in some cases large areas of land with very little timber on it indeed?—Yes.

228. Consequently a man taking up 600 acres may only get half the quantity?—Yes. We say we want so much timber—we do not care about the land at all.

229. Do you find it more expensive to work scattered timber than timber lying close together? Yes, and in that way it hugely increases the cost.

230. A man holding a large area of scattered timber would find it more expensive?—Yes. I gave you an example of 2s. in the cost of production, and it is all that.

231. Do you find the increased interest on money has hampered you and put up the cost of production to any great extent?—It has put up the cost of the material a good deal, but it has not hampered the sawmillers to any great extent, because it is a cash business to a great extent, but it has no doubt increased the price of commodities.

232. You stated that your sawmills here were quite up to date with the rest of the Dominion?—Yes, the red-pine sawmillers—I am not referring to the large kauri mills—they are in a different position.

233. Do you not think it would save a great deal of sawdust by having finer saws in your mills: not cutting so much with your large circulars?—I do not think the timber is large enough for gang-frames.

234. In some of our mills we have gang-frames in which you put the whole log through, and bring the timber out at the other end in the form of boards, and all that means that a great deal of saving is effected in the sawdust, instead of putting these twin circulars through the log and wasting a quarter of an inch in the cut?—Yes, but in recutting we have a smaller-gauge saw. We go down in gauge to three different grades, and in recutting we have a very fine gauge.

235. Do you find that the introduction of the Oregon into this colony has reduced the price of the timber to the builder?—I do not think so.

236. Do you think it likely that the timber-merchants dealing in other classes of timber will allow the price of Oregon to reduce the price of timbers in New Zealand by the competition?—I do not think they have a say in the matter. Oregon can be imported by any one. It has been imported by those who have nothing to do with timber. Mr. Stead brought a shipment to Christchurch, and he had nothing to do with timber.

237. Do you find that you get the same results from your workmen now that you did fifteen or twenty years ago per hour: do they throw the same energy into their work?—They complain that the work is harder and the bush is harder to work at the present, and I have no doubt it is.

238. Do you find the workmen give the same results per hour as they used to?—No, I do not think they do.

239. That would be an additional cost?—Yes. I gave similar evidence to that before the Arbitration Court not long ago. We have some very good men, but, taking it all through, it takes more men now to produce a similar quantity of timber than it did some years ago. I have no doubt the timber is harder to work.

240. Do you not find that also comes in in putting the timber through the mill?—Yes.

241. Have you any experience at all in regard to Oregon?—I have not dealt at all in Oregon.

242. Do you know if it takes the dry-rot at all?—I have heard so, but I have heard the builders in Dunedin say it stands better than red-pine.

243. You have had a great deal of experience in regard to red-pine?—Yes.

244. How long have you known it to be in a building?—Forty years.

245. And would it be rotten in that time?—No, not if in a good position.

246. I mean inside the building in a dry position?—Yes.

247. *Mr. Field.*] I want to put a price-list into your hands. Mr. Barber referred to the price of 17s. for rimu. Look through that price-list and tell me if you think it is an unreasonable price-list?—How is this timber delivered?

248. Delivered out of the yard.—And subject to trade discounts?

249. *Mr. Barber.*] Yes, there is a very small discount. There is no discount to any one unless they are in the association—the general public have no discount?—Yes. The prices contained in this price-list do not seem to be unreasonable out of the yard, when you consider the expense of the yard. When you consider that it has been railed probably a considerable distance and stacked in the yard, and the loss there, I do not think it is at all unreasonable.

250. Look at the price for Oregon pine in that price-list: do you think the price charged there is a fair price?—Apparently so.

251. According to that you must take the price of 17s. 6d. charged for Oregon pine as a good price?—Yes.

ANDREW BAIN sworn and examined. (No. 6.)

1. *Hon. the Chairman.*] What are you?—Chairman of the Builders' Association.

2. Will you make a statement?—Well, Mr. Chairman and gentlemen, I have been asked to come here as a builder, or, at least, as President of the Builders' Association, and I will be as brief as I possibly can in my remarks. Our principal object, of course, is to oppose any increase in the duty on Oregon pine. That matter has been before two conferences of builders in the Dominion, and in the interests of the general public they consider that if there is to be any change at all it should be in the way of reduction, so far as Southland is concerned. Really, it does not affect Southland very much, because we cannot get Oregon in here at anything like as cheap as they can in the North Island. I do not think there has been any Oregon, or very little, brought in here under, say, about £1 1s., and I think the sawmillers here have very little to fear so far as that price is concerned. There have been various advantages in regard to the Oregon that has been used here as compared with the local timber: it has been principally used for flooring-joists and beams, especially in two- or three-story buildings, where it is much superior and much preferable to the local timber. One reason, of course, is that you get it dry, which you cannot possibly do with the local timber, and I, personally, and others can really get it in large sixes from Melbourne and Sydney quicker than you can from the local mills. One great fault with the local timber for joists is that you get it green from the mills. It is put into the building, and by the time that the contractor gets clear of his job, if the work is defective up above, he is very often called on to do some extra work in regard to some shrinkage. In some cases it will go pretty well an inch—the floor being away from the skirting.

3. End way?—No, sideways. For lath-and-plastering work I believe Oregon is superior. Of course, in long lengths and wide joists it becomes cheaper than what we can get the local timber at, because the present price-list of the local combination is really like a Chinese puzzle. It increases as you get up. As soon as you reach or go over 8 in. it starts to increase on the width, and as soon as you get over 20 ft. in length it starts the other way. If you have a price-list here you will see that for yourselves. I think you have been told that the increase in the price of timber here is only 1s. Well, I have had timber delivered to me, after being carted six miles, at 3s. 9d. per hundred in Invercargill, and better timber than I am paying 10s. 6d. for now.

4. What date?—About twenty years ago, and dressed timber 5s. 9d. and 6s. That used to be the regular price here at one time, and you were not limited to any width or length—from 6s. to 6s. 6d., so that you will see by the difference in the calculations that it means a very large increase during that twenty years. I worked out two lines on a job I have just finished—just for comparison. On the two lines I have used—that is, T. and G. flooring and T. and G. lining—the difference in the cost now and what it was then is £194 more. The total cost at the present time is £338, and I could have got it then for £144, so that on those two lines alone, if you compare the whole building, it must mean a fairly large increase. In regard to the increases in workmen's cottages that you have been told about, they are altogether out of proportion, because I think in the twenty years it has increased pretty well three times the amount you have been told. I think that that has affected the rents a good deal here—the increase in the building-material. They also charge now for the feathers in the T. and G., which they did not do twenty years ago: it is only recently that has been done. I do not know if they could invent any other way of increasing it at all, but there is a price-list here which used to be a general one. [Price-list produced and put in, marked "Exhibit B."]

5. What was that?—In 1889. Rough timber carted, 4s. 3d.; dressed, in all classes, 6d. 3d.; and weatherboards, 5s. 9d.; 8 in. by ½ in. was 3s. 3d., for which they now charge 8s., and I have here various old lists showing that this was not one special quotation. I have had totara carted six miles for 9s. 6d., red-pine scantling 3s. 9d.; T. and G. 4 in. by 1¼ in., 6s.; 4 in. by ⅝ in. T. and G., 5s. 9d.; dressed 8 in. by ¾ in., 5s. 9d.; 13 in. by 1½ in., 10s.; 6 in. architraves, 6s.; margins, 5s. 6d. And I heard it stated here to-day that on account of the class of buildings that were put up now—improved buildings—they cost a good deal more than they did some time ago. Well, my experience is entirely different to that, because the finish inside the majority of the buildings now

is not so good as it used to be. The cornices used to be got here at 4d., 4½d., and 5d. per foot which you have to pay 11d. for now, and so the poor working-man has to dispense with that luxury now. Cavettoes you could get for 2s. 6d. and 3s., and I think they now charge about 10s. for 2 in. and 11s. for 2¼ in., so that the prices have risen very nearly three times above that of twenty years ago, because you will see there are some lines, when you come to wide stuff, that cost a considerable amount. For instance, 12 in. by ½ in. costs 13s. 6d. now, compared with about 5s. and 5s. 9d.; and 12 in. by ¾ in., 15s. 6d.; 16 in. by 1 in., 17s. 6d.; 18 in. by 1 in., 19s.; and 10 in. by 1 in., which was a very small size, 14s. 6d., and then for 2 in. by 1 in. they charge 10s.

6. You are speaking now of rimu?—Yes, that is the principal thing we use here. 20 in. by 1 in. is £1 0s. 6d., and so it goes on. That used to be all supplied here at the same price, about 6s. 6d. In getting timber for a job there was nothing really extra in the way of charges, and at that time you could get lengths up to 24 ft. without any extra charge, and odd lengths for beams at the same price. Then they started increasing and reducing the lengths, and it came down to 22 ft., and if you wanted a 11 ft. stud you were charged for the odd length. The builders, to get over that, used to order at that time 22 ft. and cut them in the centre; but now they cannot do that, because the sawmiller beat them—he limits them to 20 ft., so that they were beaten in every way.

7. Could you give the Commission the difference in the cost of a workman's cottage of five good rooms during that period?—I have not taken that out, but, compared with twenty years ago, I should say there would be a difference of £50 or £60.

8. About £10 a room?—About twenty years ago we reckoned £40 a room, but now you can scarcely do it at £100 a room here. That is, if they are well finished.

9. *Mr. Arnold.*] But could you give the difference in the price of the timber—according to the higher rate of the timber?—I have given you the difference in two lines I have used. Those two lines are in general use on one job I have just done. If I had had time I could have taken out the lot and shown the actual difference.

10. Do I understand you to say that it is £12 per room difference in the price of the timber?—It would be about that.

11. *Mr. Hanan.*] Comparing the prices of timber obtaining to-day with those obtaining in 1901, what do you say would be the percentage of increase?—I do not know exactly what it was at that time; I think it was about 6s. 6d. or 6s. 9d. from memory.

12. And to-day?—It is 10s. 6d. with all increases.

13. Now, in regard to the labour in the building trade, can you give us any idea as to the percentage of increase of wages, comparing 1907–8 with 1901?—So far as the timber branch of it is concerned, there is very little difference.

14. Do you think the wages are as high to-day, or the same as they were ten years ago?—There is probably in some cases a difference of 1s., but with good men they are just about the same.

15. Do you find a difficulty in getting men at the present time?—No, unfortunately not, because there is very little doing at the present time; but twelve months or two years ago there was a difficulty in getting good men.

16. Do you find the men as expert to-day as they were ten years ago?—Well, some of them.

17. Speaking generally, what is your opinion?—I do not think we can get hold of so many good men at the present time.

18. To what do you attribute that?—Well, I think one of the reasons is the awards—at least, that is one of the conclusions I have come to. Of course, you are barred under all the awards from employing youths—you have got to bind them; and there is not room to employ all boys in that way, and it has been the means of forcing a number of youths to tender in the market themselves before they have learned the trade. First of all they tender for small jobs—fencing, and the like, and work up that way. Well, that has really barred any one employing labour from being able to get that class of work. I think it has had that effect.

19. *Mr. Hanan.*] What increases in wages have been made under the Arbitration Court?—Under the award here, of course, the ordinary carpenter gets 10s. per day. Previous to that they were getting 9s.

20. Do you know anything about the effect on the bricklayers?—They have no award here.

21. What are you paying bricklayers here?—Various prices—a good man gets 13s., and a leading man 14s. per day.

22. Painters?—They are under an award.

23. Do you know what their award is?—I do not know exactly what it is.

24. You do not know if the wages have increased in the last ten years for them?—They have, slightly.

25. Plumbers?—They have got no award.

26. What are you paying them?—The plumbing is generally sublet.

27. What are the prices ruling? Would you say they are good? What is the position of the building trade? Is it in a good condition? Is it flourishing or going down?—At the present time it is very quiet.

28. What is that due to?—It is due to the depression, I take it—tightness of money.

29. Do you attribute the falling-off in the building trade to the prices charged for timber?—Well, I cannot exactly say that, although it has a tendency that way in this respect: as the cost of buildings increases, the rents are bound to increase, and that has a tendency to make two families live in the one house.

30. Comparing brick with timber, how do the prices stand in regard to a five-roomed, a four-roomed, or a six-roomed house?—Well, there is very little difference so far as that is concerned here, because a brick house is really a brick shell. It would be about 20 per cent. more.

31. To build in brick than in wood at the present day?—Yes.

32. Can you speak as to the other items as apart from the mere building of the structure—ironmongers' charges—nails, and so forth?—In some lines—in fact, I think most have gone up, but not to the same extent as the timber.

33. Sashes and doors?—They have gone up; they are affected by the timber-rise.

34. What has been the increase?—I could not state the difference in regard to those.

35. Can you state the difference in regard to iron?—Not at the present time. I do not think there would be much difference on what it used to be.

36. Have there been substantial increases made in wages by the Arbitration Court during the last ten years?—Only 1s. per day, so far as we are concerned.

37. In your opinion, was that increase warrantable?—Well, I dare say it is a fair wage; but the question arises that those who are employing men are handicapped to a certain extent: two or three workers go together and tender for a job—it was done by some of those who had been agitating for the award—and employ no labour. Of course, they had an advantage over those under the award, because they were not bound by the award. So far as their own time was concerned, they could work harder and for longer hours, and probably not get any more than we had to pay a man working less time.

38. Has the effect of the award been to make better tradesmen?—I do not think so.

39. Has it had the opposite effect?—It has, so far as I know.

40. *Mr. Arnold.*] If you are going to open up that question, we must have evidence from the employees cited. I do not know how far you are going to extend that.

Hon. the Chairman: I think we shall have to go into the prices.

Mr. Arnold: I shall have to call the evidence of some of the men.

Witness: So far as labour in the cost of production is concerned, I think, so far as my memory serves me, twenty or twenty-two years ago the whole cost of production put on the trucks, let by contract, would be about 2s. 2d. Trollying and all was included. No doubt, if you ask some of the sawmill employees' witnesses, when they are here, they may be able to give you that information.

41. *Mr. Field.*] Covering everything?—The mill that was referred to to-day was four miles distant.

42. *Mr. Hanan.*] But twenty miles from here to where they are cutting?—That is so.

43. Can you give us in the order of importance the causes to which you attribute the increased cost of building in Invercargill or Southland? First, you take the increase in the price of timber?—That has increased very largely.

44. Would that be the main factor?—Yes, that was the first combination that started here.

45. What do we understand by "combination"?—Well, the association.

46. Did increase the price?—Well, the price has gradually raised since the association was formed in 1907. There had been an association in existence a good many years before that, and it was through the formation of that association that the timber rose from 5s. and 6s. per 100 ft. to 10s. 6d. Of course, I believe that at that time there was a bit of a split on, and it was re-formed; and, I suppose, that is the reason why they made a statement that it was formed in 1907. They had a combination before that, and a price agreed, but some of them used certain ways of selling under the price at certain times. At that time some of them found a difference, and there was a split. I remember one particular instance: there was a church job; a company was going to tender for it, and, of course, the sawmillers were working to get the order. The church people were keen to get a donation, and the millers, I believe, told them that they could not give them a reduction, but if they were satisfied that the timber ought to be taken from them that they would give them a good donation. That was one way of getting out of it, and I believe that was the means of breaking up the combination. But they found it a matter of mutual advantage to agree again, and then they rose the timber again.

47. Do you say that the price of timber is too high?—I think it is, personally.

48. Having regard to the rates payable now—having regard to rents, cost of living, and other factors, do you think the cost of building is too high in Invercargill to-day?—Well, if you go into the ordinary building of a cottage here for the purpose of letting, I am satisfied that it would not pay. I have a few cottages myself, but then, of course, I do not build them in the ordinary way that the general public would.

49. What do you mean by quoting in the ordinary way?—I mean employing an architect, getting plans drawn, &c. Of course, what I mean by myself is that I very often have odd lines which I cannot use up in any other way, but even then I can assure you it takes me all my time to make them pay. I have close on a dozen cottages, and to get 7 per cent. out of the buildings, and to pay rates and insurance out of that, I do not think there is much in it for anybody.

50. You have taken the increase of price, first of all, as a main factor: what is the next?—Well, bricks are a little dearer, and the other materials also—lime, and so forth—all have gone up.

51. Where would you put wages? Would you regard that as a small factor?—As a matter of fact, so far as building operations are concerned, working it out at per hundred, you can get very little more now that ten or twenty years ago.

52. *Mr. Jennings.*] Is it fair to contrast the present position, so far as building is concerned, with what existed in 1889 when there was a great depression all over the colony?—I am not contrasting it.

53. You gave us the price in 1889?—Well, I consider about that time. It may have been before that time or after; it was probably before and after.

54. Was there much building going on at all in the year you quote?—More than now—as much any way; I could get more, at all events.

55. That was the time of the exodus?—I know that.

56. There is a Builders' Association here? What is its object?—Well, the principal object of forming it was, of course, to defend the trade in the Arbitration Court when the award was fixed. That was really the reason why it was formed.

57. Not for the purpose of putting up the price?—We cannot possibly do that. I wish we could, the same as the sawmillers have done. We should only be too pleased to do it.

58. You stated that the increase in the cost of timber has gone up to the extent of £12 per room?—Roughly, I should think it would amount to that.

59. That on a seven-roomed house would amount to £84?—That is what it would be.

60. Making a total of £370? There are the outbuildings?—It all depends on the size of the house.

61. I have worked it out?—I reckon about £50 or £60 of an increase in a four- or five-roomed house compared to what it was.

62. *Mr. Field.*] Covering everything?—No, timber only.

63. *Mr. Jennings.*] Timber at that time was 3s. 9d. and 4s. per hundred: have you any idea with regard to cost of chimneys, painting, paperhanging, &c.?—There is a general rise all through.

64. But you were very clear as to the increase in cost of timber?—I have given you two or three lines I recently worked out, and there is a difference of £194 on these two lines alone.

65. *Mr. Field.*] This increase has been apparent for twenty years?—I think the greatest has been in the last ten years.

66. Can you give us an idea in regard to the last eight years?—I think the ruling rate was about 6s. 6d. and 6s. 9d. for rough timber.

67. And now what is it?—10s. 6d.

68. An increase of 4s.?—Yes.

69. How many feet of timber would be in one of those cottages you speak of?—About 16,000 ft. or 17,000 ft.

70. As much as that?—Yes.

71. *Mr. Jennings.*] 20,000 ft. for a seven-roomed house?—It all depends on the size.

72. *Mr. Field.*] And what do you say the difference would be in that class of house for 16,000 ft.?—I think between £50 and £60. I have not gone into it closely, but I should say about £60.

73. An increase of £50 or £60 in a house of that size would show an increase of considerably more than 4s. per 100 ft. in the timber. If the increase was £50 or £60 in a house of that size, it would amount to considerably more than an increase of 4s. per 100 ft.?—It is an increase of from 3s. 9d. to 10s. 6d.

74. You speak of twenty years ago?—Yes, I am quoting from 3s. 9d. time.

75. But the increase in the cost of the building, if the increase of timber has only been 4s. per 100 ft., could not be £50 or £60 on such a building as I have mentioned?—Of course not.

76. In the last eight years it would be less—something like £32?—Just about half the money.

77. We desire our figures to be directed very largely to the occurrences of the last seven or eight years. That is why I mentioned eight years, and the sawmillers have mentioned eight years?—That would be the increase here during that time.

78. Does your Building Association get any more discounts than an outside builder?—No, just the same. As a matter of fact, it is only since this last rise that we got that discount.

79. We have had it in evidence that it costs something like 8s. 6d. per 100 ft. to produce this timber?—Yes.

80. Do you think, in view of the cost being that amount, the 10s. 6d. is an exorbitant price to ask?—It all depends on how they work it out. To my mind, it seems a fair profit on the rough timber. Then you have got to consider the dressed lines. There is an enormous increase in them and the mouldings, which must bring them considerably more profit, to my mind.

81. Taking the rough timber only, and the cost of production, do you think 2s. per 100 ft. will be too much profit?—I take it from the evidence given that the 8s. 6d. per 100 ft. covers depreciation and everything else. The other was fair.

82. No, it did not represent the interest on capital?—I understood it did

83. We had the evidence of the last witness?—He said his firm in a general way.

84. I think you will find that there is no intention whatever of suggesting that this figure covers interest on capital?—What does the 4s. 6d. cover? That leaves 4s. 6d. to them.

85. Look over that list and see?—I am not a sawmiller.

86. At any rate we have sworn evidence that the cost of production is 8s. 6d, and that it does not cover interest on capital. Two shillings includes interest on capital. That is their profit. Would that be too much?—I do not think it would be if the other lines were cheaper.

87. Did you say that Oregon was a better timber than our rimu?—I did not say so, but I think it is.

88. More durable?—Yes.

89. Can it be used for all purposes?—I do not think it can.

90. For what can it not be used?—It would not do so well for some finishing work.

91. Would you agree with this statement by the chairman of the Wellington Builders' Association in a deputation to the Government some time ago, that Oregon was not suitable for work exposed to the weather?—I have not had experience. We do not use very much of it.

92. You do not use much of it?—Not for certain classes of work.

93. We have had it in evidence that it costs to put Oregon in Dunedin—to land it in the yard—about 10s.?—Not quite so low as that, I think.

94. We had it in evidence from witnesses that on board ship it costs 7s. 9d. per 100 ft.—some said a little less or a little more, but 7s. 9d. seemed quite certain. You have got to pay 2s. duty;—that brings it to 9s. 9d.; but there is some 6d. or so cartage and wharfage that brings it up to 10s. 3d.?—These figures are right.

95. *Mr. Leyland.*] Wharfage alone is 6d.?—I do not suppose I could put into the yard at less than 12s.

96. *Mr. Field.*] We had it in evidence that you could land it at something like 11s., and that you could put ordinary building rimu in Dunedin at about the same price—rather less, 6d. or 1s. less?—I do not think you could if they charge the same as we are being charged here.

97. Apparently there is not more than 1s. difference between the cost of landing Oregon and rimu in Dunedin?—I do not suppose there is.

98. Would you think that Oregon is worth 1s. per hundred more than rimu taken all through?—It is worth more than that for certain classes of work, even for joisting. You can do with one-third less in size for strength, which reduces the cost.

99. Of course, we all admit we must have Oregon here in large sizes, but, putting the two side by side, you say there is more than 1s. difference between them?—For certain classes of general work, I should say it would pay a builder to give more than that.

100. Do you not think, if that is so, that Oregon would be more largely used to supplant our rimu?—In certain districts it will, but if you have got to rail it it will not. You have still got a handicap there. As well as the duty they charge rate and a half to rail Oregon, so that you can only land it at that price at probably four centres in the Dominion, where they can bring direct shipments.

101. It comes direct to Timaru, I understand, and other smaller ports?—It may there, but they could not land it here.

102. Is it your opinion that it is never likely to compete with our rimu?—Oh, it will, because the rimu will get scarcer. That is what the large increase in the cost means.

103. Have you any knowledge of what is going on north?—I know that there is more Oregon used there than here.

104. You have seen it used?—I have seen it, but I have not been using it myself.

105. You say it is affecting our rimu trade here?—Very little.

106. Not even in Wellington?—It is the quiet times that are affecting it.

107. Do you not think that that is the very time our industry wants protecting?—You see, the times are very quiet all over, and the 2s. duty upon it would not stop it from coming in. If things are going bad on the other side, they have got an immense output, and they have got to send it away somewhere. It is better to send it away than keep it stacked until it gets rotten. It would be far better if some millers emptied their yards instead of keeping the timber stacked till it gets rotten.

108. Assuming that we have had it in evidence that Oregon is going to largely affect our sawmilling trade, what is going to become of our rimu trade—what are we going to do with it?—It is quite evident that we have not got much of it about by the evidence you have got.

109. I mean in other parts of the country?—It is increasing rapidly.

110. You will be cut out in fifteen years' time?—A good deal of it has been burnt down in the north?

111. What is going to become of it?—If they cannot produce it at a reasonable price, what are you to do?

112. Better to burn it?—Then tax the whole community for it. If you have to increase the cost of building operations you are taxing the whole community, and it affects the worker.

113. I am not an advocate of timber going up in price. Do you not think it will be a great misfortune if our rimu timber were burned?—Well, I think that if instead of being burned it were supplied at a cheap rate it would be all right.

114. If it cannot be milled profitably?—It becomes a luxury then.

115. *Mr. Leyland.*] You tell us that you paid twenty years ago 3s. 9d. per hundred for rough timber carted six miles?—Yes. I might explain that a little bit fuller. There was a mill there—one of McCallum's. They also had a mill at Longbush. They took one wagon-load of timber from Invercargill to the site, and then went for the second load from their Longbush mill, making two loads a day.

116. What do you estimate it was worth?—I am giving you the time, the time it would take to do two trips. He carted his load in the morning from the town mill, delivered that on the job, and then went from the job to Longbush mill, and brought back a second load, and then came on with the wagon. That was a day's work.

117. You are not charged for the tongue or feather, nor for the timber that was planed away in dressing?—No.

118. You got that for nothing?—Well, I cannot say Yes to that, because I suppose they reckoned that when they quoted the price.

119. You tell us you got the feather, which was not measured in?—It has not been measured in until the last rise, two years ago.

120. You have always had that given to you for nothing as far as measurement is concerned?—Yes.

121. That would be cheap enough for you?—Yes, 3s. 9d. was cheap enough at that time.

122. Do you think that 3s. 9d. was a fair price with cartage six miles?—I did not tender for it. It was given voluntarily. They thought it was a fair price when they gave it to me. From what I can make out, they did not lose any money at that time.

123. They did not get standing timber for nothing?—They had to pay 3d. per hundred at that time.

124. Can you tell us the difference between a five-roomed cottage then and to-day?—About £50 or £60, but I have not gone into that.

125. Do you think it is any wonder that a rise has taken place in twenty years?—I think the rise has been too much.

126. You do not think timber ought not to have risen?—I believe it costs more, but I do not think it costs the amount that they state.

127. In building cottages in those days, were ranges put into the cottages?—In a good many of them, as far back as twenty years ago. As a matter of fact, the timber in those days in the cottages was heavier than now, because at present there is a scheme to make framework as light as possible.

128. So the sawmiller to-day has more sawing?—Yes, it is his own fault, through increasing the price.

129. Could you have kept the price down to 3s. 9d.?—No, I do not say so. I do not say they should not be allowed a fair increase on those prices. You cannot call from 3s. 9d. to 10s. 6d. a very small rise.

130. You tell us, on your cottage property you got about 7 per cent. only, and out of that you had to pay rates and taxes: do you think that a fair return?—No, but you cannot get any more.

131. Do you think the sawmillers have earned that?—I think they have and more. Some of them are reputed millionaires out of it.

132. What do you think, considering the short life of our business and risks, would be a fair return?—I have not had any experience.

Mr. Leyland: I wish to put in evidence the actual cost of producing New Zealand timber, under special and favourable conditions.

Hon. the Chairman: I will ask you for that later on. You can ask him questions.

133. *Mr. Clarke.*] Dealing with the question of prices there has been reference made to the increased cost of a building containing, say, 15,000 ft. of timber; 1s. rise on that would amount to £7 10s. in timber only. I notice in your prices a good many lines have risen very much, more in proportion than the others. For instance, from 6s. 6d. to 10s. 6d., while others are quoted at 14s. 6d. and up to £1. There will be a large proportion of the timber in the ordinary building that would be included in those higher prices?—All the dressed lines, of course. For instance, in that statement I made about the difference in the cost of two lines in the job I have finished—close on 50,000 ft. of dressed material—there is £194 difference, and I think, even if any of you like to work that amount out on an average of twenty men on a mill, you will find that there is a very fair margin of profit over and above everything.

134. Allowing for the greater increase on raw material generally, if you take for the last ten years, where it is allowed that the price has gone up 4s. per hundred, that would not represent the real rise or the average rise of all timber used on the building?—Nothing like it. Some have gone up a good bit more. That only applies to rough timber, and on rough timber up to 8 in. in width—over that it increases 6d. per inch.

135. The average increase would be more than 4s.?—I should not be a bit surprised if it would not amount to nearly double that.

136. At 1s. per hundred on 15,000 it would make a difference of £7 10s.—if we say 4s. per hundred, that would make £30, but that being nearly double, as you say, does not the cost further increase, and would not the difference be £60 instead of £30 in a house of that size?—It would follow if you worked it that way. You would have to include all mouldings, &c., which have gone up enormously. The timber-merchants state that was their average cost on the whole of their output.

137. Have you found any inconvenience in the matter of lengths? Have you been able to get long timbers for your work?—You can bring them from Sydney and Melbourne quicker, and then these are drier.

138. Then, with regard to lath-and-plaster work, have you any by-laws in this borough dealing specially with this or as to seasoning certain classes of dried timber?—No, I do not think it applies in that respect. There are by-laws in the inner area, but they do not specify the class of timber that is to be used.

139. What do your architects do when they are specifying this class of work?—Architects here are generally giving up lath-and-plastering altogether on account of the plaster breaking away.

140. That would be the result of using timber which was unsuitable?—I think so.

141. Then, with regard to future supplies, as a builder you would be glad of anything that would tend to procure future supplies for the work, and not to find our timbers worked out too quickly?—As builders we want to get the timber as cheaply as we can, because it would tend to increase work.

142. If Oregon can be used to take the place of some of our local timbers for some of the finer work and for work that is painted, would it not be preferable to use Oregon in rough work, and use our better timbers for better work?—It would if it was all good timber, but of course I understand there is a large proportion of milling-timber not fit for dressing. In fact, the timber we are getting here now and paying 10s. 6d. for is not nearly so good as the second-class we used to get. It is graded very fine.

143. *Mr. Morris.*] You told us you were opposed to any reduction of duty on Oregon pine?—No. I am opposed to any increase of the duty. You can reduce it as much as you like. There is very little used here, because it is too expensive.

144. It does not concern you very much?—It concerns us in this respect: that previous to this late importation we had to bring it from Melbourne and Sydney, and the cheapest that you can bring it from there is £1 2s. If it is landed in Dunedin we can get it round here direct at about 15s. or 16s., which would make a difference to us. If you take the duty off it would be reduced by 2s., which would help us.

145. You state that Oregon is very much stronger and superior to rimu for joists?—For the same size, all engineers agree that that is so. I have not tested it myself personally, but there are engineers in this town who state they can do with a third less in thickness.

146. You might be surprised to hear that the architects in Wellington specify for a larger size in Oregon in cases where they use it instead of rimu?—I should be surprised.

147. Rimu of equal quality with Oregon has stood under hydraulic test 33 per cent. more pressure?—I am still surprised.

148. I have seen it done?—I am surprised. They use lighter Oregon here.

149. You made some reference to the cheapness of timber in 1889. Can you tell us anything about the conditions at that time—that is, were the people in a prosperous condition, or were they merely existing?—I found them better than they are now, as far as I am personally concerned.

150. You also stated that you knew that some men put timber on the trucks for 2s. 2d. per 100 ft. at Woodend twenty-two years ago?—I stated that the contract was let, and from memory I believe that it included all labour. It was either at Woodend or a mill down there, and I believe the price was 2s. 2d. from memory.

151. You are doubtful?—I am not doubtful about the 2s. 2d. I said it included all labour. I said that you would have some sawmill union representative here who would probably be able to tell you more.

152. It is impossible to do it?—Well, it may be information, but I am giving you the information I had at the time.

153. If it refers to cutting timber after the logs are put into the mill you may be right?—No, including bushfelling and everything else.

154. You tell us that on some houses you have you only make 7 per cent. Did you build these houses when timber was at 2s. 2d. or 3s. 9d. per hundred?—No, I did not. I did build some of them at a cheaper rate than I can now.

155. You have left an impression on the minds of the Commission, I think, that this Sawmillers' Association is responsible for the increased price that you are now paying for timber?—To a large extent I believe they are.

156. With regard to the other forty-seven mills outside the association, why do you not deal with them?—I think you are misled in that. From what I heard to-day there are so many mills in the district and so many millers?—Three mills out of fifty-two millers. A number of these small mills very often sell their output to the association miller.

157. Can you not buy cheaper from the big merchant?—Every one knows that a small mill costs more proportionately to run than a large one. If these small mills can get the same price as the association, they will not refuse it.

158. I understand trade is slack?—It is slack all over the Dominion.

159. Are the millers fully employed?—No, I understand they are not.

160. The men who are not perhaps working half-time would be glad to supply you with timber?—I question that. If they supplied me with it at half-price, though I am not doing very much now, I would stock some.

161. You are not very certain yet whether 2s. 2d. was the net price of cutting timber in the mill?—I believe it is the whole of the labour in connection with the production of timber in Woodend. I will not vary that. I was a member of the Southland Trades and Labour Council at that particular period, and it was there that I had my information.

162. You tell us also that the cost per hundred feet of timber for labour runs about the same as it was fifteen years ago?—Very little difference.

163. That means that you are trying to leave an impression on our minds that the increased cost of building is owing to the increased cost of timber?—No, other material also, to a certain—not timber only.

164. *Mr. Barber.*] You are, of course, aware of the large number of trades that are concerned in the erection of a building?—Yes.

165. Such as bricklayers, plumbers, painters, and paperhangers?—Yes.

166. Do you think that the slackness which has been experienced not only in this district, but throughout the Dominion, is due to the high price prevailing for building-material?—I do not think so; I think it is owing to the money-market.

167. You said just now that if you got timber cheaper you would soon start building?—No, I said "stock" it.

168. You said that under the present conditions with regard to erecting dwellings, you were only getting 7 per cent.?—Yes.

169. Well, do you think that that small percentage under ordinary building-conditions deters the capitalist from investing money in the building trade?—There is no doubt it does, because it will not pay him owing to the large increase in the cost, and you cannot possibly get rents out of it.

170. If it influences the capitalist, do you not think that the slackness in the timber trade is increased to a large extent by the high price of the materials themselves?—It would have a tendency that way.

171. Mr. Field, in asking you a question, mentioned that the price charged by the millers did not include interest on capital. The managing director of the Southland Timber Company said the cost of production was 8s. 6d., and included in that was interest on capital. Then I asked him the question—"You said it included the interest on capital?" "Yes, that is right." "So that the 1s. is over and above the net cost?" "Yes." Mr. Field rather contradicted him, and said that amount did not provide for interest on capital, and the witness was quite clear that the amount of 8s. 6d. did cover interest on capital?—Yes. Mr. Brent only dealt with his own firm.

172. Are you aware that a concrete building can be erected for about the same price as the present price of timber in Wellington?—It all depends on the cost of the gravel and cement—you can scarcely do it here.

173. Cement may be cheaper in Wellington, but gravel is dear; but in regard to a workman's cottage, a concrete house was erected for the same price as a wooden house there, and you

say that cannot be done?—It has not been tried here. I question very much if we could. Our timber is cheaper than it is in Wellington, but the cement would be more.

174. In quoting the price of timber twenty years ago, are you quoting the same figures as those given by Professor Kirk in the report published by him?—I was not aware of his report.

175. He published a report on the timber of New Zealand, and he quotes in this district the same prices as you have quoted, going down as low as 4s. 6d. and 3s. 9d. in one case?—He did not get his information from me.

176. I understand that the information you have given us is your own practical experience?—Yes, and I have shown the quotations that I have here.

177. It coincides exactly with the official report of Professor Kirk on the same subject?

178. *Hon. the Chairman.*] His report was obtained from stamped receipts?—The secretary has a copy of the quotations I gave.

179. *Mr. Barber.*] With regard to the extra price for the erection of a five- or six-roomed cottage, you said that it cost about £60 a room?—An increase of about £50 or £60 on the timber.

180. Mr. Field, in calculating the additional cost in proportion to the number of feet that was used in the erection of a building, referred to ordinary building-timber?—Yes. Mr. Clarke, I think, asked the question.

181. It seemed to me that 4s. was the increase for the last ten years on ordinary building-timber?—I think if it was worked out that all the increases would very nearly double that.

182. *Mr. Ell.*] With regard to the cost to the timber-merchant in yarding his timber, how is it there is timber rotting in the yards here?—The way it is stacked at the mills—no air gets to it.

183. It is due to the way it is stacked?—Yes, the bottom of the stack.

184. Could that be put down to carelessness in management or incompetence?—No, I do not think it could. They stack it that way when things are good, and they get it away before it gets rot; but at the present time when things are slack the stocks are getting larger, and naturally they take off the top, and the bottom is left till it gets pretty bad, instead of selling it at a lesser price, which I think would pay them.

185. You think the loss and waste in yarding may be minimised or reduced considerably if more care was exercised in storing it?—I think they might.

186. So that it is due to want of care in that respect?—When things are slack, mostly.

187. How is the timber stacked in the yards here?—In the yards in town there are generally roofs for them, but the bulk of the timber here comes direct from the mills, and not from the yards.

188. You said it would be far better for the timber-merchants to sell at a lower price than to hold on to their lots of timber?—That is at the sidings.

189. Then, you mean the millers and not the timber-merchants?—They are practically the same here.

190. Then a miller at the siding or the timber-merchant loses a great deal in carelessness in not taking proper care?—I do not call it want of proper care. It is the stacking and holding the stocks to keep the price up. I believe they could deal with a good deal of that at a lesser price.

191. Then, surely the waste consequent upon the method of stacking would be saved if stored in a better condition?—Yes, that would mean more money. It would pay them better to sell it direct from the mill at a lesser cost.

192. But I want to get at the waste, and see whether we cannot adopt some better method and put a stop to it?—Yes.

193. You say you have a difficulty in obtaining seasoned timber for building purposes?—Yes, at times. So far as joists are concerned, we do not get it seasoned.

194. Why not?—Because it comes direct off the saw to us.

195. And do the timber-merchants never store it a sufficient length of time to get it seasoned?—The general way here is that you may sign a contract to-day, and you have got to have all the timber stacked on the ground within so many days. Probably the whole of that timber has to be cut and run at the mill before it is delivered there.

196. Is that likely to help in the timber lasting if it goes into the building in a green state?—No, it has the opposite effect.

197. What is the effect of putting green timber into a building?—It makes a wonderful difference to the building: you have shrinkage over the building, and that is where the Oregon pine is a great advantage in roof-work, because if you have it dry the joists are good, whereas the local timber comes away.

198. A building of four or five rooms erected with good seasoned timber—would that last longer than a building erected with green timber?—Well, I believe it would.

199. Then, in your opinion, if timber was better seasoned it would mean a public gain?—I think that would mean more money—they would want more money for it.

200. You have to stand the racket?—We have to stand the racket, and we put everything on to the builder. If the stuff is all green it is the builder's fault—the architect looks to the builder.

201. Why is not beech used down here for building purposes?—Well, I have not had much experience in beech. It twists about too much, I think, for ordinary building purposes. I have seen it used up in the lakes district for weatherboards, but you have to be very careful with it, because on a warm day you may lay a board down and go and have lunch, and when you come back it would have turned a circle.

202. That is why you do not use it?—I take it that is the principal reason that it is not allowed to be used.

203. If properly seasoned would it curl like that?—I have not had any experience with it. It may be all right if cut at the proper time in the log.

204. Have you got any price-list issued by the local timber-merchants covering dressed and ordinary rough building-timber?—There is a combination price-list.

205. What is the latest or earliest you have covering all classes of building-timber?—The last one was issued in July, 1907.

206. What is the earliest one?—At that time there was no printed list: you simply went to the various millers and got quotations.

207. *Mr. Arnold.*] Has there not been one out within the last eight weeks?—I am not aware of one.

208. Following up the last question put by Mr. Ell, how long do you think the timber should be kept by the miller before it becomes thoroughly seasoned?—That is a question I do not think even the millers themselves could answer.

209. What is a rough guess?—It entirely depends on the timber. I have seen timber stacked under cover for two years, and you could then cut more off with the plane on it than some timber you get straight from the mill.

210. So that you cannot depend upon it?—No.

211. Would you say twelve months on the average?—For ordinary work twelve months should be sufficient—there is no doubt about that. We do most of our work with a great deal less—we have got to. We have to stack it on the job, and use it before we are done.

212. Have you formed any idea as to what extent the various millers would have to increase their capital to if they were to stack all their timber for twelve months?—I have not.

213. They would have to do so, would they not?—They would have to work it out and see what it was going to cost them. I know it would be a big item.

214. As a matter of fact it would be almost impossible for the present millers to do so?—I do not think they could do it—it would be asking too much.

215. And if it was so the increase in price would be considerable?—Yes, I think it would increase the cost considerably.

216. Now, with regard to the question of timber rotting in the yard: have you any idea what percentage of the timber becomes useless?—No, I have not.

217. Would it be very slight?—There must be a good deal of it, because it discolours very quickly at times.

218. Do you think it would be 1 per cent. of the output?—I could not say.

219. Do you think it would pay the millers to erect coverings for the timber stacked at the sidings?—I do not think it would make much difference so far as the timber is concerned, because it is all stacked green, and the sap itself is sufficient.

220. If the percentage was so great that it would pay them to erect a covering and stack it differently, do you not think they would do a better business?—You would naturally think so, but still they are satisfied with the way they are doing. They get enough out of it, and probably more than if they did it the other way.

221. *Mr. Stallworthy.*] You said that your association opposed the increase in the duty on Oregon pine. Would you be as much opposed to an increase in the duty on small Oregon sizes in order to free the larger sizes?—I think, personally, the duty ought to come off the lot of it, but in any case I think it would be better if the duty was taken off the larger sizes if not off the lot: bring it in in junk. There is a very small percentage of small stuff. By doing that it would all be cut up here, and it would employ a portion of the labour that is talked about as being idle on account of the mills closing.

222. Is the merchant from whom you bought timber at these low prices twenty years ago still in business?—Yes, and worth a good deal of money.

223. We have been told that one reason for the formation of the Sawmillers' Association was that builders would go to one miller and inquire the price and perhaps be told it was 6s. a hundred, and then go to a second miller and be told the same price, but would reply that So-and-so was selling it cheaper; and therefore, because the millers were being blackmailed, if I may so term it, they formed the association. Is there anything in that?—I do not think the association was formed for that purpose at all.

224. Was it the practice of the builders to do that?—Not to my knowledge. I do not think there was very much of that done.

225. *Mr. Mander.*] Do you think it is fair to go back twenty years ago and compare the prices then with the prices of the timber produced to-day?—I think it is with a fair allowance.

226. Do you think it would be fair to go back forty-five years?—Then it would be dearer.

227. I suppose you are aware it was £2 5s. then?—Yes, and twenty-six and twenty-seven years ago it was 6s. and 6s. 6d., and came down for a long time.

228. Do you think the sawmillers made any money when the timber was 3s. and 3s. 9d. per hundred?—I have no doubt in my own mind that they did.

229. Was the timber standing right alongside the mills in those days?—Pretty close—not very far away.

230. Are you aware that the difficulties of getting timber now are very much greater?—Yes, but they have got better facilities in the way of improved plant.

231. Is the quality of the timber as good now?—No, it is not. Second-class timber in those days was better than first-class now.

232. Do you not think it was an advantage to the miller?—Yes, no doubt.

233. Do you think that if the Government took the whole business over they could produce it at a cheaper rate than the private individuals?—Well, it is questionable whether they could. They might see a very good thing in it and have a monopoly, and then they would be in this position, of course: that there would be no question as to the duty on Oregon, and they would increase that if necessary. They would have the whole business in their own hands.

234. Would the introduction of Oregon here reduce the price of other timbers?—As far as this part is concerned it would not, because we cannot get it delivered here as quick as in the main centres.

235. Do you think it would in other parts?—I think it would, but in the centres where they have the railway only I do not think it would, much.

236. Seeing that the timber-merchants who handle other timbers in this country would be the principal persons to handle Oregon, do you think they would introduce Oregon and bring down the price of other timbers?—That might apply up north, but those handling the timber here are the sawmillers themselves. They are all interested practically in the mills here, and evidently there is a smaller profit in one than in the other, otherwise they would have handled it.

237. Do you not think the other people would handle Oregon?—Yes, some of them would, no doubt.

238. Have you ever known of any Oregon coming out to this country in the log?—Not in the log, but spare in the junk—sawn timber. We get it up to 16 and up to 18 by 18.

239. *Mr. Leyland.*] There is a difference between a hewn log and sawn?—Yes.

240. *Mr. Mander.*] Do you think it would be an advantage to insist on the Oregon being delivered here in the log to give the workmen employment?—Yes, I think it would.

241. You complained about rimu timber being delivered on the job green: is it not a fact that the builders prefer that?—I do not know who does—I do not.

242. I understand there is no difficulty in driving nails in when it is green?—I have not found that.

243. Have you known any timber-miller in this district making out of timber a million of money?—We have got one here who is reputed to be getting that way.

244. Made out of timber?—Yes, out of timber.

245. Out of the 3s. 9d. per hundred?—He is getting more than that.

246. How many minimum feet must you have for a profit?—There was one miller who is not here now, but who was selling at this price, and he said to me in Wellington not many months ago that he had cleared over £25,000 out of one mill.

247. Do you know his name?—I know his name, but I do not think it fair to state it.

Mr. Field: If you have got the name of that miller, if he is about, I would like to call him.

Hon. the Chairman: He lives in Dunedin.

EDMUND RICHARDSON WILSON sworn and examined. (No. 7.)

1. *Hon. the Chairman.*] You were an architect in Invercargill?—Yes. I may say that the question of Oregon pine does not affect Invercargill very vitally. The only local use we have for it is for heavy beams, such as joists and suchlike. Beyond that, we use Oregon very little indeed.

2. Will you just state to the Commission generally your impression with regard to the questions we are inquiring into? You do not know anything about the cost of production in the mill?—No.

3. You know more about the builders' part of it?—Yes.

4. Could you tell us anything in that way?—With regard to the increased cost in building I think the statement that the increase amounts to something like 1s. per hundred feet is not quite correct, because, as the last witness pointed out, there is an increase on larger sizes—larger lengths; also there is a very great increase on what the timber used to cost, but of course the increase in the cost of building is not entirely due to the rise in timber. For instance, in brickwork they were sold ten years ago at £1 8s. per thousand. The same bricks now cost from £1 17s. to £2 per thousand. Bricklayer's labour was also very much less then. It was 8s. or 9s. a day, whereas now they are getting about 12s. Plasterers are also getting an increased wage, but I think the main cause of the increase on buildings is the timber: that is the largest item. In addition, people now demand a very much better class of building than they had before. If you go back ten years, very few houses of five or six rooms had bathrooms. Even a pantry was more or less of a luxury, whereas the same class of houses have bathroom, pantry, and scullery now, with hot and cold water and a range. Ranges nine or ten years ago were mostly low-pressure, whereas now they are high-pressure. Again, the majority of the washing used to be done out of doors. Now people have a wash-house as part of the building, and the coalhouse is also part of the building. The general finish also, I think, on the whole, is better than it was ten years ago.

5. Could you tell us what the difference in price is between then and now?—Well, I could not tell you accurately, but I should think that, say, a five-roomed house would now cost from £100 upwards more than ten years ago.

6. And a large proportion of that increase is due to the increase on the timber?—Yes, undoubtedly; but it is almost essential that we should have Oregon pine here for heavy joists and work of that nature. It has been stated that we cannot get heavy red-pine timber here dry. I do not know what the stocks are lying at the sidings, but I know that the timber is now growing in the bush for actual contracts that may be let. Of course, timber takes a long time to season. If it is not properly seasoned, it means that the upper floors draw away from the walls. It means a considerable amount of trouble and cost. You have your employer complaining about it. By using Oregon we get the stuff on to the building seasoned, so that a good deal of that trouble is obviated. Then, when it comes to getting very heavy stuff for large props, Oregon is the only timber that is fit; but I do not think that Oregon will ever be very greatly used in Invercargill, unless red-pine were greatly increased in cost, because we have got to face the haulage from the Bluff. Only small boats can come to our port; big shipments have to be landed at the Bluff. Then, of course, the Railway Department charge for bogie-trucks for long lengths. I worked out recently what it would cost to put a roof of a 60 ft. span over a certain building, and I came to

the conclusion that it would be cheaper to use a steel truss than to use Oregon for the heavy stuff, and red-pine for the lighter.

7. *Mr. Hanan.*] Do you think it is desirable to increase the duty on Oregon pine?—No, I do not think it is.

8. You think it is not in the interest of the Dominion?—If any alteration were made, I think, if anything, it should be reduced on the heavy stuff, because the Dominion cannot produce large balks of timber. If any alteration were made, heavy Oregon should rather be reduced. It may be that on small sizes it would be advisable to make some small increase, but I think to increase the duty on heavy stuff would be a great mistake. We must have heavy timber for certain classes of work, and it is practically admitted that the mills cannot supply it.

9. *Mr. Jennings.*] You mean local millers?—I am speaking, of course, of local millers.

10. *Mr. Hanan.*] You think an export duty should be placed on our timber?—I am strongly of opinion it should be on red-pine and totara, and I think the whole trouble is caused by our timber being given away in past years. I cannot give you the returns, but we all know it was shipped very largely to Australia up to the time that Oregon came into competition. Our birthright was given away for very little return, and we have undoubtedly to pay for that in the increased cost of the timber. As regards increased production, that is easily understood, because originally all the flat country around Invercargill was under bush, but it has all been cut out. Seaward Bush was the last; that has all been cut out, and we are not getting the same class now. It was cleaner timber for rough purposes, but what we are getting from the western districts is far more durable, and is beautiful timber. Take the mouldings in this room: we would not take such mouldings now for a job; we get beautiful figured timber all around Invercargill. That is due to going to the hilly country; it is more durable, and we get a more beautiful grain, but I certainly think there should be an export duty on our timber to keep it in the country. I think also it would be a wise thing to provide for replanting wherever it is cut out. In Germany, Norway, and Sweden the law enforces planting for every tree that is cut, and I want to see that done here. There is a timber shortage all over the world, and the cost of timber is greatly increasing. The main supplies in England now are being taken from America in place of Norway and Sweden. Californian redwood is undoubtedly better than Baltic for some purposes, and will come into competition with New Zealand timber in the near future. It is already used for venetian-blinds; it will not rot, and will not burn; and if you put it into the ground between wind and water it is durable. It is very little lighter than Oregon, and of a good colour, but is not suitable for heavy work. For building-work we shall see more of it used for sashes and doors. It is practically unshrinkable even if it is wet.

11. What woods do you find affected by the borer?—The borer, as we know, is peculiar to white-pine. I have never known a case of any other timber being affected by it except where it was in the vicinity of white-pine. I know one case of a mahogany piano being practically destroyed because it was in a house which had been built of white-pine. Of course, we often hear talk of dry-rot, and forget that it is common to nearly all timber under certain conditions. The white-pine borer is not the ordinary dry-rot at all. So far as I can learn, it is peculiar to that timber, but it will go into red-pine and other timbers if they are in the proximity of white-pine that has been affected.

12. Do you know of any methods or means that have been found satisfactory to destroy the borer?—Sometimes I have heard of turpentine being used. There have been one or two patent mixtures, no doubt, but the proper way to avoid the borer in a building is not to use white-pine, and it is not being used now.

13. Do you know of any effective destroyer or preservative?—No.

14. Have you much difficulty in getting red-pine here?—No serious difficulty for finishing-work; but, of course, we get timber now for rough purposes of an inferior class. At the time of the Seaward Bush we never got strips of bark of considerable length. At that time you saw all heart of totara, but it is scarcely procurable now; you do not get it.

15. What is your opinion regarding the importation of hardwoods?—As regards competition with local timber, I do not think that hardwood competes with local timber to any extent, unless it might be in railway-work. Of course, we should never use it for any ordinary work here; but the cost of totara is now so great that we would use jarrah in preference to it, because it is a far better wood in every respect. The only trouble with jarrah is that it takes two years to season for rough purposes and five years for joinery. Generally speaking, we prefer it to totara, and occasionally we specify it for totara.

16. Do you think all these hardwoods should be allowed to come in free?—I am hardly in a position to say that, but I do not think they should be increased in cost anyhow.

17. Is the building trade generally in a prosperous condition?—It is quiet just now—in some cases decidedly slack. Cottage-building has fallen off; it has almost stopped. At present it does not affect me very much, but I see many men idle.

18. There has been a boom in the building trade in Invercargill?—I do not think you can fairly call it a boom. We have very seldom had works stopped for want of men. There has been tightness of money and scarcity of labour. Things have not been prosperous, and you could not say more than that for them.

19. As to the workmen, how do they compare with those of ten years ago?—I believe there are fewer good joiners amongst the younger men, and I attribute that mainly to factory-work. Now, very few builders are in the habit of making their own sashes, and they scarcely ever make a door. At one time they had to make all that work and all the ordinary joinery. Such work is done almost entirely now by machinery in factories. Even builders are putting in machinery for mortising, and the effect among the workmen has been that you do not see so many competent men.

20. So there has been a falling-off all round?—I am speaking particularly of carpenters and joiners. I do not think there has been a falling-off otherwise.

21. In the case of a building, say, of ten years ago, what would be the difference in the cost of the timber?—I should say about 2s. per hundred all round would be pretty near the mark.

22. As regards the work of construction — carpentering, painting, plumbing, &c.—what is the increase?—Of course, there has been a decided increase. You may take one trade—plastering. Mr. Bain mentioned that architects specified little plastering, because they were afraid of shrinkage in the timber. Personally, I would not use plaster for a ceiling, and there is a dreadful scarcity of plasterers. We are having to pay 15s. per day, and sometimes as much as £1 per day, and even then we cannot get the labour. Of course, architects have protected their clients by using a minimum amount of plaster.

23. Coming back to the cost of getting a six-roomed house, you mentioned timber: what about carpentering, painting, &c.?—I doubt if there is any increase on painting and framing. I believe the men get rather a better wage, but it has made no difference. Of course, now we have got better drainage and better sanitary arrangements, and the by-laws insist upon these things being put in. If you go back ten years ago, the regulations were quite different. In farmhouses the drainage-pipes have been put in with ordinary agricultural tiles. I even had a case the other day where a farmer thought they were good enough to take his kitchen-slops and the drainage from his sinks away. That used to be very common in the towns. Now, of course, they are getting much better. The Health Department is insisting upon keeping people up to the mark. Of course, that means better sanitation, but, on the other hand, increased work.

24. As to iron?—Iron is about the same, I think.

25. What is the difference in the cost of a six-roomed house compared to now and ten years ago?—I know of one case of a house built about fourteen years ago which cost about £400, and the same house now would cost £700. The increase has taken place gradually ever since. Then you have to remember that timber which was bought for something like 5s. or 6s. per hundred will cost more than that now, while the men during the depression were working for something like 5s. per day. If you go back even ten years you are in the middle of the time of the depression. At that time carpenters would club together and work for a mere pittance. It was pitiable to see them working for so little, and in many cases I am sure they did not get enough to eat.

26. What would it cost to build a five-roomed good house to-day?—If it were a good class of house—with a bathroom, pantry, scullery, and laundry attached, concrete foundation, proper drains, and proper sanitary arrangements—it would cost you from £550 upwards, according to the class of finish in the building.

27. In brick?—About another £100 in brick.

28. Take a six-roomed wooden house, what would that cost?—Probably about another £50.

29. In brick?—You see, it is not a fair way to talk about the cost of a house being so much per room. The cost of a four-roomed house must work out heavier than a five or six roomed. Even for an eight- or nine-roomed house, you must have the same conveniences in each case.

30. Given a seven-roomed house?—I cannot say in that way.

31. Generally speaking, what would a seven-roomed house cost?—About £650 or upwards, according to the class of finish.

32. As to the architect's fees, what are they?—The same as in any other part of the colony—6½ per cent.

33. *Mr. Jennings.*] According to your answer you are the only profession that has not got any increase?—It means an increase to us. The more work we put through and the larger buildings we put up, the more we benefit.

34. You are apprehensive about the scarcity of timber in the future?—Yes.

35. You are aware that steel and concrete are very largely used in large buildings?—Yes.

36. Will that not be a factor in determining whether our supplies will last?—Of course, to build in steel or concrete—steel is out of the question in this Dominion, except in earthquake towns. It is only a fad to talk of putting up steel buildings.

37. What about Wellington?—Wellington is an earthquake town. I am speaking of the South Island.

38. Do you know anything about the processes that tend to increase the life of cut timber?—No, I know nothing about different processes. All I know is that natural seasoning is generally reputed to be about the best method of prolonging the life of cut timber. All rapid seasoning is detrimental to the durability of the timber.

39. Not according to the investigation of the Society of Architects in Western Australia quite recently?—The Royal Institute of Architects bears out my statement.

40. In regard to afforestation, do you know what is being done?—I know that the Government is doing something at Rotorua with prison labour, but how much I do not know.

41. Up to the present time there have been 22,000,000 trees planted?—Yes.

42. That will meet your views?—Yes. Do you not think that the cutting of the forests at present will amount to more than a million a year? Remember, too, the number of years we have been slaughtering timber. Look at the North Island where they have destroyed it wholesale by burning.

43. There is no necessity for that?—No.

44. Have you any very great knowledge of the bush in the North Island?—Only by passing through as a visitor.

45. *Mr. Field.*] How long have you practised in the colony?—Eleven years. It is about twenty-two years since I started serving my apprenticeship.

46. You said it was wrong to say that the increase in timber during the last eight years was 1s., because you had to consider mouldings, &c.?—Yes.

47. I want to point out that the amount stated by Mr. Brent was 1s. 6d., not 1s. On that point I should like to know whether, seeing the comparatively small effect that a rise of 2s. in timber would have on the total cost of a cottage, the quantities and values of sawn timber should be taken into account for the reason that the extra cost of dressing will be enough to account for the difference?—I really cannot say.

48. Is that a fair way of looking at it?—I do not know. My reference to the increase in price is with respect to mouldings.

49. We are talking of sawn timber only. In view of that, 1s. 6d. would be a moderate amount?—I think it is within the mark even then—even a little more than that. The cost increases as you rise in size.

50. You say that 2s. per hundred for all classes of timber would be a fair thing for ten years: would it not be fair to assume that 1s. 6d. would be a fair thing?—Yes.

51. You would not contradict on that point?—I would not without data before me to go into it.

52. Putting the cost of timber alone, in ten years at 2s. per hundred, that means an increase in the price between now and ten years ago, and makes £15 difference in a house of five rooms?—I think I would modify my former statement. It would not include mouldings—excluding mouldings it would be that approximately.

53. You told us how houses can be dearer than they used to be. Numerous items were mentioned by you. Houses are better-finished than they used to be. There is the bath, pantry, wash-house, &c.?—Yes, they are better-finished and of better construction.

54. Are mouldings more in use now than ten years ago?—I do not think so. It is very much the same in that respect—that is, in the class of house you refer to. Of course, I do not speak of four-roomed cottages built to let.

55. I am talking about workers' cottages?—I was referring to the better class of workers' cottages.

56. You think they have at least as many mouldings in their house now as they had before?—Yes, every bit. Mr. Bain was speaking of workers' cottages. He has them to let; but they are cheap cottages. People do not go to architects for that class of work. People who go to architects want good buildings.

57. How does that agree with the large stocks of timber that we see?—There is a slump in trade. Generally, you cannot buy seasoned timber here at all.

58. Do you use shingles?—We do not use shingles.

59. You are a believer in our afforestation?—Decidedly.

60. Can you see any good reason for private individuals being asked to keep their timber lands for an indefinite period rather than use them now?—Most men who take up land do so to make money out of it.

61. Would it be a fair thing to ask a business man to retain it?—I do not think so.

62. Of course, you agree that it would be a good thing for the State to have large forest reserves?—It is a work I think for the State to undertake. It may pay individuals in certain cases, such as those who have poor land suitable for afforestation.

63. Do you know anything about the class of timber that would grow here?—No, I am not prepared to make any suggestion on that.

64. On this question of Oregon pine, we are told that we must have the large pieces and encourage their admission into the country; but, on the other hand, in regard to the smaller pieces, seeing that they are competing severely with the red-pine of this Dominion, would it not be a fair thing to increase the duty? I understand that you are in favour of that?—No, I did not say that. I did not say it would be advisable.

65. What about those other timbers that you mentioned—viz., Californian redwood, Manchurian, and any other timbers which might enter into competition with us?—I know nothing about Manchurian timbers. We cannot fall back on Baltic. It is America we have to look to. Oregon pine is not used much in America, except in the Western States. The haulage is too great. It is simply sent where it can be most easily shipped.

66. It behoves us to watch those things in the matter of imported timber?—I doubt if it would affect our trade unreasonably.

67. The duty of 2s. per hundred on Oregon pine was put on a good many years ago?—I am aware of that.

68. That was at a time when millers were suffering under the same trouble as they are now?—Yes.

69. Now that they are in distress there would be more reason for increasing the duty rather than reducing it?—Yes.

70. *Mr. Leyland.*] You have told us clearly where Oregon is most suitable for constructive purposes. Is rimu not more suitable for flooring and ceiling work?—For such work it is no doubt far and away preferable to Oregon.

71. It is our custom to season rimu in the north. Would it not be better if it was seasoned before it was matched or machined?—You mean, in the mill.

72. Cut to the size and then seasoned before it was put through the machine?—It might be a better job. I could not say. Of course, it would shrink again then.

73. With reference to the increased duty on large sizes of Oregon, I just want to point out that when we are told that Oregon can be landed at a certain price what is stated in the following quotation. It will not be a waste of time if I may read a quotation here. The prices are fixed or quoted on a basis of the E list—that is, a basis of $15, f.o.b.

74. Now we turn to the price-list, and we find here that it is only the small size and the short lengths that carries the 15-dollar basis, and some of the sizes of the same quality cost as high as $25.

75. Bearing in mind that the long lengths and the heavy lengths cost more than the quoted price, and that it costs very much more to handle, and it has often to be taken in to the saw and resawn, do you not think that handicap is quite enough without putting any duty on the extra sizes?—I do not think any duty should be added to the heavy stuff at all. Quite the reverse.

76. If the duty was increased on the small size, seeing that the cost to the merchant will be very much greater on the large sizes, do you not think the large sizes should come in free?—No, I do not think so. I think, in the majority of cases in New Zealand the Oregon is sought for for heavy work. It would never be used except for heavy work and for framing. It is quite unsuitable for flooring and ordinary finishing.

77. It is suitable for joists, &c.?—Yes.

78. The small sizes are competing with the rimu. If more duty is put on the small sizes, do you not think it would be a fair thing to take some duty off the large sizes?—I think, if anything, the duty should be reduced on the heavy stuff.

79. You are aware as an architect that the cost of timber has increased all over the world?—Yes.

80. Probably you have not had a chance of reading the last report of the British Royal Commission on this question, in which it is estimated that timber has risen 50 per cent.?—I am not surprised.

81. During the next ten years it is estimated it will increase 50 per cent. again?—I should hardly think it would increase so much as that.

82. You are not surprised that there has been a rise in the cost of timber in New Zealand?—No.

83. Now, in using rimu for joists, you would prefer heart to sap?—Yes, anywhere.

84. Are you aware that a group of rimu-millers who are working in the King-country and the Waikato have very carefully tested the percentage of first-class heart, and have found that there is only 6 per cent. of first-class timber?—Only 6 per cent.?

85. Now, Oregon is sent out all heart, and I want you to tell us if, in your opinion, all-heart Oregon is not superior to timber that may be partly heart and partly sap?—Yes, if it were all heart; but I know from the best Oregon authority that Oregon varies enormously throughout the States in quality. Its defect is that it makes such a large growth that the wood is very stringy. For rough framing I believe that in the majority of cases Oregon would be preferable. I do not think it would be so good for weatherboarding.

86. Are you aware that No. 1 merchantable, for shipping to the colonies, has to be passed by an inspector before shipment, and it is the custom to condemn any timber that contains sap in that grade?—Yes.

87. If it is a bit under that grade it is rejected?—When you reflect that the Oregon tree is often 6 ft. in diameter, you cannot wonder that the heart is so great.

88. Is it not a fact that it is better than rimu owing to its being all heart?—It does not follow. The sap of one timber might be better than the heart of another.

89. Do you not think it would decay quicker?—I would rather take my chance of red-pine weatherboarding

90. Speaking of afforestation, no doubt you are aware that the increase in consumption, from evidence gathered recently, has been out of all proportion to the increase in population?—That is so.

91. Whilst the population of the United States has increased 53 per cent., the consumption of lumber has increased 94 per cent.; further, are you aware that, whilst in 1895 in New Zealand the output was 191,000,000 ft., it increased to 413,000,000 ft. in 1905—more than twice as much?—No, I was not aware of that.

92. Seeing that this is so, do you not think that is another reason why there should not be a prohibitive duty put on Oregon pine?—Yes, I certainly think it would be a mistake to put a prohibitive duty on Oregon.

93. The importation should rather be encouraged?—It should be encouraged in heavy stuff.

94. Speaking of the Crown timber supply, I suppose you were referring to your own district?—Yes.

95. With reference to the burning of timber off lands, do you not think it is the duty of the Government to settle all open lands capable of settlement before putting settlers on bush lands where the bush cannot be used and must be burned?—Decidedly, if the timber can be moved in the future.

96. *Mr. Clarke.*] In answer to a question by Mr. Field, did I understand you to say that you do not connect mouldings with joinery in the increased cost?—Not exactly. I was speaking more of the rise in the timber. We get our mouldings from the mills; but the joinery, such as doors, sashes, and cupboards, is supplied usually by the factories apart altogether from the miller.

97. Is not the term "joinery" usually meant to be manufactured work?—Yes, that is so; but I distinguished, and meant it to be understood to be the general rise in timber.

98. Then, with regard to the future supply, bearing in mind that the report of this Commission will, no doubt, have some influence on the timber-supply of this country, do you not think everything possible should be done to insure a future supply?—Decidedly.

99. And you are aware, of course, from reports published by Departments in our own Dominion, that it is quite wrong to speak of our inexhaustible forests?—Yes.

100. And that practically our supply, assuming that the output continues at about the same rate—that it may last for comparatively few years—say, from forty-five to fifty at the ouside?—Yes.

101. Do you not think, then, that under the circumstances the Government of this country should at very short notice take some steps to see that this Dominion is not left entirely dependent

on foreign sources of supply for its timber?—Yes, decidedly. That is why I mentioned that a tree should be planted for every one cut.

102. You think it should be renewed?—Yes, it should be renewed.

103. *Mr. Morris.*] In regard to this Oregon pine, do you know much about it?—No, I cannot pretend to have had any very wide experience of it. We have used it for the last five years or thereabouts mainly for heavy joists.

104. Have you had any with large knots running through it?—Sometimes, and same shaky, too.

105. Would you call that the top of the trees?—I should say that timber was cut well up the tree in view of the full size of the Oregon tree.

106. And the quality of the stuff?—Yes. It is not all one quality—there is no good denying that. We have had Oregon timber here 13 by 13 which was scarcely worth cutting up—it was so shaken and had arrived from Melbourne in that condition. Of course, the Oregon we use in Southland mainly comes from Melbourne, because it can be landed cheaper from the Bluff than from Wellington.

107. Have you ever tried any of the beech or birch that you have here in large quantities?—Yes, we are using it just now, and also a few years ago.

108. How does it compare with rimu?—I think it is a much more durable timber, but it has got a nasty habit of curling, and shrinks more, but it is certainly a much more durable timber. I saw one building built over forty years ago which had apparently never been painted, and I examined it, and found the plates about the place as sound as a bell. That was in the lakes district, and the timber was red-birch. I am now building a house for a client of mine costing some £1,600 or thereabouts, and he would not have any totara in the building except where I highly recommended it in the way of window-sills—the whole of his place is to be put up in birch. After his own experience he would not have a bit of totara in the job except where it was immaterial whether it split, which, of course, it is inclined to do.

109. In view of the fact of birch being brought into consumption for building-timber, will the timber-supply increase?—I think the timber-supply will be much more useful in the future. If birch is obtainable in Southland it has a future before it.

110. *Mr. Barber.*] In your experience, has the high price of building-materials interfered with the building trade?—Well, I do not think it has really seriously interfered with the building trade, because we have just been through a period of prosperity. Although I dispute that there has been what you may fairly call a boom, still, we have certainly been prosperous. I do not think many people have wanted buildings and had to go without them on account of that; but should we get a lengthened period of depression, I am quite sure that the largely increased cost of building will be seriously detrimental to the building trade. That is where we shall feel it. So long as we are prosperous I do not think it will make any great difference. I have not heard of people here being herded up in confined quarters or being inconvenienced by present prices. Money has been cheap, and things generally prosperous. I think it is too soon yet to say, but probably the slackness is due to that, as well as the scarcity of money.

111. You mean the scarcity of money or the high price of timber?—Both.

112. And, of course, you realise that if the timber industry or building trade is slack a large number of the artisans are unemployed?—Yes, and it is very far-reaching.

113. Do you not think that when the timber was very plentiful here that was the time to put the duty on the imported article, and now that the timber is getting scarce and very difficult to obtain, do you not think that that is a reason why we should be a little more reasonable in our restrictions with regard to the imported article?—Well, of course, while timber is plentiful it is cheap.

114. *Hon. the Chairman.*] Not always?—It is practically so with us. While timber was plentiful with us it was on the flat country, but now they have to go to the hilly country, and very soon will have to go to the mountain country.

115. *Mr. Barber.*] Do you not think, as the timber here is getting scarce, and as you say the imported article is equal to the local timber, that we should allow the imported article to come here?—Well, of course, if you can do it without crippling the local industry it would be all right. It has to be shown whether it would really be fair to the local industry.

116. Do you think that, if the cost of timber is high owing to the disadvantages of procuring it, rents are to be kept up to an exorbitant price and the building trade restricted?—I do not think it has come to that. If it went any higher, I say Yes. I think it is as high now as it can fairly stand.

117. Have you any reason for believing that it is at the maximum height?—No; I think it is more likely to rise again in the future—it stands to reason it must. When they go out beyond Waiau in this district there will be greater haulage, and that is not its limit then.

118. Do you think that if timber is likely to go any higher it would be fair to impose this additional cost on the workers who pay the rent?—It would be simply a question which affected the major number of people from a national point of view.

119. *Mr. Ell.*] In your experience as an architect, is any of the imported timber taking the place of the rimu and kauri for the inside work?—No, I do not think so. There is no timber at a reasonable price that would fairly take its place. They work more easily, but not more so than kauri: but we use very little kauri. I think we can land Oregon cheaper here than kauri.

120. Of course, kauri is practically cut out?—Yes. Of course, rimu is better than Oregon for finish. It is firmer altogether in the grain, and it has a beautiful polish where Oregon has not.

121. And you think no imported timber takes the place of it for that work?—No, not at a reasonable cost.

122. You have no doubt seen the extent to which rimu is used in our furniture-factories?—Yes.

123. Is there any imported timber to come up to it at anything like the price?—I do not think there is. I am personally very fond of rimu. I think it is one of the most beautiful timbers in the world, and I think we greatly underrate its true value for good work. It is often a great pity to see the beautiful figured stuff put into joists and other roof-stuff, and buried in a building where it is absolutely lost—it is a material which is fit for any pianomaking.

124. Having regard to the fact that it is necessary to consider the more permanent industries of the country—that is, woodworking and furniture-making, and so forth—do you think it is necessary that we should make some permanent reserves so as to perpetuate the supply for our standard industries?—I think it would be a very wise thing to do. Such a thing never occurred to me, because the day will undoubtedly come when timber will be almost unprocurable.

125. And you know of no timber so well suitable at the price?—No.

126. Now, in regard to beech. I refer to this because it is the quickest-growing—it will reproduce itself?—You are referring to the red-birch?

127. Yes. Do you think, if it were cut at the right time only—that is, during the winter, when the sawmillers themselves say it is not liable to shrink and warp—that that would help to put it on the market with a better character?—Yes, I think it would. Of course, on the other hand, it is almost impossible and hopeless to expect to get it cut in the winter only. It would not pay the miller to run a mill only for winter cutting. We cut the whole year round, and the only way to control it is for the individual who builds to time his building so that he may get winter-cut timber.

128. But you say that on account of the twisting and warping it is practically useless for building purposes?—No, I do not say so—decidedly not. I told you of two cases where we recently had it used with very gratifying results, but I still say it shrinks and warps more than red-pine does, and it also has a tendency to split in cases like window-sills and heavy material, which, of course, is a serious detriment to the building.

129. If it were properly seasoned, do you think it would?—For ordinary framing-work I think it is suitable and more durable than red-pine.

130. A miller has told me that it is better in damp situations?—Yes.

131. In regard to seasoned and unseasoned timber, speaking as an architect, is a building likely to last longer built with seasoned timber than a building built of green timber?—Yes, decidedly. That is common knowledge.

132. And it lengthens the life of a house?—In the case of ordinary cottages you get your timber on to the job and up-end it, and it is generally sufficiently seasoned when you come to construct your building.

133. How long does it take to season the timber?—It varies according to the season. With large joists it takes longer. What I said applied to 4 by 2 for the construction of framed houses. Such stuff seasons quite sufficiently, and you would never detect the shrinkage if it is a given a fair chance.

134. You told us that in this town, as large as it is, you found a difficulty in obtaining 1,000 ft. of seasoned timber?—Yes, very difficult. It would not be so at this moment, but that would generally be the case. At this moment there is a slackness.

135. The millers do not seem to cater for the demand for seasoned timber?—I understand it does not pay them with the double handling.

136. I have here price-lists of experienced sawmillers and timber-merchants in Christchurch, and the difference in the price of seasoned southern red-pine is 1s. per hundred feet?—That is in Christchurch; but then you are not in a timber-producing district there—they have to store it; and this is a timber-producing district. It is like going to the Bluff to buy fish. You cannot buy it retail: it is sent away in big orders, and it would not pay them to hold it, and likewise it would not pay our millers to stack the timber and season it here. I have given you the reason why the architects do not insist upon its being bought seasoned. It is not necessary, and the clients will not wait. They come to you and want a building put up. You have to hurry and get it done; and the stuff is growing in the bush. You know the heavy joists will shrink and give trouble, and our only way is to use one timber for the purpose.

137. And from a public standpoint it is a matter of economy to use Oregon as against green timber?—Yes.

138. I find that the difference here in red-pine 6 in. by ½ in. unmatched lining is 6d. per hundred feet?—That is between seasoned and green.

139. Do you think it is too costly for timber-merchants to season timber in view of the small difference there is between the two?—You are quoting Christchurch.

140. Why should it cost more to have it seasoned here?—Because here they do not stack it, but there they have to. They must stack it or it is detrimental to the timber.

141. But if it only costs them 6d. there to season it, why should it cost more here?—Because they have to stack it there. The fact remains that we do not do it. A miller will stack the timber for you, but I understand it is a matter of arrangement between the two to save the builder the trouble of putting it on another site.

142. Evidence has been adduced here to try and show that timber-merchants cannot afford to season the timber properly?—Yes, I do not think they can in Southland.

143. With regard to preserving our timber-supply and the export duty, the quantity of timber exported in 1895 was 191,000,000 ft., and in 1907 432,000,000 ft. In view of that increase in twelve years, do you think, with the increasing demand for timber as the population increases, that the industry should be put on a better footing?—Yes, I think so. It is a pity it was not done twenty years ago.

FRANCIS LEVI VICKERY sworn and examined. (No. 8.)

1. *Hon. the Chairman.*] What are you?—A builder, and secretary of the Builders' Association. I may say that I am in favour of the duty being reduced on heavy Oregon on account of the utility of the timber for use here. It was mentioned before the Commission that Oregon timber would not stand more than four years. Well, I lived in America, and worked amongst timber for two or three years, and also worked amongst Oregon timber, and I never heard of it only lasting that short time. It has always been considered to be a lasting timber. There is a class of timber grown in Canada and North America, a sort of sugar-pine, which would only last perhaps four or five years. I might say that I have a straight-edge made of Oregon: I have had it in use for twelve years, and it is in good condition now, and has been lying about in the grass at various places. Then, in regard to the cost of building, I quite agree that the cost of building is about 40 per cent. more, at least, than it was fifteen years ago. I have a list of prices here that I paid for timber in 1887, obtained from Mr. Massey, delivered at West Plains. Ordinary red-pine, 4s. 4d.; 8 in. by ½ in., 3s. 3d.; rimu, 4s. 4d. delivered on the job, and totara, 9s. 6d.

2. What distance had it to be carried?—He had a mill at Makarimu, and he delivered it on the job four or five miles distant at that price. The price of timber, all lines, was 6s. 3d.; 10 in. by ½ in., 5s. 9d.; 3½ in. T. and G. without the tongue, 6s. 3d.; 6 in. by 1 in. T. and G., 5s. 9d.; 6 in. architraves, lineal measure, 8s. 6d.; and 3 in. ogee milling, 5s. 9d. Then I have the later prices (1895) of the Excelsior Timber Company—rough stuff delivered in a town, 5s. They have a very small forest now about cut out. Then the Excelsior Timber Company was in partnership with a man named Dawson. The prices were, for that year—rough timber (rimu), 5s. per 100 ft.; dressed weatherboards, 7s. 3d.; 7 and 8, 6 in., 7s. 6d.; ditto, 4 in., 8s.; black-pine, 10s.; T. and G., 3½ in. by ⅝ in., 7s. 9d. That is subject to only the usual 2½ per cent. discount; but I have some quotations here that were subject to 12½ per cent. McCallum's rough stuff in 1900 was 6s. 9d.; 4 in. by 2 in. ordinary rimu—first-class, 6s. 9d.; second-class, 5s. 3d.; dressed stuff, 6 in. by 1 in., 10s. 3d.; 12 in. by 1 in., 10s. 9d.; and there are various other things in proportion. This was subject to 12½ per cent. discount, and 2½ per cent. extra on payment of the account—making 15 per cent. altogether. But timber went up shortly after that. A combination was formed, and the price went up to 8s., I think. The cost of building must be more now, as the price of timber grew higher.

3. *Mr. Clarke.*] There is one question I wish to put to you with reference to the formation of the Sawmillers' Association. A statement was made in evidence the other day which had some bearing on the Sawmillers' Association of Invercargill. It was stated that the association was formed for certain purposes, and I want to know if you agree with the witness when he said that it was formed in self-defence, because a builder would come to the office and ask for a quotation. He would be told it was 6s. per hundred feet: he would then go to another sawmiller and ask what was the price, and would probably be told the same thing. The contractor would then say, "I have just left So-and-so, and he has offered the timber at 5s. 6d." Consequently they were bound to have some understanding amongst themselves. Do you agree that that was the moral tone of the builders of Invercargill and Southland at that time?—No; but I admit that the sawmillers used to cut against one another: they gave different quotations, but the builders are not in the habit of explaining their tenders to another man.

4. *Mr. Field.*] That is in Mr. Massey's sworn evidence?—It may be, I do not know.

5. *Mr. Clarke.*] With regard to the increased cost of timber, it is not very long since the increase went up from 6s. 9d., less 12½ per cent., in 1900, to its present price, and the main bulk of the increase has been within the last nine years to 10s. 6d., minus 5 per cent.?—About 4s. per hundred, roughly speaking.

6. That in itself would largely account for the increased cost of building within the last nine years?—It would account for 33 or 40 per cent.

7. Not only with regard to sawn timber, but do you not think that there has been a great proportion of the increase in the cost of manufacturing milled stuff—timber run into mouldings? Has not that increased at a greater rate than the ordinary sawn timber?—I think so. Take 1½ in. nosing, which used to be sold at 2s. 6d. per hundred, and now I believe it is 9s. 9d.

8. Do you not consider that is good evidence of the increased cost of building-material?—It is very much used. And cavetto is also high. I think the sawmillers might come down on these lines.

9. You think it would not be fair for them to say they are only making a reasonable profit when they are selling stuff at £1 10s. per hundred which they are making for 10s. 6d.?—I do not know much about their cost, but it stands to reason that their profit is great on small mouldings.

10. If it has been admitted that it costs them 10s. 6d. for the timber, and 9d. extra to run the stuff into mouldings, would you not consider £1 10s. rather high for stuff that has cost them about 11s. 3d.?—Taking the cost of production into account, it does seem rather high, I admit. The buildings that are being erected now, especially residences, do not have as much timber in them as they used to have. Therefore they do not get quite so permanent a job. They may have a more finished job, but the permanency of the job has suffered. There are lighter timbers used now, and the rafters are further apart. For instance, they used to be 18 in., now they are almost 2 ft. centres; and sarking I used to put on 1¼ in. thick, and now the timber used is lighter and second class, mostly 8 in. by ¾ in.

11. With regard to the difficulty of conserving your timbers, do you not think it would be advantageous to restrict the use of red-pine as far as possible to inside work and to joinery, and not use it for rough work any more than is possible, so that we could have a greater supply to go upon for finished work?—It think it would be. Red-pine is certainly a very good timber and

well figured. It is a very pretty and very valuable timber. In fact, in any part of the world you would not find a better timber in appearance.

12. Do you not think we should have full liberty to import Oregon, not altogether from the effect it would have on the sawmiller, but with a view to conserving the Dominion's interests and use of its own natural products? Should we not do all we can in that direction by using foreign timber where we can get it at the same or a lesser rate?—I think so. Of course, we must take into consideration our industry a little, but I think it would be wise to import Oregon and conserve the red-pine, as it is getting very scarce; and if building goes on at the rate we had during the last two or three years the local millers will not be able to supply us except they stick on a high price and go further for it. I think it is essential to the building trade of the colony to import Oregon.

13. With regard to the so-called injury to our interests, do you think this generation has a right to use up all the timber without any consideration for the future?—No, I think we should look to the future.

14. Do you not think it would be wise to protect the sawmillers against themselves by not allowing them to destroy the industry within the next thirty-five years?—I think it would be a wise thing to conserve some forests for the future, and not allow the whole of them to be cut out.

15. Would you be in favour of a policy which would insure replanting on some scientific and systematic plan?—What would you replant?

16. I am not saying what to plant, but that would be a matter to be decided by those competent to determine. Would you be in favour of taking immediate action to secure a constant and permanent supply of timber for this Dominion and within the Dominion itself?—I would.

17. *Mr. Morris.*] Have you had any experience of the conversion of logs into sawn timber?—No; I have seen it. But my opinion is that if Oregon was imported free in bulk or junk it would keep the labour in the country.

18. Then, of course, you have no idea as to whether our native timber would answer for the purpose Mr. Clark is anxious to conserve this timber for?—No.

19. I am leading up to this question: What is the sawmiller to do with the whole of the timber that comes out of the log if you want to restrict him to the sale of stuff fit for dressing purposes only?—Well, the sap-wood is wanted sometimes for inside work, and it sometimes makes very good moulding, but would not do for polished work.

20. You should know that the cleanest part of the timber is next to the bark?—Yes, and the sappiest, too.

21. What percentage would turn out marketable for present purposes off of a log?—Well, I suppose it depends on the kind of log. You get hold of some that would produce more than others. I suppose you would get about 50 per cent. out of a good log.

22. You would be lucky to get 50 per cent. altogether?—Run it into mouldings—the sap-wood.

23. I think about 30 per cent. is as much as you would be able to work up. Then, what are you going to do with the balance?—There is a great demand for second-class timber at the present time from the farmers, and the millers get good prices for it. The farmers prefer second-class stuff.

24. You admit that we have to sell it somewhere? We cannot cut the outside off the trees and leave the rest?—The sawmillers will find some means of selling it.

25. Some members of the Commission were advocating the use of rimu for inside work: that is the only place you can dispose of the rough timber of the rimu. It is all contained in the centre of the tree, and is the best timber for bottom plates?—The timber used here for that purpose is totara or black-pine.

26. You made considerable reference to the difference in price now and some years ago. Do you think the Sawmillers' Association in this district is responsible for the rise in price?—It is to a certain extent.

27. Why not buy from a man not concerned with the association?—I am told that a good many not in the association are under the association.

28. Then, they are in the association?—No, but the association members buy their output, and in a good many cases they are men of small means and are anxious for the cash. I have heard of such being the case, but, of course, I do not know for a fact whether it is true or not.

29. Is not the usual experience that when trade slackens prices come down?—But the timber is not coming down.

30. Is it not evident that it cannot come down much more and leave any margin of profit for the man working it?—I suppose they have got some reasons on their side, but on the other side, if it were to come down, it would increase our building trade.

31. After the evidence that we got from Mr. Wilson as to the improved quality of the buildings in recent years, do you attribute the cause to the increase in the price of timber?—Not altogether. The price of bricks has gone up, and also of labour. In addition ironmongery has slightly gone up.

32. Is it not very largely due to the fact of the increased conveniences put into houses built to-day as compared with ten or twelve years ago?—There is something in that. Houses now have hot and cold water, wash-tubs, and under the sanitary by-laws of the town we have to put in inspection-chambers. All these things add to the cost of a building. Of course, it is much better for the owner and occupier, but it adds to the cost.

33. Then, this bogey that is put forward that the increased cost of buildings is due to the increased cost of the timber is not quite true?—Not altogether, that stands to reason.

34. Is it not more largely due to the improved style of the buildings?—But the cost of the timber is the biggest item.

35. What does it amount to—20 or 25 per cent.?—It all depends upon the kind of building. Here in my own hands now I have one with a 4½ in. brick wall outside.

36. I mean a wooden building altogether?—Weatherboards? It all depends on the size of the building. Do you mean a four-roomed house?

37. Say the average cottage building for a working-man, with four rooms, a scullery, and bathroom?—You must have a bathroom now according to the by-laws of the town. Say from £90 to £100

38. What would be the value of the cottage when finished — the building alone?—£350, probably.

39. That is not much more than 25 per cent. when all is said and done?—The average cost of the timber on a wooden building is about 30 to 33 per cent.

40. *Mr. Barber.*] Do you mean increased cost?—No, the total cost of the timber. The rest is taken up by ironmongery, bricks, conveniences, piping, and so forth.

41. You say that the conveniences that are insisted upon by the municipality add to the cost of the house?—Yes.

42. But, comparing the price of timber to-day with what obtained ten years ago in regard to style, would there be any increase in the cost of erecting it?—They did not have those by-laws then.

43. But supposing you were asked to erect the same style of cottage where the by-laws did not prevail?—Yes, I had an experience of that kind twelve months ago. For the same plan of fourteen years ago I made it £400, and at that time it was £227 for the same style of house. I did not get the job all the same.

44. Do you believe that slackness of trade in the building line is due to the high price of material?—I would not say that. Of course, you know the money-market is a bit tight; people cannot borrow so easily, and living is a bit higher.

45. They can borrow, but they have to borrow more to build a house?—And they have to pay a higher rate of interest. In some cases unless they are very good marks they might have a job to get the money.

46. Do you think it is a good investment to build houses with the present material?—There are some. I met a man some time back with plenty of money, and I asked him if he was going to put up any more houses. He said things were too high now. He did not say timber, but he meant that the cost of building was too much money.

47. *Mr. Ell.*] With regard to the price, you were saying just now that you thought millers could come down on certain lines of timber?—Yes.

48. I want to know whether the prices here have gone up the same as in Christchurch?—No.

49. Take glass doors?—Of course, doors have increased very much in value during the last ten years.

50. Glass doors in Christchurch in 1894, 2 ft. 8 in. by 1¾ in., was £1 2s. The price now is £1 10s.?—Well, I know that about sixteen years ago I had as much as 25 per cent. discount on doors, and the prices are much higher now.

51. What is the discount on doors now?—5 per cent.

52. Ordinary glass doors in Christchurch, 2 ft. 6 in. by 1½ in. kauri, cost 9s. in 1894. In 1904 they cost 15s., or an increase of 6s. The builders can make them very much cheaper themselves.

53. You do not think that difference is altogether justified?—It is justified with kauri doors, as kauri is much dearer nowadays. But it seems a very high advance.

54. Flooring, 7 and 8, 6 in. by 1 in., in 1894 was 11s. 9d. a hundred, now it stands at 18s. 6d. for red-pine. In your experience do you think that increase is justified?—Not so much as that. In 1895 it was 7s. 6d. for other lines, and now it is 15s. There is one thing I notice —the sawmillers stock their timber here, and they charge 1s. per hundred for seasoned timber.

55. They charge 2s. per hundred for seasoning in Christchurch?—Yes.

56. With regard to seasoned or unseasoned, what is your opinion?—Of course, I prefer the seasoned timber.

57. What would be the difference in the cost?—It would pay a man to have seasoned timber every time.

58. I understand you to say that the difference in the cost is not very much?—Not very much.

59. How many thousand feet would you require for a four-roomed cottage?—It would take fully 10,000 ft. of timber. I think it would be wise on the part of an owner to have thoroughly seasoned timber.

60. It would be thoroughly economical?—Yes. Even if you scrim and paper over rough work you will find the scrim bagging, whereas if it were dry timber that would not be so, and it would last.

61. Would it be a good thing in the interests of the public to do anything in the way of enforcing the seasoning of timber?—It would be for the benefit of the public if the architects were induced to specify that all timber be seasoned thoroughly. It would be more satisfactory to the owner and also to the builder.

62. Have you any difficulty in obtaining seasoned timber in this town?—We generally get it direct from the mill, and stack it as soon as possible.

63. *Mr. Arnold.*] It is not the usual thing to specify for timber to be seasoned?—No, only for certain work.

64. When it is not so specified, and tenders are called for, are they supposed to put in green timber?—No; they are supposed to give it as long a chance as they can.

65. The point is, if there is a difference of £5 in the cottage owing to the seasoning?—Well, it all depends on the conditions. It a man puts in a tender, and intends to put in thoroughly

seasoned timber, unless he mentions it the architect would not know, and the other man gets the advantage.

66. So that any desire to use seasoned timber only, which is not likely, I presume, is for the proprietor to specify?—Yes, that would mean that the sawmillers would have to keep fairly large stocks. There is no doubt that a lot of timber has been wasted at the bottom of the stacks, because they always take the top of the stack and the bottom is left.

67. Everything is taken from the raw without being thoroughly matured?—It is so with regard to timber, I know. In regard to furniture, I think they season it very well.

68. Is it not a fact that the only cure for this would be by a very much larger output and larger stocks, and much larger capital than at present?—Yes, unless they become a monopoly and bump up the prices as high as possible.

69. Could the small mills afford to stack the timber for one or two years?—I think it would pay them at 1s. per hundred.

70. Everything would depend on the specification?—Yes. If a man was to order seasoned timber we should have to supply it.

71. Can you give us a suggestion as to how to bring it about?—I think the people want to be educated up to that kind of thing.

72. Would municipal by-laws cover it: do you suggest municipal interfering?—That might interfere with the liberty of the subject. It is different from a question of sanitation. Of course, it could be done by municipal control.

73. *Mr. Stallworthy.*] How long does it take to season red-pine for building purposes?—It ought to be twelve months, but it would dry very well in three or four months.

74. Could a man not get the timber himself and have it seasoned—that is, keep it on the job for a time seasoning?—There is nothing to prevent him. Builders do not like that, however, although there are plenty of ways to do it. They have only to pay an extra price. I have known people to get the timber on the ground for six months before the house was put up.

75. *Mr. Field.*] You told us the cost of rimu in 1900 was 6s. 9d. Then you said, in nine years it had gone to about 9s.?—It is 10s. 6d. now.

76. You said, just after 1900 there was a sudden rise because of the association. Therefore in 1901 it was selling at more than 6s. 9d.?—It was 8s. 6d., I think—it went up by a big rise.

77. I want to show that Mr. Brent is right?—Two years ago there was a little bit of a split with the sawmillers, and we got the benefit of it by a 12½-per-cent. discount. It was only 9s. 6d. then.

78. Mr. Clarke, in asking you a question, suggested that the millers were getting £1 10s. for what cost them 10s.?—I did not work it out. It is easily worked out.

79. What would they be worth now?—Two-inch dado moulding, 11s.; rough timber would cost them about 1s. 9d. It certainly counterbalances the small profit of 1s. a hundred.

80. *Mr. Leyland.*] How much do you estimate for the running—for 100 ft. lineal?—I do not suppose it costs very much to run through that—say 9d.

81. In 100 ft. super. there are 6 ft. running?—This 100 ft. is solid lineal.

82. You told us before it would come to £1 10s. super.?—It would come to more than that—it would come to £3.

83. *Mr. Field.*] Would you as a builder pay 2s. a hundred more, or any other sum, for seasoned timber than for timber just cut?—Only 1s. a hundred is required here.

84. Would you be prepared to pay 1s. a hundred?—If I were building a house for myself, yes.

85. But if you were building a house for me, and I did not contract for seasoned timber?—I would do the same as other people—get it as dry as I could.

86. You said you believed in conserving the timber. Supposing you are the owner of 500 acres of timber country, and it is fit for farming as well, and for some reason or other you are forced to conserve it, what are you going to do if you are a poor man and you are forced to tie it up?—I do not think that is likely to occur. It should be a State job.

WILLIAM STEAD sworn and examined. (No. 9.)

1. *Hon. the Chairman.*] What are you?—A furniture-maker. I do not think I can give you much information in connection with what the Commission really wants to know, because Oregon pine does not affect our trade, and the various prices you have been told about by the sawmillers. There has been a slight increase in the price of timber to what it was a few years ago. I suppose, in the furniture trade it is from 10s. a hundred up to 18s. The increase has been mostly in wide timber. I am speaking from memory when I say that 12s. 6d. was a good price for 12 by 1, and 18s. 6d. dressed.

2. Do you think that was too much?—We have got used to it, and it is the ordinary price. Of course, we would much prefer it to be lower, but the quantity I use is not extra great, and with the combine in the timber business it means you cannot get it any cheaper, and therefore you have to pay it. The association fixes the price, and if you can get it at the mills outside the association you will get a discount of 15 or 17 per cent. off.

3. Can you get it at the outside mills at a cheaper rate?—Sometimes. The last lot I got cheaper than from the association..

4. Then the price is not ruled by the association?—They practically charge the same as the association charges, except that they take off 17½ per cent., including 5 per cent. for cash. The prices for the other timber for making furniture are fairly high, and I do not think it will compete with the local timber—I refer to the walnut and oak. I cannot say that we have used much birch here—it is nearly all red-pine. I do not consider the timber we get now is as good as we

used to get. In ordering an amount of red-pine you get a proportion of miro in it, which is not as good as red-pine. Red-pine is being used for chairs, and a fair amount of beech is being used for furniture in Christchurch. We are getting birch now at 1s. less than red-pine. The Oregon does not affect us in our line—we do not use it at all.

5. It would not affect you in any way, whether the duty was increased or reduced?—It would not affect us, because I do not think it is a timber that we would use in the making of furniture unless it was cheap. You may use it for inside work, but not outside. We are debarred by the borer from using white-pine. There are imported woods that do affect the New Zealand wood, one being the American three-ply, and they are importing that largely just now for the inside of drawers and other inside work, such as the backs of mirrors.

6. *Mr. Clarke.*] What about the American clear-pine?—We very seldom use it. I believe they use nothing else but the three-ply in Dunedin and Christchurch.

7. *Mr. Hanan.*] How do the prices for locally manufactured furniture compare with the prices which obtained five years ago?—The locally manufactured furniture runs about the same. The difference has practically come off the profits. You do not get any more for the furniture, although you pay more for the timber. The labour used to be 8s. a day, but now it is 10s., and that makes the difference.

8. Do you think that that is the chief factor—the increasing wages—in accounting for the increase in the price of furniture?—Yes, and this has to be taken into consideration also: that the furniture made now is much higher in quality than what it used to be, so that you could scarcely compare the price of the furniture now with what it used to be. Nearly every house now has its duchess chest and washstand.

9. But the increase in the price of timber has not contributed to the increase in the price of the locally manufactured article?—Scarcely.

10. I do not know whether it is relative to the inquiry, but do you find that imported furniture is increasing in this country?—I think it is. There are travellers around now pushing the Home furniture, and you can get it fairly reasonable—such as oak or walnut—and you could scarcely compete against that. If you get the oak and walnut made here you could not compete against the Home article, because of the timber being so dear.

11. *Mr. Jennings.*] How do you find the class of workmen now as compared with fifteen or more years ago?—Taking them as a whole, they are better now, because the class of work they have been doing has been different. Of course, I could not speak for any place outside of Southland. For tradespeople it is fairly good here, equal practically to what they have in Melbourne.

12. And you find the timbers here suitable for the manufacture of furniture?—Red-pine is: I do not think you can beat it if it is seasoned. I have used a great deal, but the trouble is to dry it. A great waste is in the drying, as very often you have a very good board that splits right up and makes a lot of waste.

13. *Mr. Field.*] Would you call this an accurate statement made by a well-known North Island architect the other day: that for first-class building-timber he would only put one timber ahead of heart of rimu, and that that was English oak?—I would not like to say that, because I do not know the durability of Oregon. Of course, red-pine is very good as long as it is kept dry, but I do not think it would stand anything compared to oak.

15. You say that timber has gone up from 10s. 6d.: that is, of course, heart of red-pine?—They charge us more if we order it figured.

16. It is good stuff, of course, or it would not be fit for furniture-making?—Yes.

17. It has gone up from 10s. 6d. to 18s. 6d. during a few years?—Not in a few years—I am speaking of when it was cheap. Of course, as I say, you could buy timber from 5s. upwards, grading from 8 by 1 up.

18. In what period has it gone up from 10s. 6d. to 18s. 6d.?—Twenty years.

19. And you say you have been able to get it as low as 17½ per cent. off 18s.?—That is not the general thing: it is taking advantage of pushing it, because things have been low perhaps.

20. You pay 15s. for a particular grade. In this case it has gone up only 50 per cent. in twenty years, or if you put it down at 18s. it has gone up 75 per cent. in twenty years?—Yes, about that.

21. In view of the fact that timber all over the world has gone up 50 per cent. in ten years, do you regard that as a serious increase in cost?—I do not think so. Of course, we know that timber is getting further away, and getting scarcer, and the extra cost must be borne.

22. How wide were the boards you were getting for 18s.?—18 by 1, not dressed.

23. That is 18 in. wide?—Yes.

24. Have you been up to the timber-mills here and seen the class of timber they are moulding?—I have not been particularly to the mills.

25. You know they are not very big trees taken all through: the timber is only big here and there?—Yes, big trees are scarce there.

26. Do you not think it is a very reasonable price?—I dare say it is cheap, but when you are used to getting it much cheaper you do not think so.

27. But in view of the increased cost of labour and the fact of having to go further back?—I think it is a reasonable price, because I understand it is very hard to find a mill in this country that is making a profit. I understand they have lost money, but I only heard that in a conversational way.

28. You have not come here to suggest that these millers, as some other people would have us believe, are rascally people?—Well, some of them seem to be doing very well, and I would not mind changing with them. There is an explanation: that in some instances a man has secured a forest and bought a long way ahead, and he is not paying the same royalty as the others.

29. I am speaking of the average miller who is taking up Government property, and paying 6d. per hundred in advance?—I say the advance they are paying on that is reasonable, because

the timber is much scarcer. The only thing is that they are cutting trees now that they used to pass at one time; they have to do it. Where an area has been cut out they have started and gone through it again, so that they may make a little there.

30. Do you regard this beech as a first-class furniture-making timber for chairs?—I do not think you can beat it for chair-work; it is equal to walnut for durability and standing. Of course, the beauty of it is that it stands beautifully, and looks almost like walnut.

31. *Mr. Clarke.*] You said nothing could beat red-pine for furniture: by that you mean rimu, I presume?—Rimu when it is thoroughly seasoned. If it got the same course as the Home timber it would be equally as good.

32. By red-pine you mean rimu only?—Yes.

33. You say that in some of those orders they were selling a good proportion of miro?—In 2 by 1 and 4 by 1. You do not get any of that in 16 size.

34. Is that where the rascality creeps in—in sending you miro for red-pine?—When you get a little you do not mind, but it is a very hard timber, and you cannot drive nails in it the same way.

35. With regard to the suggestion that you are not bound to deal with the associated millers, do these people ever approach you seeking to do business, or do you have to approach them—those who do not belong to the association?—I do not know that they do. See, it would not pay them to go to bothering us, because we only take, perhaps once a year, about 20 pounds' worth or so, and it is eighteen months perhaps before you can use it.

36. You mostly deal with the associated millers?—Generally with them.

37. *Mr. Morris.*] You have just told us that you only take about 20 pounds' worth per annum?—At certain times—generally about the winter—and stack it up. That keeps us going.

38. When you can get it you want rimu chiefly for your work?—We do not order special timber now, because trade is different—because it is all mostly stained wood—in fact, we order it without figuring. There is not the demand for figured stuff there was.

39. You do not expect that the timber will be cut out in your day for all you require?—Not for the furniture, but I expect it to go much dearer.

40. It will be very difficult to get?—The further it gets away, and, of course, they are getting pretty far away now, and the part of the country is very rough—getting back to the hilly country.

41. Knowing the cost, you will select the class of timber for your work, and no rough timber at all?—No rough timber at all. It is all cut up and hand-dressed, and you must have the best.

42. You buy it green, and season it yourself?—Yes. Of course, we pay a little extra.

43. *Mr. Barber.*] You said the timber had gone up 8s. in twenty years?—Yes.

44. What knowledge have you got of the price twenty years ago?—The fact that I bought it.

45. At Invercargill?—Yes.

46. Do you know that a witness this afternoon produced stamped receipts showing that he had bought it for 4s. or 3s. 9d.?—I believe that.

47. And do you know that good timber was much easier to get then than now?—By a long way.

48. If the ordinary timber was 3s. 9d. twenty years ago, the timber you require for your work would be about 10s. for the 18 by 1 you require for your work?—I think it would be about that.

49. Do you know what Professor Kirk says about timber twenty years ago: He says first-class rimu for building purposes was loaded on railway-trucks at 4s. per 100 superficial feet. Do you think you really did pay 10s. 6d. for it twenty years ago?—Yes, I think so.

50. Therefore it seems that the difference then was a great deal more than the difference now, because ordinary building-timber was £1?—I think so.

51. Do you find any difficulty in competing with imported furniture?—Not unless they go in for the same kind of timber. The people are better off, and some of them like to get an oak or a walnut, and perhaps they are willing to pay a bit more for it. I think, in the ordinary run of things, the difference does not affect us.

52. You said that the increased price of production was caused by the rise in wages?—That is natural.

53. What machinery do you use?—I use machinery.

54. You have no more machinery than you had twenty years ago?—No.

55. Speaking on behalf of your trade, what machinery is used in Invercargill?—There are three factories here, and they use a large lot of machinery. Nearly all the ordinary stuff we get from the factory.

56. Is it not a fact that, in consequence of the machinery that is used to-day, the amount spent in labour, although there is an increased wage, is very much less proportionately than it was twenty years ago. I am speaking of the trade as a whole?—I could not say that.

57. Would you be surprised to know that it is so?—Of course, machinery puts it down, and gives you stuff we could not produce. I have not been into any of these up-to-date places. We could not make the stuff for the money. I am not surprised at what you state.

INVERCARGILL, TUESDAY, 30TH MARCH, 1909.

CHARLES ALBERT PIPER sworn and examined. (No. 10.)

1. *Hon. the Chairman.*] What are you?—I am Traffic Manager of the railways in Invercargill.

2. Will you just give to the Commission a statement as to the traffic in timber, the railage according to distances from the bush to here and from here to the distributors?—To give you a statement of the various charges from all stations now would cover pages, but I could have a printed statement produced.

3. *Mr. Leyland.*] What are your minimum charges for certain distances, and your charges for certain distances above that?—I will read out the charges, say, for the first ten miles, and every ten miles after that. White-pine is charged one rate, then red-pine, and then Oregon pine is charged at rate and a half.

4. *Mr. Barber.*] What about totara and matai?—That is taken the same as red-pine. Well, ordinary rates for timber up to 10 miles is 8d. (one mile would count the same as eight); for 20 miles, 1s. 4d.; 30 miles, 1s. 8d.; 40 miles, 1s. 11d.; 50 miles, 2s. 2d.; 60 miles, 2s. 6d.; 70 miles, 2s. 9d.; 80 miles, 3s.; 90 miles, 3s. 1d.; and 100 miles, 3s. 2d.: and now you can take it for 20 miles after that—120 miles, 3s. 5d.; 140 miles, 3s. 7d.; 155 miles, 3s. 8d.: and it was after 155 miles that the last reduction was made, in January. Now, from 155 miles the rate is taken in groups of five miles. In fact, it is practically taken in groups of ten miles. These rates are made up in the Head Office: 155 miles, 3s. 8d.; 165 miles, 3s. 9d.; 175 miles, 3s. 10d.; 185 miles, 3s. 11d.; and so on right up to 400 miles. Now, those are the ordinary mileage rates for ordinary timber.

5. That also applies to logs as well as sawn timber?—Yes. Of course, we have no log traffic down here. These are the ordinary rates for mileage so far as this part of the railway is concerned, less the reductions which were made to the Southland mills on timber to Dunedin and beyond.

6. *Mr. Ell.*] You said there was a difference in white-pine?—The charges I have given are for the ordinary timber.

7. They are general?—Yes. I will take white-pine separately. Those rates which I have given you are subject to a reduction as follows: We had, I might explain, an old rate up to December, in which timber from the sawmills in Southland consigned to Kensington or Dunedin was charged 1s. less, and stations between Pelichet Bay and Orari 9d. That regulation has been altered, and the sliding scale has been made to keep it in uniformity with the new rates.

8. *Mr. Jennings.*] When was that alteration made?—At the beginning of January. Now, those reductions, I might explain, only apply to sawmills in Southland sending timber to Dunedin and north; the same distance going anywhere else would be subject to the ordinary rates. Timber from sawmills in Southland consigned to Kensington and Dunedin will be charged 1s. per hundred superficial feet less than the classified rates, and the further reduction for distances beyond Dunedin is as follows: Not exceeding 160 miles, 9d.; 220 miles, 8d.; 230 miles, 7d.; 235 miles, 6d.; 240 miles, 5d.; 250 miles, 4d.; 255 miles, 3d.; 260 miles, 2d.; and 270 miles, 1d. Then the reduction exhausts itself, and you come back to the original rate.

9. *Mr. Leyland.*] There was a sliding scale in January?—Yes.

10. And that applied generally?—Yes.

11. And are those rates less than that?—Those are reductions which are to apply to all timber consigned to Dunedin and stations north of Dunedin from Southland only.

12. Do you know if there is any similar arrangement in Waikato?—I cannot tell you that offhand—it will be in the regulations. I should say, speaking without the book, that there are local rates.

13. *Mr. Jennings.*] Do you have differential railway rates existing throughout the Dominion?—Yes. These reductions here are entirely on account of water competition.

14. *Mr. Hanan.*] The difference in the railage to Dunedin and Mosgiel is on account of the water competition?—Yes. If our rates were 5s., and the steamer would take the timber for 3s., we should have to cut into that.

15. Take Invercargill to the Bluff?—The same thing.

16. *Mr. Arnold.*] What station do you term "north of Dunedin"?—You start at Pelichet Bay.

17. But Pelichet Bay is in Dunedin?—It is not in Dunedin so far as we are concerned—you must make a start somewhere. Well, that is really all there is to be said so far as the ordinary rates are concerned, and so far as the reduction is concerned to the stations starting from Dunedin north. Now, with regard to white-pine, the rates are 8d. per 100 ft. up to 20 miles; 22 miles, 9d.; 24 miles, 10d.; 26 miles, 11d.; 28 miles, 1s.; and then, up to 32 miles, 1s. 1d.; 38 miles, 1s. 2d.; 44 miles, 1s. 3d.; 50 miles, 1s. 4d.; 56 miles, 1s. 5d.; 62 miles, 1s. 6d.; 68 miles, 1s. 7d.; 74 miles, 1s. 8d.; 80 miles, 1s. 9d.; and after that it is $\frac{1}{8}$d. per hundred feet per mile up to 180 miles, and beyond 180 miles it is $\frac{1}{10}$d. per mile. That is to say, you go ten miles for 1d. The difference in the rates between red and white pine, taking 25 miles, is as follows: 25 miles—red-pine 1s. 6d., white-pine 11d.; 50 miles—red-pine 2s. 2d., white-pine 1s. 4d.; 70 miles—red-pine 2s. 9d., white-pine 1s. 8d.; 110 miles—red-pine 3s. 3d., white-pine 2s. 2d.; 180 miles—red-pine 3s. 11d., white-pine 3s. 2d.; 300 miles—red-pine 4s. 11d., white-pine 4s. 2d.; 400 miles—red-pine 5s. 9d., white-pine 5s. The rates on red-pine are subject to the reduction

I have already mentioned. The reduction means 4d. per hundred in the case of Timaru—that is, taking from Riverton to Timaru; 1s. 8d. off Ashburton, and 2s. 4d. off Christchurch. I have given you that rate from Riverton because it is the ruling rate and applied down here.

18. *Hon. the Chairman.*] And does that apply to Oamaru?—No, not Oamaru. The rate 4s. is the same as before.

19. *Mr. Mander.*] Why not Oamaru?—Because the reduction was made to what the Head Office thought was sufficient to meet the case. There is not so much timber going along there—they use a lot of stone.

20. *Mr. Hanan.*] Is there not a distinction made between the rates on the railways on imported timber and local timber?—Imported timber is all charged rate and a half.

21. Can you say if the rates you have mentioned on timber pay the Department?—Well, I do not know if that is a question I should answer—it is hardly within my province—but, speaking unofficially, I should say they will not stand any further reduction.

22. Are you in a position to say whether that last reduction which was made on the railway rates for timber is paying?—Well, it has not been in operation long enough to properly test it. I should say, generally speaking, that the fact of reducing it the longer distance will give the merchants down here an opportunity of cutting into the trade north of Oamaru and Timaru more than they have been able to do, and when you get to Christchurch the reduction is fairly heavy. The quantities, in fact, that have been going to Christchurch have been a mere bagatelle.

23. Do you know if the rates on firewood have been increased?—Firewood rates have not been altered for many years—it is charged for by the truck. Firewood, posts, and fencing-material are charged at the same rate, and they are carried by the truck, which is supposed to hold 6 tons.

24. Would you say that is the bed-rock charge that is being made now?—If you take fifty miles it is £1 3s. 6d., and if divided by six it only comes to 4s. a ton.

25. Does not the same remark apply to carrying timber?—You could not possibly carry firewood long distances—it is out of the question. So far as Southland is concerned, you cannot do any firewood business in Dunedin, because you have the Catlin's district in between. If the rates were cut down it would not pay us, and would not do any good to them. If you take 140 miles to Dunedin it is £2 6s. a truck, and if that were reduced where would the Catlin's River people come in? We should have to carry their stuff for nothing.

26. Can you give us any figures showing any increase in revenue on account of the timber carried in this district?—I cannot give you the total, but I can give you the figures of what we have carried during the last three years. I may tell you before giving the figures for Southland that the total quantity of timber carried on the Hurunui–Bluff Section, from Culverden right down, in 1895, was 36,000,000 ft., in 1900 it grew to 58,000,000 ft., and last year it was 89,000,000 ft.

27. *Mr. Ell.*] Native timber only, or all classes?—That is all classes, but the proportion of imported timber to that is not very large.

28. Have you got the proportion?—No, I have not. I can give you the proportion of our local stuff, and this is simply a general statement. Now, coming to Southland, our figures for the year ending the 31st March, 1907, were 28,300,000 ft. That, of course, includes all timber that goes through our books. For the year ending 31st March, 1908, it was 28,400,000 ft., and for this year ending 31st March, assuming that this month will be the average of the preceding months of the year, the total will be about 28,080,000 ft., a drop of about 400,000 ft. for the year. If you wish the figures for the various districts I can give them to you, only I should like to explain here that, owing to our method of book-keeping, we do not show each siding and station separately. Where you have a number of stations such as at Riverton, where you have Longwood, Oraki, Colac, Wakapatu, Ruahine, and Pahia, they are all accounted for at Riverton. The timber from Orepuki and those places beyond it up the Waiau would be shown under the heading of Orepuki. These are the figures for the year ending 31st March, 1908: Kelso, 19,350 ft.; Gore, 118,100 ft.; Mataura, an average of 200,000 ft. for the last three years; Woodlands' average is about 1,600,000 ft.; Invercargill, including Longbush, One-tree Point, West Plains, Wallacetown, and the stations on the Waimahaka Branch average for the three years 4,500,000 ft. Of course the original Seaward Bush is nearly cut out; I suppose the drop there during the last four or five years is 3,000,000 ft. a year. Waimahaka averages 300,000 ft.; Makarewa, roughly, 1,000,000 ft.; Riverton, up to 8,000,000 ft.; Orepuki, 5,000,000 ft.; Fairfax, 1,500,000 ft.; Otautau, 2,250,000 ft.; Winton, 1,500,000 ft.; Centre Bush, 400,000 ft. These are the main districts from which the timber is sent. Of course, there are a number of smaller ones which cut a matter of thirty or forty thousand feet, but they are not worth taking into account. The total forwarded from this district for the three years past amounted to 84,780,000 ft. As regards imported timber, the total quantity imported during the last two years at the Bluff was, for 1907 838,400 ft., and for 1908 1,089,124 ft. The quantity shipped in 1907 was 446,000 ft., and last year 756,000 ft.

29. *Mr. Ell.*] That is all native timber shipped away?—Yes. Including the imports there are about 60,000 ft. of kauri in each year; the great bulk of the balance is Australian timber. So far as I can learn, from the Bluff during the last two years there has only been one small lot of 15,000 ft. of Oregon imported.

30. *Mr. Hanan.*] You cannot say what has been the quantity of Oregon railed?—No, it would be simply charged up as timber; but it could not come in through other places than the Bluff—it is hardly likely to come from Dunedin. In addition to the timber which I gave you, there is an item of 6,800 tons of hardwood sleepers—roughly, about 130,000 or 140,000—imported by the Government last year. I may tell you that, last year, of the total quantity imported, 475,000 ft. was for the Harbour Board for wharves.

31. What was the class of the timber?—Hardwood timber for the Bluff Harbour Board; in fact, you can say that actually one-half of the total quantity imported is general, and the rest Government. With regard to the timber exported, it is difficult to find out where it has gone to; but as far as I have been able to learn you can pretty well divide it into thirds—between Melbourne, Lyttelton, and Wellington. That deals with practically all that I have to say. I have a list here of the total number of mills in Southland. The total number that are actually erected is forty-five, and some of these are not working. The great bulk of these mills, of course, are cutting what is generally called ordinary building-timber. There are two or three small mills that deal almost exclusively with what is called "factory" timber, but they are comparatively small.

32. *Mr. Morris.*] I presume these are the mills connected with the railway?—Oh, yes! I am not touching the Waikawa or Stewart Island mills. These I have mentioned are all on the railway.

33. *Hon. the Chairman.*] Do these take in any in Otago?—No, nothing on the Catlin's River. Purely south of Gore.

34. *Mr. Jennings.*] Do you know how many mills there are on Stewart Island?—No, I do not know. Taking the total of the output as 28,000,000 ft., so far as I can find out from my figures the approximate quantity of white-pine included in that is 5,000,000 ft.—that is, 5,000,000 ft. of white-pine and 23,000,000 ft. of red.

35. *Mr. Hanan.*] Is sawmilling machinery carried at a reduced rate?—Oh, no! Just charged as machinery.

36. As to dairying machinery, is that carried at a reduced rate?—No.

37. As to building-material going from the town to the country, is there a reduced rate on that—say, iron?—No.

38. *Mr. Jennings.*] Do you know if differential rates exist in other parts of the railway service?—Oh, yes! they do.

39. Local conditions would apply?—Differential rates exist in many places to suit local requirements. We have a reduction here for Dunedin and beyond.

40. And do these apply to second-class timber?—We make no distinction between ordinary and second-class timber: the only difference is between red and white pine. All that is not white is red as far as we are concerned. Of course, Australian timber imported is charged at rate and a half. I do not think the sawmillers in Southland, as far as I can learn, have any complaint with regard to the rates; in fact, the last reductions please them very much—they reckoned that they would give them a chance of cutting into the West Coast trade in Canterbury.

41. *Mr. Field.*] So far as railway charges on our timber are concerned, you have only two classes—white-pine and all the rest?—That is so. Of course, white-pine is principally used for fruit and butter boxes, cheese-cases, soap-boxes, and so forth.

42. Is that the same all over the Dominion?—Practically. There may be some special rates, but I think it applies generally to the whole lot.

43. The Main Trunk line I am speaking of?—I tell you that white-pine is common to all New Zealand, except where special rates obtain.

44. The concessions were on the other class: then, there has been no alteration recently in white-pine?—Well, I have not looked into that question. There is a special rate for timber consigned to Dargaville for shipment. There is also a special rate spread over a large number of stations in Auckland—to Newmarket, Mount Eden, Auckland, and Onehunga Wharf. These rates are, I suppose, arranged for local purposes.

45. Are there any special concessions in the Wellington district?—There is a shipping rate on timber for export outside New Zealand.

46. That is only for export?—Only for export.

47. Comparing timber with other classes of goods, weight for weight, do you not think that, even with the reduction you refer to, timber is charged for rather heavily?—The basis of railway carriage is supposed to be the value of the article. The basis of this book of rates is that you are supposed to get as much out of your traffic as the thing will stand. There are some things you must carry at bed-rock—you must balance them.

48. The balance would be more favourable to white-pine—it would be much cheaper than other things?—You have got to take into account the use of our trucks. You cannot return a truck in less than five days from here. If it goes to Longwood and then goes to Orari, it takes generally a week.

49. Does not the same apply to other goods?—No; in many cases there is no handling at all.

50. Generally, you think that, compared with other goods, the charges on timber are reasonable?—I think so.

51. Have you any special concessions here to compete with seaborne traffic?—Only so far as I have said here.

52. They are for that purpose?—Yes; they were started twenty years ago.

53. What was the object of it?—To compete successfully with the vessels.

54. Do you think that is a good policy?—It is not for me to say.

55. *Mr. Morris.*] Do you send timber for fruit-cases from here to Christchurch free?—Fruit-cases go free; there is no limit to distance.

56. Do they have to come from Christchurch first before you return them?—I think you mean the timber for the fruit-cases. Here is the regulation: "Shooks of New Zealand timber consigned to fruit-growers for manufacture of cases to be used for carriage by rail of New-Zealand-grown fresh fruit will be carried free."

57. *Mr. Leyland.*] You have to carry the fruit, or do not carry cases free?—We carry the fruit very cheaply so far as that is concerned.

58. *Mr. Morris.*] I have got an extract from the *Gazette:* the rate is 4s. 7d.?—Then, you have to take the reduction off that. You will find another slip in the same *Gazette.*

59. I suppose this was also made in the interest of the West Coast?—Oh, yes! we have an interest in the West Coast. I do not think it has very much to complain of.

60. *Mr. Barber.*] Do you think the timber traffic in this district is likely to last very long?—Well, I do not know. Seaward Bush is getting cut out, and they have to go further back. There is a large quantity back of Orepuki and on the other side of the Waiau, but how long it will last I do not know. We have maintained an average of 28,000,000 ft. these last three years—that is, roughly, four or five millions less than some years ago.

61. Would it be a serious thing for the railway traffic if the timber traffic were to cease?—Oh, I do not know; most of the land is good. It is different to the West Coast, because you can make some use of it when the timber is gone.

62. Do you think 75 per cent. of the land would be useful without the timber?—Oh, yes! The land beyond Orepuki is beautiful.

63. Tell me the freight on imported timber from the Bluff to Invercargill?—1s. 11d.

64. Do you know what the wharfage is?—I think 1s. per thousand feet, but I am not quite sure about the wharfage.

65. The wharfage is only 1d. per hundred feet—that is, 4s. of a tax on imported timber to compete with the timber of this district?—Yes, putting it that way.

66. *Mr. Ell.*] When you say "rate and a half" what do you mean?—Rate and a half on whatever the initial rate is.

67. You are not taking into consideration the distance to be allowed for?—Rate and a half on the initial timber rate.

68. I suppose you cannot give us information with regard to the kind of timber used for sleepers?—I could not give you information about that.

69. The Engineer would be able to give that?—Yes.

70. *Mr. Stallworthy.*] Have you noticed any increase in the haulage since the reduction of the rates?—No, not yet. These reduced rates came into operation in January, and things were pretty slack down here at that time, and have not improved very much yet. Going back to February, the number of feet forwarded was 2,263,500, and for the previous January 1,337,850. We have not had time yet to see the effect.

71. How many branch lines have you got in this district?—Nine.

72. How long have they been laid down?—Some of them long before I was here: I could not give you the dates offhand. The line to Riverton was laid down about twenty-five years ago.

73. *Mr. Mander.*] Considering the fact that only 252,000 ft. of timber has been exported from this district during the last year, do you see any urgent necessity for an export duty on timber?—The export of timber is confined chiefly to birch and white-pine. About one-third of it has gone to Melbourne. It does not concern us very much. It is used in the furniture business.

74. You consider there is no urgent necessity for an export duty on timber?—I do not think so.

75. *Hon. the Chairman.*] With regard to the export of timber for furniture, do you think there is any falling-off in the export of that?—No, it is growing.

76. Are you aware that a duty was put on lately in Australia?—No. In 1907 we exported 446,000 ft., and last year it went up to 756,000 ft. The bulk of that has been used for furniture, and it is chiefly birch and white-pine.

77. *Mr. Hanan.*] Are you aware that at one time here the merchants put on wagons for the purpose of carting their stuff to the Bluff in opposition to the railway?—I am not aware of that.

E. H. WILMOT, Commissioner of Crown Lands, sworn and examined. (No. 11.)

Hon. the Chairman: We want you to tell us specially, as far as you know, respecting the quantity of land as leased for sawmilling, the average quantity of timber on these leases, and the quantity of timber and timber land held by the Crown unleased, with the distance from rails, together with other and general information of that class?

Witness: I am not in a position to supply that information just for the moment, but I will go and get the papers.

Hon. the Chairman: Very well, we will take your evidence later.

JAMES LEGGAT sworn and examined. (No. 12.)

Hon. the Chairman.] We want you to tell us specially, as far as you know, respecting the timber industry?—I am not quite sure what the Chairman would like.

Hon. the Chairman: The Commission would like to know with regard to the prices and cost to the miller.

2. *Mr. Hanan.*] How many years have you been engaged in the trade?—As a sawmiller only two years, but I have been connected with the business for about forty years. I have taken out four or five months of last year before the end of the year, and I find that, so far as wages go, they run about 4s. 10d. per hundred feet for wages alone, and that covers all wages only. I expect that my cost per hundred feet would be a little higher than some millers, who have perhaps better and more easily worked bush. With the conditions such as were given here the other day, and with which I agree, it makes the cost just over 8s. per hundred feet, including everything—interest, rates and taxes, royalty, and upkeep of machinery, and so on. Our selling-price is 9s.

3. *Hon. the Chairman.*] Do you tell the Commission that you have a profit?—If we sold our timber for less than that we should have to close up. On some timber we get more, and on some less. I sold some six weeks ago for——.

4. What class?—There was some first and some second, for 4s. 6d. per hundred feet.

5. *Mr. Ell.*] At a railway-station?—No, at the yard.

6. *Hon. the Chairman.*] In Invercargill?—No, five miles from Invercargill. Some stuff gathers on your hands, and we have to sell it and take what we can get for it. The average for the two mills that we own is just a fraction over 9s.—about 9s. 0¼d.; that is the average selling-price. The average cost of production is just a tick over 8s. I just mention these facts to show that 1s. per hundred in my case is nothing at all like a fair return. We have one mill about five or six miles from here which has only a life of about two years and a half from the time we started, and the same initial expense must be incurred in starting all mills. We are leaving several miles of tramways costing hundreds of pounds, and they are not worth a penny to us, and so they are left there. Members will therefore see that 1s. per hundred profit is a mighty poor return for the expenditure of capital in an investment of that kind. The trouble is, of course, that you cannot get the sawmilling area within a reasonable distance, otherwise we should have taken a larger area in preference to a smaller one. I see there was something said, according to the paper this morning, about the extra cost per room for timber supplied for a house. One witness said it would average about £12 a room. I have just supplied a seven-roomed house in which there was about 22,500 ft. of timber, costing £123. If you assume that statement to be correct, that man could have bought that timber for £39.

7. This cost you are quoting may be exceptional?—That is an average of nearly 12s. per hundred. It was a good house, and well finished, quite up to, and, in fact, rather beyond the average standard.

8. *Mr. Mander.*] The total cost was £123?—The seven-roomed house was a specially well-finished house. There were 1,850 ft. of mouldings in it, showing that it was much above the average for a house of that size.

9. What would the total cost of that house be?—From £550 to £560; I am not quite sure It was a contract work.

10. *Hon. the Chairman.*] What was the amount you said the timber cost for this house?—£123.

11. The builder got the balance?—Yes, of course. I notice there was a good deal said about how cheap timber was some years ago; and, of course, it was much cheaper. If I give you the price of some contracts let some years ago, it will give you an idea how the discrepancy arises. Twenty years ago we were letting contracts as follows: Bush-work, 9½d., which put the timber on trollies; then there was haulage to the mill and haulage to the yard. The bush-work included the cutting of tracks, felling the timber, the bullocks, &c., 9½d.; the mill-work—that is, simply cutting the timber at the mill and putting it on the trollies—8½d.; the yard contract was 3d. per hundred. Eight years ago we were letting contracts at 2s. 8d. per hundred, and that meant felling, hauling, sawing, and delivery in yard, but not including yard-work, of course. I may say that I was managing one of the largest firms in the South Island, and that is how I have all these things at my finger-ends. I have only been sawmilling myself for two years.

12. *Mr. Ell.*] You are not relying on your memory for these statements altogether?—Well, I am speaking from memory just now, and I may say I had the handling of the money all the time.

13. *Mr. Field.*] You could not have forgotten it?—A few years ago, when I left the firm I am referring to, we asked for tenders for the same work, and they wanted 4s. and 5s. By the way, the first contract I referred to as being 2s. 8d. did not include second-class.

14. *Mr. Morris.*] What did you pay for the second-class?—We paid the contractor nothing at all at that time. Second-class timber was not dealt with. The contractor did not have a right to sell it himself.

15. *Hon. the Chairman.*] What became of it then?—It was sold by the miller.

16. What proportion would you reckon was second-class timber?—It depends entirely upon the kind of bush you are in; one place might give you 50 per cent. of second-class, whilst another place would not be more than 25 or 30 per cent. In letting the contract you vary according to the nature of the bush.

17. What do you suppose they tender for now?—As I said, before I left this firm three years ago we called for tenders for a certain mill, and they asked 5s. per hundred for it.

18. It has not gone up any since?—I really do not know. That was a firm that did more contracting. Since I left them I do not know so much about that part of the subject.

19. Do you think the men contracting for those low prices were better up to their work than the men contracting now?—They were certainly good men, and they worked hard.

20. They did not confine themselves to eight hours?—Their men did. The contractor himself might work, but his men would keep to the eight hours.

21. *Mr. Hanan.*] Do you favour increasing the duties on Oregon pine? If not, what are your views on the question of import duties on foreign timber?—It is rather a biggish question, and my convictions and my interests perhaps clash somewhat. As a miller I think we should be quite reasonable in asking for an increased duty on Oregon timber. If it can be shown that jarrah is a much better timber than we can get here, then I do not think it would be a reasonable thing in that case to keep that timber out by a duty. If, on the other hand, it is timber we can supply here ourselves, it is reasonable to have a duty on it.

22. Take Oregon, what do you suggest in the way of duty, on balk, small sizes or large sizes?—Principally large sizes.

23. What duty do you suggest?—I do not know; I have not gone into it sufficiently to say. The price of Oregon has varied, and what may have been a reasonable thing to ask six months ago may not be a reasonable amount now, because the price has gone up.

24. Why do you say there should be a duty imposed on Oregon?—Well, there are various reasons. It is coming in here in fairly large quantities, and competing with the timber we have

in our own country. If we import it with a small duty and they have an inexhaustible supply, which we are told they have, and they can bring it here as cheap as we can from Orepuki, well, the question is where it is going to end. We have five or six thousand men employed in the industry here, and if that inexhaustible supply is coming in here, it may be a very serious thing for the men employed in the business, unless it can be shown that the country really requires it and cannot do without it, and I do not think we have reached that stage yet.

25. You said you were speaking as an individual sawmiller: now let us have your opinion from a national standpoint?—I put it this way: I am a Free-trader by conviction, and I think I am not at all inconsistent when I say that the Government ought to consider us a little in this matter just now; and I will tell you why. The increase in the cost of production has been caused a great deal by the increase in wages, the restrictions in regard to the carrying-on of our work, double royalty, and so on, and it seems to me that, if the Government passes these laws and restrictions, and increases the cost in various ways, even as a Free-trader I could not be charged with inconsistency very much if I said you have considered one side and we are entitled to consideration too.

26. What percentage of the increase that has taken place do the wages bear to the increase in prices during the last ten years? I take it you have considered that question in coming to your conclusion?—No, I have not thought that out. I know there is a large increase. We were paying 8s. to men twelve years ago, and we are now paying 12s. and 13s.

27. To what class of men do you pay the 13s?—To the sawyers.

28. What is the average increase in the wages of the men?—It must be at least 20 per cent.

29. What is the average increase as regards the price of timber?—Nine years ago timber was selling here at 8s. 6d., and it is now 10s. 6d., less 5 per cent.

30. Do I understand from you that the increase in wages has been the chief factor in contributing towards the increase in the price of timber, or a small factor?—It is a considerable factor, but I would not like to say it is the chief factor.

31. What do you say is the main factor?—Of course, there is no doubt at all that eight or nine years ago 80 or 85 per cent. of the sawmilling was carried on in flat country with good and easily worked bush, as compared nowadays with 80 per cent. of the sawmilling being carried on in hilly country.

32. Am I right in saying that the main factor has been the cost of production as regards the working hilly country?—Yes, of course.

33. Is it not a fact that two-thirds of the mills in this district are working in the Longwood district?—More than two-thirds in the hilly country.

34. Can you give me the cost of labour for producing 100 ft. in the Seaward Bush as compared with the cost of producing the same quantity in the Longwood Bush?—The lowest price is in the Seaward Bush, and the highest price in the higher country. Of course, you must bear in mind the fact that it is not only the hilly country, but the bush is better.

35. What is the quantity of red-pine in the Seaward Bush as compared with that in Longwood?—There were large tracts in the Seaward Bush.

36. Am I right in putting down the Seaward Bush at 90 per cent. red-pine and Longwood at 50 per cent.?—I do not think you are far out. In the Seaward Bush there is about 85 per cent.

37. And Longwood?—It is very hard to say. The bush does very well in hilly country—you get large tracts, and in flat country it is practically the same all over. You come to one patch in hilly country where there are great tracts of one class of timber, and perhaps half a mile away you find a different kind. My own experience has been that at least 60 or 65 per cent. is red-pine.

38. Am I right in saying that the class of bush worked now is inferior to the class worked ten years ago?—Yes, infinitely—no comparison.

39. As regards wages, I understand there is a difficulty in getting men in Southland: that is the reason they are paying higher wages?—There has been up to perhaps now.

40. Are you a member of the association?—Yes.

41. Suppose that the association were broken up, would it follow that, with the cut-throat competition which would ensue, the mills would have to shut up?—I should say it would be certain to have that effect on some of the mills.

42. Which is your most profitable market?—Dunedin is our best market.

43. Is it a better market than Invercargill?—Yes.

44. How many mills are working in Longwood?—I am not quite sure—I think sixty or sixty-seven altogether, but I do not remember for certain.

45. How many mills have you?—Two.

46. Where is your bush?—At Oraki, beyond Riverton, and another at One-tree Point, thirty miles away.

47. I think you were with McCallum and Co.?—Yes, I was with them thirty years ago.

48. What was the location of the mills thirty-five years ago?—The bulk of them were in the Seaward Bush then. There was one at Woodlands and one of McCallum's at Longbush, and working right round the edge of the bush was another big mill.

49. Now what distance, generally speaking, would the mills be from Invercargill on an average, say, twenty-five years ago?—Eleven miles from Woodlands.

50. To-day how many miles back?—Mine is one of the closest, thirty-one miles.

51. So that you would say the bush has gone back during the last twenty-five years—how many miles?—Four time the distance.

52. If it has gone back in that time, does it not stand to reason that with less bush they will go back further in another twenty-five years' time?—They are bound to.

53. Does not that mean an increase in the price of timber?—I should expect that certainly.

54. Because it is further away, and more difficult, and the bush is not so good?—The bush is more sparse, and inferior in quality generally. In fact, we have no bush at all now like the Seaward Bush.

55. And that was one of the largest forests in New Zealand?—Yes.

56. And it is now practically cut out?—Yes.

57. As to firewood slabs, what is the price charged at the mills?—You get about 3s. a load.

58. Has there been any reduction in that class of timber for firewood during the last few years?—I could not say. At McCallum's it was 3s. a load then.

59. That is twenty-five years ago?—Yes.

60. Do you know if it has substantially gone up in price?—No, I do not think it has.

61. *Mr. Jennings.*] Do you pay men by a day-wage or take contracts?—By day-wages.

62. *Mr. Field.*] In estimating the cost of production, do you provide for interest on capital or interest on bank accommodation when you say the cost was 8s.?—I want to explain this to you. I could not undertake to produce a list such as I saw here—I do not think any one could do so. The only way is to take the profit at the end of the year, and the difference between your wages and the profits must be accounted for in interest and expenses—you cannot apportion everything.

63. Still, if you spent £3,000 on the mill, you must get back at least 5 per cent. on that?—Yes, apart from depreciation and everything else.

64. In addition to that. Interest on capital is not your profit. Anybody can get interest on capital without exerting himself at all?—Yes.

65. Must you not get something besides that to pay you for all the risks you run?—We should get it.

66. We have had it in evidence that it is a fair thing to ask 2s. or 3s. over the cost of production to pay for the risks that are run—would that be too much?—No, I do not think so. In my own case I have had to do with less. The length of my mill is about two years and a half altogether from the beginning to the end, and when you shift your mill of course you take what you can get, and if there is a market you may sell your plant for half its cost, but there are always hundreds of pounds' worth of tramways which are not worth one penny to you.

67. One witness stated that in a four-roomed cottage the difference in the price of timber had gone up in the last twenty years from £50 to £60: he said it used to be £40 a room and now it was £100 a room. Is that a fair estimate of the increased cost of the timber?—It is not my experience at all.

68. We had it, I think, in evidence yesterday that some years ago a man could buy timber from the miller, including cartage for six miles, at 2s. 2d.—would that be a fair thing?—I should like to know what that includes.

69. We also had it in evidence that twenty years ago rough timber could be purchased here at 3s. 9d. and 4s.: were you cognisant of that state of things at that time?—I think it is a mistake.

70. We had it from Mr. Massey that at this particular time half the millers in the district went bankrupt on account of the low prices of the timber?—Quite a number did.

71. Is it true to say that men were making large sums of money out of sawmilling at that time—at 4s. 6d. a hundred?—They simply could not do it.

72. What proportion of the millers have made a big thing out of it—say, several thousands of pounds out of it?—I do not know the whole business very well. I should say, from my knowledge of the district, that not more than two have made a good thing out of sawmilling, and these men have done it because they have had every advantage; they have had bush of the best quality, and flat country, and everything in their favour. Now you get a sawmilling area with miles of tramway and hilly country. Not long ago I went up some hilly country behind six horses, and it took the six horses all their time to haul two empty trollies up. You have also bridges to construct, and all that has to be considered as against working in flat country.

73. Do you find the combination, as it is called, has been a benevolent combination or hurtful? Has it had the effect of putting up the prices unreasonably on the consumer?—No, it has not.

74. And it was not formed for that purpose?—One reason was to get prices. At that time prices were such that the millers had either to get a better price or close up. The prices were such that they could not live.

75. What are you getting at the present time per hundred feet in excess of the cost of production?—Somewhere about 1s. to 1s. 3d.

76. And how much has the timber increased during the last eight years?—Eight years ago it was selling at 8s. 6d. in Invercargill, and it is now selling at 10s. 6d., less 5 per cent.

77. And I suppose the increased cost differs in different places?—Yes, there are no two sawmills run at the same cost.

78. And is it fair to say the increased cost in some cases is less than 2s.? We had it in evidence in one case that it was 1s. 6d.—I mean the increased price in eight years?—That is really less than 2s.—it is 2s. less than 5 per cent. It costs them 10s. now, and eight years ago it cost 8s. 6d.

79. Have the builders got anything to complain of in regard to the sawmills not filling the orders with promptitude?—I suppose once in a while it may happen that a sawmiller is a bit busy and has orders coming for 12,000 ft., and he cannot expect to supply that next day. If a man comes in and leaves an order, and we find it is a job which must be done in a certain time and the timber has to be supplied early, we do the best we can. I think a man could be supplied with the timber for a big job in ten days.

80. Has the increase in the price of timber had the effect of restricting building operations in Invercargill?—I do not think so. If a man was going to build and it was going to cost £15 or £20 more I do not think it would stop him.

81. We had it from Mr. Bain yesterday that sawmillers were in the habit of piling up stacks of timber and letting it rot rather than sell to the builders at a certain price. Do you know of any timber that is rotting in that way?—I suppose we have been foolish often, but not so foolish as that. Of course, once in a while you have biggish stacks in a yard, and sometimes you find the bottom pieces have gone rotten.

82. It is a mere bagatelle, I suppose?—Yes.

83. We had it in evidence yesterday that mouldings or scotias which were costing millers 10s. were being sold for £1 10s.?—I think the highest-priced scotia is 10s.

84. Do you know of any class of timber which is costing 10s. and being sold for £1 10s.?—There are certain mouldings, but those are three-member mouldings, and we are getting £1 10s. and more for them.

85. Is there any class of timber for which you are getting three times the cost of production?—It is so hard to say. You cannot very well tell, because in a particular order for timber there are fifty or a hundred different sizes.

86. I wanted to know, in the interests of the sawmillers, whether they were getting these big profits on any class of timber?—I simply could not say. You cannot take any one line out from fifty or sixty or a hundred and say that costs so-much.

87. Have you any recollection of any line where there is a large profit like that?—None that I know of.

88. Would the sawmillers in this part of the country do what the sawmillers in the North Island and the West Coast have promised to do if necessary—namely, mill their timber and sell it at prices to be fixed by the Government?—It is quite a new idea—I never heard of it before. It is a very difficult thing to say what would be a fair price. The man in flat country could do with a very much lower price than we could do with in hilly country. A fair price for those on the hilly country would be a big price for those on the flat, and a fair price for those on the flat land would not pay those on the hilly country at all.

89. No doubt there would be differential prices?—How could there be differential prices—you are dealing with the same market, and must sell at the same price.

90. Do you think the sawmillers would be prepared to admit the principle?—I should not like to say.

91. Now, about this importation of foreign timber: do you know much about Oregon pine, or any other foreign timber?—Do you mean the quantities coming in?

92. And how far it is affecting or likely to affect our industry?—I understand that about 17,000,000 ft. came into the colony last year. I do not speak of my own knowledge, but if it is so that means the cutting of seventeen of our ordinary mills down here. They do not cut on an average more than a million feet a year.

93. Assuming that Oregon can be sold at the seaports of this country at as low as 11s. per hundred, is it likely to affect our rimu industry materially?—Most certainly it is. Every foot that comes from outside means so much less New Zealand timber required.

94. And I suppose it would particularly affect it in bad times when there is not so much building going on. Would it be true that in these times of depression many mills could keep open and get along but for the use of Oregon pine—that the importation has just made the difference between their being able to keep going or not?—I could not say for a fact, but it is very probable. Of course, if you cut off 17,000,000, the quantity that comes into the country, it means 17,000,000 less required here.

95. What is going to happen to timber-covered land if the milling-timber on it becomes unprofitable? What would you do if you held land of that class and could not afford to keep it—pay interest on it, on a heavy mortgage, and pay rental, and so forth? What would you do with that class of country?—It is very hard to say; I think I should try and clear it.

96. Put it into grass?—Yes. It seems a shame to destroy the timber, but if a man could not do otherwise he must destroy it.

97. Is it correct to say that these results would happen in the case of a piece of bush of that kind as a necessary consequence?—I think it is perfectly reasonable to assume that.

98. That a man would lose his capital in putting up a tramway, and so forth, and the men be put out of employment?—As mill hands, at all events. They might get work of some other description.

99. As a result of clearing the land of timber which would be burnt, valuable timber would go up in smoke?—Yes.

100. And railway freights for carrying that timber would be lost?—Yes.

101. And the money spent on timber would go out of the country?—That is quite clear.

102. Have you got any feeling on the subject of keeping some of our timber-covered country for use in the years to come? What views have you got on that subject?—Of course, again, I am speaking as a somewhat biassed witness. As a sawmiller I should say, "Cut as long as there is a demand for it."

103. *Mr. Leyland.*] With reference to the production of mouldings, in the first place, when you are going to run mouldings you have to get selected timber?—Yes.

104. And it involves a certain amount of waste in cutting. You have to cut it into the size for the machine?—Of course, you do that when you are cutting your log down.

105. If you have a piece of cavetto you would not cut 2 by 1 or so for mouldings?—Oh, yes! We shape it with a saw as far as we can, and make the small cut with the machine.

106. That means that you increase your loss in conversion. Are you troubled with timber warping?—Yes

107. Then it is unsaleable?—Practically unsaleable.

108. When you go to the machine do you not find that a percentage has to be thrown out because it is cross-grained?—Plenty.

109. And are not mouldings often in stock for a long time?—Until you have to make second-class of them.

110. So that comparing the cost of mouldings with the cost of ordinary first-class timber does not give a fair comparison. It practically means that you make less on some mouldings?—Yes.

111. You assume, if we could sell Oregon at 11s., that it would interfere with red-pine. Do you know any one who can afford to retail Oregon at 11s. if it costs 11s. 9d. in the yard at Dunedin?—No, I should think not.

112. We had evidence this morning that only 15,000 ft. of Oregon has come into Southland and Invercargill. Do you think our mills here are in much danger from that?—That must be a mistake. I bought ten or twelve thousand myself, and I am in a very small way.

113. What royalty do you pay on rimu?—Sixpence.

114. If you bought 4,000,000 ft. of rimu you would give the Government £1,000?—Yes.

115. If you imported 1,000,000 ft. of Oregon you would give the Government £1,000?—Yes.

116. As a matter of fact, so far as the Government is concerned, they give nothing in return for the 2s. duty?—That is so.

117. *Mr. Clark.*] With regard to the building of a four-roomed cottage, are we not in the centre of the town?—Yes.

118. How many four-roomed cottages are there within eye-shot of this place?—None at all.

119. What proportion would you assume that the standard four-roomed cottage has in regard to the whole value of the building industry of a city?—There are always a few going up, especially in the suburbs.

120. But it would be a very small proportion?—I should think it would be.

121. In that case, to quote everlastingly a difference of £7 10s. per room in the cost of a four-roomed cottage does not convey any adequate idea of the rise in value of building-materials in a city as a whole, but only in regard to four-roomed cottages?—That is so, so I took a seven-roomed house as an instance; I gave my evidence on the basis of a seven-roomed house.

122. With regard to the increased cost of production owing to the burden of the recent laws and regulations—with regard to the Arbitration Act, you stated that it was one of the causes of the increase?—Yes.

123. Do you not think that of necessity that extra cost must fall on the consumer? As a citizen, in the sense of what the public has to pay, is there not enough burden already imposed on the public by the operation of these laws without further burdening them by increasing the Customs duties?—That is more a question for a politician than a sawmiller.

124. With regard to the cost of production here, you spoke of it being increased owing to the continually receding sites of the sawmills. Is it practical wisdom to put a sawmill in an impossible situation and expect it to pay the increased price?—Some of the mills were placed near the bush when they started, and the timber has shifted back—in some instances, four or five miles.

125. In an enterprise of that kind do you not expect your returns to be a little decreased as against a more favourable situation?—That is so.

126. With regard to importation and the constant question of the money going out of the country, is it not a fact that it is only a changing of values?—That is so.

127. Whenever we get 17,000,000 ft. of Oregon do we not get value added to the country?—As a political economist you can reason that very nicely. If you were a working-man out of employment in the country you might argue from a different standpoint.

128. Is it not a fact that the labour on the timber has only just commenced when it arrives here—the finished product as against the raw material? What is the economic value of a stock without conversion, if left there?—As a matter of fact, I would say that the bulk of the labour had been done when it reached here; the bulk is in the bush when cutting and getting logs to the mill.

129. I mean with regard to its ultimate value to the Dominion—to the consumers of timber? A stick of timber on this wharf if left to remain there—would it have any value at all? Would it not be an encumbrance?—You are assuming a log laying there. I cannot agree with you.

130. *Mr. Morris.*] Did you say that one of those contractors cutting on 1s. 9d. per hundred feet twenty-six years ago was able to pay his way?—The time I refer to it was cut under three different contracts—the bush, the mill, and the yard, and they made a do of it.

131. I would like to get your opinion on the area allowed for mills under our present regulations: are they sufficient or too small?—That is another question that cannot be answered Yes or No. They are all right in certain places. Where the bush is good I would say 800 acres is enough for a sawmill, but where you get two, three, or four thousand feet to the acre, the area may not be half so valuable.

132. Assuming 10,000 ft. to the acre, that would be 8,000,000 ft. of timber?—Yes.

133. Do you think that is sufficient to warrant a man in erecting a mill at 1s. per hundred feet?—No, I would say in my case that 3s. would not be enough.

134. You stated you were a Free-trader by conviction, but think that the Government should protect our local industries?—I said I thought I could not be charged with very much inconsistency if I asked the Government to impose a tax.

135. You think we should look after ourselves before the Americans?—I think it is human nature.

136. We were told yesterday that it is the practice here of men in the association to buy timber from mills outside the association in order to cut down competition so that the prices may not be interfered with?—Some do buy from those outsiders.

137. Do you buy any yourself?—I do not think I do myself. Of course, I am only a very small potato. If they do, it is because it is the best thing they can do with the timber. It is not so much the big running after the small, as the small running after the big.

138. The impression was that the big bought from the little to prevent them from competing?—That is not right.

139. The price is not due in any shape to the association?—I said that that certainly was part of the reason for the association being formed; the prices were so low—they were only starvation prices.

140. And you cannot control these small mills outside of the association?—Not at all.

141. They sell for the best price they can get?—Yes, and even where they supply the larger sawmillers they also supply outsiders.

142. So that the public are not being injured by the combination at all?—Oh, no!

143. *Mr. Barber.*] You say you are a member of the association?—Yes.

144. How long has it been in existence?—I think about sixteen years.

145. We were told that the association was only formed in 1907?—In a sense, it was a reconstruction. That was it.

146. There was an original association previous to the present one?—Yes.

147. So that the statement as to the rise of prices during the existence of the association only applies to the new association, or does it apply to the old association?—I could not say what they meant when they made their statements.

148. You say there are some millers in the association who contract for the whole output of the small mills?—There have been.

149. You say that, although they had a contract to supply the large miller, yet they sold to private individuals?—I am not saying that they do it now; but it has been a fairly common practice in the past.

150. That reduces the number in competition outside the association?—Yes, if they go and sell it. It has been done.

151. With regard to the 22,500 ft. you supplied for £123, where did you supply it?—In Invercargill on the job.

152. Some years ago you say the cost of milling timber was 8½d.?—That is for the bare work in the mill only.

153. How much does it cost to-day?—It is hard to say. I suppose it will cost something like 1s. 2d. or 1s. 3d.

154. What is the reason for the increased cost in the mill?—That is a question which is hard to answer. There is no doubt that increased wages is a large item, and there is no mincing matters that we do not get the same return from a man that we used to get.

155. Wages have gone up 100 per cent. then in a mill?—How?

156. From 8½d. to 1s. 2d. there is an increase of 5½d.—75 per cent., at all events?—I did not say simply on the wages paid.

157. You do not mean to tell me that the machinery is obsolete?—No, it has improved.

158. What else in the mill adds to the charges?—First of all, we pay a man higher wages for his time, and he takes longer to do the job.

159. Do you mean to tell me that with the improved machinery in the last twenty years the cost of production has gone up from 8½d. to 1s. 2d.?—No, but at that time we were working on tip-top bush.

160. That does not make any difference when you have got your logs at the mill?—I beg your pardon, it does very much—you have easier-cut timber and less slabs.

161. The cost was 8½d. twenty years ago. I want to see whether the workers are getting any advantage out of the increased cost?—I think I have answered you fairly well—that the wages have increased, but men take longer to do the work, and that the bush is not so good.

162. You say you are paying something like 14s. 6d. to a man in wages?—I said 8s. to 12s. and 14s.

163. Will you produce your wages-book?—I did not say that I was paying 14s., but that some millers are paying that; I am paying 12s.

164. With regard to the importation of Oregon pine which you say will be detrimental to the sawmillers, do you know the wharfage on Oregon pine at the Bluff?—No.

165. Are you aware that the railage from there is 1s. 11d.?—I know that.

166. Then there is 2s. duty, so that without any wharfage at all you have an advantage of 4s.?—We have not got any advantage. We have to pay freight to here, as well as they do, from the Bluff.

167. But the freight you pay is not 1s. 11d.?—It is 2s. 3d. or 2s. 4d.

168. Do you not think that the 4s. is ample protection without anything further?—There is no 4s. protection at all, because we pay more than that.

169. If you want to have the total cost, you want to add steamer or sailing freight, which is over 2s. 6d. Add that to the cost of wharfage and railage, and do you think it is right that a further levy should be imposed on those compelled to purchase timber—because it is a levy?—It is a levy in protecting highly priced artisans and workers.

170. You said you were a Free-trader by conviction, but a Protectionist when it comes to yourself?—I did not put it exactly that way, but it amounts to that pretty well.

171. With regard to the cost, when it only cost 8½d. what was the price of timber?—I think it was put on the trucks at 4s. 6d.

172. The total cost, I understood you to say, was 2s. 4d. for production?—No, there is horse-feed, &c., to be added to that. I gave the bare cost of labour in the bush, mill, and yard.

173. Do you know that it was put on the trucks for 4s. 6d.?—I know it was about that time.

174. So that there has been a gradual rise in prices up to the present day?—Yes.

175. You say Dunedin is your best mark, and that one reason for the increase is that the mills have gone back, on an average, about twenty miles further from the time you mention. Do you know that the cost of delivering timber is cheaper now although you bring it twenty miles further—that there is no extra cartage?—Of course, that only refers to Dunedin.

176. It refers to your best market?—But that is not the only market.

177. Take the price for delivering in Invercargill, does it not fall on the sawmiller on account of the concessions he has got?—I cannot follow that if the minimum charge was 8d. per hundred and now is 1s. 6d. or 2s.

178. There is no additional cost of railage?—In that one market only.

179. *Mr. Ell.*] We want to get at the cost of felling and cutting at the mill. Say that you put through your mill last year a few hundred logs: you know how many men were employed in getting those logs to the mill?—We all know that.

180. The logs having arrived at the mill, they have to pass through the mill. You know what they will cut into and the charges in connection therewith paid out. Will you show the charges paid last year for logs, getting logs to the mill, the quantity of timber you turn out at your mill, and the wages paid at the sawmill?—I have no objection at all. Do you want to get the whole of the wages paid at the mill, the amount of time in cutting, and all such charges?

181. That will give us something definite?—I would suggest that you get it from some other of the millers. I have broken time: that somewhat upsets me a little bit.

182. There is one more question in regard to Oregon: You say that the duty should be put on the largest sizes?—Yes.

183. We have evidence here from sawmillers themselves and from merchants that it is most difficult to obtain great lengths and large sizes in New Zealand timbers. Then reference was made to the difference in price between Oregon and New Zealand timbers. Do you think, therefore, we should be justified in recommending the Government to put an extra duty upon large sizes?—When I was here I heard a witness talking about the difficulty of getting 50 ft. lengths. Well, I have been about forty years now in the trade, and I have never heard a 50 ft. length asked for yet. So it seems to me that setting up the 50 ft. difficulty is like setting up an absurdity. I have supplied 48 ft. without difficulty. One is scarcely ever asked for such a length. In my experience 30 ft. is a long length, and there is no trouble in supplying that.

184. *Mr. Arnold.*] You say you have two mills?—Yes, that is so.

185. What is your output for the month?—About 180,000.

186. Now, speaking of the cost of labour, in answer to Mr. Hanan you alluded to the contract system of some years ago to show that the cost was very much less than at the present time?—Yes, I did.

187. And you said that those men made a do of it?—Yes.

188. Would you like to see that system renewed?—I certainly should. I think it is the fairest of all systems.

189. Would you like to see men working now for the wages they earned at that time?—I do not say that. I am speaking of the system. I think the wages would have to be higher.

190. There is evidence to show that the millers are paying above the arbitration award. Is that so?—Yes, in many cases.

191. So that the millers really do not complain regarding the cost of labour in connection with milling?—That does not follow. They do not complain about paying good wages to good men, but they do complain about paying a minimum wage to a duffer.

192. Have you got many duffers?—Too many.

193. What percentage?—I could not say the percentage. The men are always changing. You have a duffer, and when you discover this you pay him off and take on Dick, Tom, or Harry, and you find he is no better. People tell you you should not employ them, but my reply is that you must keep the thing going.

194. You spoke of the importation of Oregon: what quantity did you say you used within the last few months?—Nine thousand feet on one job, and over 2,000 ft. on another. Apart from that there is a building in front of my office with 20,000 ft. or 30,000 ft. in it.

195. Did the whole of this timber come *via* the Bluff?—Both of my lots came *via* the Bluff.

196. Have you any knowledge of Oregon coming through from Dunedin?—I know of some that came from Dunedin.

197. If there was a large amount of Oregon imported you say that hands would be put out of work?—I say that would be the natural result of it.

198. When you speak of the consumer, who do you mean?—I mean the man who is building a house.

199. If there is extra cost in erecting a house, is not that cost passed on to somebody else? Does not the tenant pay the extra rent?—Probably he does. A man must get interest on his money.

200. If the tenant pays the higher cost he is either a workman, or else he is able to pass it on through his business to the working-man?—I suppose it will be that way.

201. Well, then, on the whole would it not be better for a few hundred men to find other walks in life than for the whole of the people to pay an increased taxation?—It is hard to say whether a hundred or a thousand were going to suffer. For instance, suppose it meant destruction for ten, but only meant inconvenience for a thousand, I supose you would hesitate before you destroyed the ten.

202. It would not follow that the ten would not find equally good employment?—That might be so. I cannot say.

203. Speaking of the combine, in reply to Mr. Field, your association, you say, as far as Southland is concerned, does not control the prices?—You see yourself they cannot. If there are seventy mills in Southland, and only twenty-three belonging to the association, they cannot control the price. In that I include Catlin's River.

204. If it were possible for the whole of these millers to be brought into one combine they could fix the price of the timber: could they not get any price they wished?—Not any price they wished. Oregon would fix that.

205. You say Oregon shows they cannot do it. Then Oregon would be the means of guarantee to the public that they would get timber at a fair price?—If they required a guarantee. As far as our experience has gone here they do not require it. The combine is sixteen years here, and the price has never gone beyond reason. There is no place in the Dominion so cheap.

206. Have you heard of any other part of the Dominion where there is a combine that does regulate the prices?—I have heard so, but I do not know.

207. If it is possible to have a combine in Wellington, it would be possible to have it through the whole of the Dominion?—I would not say it is impossible.

208. Then, in that event, would it not be well to have some extra competition, such as the importation of Oregon?—So far as I know, the sawmillers do not object to timber coming in from outside.

209. Some of them ask for a very high duty?—I suppose there is a difference of opinion about it. As I said, it is quite true that Oregon might be a guarantee of a reasonable price being charged so far as it competes with New Zealand timbers. I do not see the need for the guarantee. There is nothing in our past history to warrant it.

210. *Mr. Stallworthy.*] Your monthly output is 180,000 ft.?—That is so.

211. You make 1s. per hundred feet on your timber?—Somewhere about that—yes.

212. One shilling a hundred on 180,000 ft. is equal to £90 per month?—Yes.

213. Is that clear of all expenses in connection with the timber?—It is as clear as I can make it up. It is practically about the right thing.

214. There are no other charges to put against that £90?—In the case of my own mill, at the end of two and a half years she is valueless. It might happen, of course, that some one would want an engine, and you could sell it. I know of one lying up here for years, and the owner cannot sell it.

215. Do you also get a timber-merchant's profit?—No.

216. In reference to this mill with two and a half years' life, when you went into it you knew that you made about 1s. profit per hundred?—I assumed that after experience.

217. After forty years' experience in the business you knew when you went into that mill that your profit would be about 1s. per hundred?—Probably, but you are never sure.

218. You thought it a good thing to go in for?—That is not exactly the way to look at it. We found that one mill was not quite sufficient to meet all cases—that is, we could not take a decent-sized order, and we thought the extra mill would help us.

219. The second one you took was the mill with the two and a half years' life?—Yes, it was the second one.

220. *Mr. Mander.*] We had evidence the other day that to build a cottage in Invercargill would cost £100 per room: is that your experience?—I am not a contractor or a builder.

221. You stated this morning that this seven-roomed house cost £560, which you thought was above the average cottage?—That was my impression. I said it was a good cottage, owing to the mouldings, &c.

222. That would be £80 a room. Do you think that a good class of house can be built for £80 a room?—I am quite satisfied in saying so. I know that a six-roomed house has been sold for £600, with a quarter-acre section.

223. What would that house be built for ten years ago?—I could not say. I am a timber-man only.

224. I do not understand your logic about having the higher duty put upon the larger sizes of timber coming from America. Do you not think it would be better to put the duty on the small sizes and a lower duty on the larger sizes that are hard to get here?—You misunderstood me. I said I was in favour of the duty on the larger sizes. I did not say that, if there is a duty at all, the higher duty should be on the smaller sizes.

225. In your experience of many contracts in the bush, did you ever lose money?—Yes, often.

E. H. WILMOT further examined. (No. 13.)

1. *Hon. the Chairman.*] I presume you have now the information we require?—I understand that the Commission requires to know the area that is taken up and held by sawmillers at present in the State forests, and also in Crown forests. I have schedules here which give details of all areas held by millers, the amount held by each, and the total. In the State forests there are 27,482 acres, and in Crown forests 9,271 acres, making a total together of 36,753 acres. The Commission also wishes to know the estimated area of Crown lands still available for sawmilling purposes but not yet taken up. This amounts to 1,132,400 acres.

2. Is there any estimate of the quantity of timber there would be per acre, not in occupation, but still in the hands of the Crown?—I should say, probably, not more than 500 ft. per acre taking it over the whole lot. This return shows the whole estimated area of Crown land available for sawmilling purposes. A great deal of that has very little timber at all.

3. Do you think this return is of any value to us?—It is really only approximate. It gives each district, the number of acres, and the amount of timber estimated thereon; but, as you know, we have great areas in Eglington and other districts that nobody has ever been through at all.

4. Then you are not able to give us any nearer approach to it than 500 ft. per acre?—No.

5. Are you aware of the amount of land that has been denuded of forest within, say, twenty years?—No.

6. Have you any record of what has been denuded during the last twenty years by sawmilling?—Yes, I could get that.

7. We will expect you to get it later on, or send it along?—Yes, possibly any time this afternoon.

8. Is there any other information you can give us in that line?—In respect to this I do not think there is any further information that I can give you in addition to these two schedules. It is all detailed here as to the amount held by each sawmiller, and where it is, together with the distance from the railway-station. In the other schedule the estimated amount is given as to each district, and it is all in detail there. I do not think I can supplement that at all.

9. Can Mr. Collins, who is an expert in timber business, give us what we want later on?—I think he would be able to give you anything you require in addition to what I have supplied. He is thoroughly conversant with all the milling business in this district, and he knows all the localities, as well as all the mills. He can be examined on any point with regard to any of that.

10. *Mr. Hanan.*] Can Mr. Wilmot say what bush has been reserved?—There have been reserves of national parks, scenic and climatic reserves, amounting in the aggregate to 855,600 acres.

11. Do you know where they are located?—The bulk of it is in the national parks.

12. Anything reserved in Longwood?—I do not think there is, speaking from memory and without consulting the maps.

13. Any bush reserved for scenic purposes?—Yes.

14. Where?—From memory, a small piece at Waikawa, and there is one at Pahia.

15. Are there any nearer to Invercargill?—Yes, there are reserves where you were the other day, near Riverton.

16. Do you know of any others?—Yes, at Edendale. At the settlement there there are two small reserves. There are a great many reserves scattered all over the place.

17. Within twenty miles of Invercargill?—That information can be got for you. I cannot speak exactly from memory. I have a schedule here that supplies information as to all those reserves. The scenic reserves have an area of 55,600 acres.

18. Where do you say they are?—They are all over Southland; they range from close handy to Invercargill, Edendale, and they go right down to Pegasus and South Cape.

19. As to the bush burnt off by your tenants under the Board, have you anything to say regarding this destruction by Crown tenants on their holdings?—You mean as to the advisability of its destruction? Well, I have thought over that matter, and it seems to me that when the bush is heavy enough to pay for the sawmiller to go into it, the land should not be opened for settlement. It is a great pity to have good sawmilling bush burnt down and destroyed as it used to be. That, however, does not occur now so much as it did formerly.

20. Has much bush been burned in this district by settlers clearing their property?—In Southland a good bit has, but not so much as in other districts. The place I was thinking of was Otago, especially Catlin's, where a great quantity of valuable timber was destroyed.

21. What does your Board do in the way of preventing this destruction of the bush?—The Board, once it has leased the land, is powerless to prevent the destruction of bush, because the Act provides for the felling and burning of bush as an improvement.

22. The fact of the bush being on the land—is that a material factor in inducing settlers to take it up?—You mean that, if there is a lot of milling-bush on the section, it will be more readily taken up in consequence of the tenant being in a position to sell the timber to a sawmiller? That is so. It is an inducement when they are able to sell the timber.

23. Have your Crown tenants been selling much bush off their property? Do they sell more than they burn?—Well, I think they do nowadays.

24. In your opinion it would be better if the sawmill went in before it was let to tenants?—I certainly do think so.

25. *Mr. Jennings.*] With regard to the land formerly covered with bush, is it suitable for grass-growing, cropping, and generally for practical farming purposes?—The Board has reports respecting all land they propose to open for settlement, and it is not opened unless they think it is good enough to be grassed and cultivated otherwise. A great deal of it, of course, is fit for grass only.

26. Generally speaking, is it good for grass land?—Yes, generally speaking it is.

27. *Mr. Field.*] Have you given any thought to the question of tree-planting?—One experiment that was made down here some time ago was not a success. The position was bad, which might account for it.

28. Are you careful to see, where the bush is being cleared for timber, that noxious weeds are kept out fairly well?—That is a matter for the Stock Department.

29. *Mr. Leyland.*] Are there any areas available for settlement that are not bush lands?—In Southland I do not think there are.

JAMES COLLINS sworn and examined. (No. 14.)

1. *Hon. the Chairman.*] What are you?—Crown Lands Ranger.

2. We wish you to give the Commission some information with regard to the amount of leased land in this district, and the amount of sawmill timber on the unleased land?—Well, there is a return that we made out showing the area taken up for sawmilling purposes.

3. And in occupation under the sawmiller's license?—Yes, both in State forests and Crown lands.

4. Are they sawmilling in the State forests now?—Yes.

5. Will you state to the Commission the quantities?—All the areas taken up are marked in red on the plan [produced]. They are taken up and held at the present time as sawmill areas in connection with different mills and by different sawmillers.

6. Can you give us the number of acres in occupation at present?—27,482. That is all State forests and Crown lands.

7. Under lease?—Yes, and in Crown forests 8,871 acres.

8. Do you know how many lessees you have got?—Twenty-two in State forests, and fifteen in Crown forests.

9. Are you aware how long it would take them to work out the leases they have now in occupation?—Some will be worked out within a couple of years, and others will take, most probably, twenty years or twenty-one years to work out.

10. How much is there that would take the longer term, twenty-one years, to work out?—In Mr. Massey's case, he holds a number of areas under the old Act, and consequently it will take him a long time to work it out.

11. Was there no specified time to work it out under the old Act?—Not specifically mentioned in the Act.

12. Nor in the agreement of lease?—Not in the regulations.

13. And he may be storing that up without cutting for some years to come, may he not?—Yes.

14. If he is not compelled to cut it within a certain time he may be holding it?—I believe that is so.

15. Could you tell us anything approaching the quantity Mr. Massey holds—the area?—I think we made out a list of that also—something like 6,000 acres.

16. And that is not all under the original unconditional leases?—No, not all.

17. How much of it, can you say?—I should say there is about 2,000 acres, as near as I can remember, under the old Act.

18. Do you know if he is working on these leases at the present time?—Yes, he is working in them at the present time.

19. And what proportion with regard to the mill-power on the unconditional leases?—His mill-power on the unconditional leases is about sixty-horse power, and he has got only one mill working on all those areas, under the old Act of 1886.

20. How long has the mill been working on that?—About six or seven years, I should say—perhaps a little more. I really cannot say from memory.

21. Can you tell us approximately what amount of that he has cleared?—I think he has abandoned one area and a part of two. I should say he has abandoned three or four hundred acres.

22. And he ceases to pay rents for those he has abandoned?—He ceases to pay taxes on them.

23. But he is still paying taxes on the balance of the 2,000 acres?—That is so.

24. How long do you think at the rate he has been going that he will be able to work it out to a finish?—I should say it would take him about twenty years, or fifteen years, at all events.

25. Is there any other besides that which Mr. Massey has on unconditional leases?—No, there are no other unconditional leases now in Southland I understand.

26. Can you tell us what has been done with the land he has abandnoed?—There has been nothing done so far.

27. Not been offered for lease to any one else?—No, none of that has been offered for lease.

28. And will it be growing noxious weeds?—Well, there is very little in the way of noxious weeds at the present time on it. It has been sown. There was a fire run through part of it, and the Lands Department here sowed it with grass.

29. And have they not let it to any one after sowing it in grass?—No. We offered it for lease, but, so far, nobody has taken it up.

30. What upset have you put on?—I think as near as I can remember 2d. or 3d. per acre per annum. Those lands adjoining were similarly burnt and sown, and have been let, some at 6d. and some at 3d. per acre per annum.

31. Have you been over these lands recently?—I was over them within the last four months.

32. And has the grass taken well on the portion abandoned by Massey?—Yes, fairly well; but not as well as other land we opened for settlement and properly burned.

33. You did not observe many noxious weeds?—Not very many.

34. Is there any Californian thistle?—There are some.

35. Has there been anything done to keep it from spreading?—Oh, yes! I think the Department has sent men to cut them down.

36. Could you tell us the rents Mr. Massey is paying for this land he still holds?—No, I could not.

37. It could be got from the books here?—Yes, certainly.

38. *Mr. Hanan.*] Your duties take you all over Southland and Stewart Island, do they not?—Yes.

39. Could you give us any information as to what is going on in the way of cutting out of bush in Stewart Island?—Yes. There are three small mills working there at the present time.

40. What areas are held there?—Only two areas. Two mills are working in Crown forests, and one mill in a private forest.

41. Now, at the present rate of milling, how long do you think it will be before our bush is cut out within a radius of thirty miles of Invercargill?—That is a fairly big question. There is Mr. Massey's mill at Gorge Road.

42. How many miles is Gorge Road mill from here?—It is twenty miles from here. It would not take very long to work out the balance within a radius of thirty miles from here, because the Waiau River is something like fifty-five miles from here, and thirty miles would reach something like Colac Bay, on the Riverton line, and I should say Fairfax, on the Nightcaps line. It would not take long to work that out. That would not even include Moore's area.

43. Would you say ten years?—I should say twelve years would work that out within thirty miles.

44. And you would expect timber to increase in price?—No, I do not expect timber to increase in price.

45. Not in face of the fact that you have got to bring it a greater distance, and the extra cost of production in having to operate in hilly country?—Well, they cannot operate in worse country than they are operating in at the present time.

46. But they will be further away?—A little further by rail only—it would mean a matter of a few pence in twenty or thirty miles.

47. We are told it is inferior bush: is that so?—That all depends on what you compare it with. If you compare Southland with the bush in the North Island, it is very inferior, undoubtedly.

48. Well, that bush that has been cut out within a radius of thirty miles?—Yes, it is inferior to bush that I have worked in the Seaward Bush some twenty or twenty-five years back.

49. Is it difficult to get good heart of red-pine?—Well, it is difficult to get red-pine of any sort in Longwood; but good heart of red-pine is quite as plentiful at the present time in comparison to production as ever it has been in Southland.

50. What is your opinion as to increasing the areas of hilly country?—I think the areas should be increased.

51. To what?—It all depends on the size of the mill.

52. Now, as to the royalties, do you think they should be increased or decreased?—I think the royalties are pretty right as they are. I do not see that there is any necessity for a change.

53. *Mr. Jennings.*] How long have you been a Crown Lands Ranger?—For a little over four years.

54. Have you had any experience in any other bushes besides Southland District?—Well, I have been through some other bushes, but not to a very great extent.

55. Are you familiar with any of the bushes in the North Island?—Yes.

56. Waimarino?—No.

57. The kauri forest?—No. I have been into the kauri forest near the Thames, but that is all.

58. What has been your experience in regard to the destruction of bush lands by fire since you have been in the district—have you any knowledge of that?—Yes, I have a fair knowledge of what has been done here by fires during the last thirty years.

59. Has it been extensive in any way?—With the exception of two or three years it has not been extensive. It was rather extensive in one block that was let between Orepuki and Waiau. There was rather much sawmilling-timber burned there or destroyed at one time: it was burned or ruined by the fires and died.

60. When was the extensive fire?—Somewhere about twelve to fourteen years ago.

61. Speaking generally, it is quite possible for a fire to get into the bush and become very destructive—is that your experience?—No.

62. Are you aware of what took place in Dannevirke, Puhipuhi, when fire got into the bush there?—Yes, I can quite understand that in the North Island it may be destructive, but I am referring to Southland.

63. I want to get at it generally?—It may be very destructive in the North Island.

64. You think there is an ample supply of timber further back within the thirty-mile area that you speak of. Have you been further back than thirty miles?—Yes.

65. And you have a knowledge of it?—Yes, part of it; it is not all valuable sawmilling country.

66. Is it possible to get an accurate knowledge of the country that is away back where the timber exists?—It is possible.

67. It has not been done to your knowledge, has it?—No, it has not been done.

68. *Mr. Field.*] You cannot give us any idea of how long it would take to cut out the timber on the Crown lands in Southland—you say twelve years for land within a radius of thirty miles?—Yes, with the exception of Mr. Massey's area.

69. But there is a large area outside that which you cannot say how long it will take to work out?—There is an extensive area to the west which has not been explored yet.

70. You say the milling areas should be increased, but how long do you think it would be a fair thing to allow the mills to run?—They should have at least ten years' life.

71. Is it possible for fires to burn your Southland forests, bearing in mind the fact where the fires have been in Longwood?—It is possible; in a dry year a fire may spread through a beech forest, but in any other forest in Southland it will not reach far in maiden bush.

72. I do not know whether it is your duty, but it seems to me you will probably agree that some attention should be paid to keeping down the noxious weeds in this timbered land as the mills cut it out: is that being done?—Yes, to a certain extent, it has been done. I dare say it has not been quite efficient; but there is a certain amount of work done, at all events, in connection with it.

73. Do you not think that their attention ought to be called to it?—I do.

74. Have you gone into the question of tree-planting?—Yes.

75. Some of this land is so filled with weeds that we are told it would cost more than the land is worth to clear it. Should not that be planted with timber-trees?—No, there is too much old wood lying about likely to destroy the work you would do.

76. But if there is no timber left?—I would advise that it should be planted.

77. Do you think it would be worth considering the question of planting in this district—not our own trees, but foreign trees of a suitable character?—That is my opinion. I advocate planting.

78. *Mr. Morris.*] I would like to get your opinion again about the area a mill should be limited to—say, a ten-years mill, capable of turning out 350,000 ft. per week?—I did not say that a mill should be limited to an area. I said it should have at least ten years' life—say, from ten to twenty years' life.

79. *Mr. Jennings.*] According to its capacity?—Yes; a mill should have an area in proportion to capacity.

80. *Mr. Barber.*] Where is this forest to last twenty years?—Along the Seaward Bush line, in an easterly direction—Oteramiki.

81. It is not part of the Seaward Bush?—It is a continuation of the Seaward Bush all the same.

82. Is it not nearly east of Invercargill?—Perhaps a little to the north-east.

83. We were told that that bush—meaning Seaward Bush—was absolutely denuded of timber. There is still a timber area?—Yes.

84. Do you not think that Mr. Massey had an advantage by having a bush with a life of the extent of twenty years to run?—In sawmilling, you mean?

85. Yes?—Yes, of course, he has got an advantage in sawmilling; but I suppose he has got disadvantages in the expense of holding it so long.

86. With regard to the replanting of these areas, what do you think it would cost to plant, say, 100 acres?—I have never gone into that.

87. You could not say whether it would not be wiser to retain the forests we have at present than go to the expense of planting?—I would certainly say, Retain the forests that you have rather than go to the expense of planting.

88. *Mr. Ell.*] You have had about thirty years' experience in this district?—Yes.

89. During the whole of that period you have only known of one extensive fire to take place in virgin forest?—No, that was with regard to the destruction of timber by settlers. There was land taken up for settlement where they destroyed the sawmilling-timber. I have said that outside of that I have not known of any extensive quantity being destroyed by settlers.

90. You were asked with regard to fires in forests generally. I understood you to say that a beech forest was liable to burn in ordinary dry weather, but an ordinary mixed forest was not?—That is so.

91. That is your experience?—Yes, but not to any appreciable extent.

92. What is your position as Crown Lands Ranger? What are your duties, roughly?—Reporting sometimes on improvements by settlers; but my principal work is as timber expert for Southland—valuing bush lands—the timber on them—and, generally speaking, attending to the sawmilling areas, and reporting on the working of the different mills.

93. Attendance on Crown lands?—Yes.

94. Must you inspect all the different reserves from time to time that are under your control or supervision?—That is so.

95. Are you the only Crown Lands Ranger in the district?—No, there are three of us altogether.

96. Where does your district extend from?—From Chasland's on the coast-line north and north-west to Lake Wakatipu.

97. Is Stewart Island included?—Yes, and from about half-way up Lake Wakatipu in a line about straight west to the coast.

98. So you have an enormous area of country to cover?—That is so.

99. With regard to the beech, can you tell us, from your knowledge of it, whether it grows more rapidly than other New Zealand timbers?—Yes, compared with red-pine, beech grows very much more rapidly.

100. How long would you say?—I would not like to say.

101. What I want to get at is this: I noticed, the other day, a lot of very young trees about a foot long. How long would they take to come on?—I think about a hundred years.

102. Do they grow as slowly as that?—Well, you know, at 1 ft. thick they are almost fit to mill. I mean that in thirty years a tree a foot through would not gain more than 6 in.

103. Take a tree 6 in. through: how long would it take to reach the size of a foot through?—I do not think it would take quite as long.

104. Twenty years?—I should think probably about that time.

105. So that the younger trees 6 in. in diameter would become marketable timber—milling-timber—in about twenty-five years?—I dare say they would.

106. What about the land on which the beech grows? Is it good land?—Some of it is good, but as a rule it is rather indifferent land where beech or birch grows.

107. I want to know whether you think it would be wise to mill out the milling-timber on a large portion of the beech country, and leave the remainder to be used from time to time?—I fear not. I fear that once you allow a mill to go through it you give up all hopes of milling in that country again. In the first place, most of the young trees are destroyed by the falling of the timber in the working of the bush; and, in the next place, the bush takes up a different attitude after the timber is felled: it grows up a lot of scrub and different kinds of trees that prevent the growth of the larger trees.

108. So that you do not think it would pay?—I do not really.

109. I understood you to say that you considered it would be a wise policy to preserve our forests so as to conserve our native supply of timber for various industries?—That is with regard to settlement—not to allow any lands to be thrown open for settlement that contained milling-timber.

110. *Mr. Arnold.*] How many acres are there now in Southland connected with the various mills taken up at the present time?—I think I said something like 36,000 acres.

111. Can you tell us what length it will be before that is worked out?—I should say about twenty years.

112. Have you any experience of the Catlin's district?—Yes, a little.

113. Do you know anything about the area of bush land to be found there?—I cannot tell you the exact area, but there is a considerable extent of country there for sawmilling, if you go down at the back of Tautuku.

114. Two or three thousand acres?—Probably that.

115. What class of timber is to be found there?—Principally rimu,

116. Also black-pine?—Yes, more than we have down here.

117. Any birch at all?—They have got some along the Catlin's River, along the flats; but in the hilly parts there is very little birch, except kamahi.

118. Is there a percentage of the forest good milling-timber—large trees?—Yes.

119. A large proportion are big trees, are they?—Yes, large trees for Southland.

120. Is there very much superior to what we saw the other day at Longwood?—No, I do not think so. Of course, you passed there a lot of birch bush; but I mean, with regard to the area where Moore's mill was working, it (Catlin's) is not equal to it. On the average there is some better bush down towards Otautau, but then as you get back on the hills it is not nearly as good at Moore's.

121. That district does not come under your jurisdiction?—No.

122. Do you know that there are large areas that have been cleared by the settlers and that have been given up?—I do not know about that.

123. *Mr. Stallworthy.*] You said there was an area of 36,000 acres now being worked. Have you any idea of the acreage that has been abandoned as having been worked out?—No.

124. Is it equal to that now being worked?—I think it is more.

125. What is the acreage still available?—Something like 1,132,400 acres.

126. You do not see the end of the timber industry here by a long way?—No.

127. *Mr. Barber.*] You stated that it averaged only about 500 ft. to the acre?—It is very hard to say what it does average, because the greater part has never been explored; but as we are exploring we find that there is a great deal more timber than we had anticipated.

128. *Mr. Morris.*] Is it accessible?—Not at present.

129. *Mr Stallworthy.*] When did Mr. Massey get his last area?—It was in New River. His last grant was about four years ago.

130. There was nothing to prevent a man who already had a large area from acquiring more?—Nothing that I know of.

131. *Mr. Morris.*] Is there no condition as to building mills?—Yes, you must have a mill on the area within six months after it has been rented—a fully equipped mill on the area, or on a site approximate to it.

132. Who is reaping the benefit of the grass on Mr. Massey's areas? Is he grazing them?—No.

133. How long is it since you offered the grazing-rights of those areas?—About twelve months ago.

134. You were asked about replanting. Would it not be more profitable to graze those areas than to replant them?—I think it would.

135. Does the Crown Lands Board open land for settlement with timber on it, or has it given that up?—It does not do it at present, at all events.

136. *Mr. Mander.*] In selecting areas for milling purposes, do you not think it would be wiser to do it by the quantity of timber on the land rather than by the number of acres?—I should say that the life of the mill would be the best means.

137. Do you not find, when you start working bush, and the tops are felled, that it is very hard to keep fires out of it?—That is so.

138. And as a sawmiller you run a big risk of being destroyed by fire?—Quite so.

139. *Mr. Hanan.*] Has the Crown sold any timber areas without fixing a time within which the timber must be removed?—Not to my knowledge. According to the regulations it cannot be done, and should not be done.

140. Is the time fixed by the regulations within which the timber must be removed?—Yes.

141. What time is fixed?—I think, as near as I can remember, in one instance the area must be cleared in four years, and in another in three years; but we will have the regulations in a second.

142. Has the Land Board, to your knowledge, any trouble in connection with the bush not being removed within a certain time?—There are many instances in which the bush has not been removed up to the time specified.

143. *Mr. Mander.*] Extensions are usually granted?—Yes, if there are reasonable excuses for the sawmiller not having the land cleared. Regulation 40 says, "The holder of every sawmill license other than for kauri must within six months of the date of his license provide and fit up, either upon his sawmill area, or upon some other site approved of by the Commissioner, a substantial and fully equipped sawmill, including all the necessary buildings thereto appertaining, which sawmill plant shall be of sufficient capacity and be kept in continuous working operation unless valid reasons shall be given to the Commissioner for such stoppage."

144. The point I want to get at is this: Is there any time mentioned for that license to expire?—There is.

145. The point is this: A license may be given to a man to cut timber; he may keep that for twenty or thirty years and do nothing?—There is a limited time. Regulation 31 says, "The original license for the first area shall be for a period of three years from the date thereof, and the licensee shall not enter upon any additional or reserved area, or cut or take timber therefrom until it shall be granted to him from the surrender of his previous area."

146. Then I take it that if the timber is not cut out in three years that license ceases to have any effect?—That is so, unless there is an extension granted.

147. *Hon. the Chairman.*] That will only apply to that area?—To that area; and then, "For the 200 acres or other area comprised in the original license for the remainder of the term it shall be at the rate of one year for each 50 acres."

148. Do you know of cases where licenses have been forfeited because the timber was not cut out within the time mentioned in the license?—No.

149. What extension of time has been granted—that is, how many years in the way of extra time?—I could not really tell you.

150. Have many been granted?—I think some have been granted, but not many. I think they did not cut them out in the time.

151. You have had no complaints of these areas not being cut out in the time?—I have made complaints myself. I have never had a complaint from any miller about another miller not having his area cut out. I have heard complaints respecting Mr. Massey's areas. The complaint was that he held them too long.

152. That is what we want. When were these regulations made?—In 1900.

153. Previous to that there was no time mentioned?—I could not say exactly. In the Act of 1885 I do not think there was any specified time mentioned in the regulations then existing.

154. *Mr. Stallworthy.*] Does the Land Board grant areas for sawmilling property to all applicants, or have they some system of limiting the output of timber?—There is a system of grading applications. That, however, remains with the Conservator of Forests and the Land Board.

155. *Hon. the Chairman.*] Have you known of any being refused?—Yes.

156. Under what conditions were they refused?—If the man holds rather more bush than they consider he should hold, they would refuse any further areas to him.

157. That would only be until he cut out what he was in occupation of?—Very probably.

158. If the output is more than the market requires, can we blame the Land Board for glutting the market?—I do not think so. The land is there available for the sawmiller. Although one man would be able to make a business pay, another man might not succeed. It is optional for any man to apply for an area if he thinks he can make the business pay.

159. *Mr. Ell.*] You spoke about the kamahi wood just now: is there very much of it?—Yes, there is a good deal of it in Southland.

160. I understand that no use is being made of it at present?—I think that is correct. Very little use is being made of it.

161. Do you know whether it has been used for sleepers?—Yes, it was used at one time.

162. Has it any length of life?—I fear not. I think they found it faulty.

THOMAS O'BYRNE sworn and examined. (No. 15.)

1. *Hon. the Chairman.*] Will you tell the Commission what you know about those sawmillers belonging to the workers' union?—I am secretary of the Sawmillers' Workers' Union—organizing secretary. My duty is to travel through the whole of the mills working under the award, interview the men, gain a general knowledge of all kinds of practical work in connection with their duties, and ascertain the wages paid. We see that the award is enforced. I now hand the Commission a copy of the awards in operation in Southland, Otago, and Catlin's River. [Copies handed in.] It might also interest the Commission to hand in particulars of two disputes before the Court, together with a great deal of information in connection with our Court case which is affecting the Oregon-pine question and the sawmilling industry generally. [Particulars handed in.] During the last seven years the increase, so far as the men's wages are concerned, has added very little to the cost of production. For instance—I am speaking of seven years back—the engine-drivers got 1s. a day rise, the unskilled workers got 6d., and boys over sixteen years of age got 1s. There were several others, such as the yard-workers, who got 6d. a day rise. I should think it would not add much more than 1d. per hundred feet during the last seven years in the cost of production. I might state that the men lost on the average about one day per week throughout the whole of the year, so that a man who was getting 9s. would only average 7s. 6d. per day. That estimate of the loss in wages per week includes wet weather, holidays, breakdowns, &c. I might state that the work is very dangerous and arduous. I think five of our members have been killed during the last eight years. Of course, there are minor accidents happening every day. Within the last week four men came into me maimed in various ways. They had fingers off, knocks in the back, broken legs, &c. I have also to say with regard to duffers, and in reply to the remark made by one of the employers when he said there were a great number of duffers amongst the men, that I have had a great deal of experience with men in various parts of Australia as well as here, and I can say that the sawmill workers of Southland are the finest body of timber-workers in New Zealand. They must be physically strong, and a great deal of skill is required in the industry. As to the remark in reference to duffers, I can only say that the gentleman who made it would not keep duffers very long. I can assure the Commission of that. I was working for that gentleman, and I was doing about the work of a man and a half—close upon sixteen trolly-loads a day. Notwithstanding this he told me he had a man who could do one-third more than I was doing. Of course, I would be classed as a duffer myself. I may say here that he had to give the next man a boy as his assistant. Some employers are never satisfied, no matter how much work is done for them. On the whole, the employers whom I am connected with in the industry are a very fine lot of employers, and treat their men very well indeed. But we have some duffers of employers. The accommodation might perhaps interest the Commission. We have always advocated better accommodation for the timber-workers, more especially in the bush. Men are compelled to stop in the bush. Their huts are waterlogged, and we should be pleased if the Government would do something to put on the statute-book an enactment compelling sawmillers to give proper and sufficient accommodation to timber-workers in the bush. You have a very good law in connection with the Shearers' Accommodation Act. The Commission will note that shearing is done at a fine time of the year and in the open country. Our men, however, have to go into the bush in the winter, and live in waterlogged huts. I think the same legislation should be placed on the statute-book in this respect. Some remarks have been made

about the industry now having reached rough country. That makes it a great deal harder on our men, because we find that the men have to work harder and have to be more skilled. For example, they have to control the hauling-engines, together with a great amount of gear in connection with their work, and the men have to be expert to hold such positions. I wish to emphasize the fact that the work in the bush now is a great deal more arduous and harder on the men than previously was the case when bushfelling was confined to comparatively level country. Some reference has been made to the time the mills last. I may say that some mills in Southland here have been in existence about thirty-five years. I know, as a matter of fact, that the Woodend mill was running thirty-five years.

2. Who was the owner?—Mr. Massey now. The Spar Bush mill ran thirty-five years. The Mabel Bush mill ran there for thirty years. In fact, one employer told me that there were two mills working in the Mabel Bush twenty-five years ago. One of them was burnt down, and they did not think then it was good enough to erect this mill again, but since that there has been one mill running twenty-five years, and there is still a considerable amount of bush there. Then there is the Gorge Road mill—one of Mr. Massey's—that has been running from seven to eight years, and there is bush there for over twenty years. The increase of 1s. a day on the men's wages cannot possibly advance the cost of production more than 5d. per hundred feet—that is, in Southland. In the evidence given before the Arbitration Court it was shown that one man averaged £7 15s. per month, and it was also shown that he had eleven to keep.

3. What was the special work he was engaged at?—Hardest work about the mill, slab-man, at 8s. a day; but his average was only £7 15s. per month, not 6s. 6d. per day. With regard to the tallymen—men who are highly skilled—I notice the rate throughout the colony is £3 per week. Those men have to do manual labour all day, and then they have to do their clerical work after they have done their day's work. The average wages paid for the whole of Southland runs out at about £103 3s. per annum. Coming to the importation of timber, one thing which I find affects the workers here is the importation of a considerable amount of sleepers from Australia—I refer to the jarrah. Just recently I understand 80,000 sleepers were imported from Western Australia. Fifty thousand were sawn and 30,000 hewn. These were examined by New Zealand experts, who condemned 17 per cent. of them. We can supply these sleepers in any quantity. It was formerly a splendid avenue for getting employment for our men. We used to go through the bush and pick up the waste timber that was left behind, but now those men cannot sell a single sleeper. The sleepers were creosoted. White-pine sap and totara, when put through the creosote-works, are supposed to be equal to any timber that comes from Australia. It seems a shame that our men have to walk about idle whilst the Railway Department is importing sleepers from Australia. The timber will only go to waste, and yet if used it would give employment to our men, and I understand it is suitable to the Railway Department. For instance, we have a mill working just close to the works down here—the Tisbury mill. They have had about a hundred sleepers over there, and these sleepers are lying upon their hands because the Government have sufficient sleepers consequent on recent importations. That mill is now idle through want of orders. In going around the mills I find that five have been closed down that were working last year, owing, I understand, to want of orders. They are in rough places, and some are in beech country. I might explain that owing to the import duty placed upon beech by the Federal Government one of these mills is affected by it. The other mills are in rough country, and it does not pay to work them when orders are not brisk. There are about seventy-five mills working under our award. There is close upon a thousand men employed in our industry, and working under our award in Southland and Catlin's. As to the prices, I understand you have had those placed fully before the Commission.

4. Mr. Paape says that twenty years ago wages were higher and timber was half the price?—That is so. The hauling-engine has been the means of tapping timber that otherwise could not have been reached by the bullock.

5. You have had experience in working for Mr. Massey, I see here?—Yes; I have worked for Mr. Massey for about ten years in the bush.

6. What wages were you getting then?—From 7s. to 12s. a day. When I was bringing evidence before the Court he said I was doing two men's work, and he was giving me 12s. a day. That is the first time he admitted it. He did not admit it when I was working for him.

7. *Mr. Hanan.*] You are secretary of the Sawmillers' Union, and also a member of the Southland Trades Council?—Yes.

8. Are you secretary of the Council?—No, just a delegate from the sawmill-workers.

9. Will you give us your opinion as to whether the duty should be increased, or should there be a duty on Oregon pine?—I should think the duty should be increased on the large sizes of Oregon pine.

10. Speaking on behalf of your union, have you passed any resolution to that effect?—Yes, we have passed a resolution in the Trades Council to that effect, and also the union.

11. Can you tell us if the workers, speaking from what you know, consider the price of timber too high?—Yes, that is the general feeling amongst the workers.

12. Do you not consider that in imposing a duty on Oregon timber it would increase the price of timber?—I should say, increase the duty on Oregon timber, and start State sawmills to regulate the price of timber.

13. You believe in nationalising the timber industry?—Yes.

14. Do you believe in forest-conservation?—Yes, as far as possible.

15. Do you think, by allowing Oregon pine to come in it would generally preserve our native bush?—It would tend to preserve it somewhat, but we have at least a thousand men employed in Southland affected, and I think it is the duty of the Government to see that those people are cared for.

16. But do you think it would seriously affect the timber industry in this country—in Southland, for instance—if Oregon timber is allowed to come in free?—I do not think it would affect us a great deal in Southland, because I am of opinion we could compete against it here.

17. Do you believe in an export duty on timber?—At the present time orders are rather slack, and I should not think it advisable at the present time.

18. Would you not favour an export duty being placed on New Zealand timber?—No, except on white-pine, which we should preserve for our farmers for butter-boxes, &c.

19. Do you believe in imposing an import duty on imported timber?—Well, to protect our own men who are employed I would place a duty on timber coming to this country.

20. Have you heard any complaint from the workers about the increase in the cost of erecting homes?—Yes, I have often heard them complaining about it.

21. Have you had any complaints about the prices of firewood?—No, I have not—there is plenty of firewood. Of course, I do not live in the town, and therefore it does not affect us or the sawmiller, because they are always in the country amongst the timber.

22. *Mr. Jennings.*] Is your Sawmillers' Union a local organization?—Yes.

23. Unassociated with sawmillers in other parts of the Dominion?—Yes, no connection. We are talking of federating shortly.

24. In reference to the statement made here by a previous witness in regard to the men not working as they did in former years, I take it that that is a reflection on every one connected with your union. Can you give any answer to such a very strong assertion?—I say the work upon the men is harder now on account of the men having to go into rougher country. The timber is larger, and therefore the work is a great deal heavier upon the men now, and some men are leaving the industry as soon as they possibly can. They cannot stand up to the work—it breaks them up in a few years.

25. Do you think the race has gone back—that they loaf more than they did fifteen or twenty years ago?—I have a good general knowledge of the whole of the mills, and I say the men more than favourably compare with the men, say, ten years ago. I will give you an instance: ten or fifteen years ago at the Woodend sawmill two men had to cut eight loads a day, and to-day two men have to cut ten loads, which shows they are doing a third more, and I know the tallyman there has to do one-third more than he did ten years ago.

26. Are you a practical sawmiller?—Yes.

27. What part of the sawmilling industry were you engaged in?—Bush-work principally, falling, hauling, tramway work, &c.

28. In the event of one of your men being insured, who is a single man and has a father and mother and other dependants, has it come to your knowledge that the insurance companies have not paid out to them on the ground that the mother and father were not dependent upon him?—Of course, according to the Act, if they can be proved to be dependent upon him the company has to pay up. If it is placed in the hands of the union they have to pay the full amount. Of course, if it can be proved that the man has nobody dependent upon him, then he is entitled to nothing further than £20 for funeral and medical expenses. That is according to the Act.

29. Now, in regard to the question of the conservation of our forests, what would be the general result if that were adopted by the Government as the policy of the Dominion?—I think if you were to conserve it very much it would create a good deal of unemployment.

30. Have you any knowledge of the effect of fires through bushes?—Yes; I have seen several patches of bush that have been burnt, but not to a very great extent, and if it is not cut very quickly after a fire goes through it—within a year or so—that timber is no good.

31. With regard to sleepers cut out in the district, what is the life of a creosoted sleeper as compared with the jarrah?—According to experts, if the sleepers are creosoted they will last from thirty to forty years.

32. Then it does not matter what timber it is?—No, so long as it is creosoted.

33. *Mr. Field.*] You said the sawmill-workers were in favour of increasing the duty on foreign timber?—Yes, for the large sizes of Oregon.

34. You understand there is a good reason for importing Australian timber?—Yes, for beam purposes, and Oregon pine for long lengths and beams. It would perhaps be too costly to get red-pine for that here.

35. Why is it that you want to increase the duty on the large sizes?—It is for the purpose of giving work to the men in cutting the large sizes up.

36. Would it not be better to reduce the duty on large sizes, and increase it on the small?—Yes, that is what I mean; I meant that the duty should be put on the small sizes.

37. Would you take it off the large sizes?—I would not say take it off the large sizes, but increase the duty on the small sizes.

38. Mr. Jennings asked you what would be the effect if our mills were closed down. Well, would it not have the same effect if the timber is burnt instead of being milled?—We do not suffer very much from fires.

39. But assuming it has to be put into grass?—That is so. If the farmers are cutting down the scrub and setting fire to it, I should say that where they are going to fire the timber it should be taken away.

40. Do you think it would be a good thing for the State to resume private timber lands, instead of allowing the timber to be destroyed?—Yes, I should think they should if it is going to be destroyed.

41. I do not understand what you mean by the increases of 5d., 2d., and 1d. in the cost of timber and wages?—That is during the last seven years. We have not had more than 1d. per hundred feet.

42. What does the 5d. refer to?—If they have 1s. a day more to pay the men, it would add about 5d. per hundred feet on to the cost.

43. I understand the men and the millers are living here in a state of harmony?—Yes. We work along all right.

44. *Mr. Leyland.*] In regard to wages, they are not the only factor in causing an increase in the cost of production?—No.

45. You say your men have gone back into rougher country; and does not that mean that the miller has to employ extra hands?—Yes, in some cases.

46. Then, not only has the extra cost of wages to be taken into consideration, but also the extra number of hands, in arriving at the cost of production?—Yes, in the bush it takes more hands to get out the same quantity of timber than in level country.

47. That would add to the 5d. considerably?—Yes.

48. Then you say that upon the average the men have lost a day per week. Does that not also add to the cost of production, because the employer has certain current expenses which he cannot get out of on that idle day?—It will make a great difference to the employer, because he makes more profit than us.

49. It would pay the employer to work every day?—Yes.

50. You told us the average wage was 8s. a day for the tallyman?—£10 10s. a month.

51. But you did not tell the Commission that it was paid the day the mill stopped—he gets it whether working or not?—He can claim the full time.

52. I also see that the bullock-drivers are paid by the month, whether working or not?—They are very nearly extinct now.

53. Then, I suppose the clerks would be paid, too, whether the mill was working or not?—The tallying-man is the only clerk at the mill.

54. There must be a book-keeper?—It is generally done in the towns, but he has to be paid.

55. Then the manager has to be paid?—I should think so.

56. Do you think it is fair that the manager of the mill should be a member of your union—do you think it fair to the employer or to your union?—The general managers of the mills are not members.

57. But the man in charge?—He is generally not.

58. You said he was?—I meant the man managing the bush—he is different to the man managing the mill.

59. With reference to the five idle mills, there are, of course, certain current expenses in connection with the mills and the interest, and who pays that expense?—The employer, I suppose.

60. Should not that be taken into consideration in working out the cost of production—the risks and the liabilities?—Of course, the mills are generally running—they are not built for the purpose of standing idle. Of course, when they are standing idle it will add to the cost.

61. You stated there were about a thousand men employed in the industry in Southland: how many of them are members of your union?—Close on nine hundred.

62. Do you favour an export duty on white-pine?—Yes.

63. If the Government put a duty on white-pine it would not affect Southland only, but all the men who were at work cutting the 57,000,000 ft. exported last year?—We have a large farming community, and they will eventually want some preserved for butter-boxes.

64. Would you be surprised to know, with reference to Oregon pine, that in the North we have mills depending on the logs being towed from the coast. We have a hundred men employed; and, when log-supplies fail, through having the Oregon pine we have been able to keep them employed and pay more wages. If you knew that, would you be inclined to modify your opinions?—The importation of Oregon pine has given more of them work.

65. The work would have been stopped were it not for the Oregon pine?—Perhaps we have felt the effect of that down here, because our mills are slack, and on the West Coast the people suffer most, I understand.

66. But there are other reasons, such as the falling-off in our exports?—I realise it is the tightness of the money-market that has been the cause of the slackness to a great extent, but Oregon pine has some effect upon it.

67. *Mr. Clarke.*] With reference to the effect on your union of a continuous supply: you have been asked as to what would happen if the mills were stopped to provide for conservation in any way. Supposing the timber were cut down as rapidly as possible, what would happen when it was all down—where would your union stand then in relation to the sawmills?—They would have to follow up some other avenues of employment.

68. Would it not be in the interests of your union that some movement should be started to maintain a regular supply of timber whereby the Sawmill Workers' Union should be kept in existence for another 150 or 250 years, instead of at the most fifty years?—Yes, I suppose it would make it last longer; but in the meantime we have, as I say, a thousand men employed, with three thousand people dependent upon them, and, therefore, it is only right we should look after those we have here now.

69. Would you consider it right for this generation of sawmill-workers simply to take into account the sawmill-workers now, and not provide anything for the next generation?—When all the timber was cut out you could then take all the duty off Oregon pine.

70. *Mr. Morris.*] Can you tell us the amount the Government receive in the way of royalty and railway charges on timber carried over the railway-lines in this district?—No, I have no information; I think it is a good deal.

71. Do you not think it will average at least the amount of duty levied on Oregon timber now coming into the country?—I should think so.

72. Two shillings per hundred feet?—I should think there would be a considerable amount of revenue received from the railway charges and also for royalties. I do not know much about that question.

73. You said that the sawmill-workers lose on the average about one day per week right through the year down here?—Yes.

74. Is not that due to the fact that you have not sufficient orders to keep them going for the six days?—It had some effect this year, but it is mostly due to the mills—something going wrong.

75. Mr. Leyland asked you whether you did not think it would be advisable that Oregon should be landed in this country, but then there are five hundred men who are not working more than three days a week, and they could supply New Zealand with the whole of the timber they wanted?—I say, look after our own workers.

76. *Mr. Barber.*] Do you know anything about the Sawmillers' Association in existence here?—I know there is an association in existence in Southland.

77. And do you know to what extent they buy up the product of the unassociated mills?—The timber-merchants, of course, take their timber from the smaller mills.

78. Are those timber-merchants members of the association?—Yes, I understand they are.

79. Do you know to what extent the association members purchase from the small mills?—Considerably.

80. They control to a large extent the timber trade altogether?—Yes, control the timber trade.

81. Are they paying the ordinary Arbitration Court award wage?—Yes, and 50 per cent. more. They will come down as they get a surplus of labour—the wages will come down to the union's award.

82. Take that award you have put in—it is rather misleading from the Commission's point of view if 50 per cent. of the millers are paying above that?—Yes, they are paying more. That was gone into when the case was before the Arbitration Court in October last.

83. What is the maximum paid by the association to a sawmill hand?—It would run about 1s. a day beyond the award rates.

84. What are the award rates?—Take a sawyer at 10s., he will be getting 11s.; a bushman at 9s. will get 10s.

85. Do you know of any getting 14s. a day?—I do not know of any here.

86. Are there many in the union out of work?—There are a few; they mostly get other employment. For instance, if a mill closes down they get other work.

87. There are not a great many out of work?—There are a few.

88. With regard to the number of hands employed, you say there are about a thousand?—Yes; I should think that in Otago and Southland we have close on nine hundred in the union.

89. There was a statement made by a previous witness that there are between five and six thousand connected with the trade in Otago and Southland?—In connection with the whole trade there no doubt would be, including those connected with the building industry.

90. With regard to the duty on Oregon pine, do you not think that it helps to make building expensive, and therefore keeps up a high rent?—We have sufficient here to meet all the requirements in New Zealand.

91. But if the price by the exclusion of Oregon is kept up to a figure beyond its value by the association, is it not likely to add to the cost of building and penalise the whole body of the workers in a district by high prices?—I suggested before that the State should start sawmills, and regulate the price of timber.

92. You are here as a representative of the workers, and do you realise that the fact of high building-material is responsible for a large number of artisans being out of work—carpenters, joiners, painters, paperhangers, and everybody else engaged in the erection of a building? If that business is slack, depression prevails throughout a district?—I suppose the high prices would have some effect, but by regulating the price in State sawmills we should get over that.

93. With regard to the losses through wet weather and the losses on workmen, you said it was fair to charge the increased cost: do these occur any more now than when the timber was at a lower rate?—Just the same.

94. *Mr. Stallworthy.*] Are your men paid by the day?—Yes.

95. Do they lose an hour if it is short?—Yes.

96. What price do the Government pay for creosoted sleepers?—To the miller about 1s. 6d. or 1s. 8d. a sleeper.

97. *Mr. Leyland.*] Is that creosoted?—Oh, no!

98. *Mr. Stallworthy.*] You said you favoured a duty on white-pine because you thought farmers wanting timber were well able to pay for it. Would not the same reason make you advocate a duty on rimu?—Of course, the dairy industry is enlarging, and we shall want more white-pine in the future than at the present time.

99. You think the crop we have is limited?—Yes, there is more red-pine than white.

100. Do your mills work double shifts sometimes?—No, never.

101. *Mr. Mander.*] You said there were some complaints amongst the workers in regard to the increased cost of rents of workers' cottages?—I never said that: I spoke of the cost of erecting homes.

102. Do you not think that the increased cost of labour all along the line is a factor in the increased cost of building?—It has had some effect.

103. Not a very large effect?—I do not think so. For instance, the increase that the sawmill-worker has got has not been the means of raising it more than 5d. per hundred feet, while it has gone up 100 per cent.

104. But all those other factors in connection with that would put up the price of the building?—So far as I know of the charges down here during the last ten years, there has not been much of an increase. A painter gets 9s. 2d., for instance.

105. Do you not think that employers are compelled almost to employ incompetent hands very often?—I do not think so. So far as I am aware, if they are not competent they are very quickly put off.

106. But where labour is scarce you cannot always get competent hands, and since you are compelled to employ incompetent as well as competent hands, an employer would not be able to turn them off so rapidly?—You are not compelled to pay incompetent the same as competent hands. If a man is physically unfit or old he gets a permit to work at a reduced wage.

107. But employers usually do not care to pronounce a man incompetent?—Of course, you can get a man who may think he is a very good man, and not be.

108. Do you think there is any probability of Oregon, if it is introduced here in large quantities, reducing the price of timber?—I do not think it will reduce the price of timber much.

109. What would be the advantage of letting it in here in large quantities if it did not reduce the price for the working-man?—If it came in large quantities we should have men out of work.

110. Would it not be an injury without any practical benefit?—Yes, that is so.

111. *Mr. Field.*] You said you thought it would be a good thing for the State to erect sawmills, and so fix the price for timber. Do you not think, if the offer has been made—and it has, by the millers of the North Island and the west coast of the South Island—to put their books into the hands of the Government and mill at its price—do you not think that is a fair offer?—Yes, I think that would be very fair. I was in Wellington when they offered that.

112. *Hon. the Chairman.*] With your knowledge, do you think the Government is competent to fix what would be a fair price to apply to Southland, Westland, and the North Island?—There may be some trouble as far as that is concerned.

113. I see here that in your evidence some time back before the Arbitration Court you stated "Timber had advanced 4s. 6d. since 1896"?—Yes.

114. Do you still believe that that is so?—That is according to the price-list. Of course, there may be discounts, &c., afterwards. I have old accounts here.

115. But the increase of wages you stated only amounted to 4d. per hundred feet?—Yes.

116. So that the worker only got 4d., in other words, out of this 4s. 6d.?—That is so.

117. You still believe that is so?—Yes.

JAMES PERCY RIDINGS sworn and examined. (No. 16.)

1. *Hon. the Chairman.*] We wish you to give the Commission some evidence as to the quantity of timber passing through the Customs?—Well, I have some returns here supplied to the Head Office some time ago when the question of Oregon pine was under consideration. The returns are made up to the 31st August, and I have the returns for the years 1904 to 1908, the quantities, values, and duties.

2. *Mr. Hanan.*] Is that for timber arriving at the Bluff?—Yes, simply at the Bluff. I produce a return of timber imported from the 1st July, 1908, to the 28th February, 1909 [put in, marked "Exhibit A"]; also a return of imports of Oregon timber for the years ended 31st August, 1904 to 1908 [put in, marked "Exhibit B"]; a return of imports of foreign timber during the years ended 30th June, 1907 and 1908, including sleepers [put in, and marked "Exhibit C"]; returns of timbers imported and duty collected thereon, during the years ended 30th June, 1907 and 1908, and returns of sleepers for same period [put in, and marked "Exhibit D"]; returns of foreign timbers imported for year ended 30th June, 1907 and 1908, not including Australian timber [put in, and marked "Exhibit E"]

3. *Mr. Barber.*] What are the wharfage charges on timber at the Bluff?—I could not tell you. I heard the last witness say that the duty on doors was 2s. apiece, but that is not correct—the duty is 20 per cent., and foreign manufacture 10 per cent. additional, making 30 per cent.

WILLIAM ROY RIDDELL, Smith's Factory, Invercargill, sworn and examined. (No. 17.)

1. *Hon. the Chairman.*] You are one of the proprietors?—Yes.

2. Can you give any evidence with regard to the timber-work in the factory?—I do not know exactly what evidence I could give. I certainly have been at it now for twenty years, and I ought to be able to give some idea of it, but I do not know exactly what is wanted. I would be willing to answer any questions.

3. We want to get evidence as to the prices at which you sell to the middleman and to the consumer and the retailer. Can you give us any evidence of that?—The price as sold to the middleman? I suppose that it would be considered that the firm I am connected with would be the middleman. We have a sawmill also of our own, but have purchased largely in the last ten years. So far as the price goes, it certainly has risen a good deal, but the timber is much more difficult to procure. Ten years ago we used to buy timber here, for what costs us now 10s. 6d. less 5 per cent., at a cost of 6s. 9d. At that time we used to purchase the greater part of our supplies from the Seaward Bush, which was a very good bush, the best in this neighbourhood, and the good trees were standing close together like wheat, and you could go into an acre of ground and hew them down, which, of course, made the production cheap. As it is now, the sawmill we are interested in is close on fifty miles from here: you have to go that far back before you can procure bush. The timber there is of a different class altogether; the trees are short, and a long distance between them with a lot of inferior timber in between. Some of it is useful and some of no use, and it has got to be left standing. The consequence is that the price of good timber must rise. On account of the long distance, you have to face that. It costs us railage at the present time 2s. 3d. per hundred feet.

4. What was the railage before?—There was none before: it was delivered right into our yards. We had it growing in our back yard, as it were, and it only cost about 4d. to deliver it in town. We put no siding into our place because it would not pay us.

5. How do you get the timber in?—By carting it from the railway-station.

6. Do you find that that is cheaper?—It is more convenient. We could get a siding. Our next-door neighbours, Broad and Small, got a siding, which costs them £60 a year. It costs us 4d. per hundred feet. We get it generally from 40,000 ft. to 60,000 ft. per month, and then you can get it put where you want it, whereas if you got it on a siding it would have to be handled, and every time you handle green timber it costs you 6d. per hundred feet. In this other forest now there is a much larger proportion of inferior timber than when we got it in the Seaward Bush. The consequence is that that has to be got rid of. There is much more second-class in it and much more of inferior quality. So far as the manufacture goes it is really difficult for us to get sufficient good stuff for manufacture out of the one mill. There is only about one-third of the cut of a mill that is suitable for our purpose. The consequence is that the remainder has to be got rid of in one way or another. We have been in the habit of getting it sent into our yards and retailing it out in small quantities, which means that we get nothing for it. For instance, a man wants 50 ft. of timber; it costs about 1s. 6d. to cart it, and you have got to do it. In a large order you can afford to do it, but in a small order like that it is a loss. The Sawmillers' Association allow us 12½ per cent. That is all the profit we get, and we have to take and stow it into our yards and recart it out in small quantities. Since we have got the mill further off we have been able to buy it a little cheaper, so that we have not as much loss in distributing it. The timber costs us on trucks at the siding at Waihoka from 7s. 6d. to 8s.—as much as 8s. 6d. for wider stuff; then it costs 2s. 3d. railage and 4d. cartage, so that there is really nothing in it. However, you are not charged extra for the good quality of stuff, and the consequence is that we get that for our own manufacturing purposes, which suits us, and it is what we make our living by.

7. Mostly profit on the best class of timber?—Yes.

8. *Mr. Hanan.*] Speaking as the owner of a woodware-factory, do you think it is desirable that there should be an increased duty on Oregon pine?—I would certainly say there should be no increased duty.

9. Do you think that Oregon pine should be allowed to come in free, speaking as a woodware-factory proprietor?—It would suit better if it were to come in free.

10. Why?—Simply because more of it would be used.

11. Will you tell us the main work for which you use Oregon?—There is a big variety of qualities in Oregon. We use a small quantity of it—and we would use more of it if it came in free—for inside doors and all internal fittings for buildings, joists for buildings, and various other works, except outside. We have used it outside, but it would want painting about once a year. It is not very suitable for that.

12. Would you use it in preference to New Zealand timber?—If it were the same price we certainly should.

13. You would prefer it?—Yes.

14. For all kinds of work except outside?—For joists and floors and that sort of thing it would do equally as well as New Zealand timber.

15. You make up window-sashes and doors?—Yes.

16. Has there been much increase in the price during the last seven or eight years?—Yes, there has been a fair increase, principally during the last four years—in fact, since they began to raise the kauri. Kauri has got to be used for them at the present time; it is the most suitable. We use our local timber occasionally, but it is much more expensive to work, and there is a prejudice against red-pine amongst local people for doors and sashes. It is liable to warp and break the glass of doors, and kauri is more suitable.

17. Do you manufacture furniture?—Yes.

18. Is there an increase in the cost during the last seven or eight years?—Very little—an increase of probably from 7½ to 10 per cent. during the last seven years.

19. Is the manufacture of furniture increasing or decreasing?—Up to about six months ago it increased; since then it has decreased.

20. Are your works working full time?—Full-handed we employ about sixty hands altogether; at the present time when things slacken off with us we simply shorten the hands, we do not work short time if we have a falling-off in any particular line.

21. *Mr. Field.*] The Seaward Bush was close at your doors here?—Within two miles of where we sit.

22. It is easy, then, to understand the timber going up from 6s. 9d. ten years ago to 10s. 6d. now?—Quite easy.

23. We have had it in evidence that the cost of production per hundred feet is over 8s. Do you know if that is a reasonable estimate?—I am not well acquainted with the production of timber. But it would be 8s., I suppose.

24. Where would that be from?—Longwood way.

25. On trucks at the siding?—I believe that is perfectly true. It depends upon the sort of timber it is. Some of ours costs more than that. If other witnesses said so I would not dispute it, because it is very difficult to get.

26. Do you think the price now is exorbitant?—Not a bit. It is less than anywhere else in New Zealand. The difficulty here has been that we were too near the mills; there is no room for middlemen here at all.

27. Do you know anything about the use of the beech growing up there for furniture purposes?—It has a very good appearance, seems to be nice and clear and very durable.

28. It would be particularly valuable for chairmaking?—Very good for that.

29. We learn that the duty in Australia has had the effect of killing the trade?—Yes, I have heard that; I cannot speak from experience; we have nothing of it in the bush that I have to do with.

30. We have been informed that the mills have closed down on account of the cessation of that trade. Would you make some suggestion in regard to reviving the trade?—It would be advisable to revive it.

31. How much Oregon pine was used here during the last two years?—I think Smith and Co. used the bulk of it. We use from 800 ft. to 1,000 ft. per month. I should think, outside of that, the whole district would not use more than as much again. The trouble here is, you cannot get the price for it. The local timber is much cheaper.

32. We were told that only 15,000 ft. of timber was carried on the Bluff line in two years?—It is far more than that, because we get more ourselves.

33. The Traffic Manager of Railways gave us that information?—Then that must apply to one year, not two.

34. You are against putting increased duty on Oregon pine, but what would you say if the effect of taking off the duty or leaving it as it is was to very injuriously affect, possibly kill, our red-pine industry. I know you have not felt it very much here, but in other parts of the colony the Oregon is coming in in very large quantities. Now, I ask you, would it be a good thing or a bad thing?—It would be a bad thing. Speaking as a sawmiller, I would raise the duty on it.

35. *Mr. Leyland.*] With reference to kauri, apart from the extra cost, have you experienced a considerable amount of trouble in getting your orders filled?—Yes. We have had orders for two years without getting them filled.

36. Seeing that Oregon is suitable for many purposes where kauri is used, should Oregon not be let in so that the business of the country can be carried on?—You put me in a fix, because I have equal interests.

37. *Mr. Clarke.*] Did you say that your firm was taking 60,000 ft. a month of local timber, and that you experience some difficulty in getting good timber for your work?—Yes.

38. Does not that prove that we should have importation of Oregon for rough purposes, so that our better timbers might be reserved for finer work?—No. I do not think so. We have far more rough timber than we can get rid of.

39. It is not a particular timber that you want?—The Oregon is not suitable for all the timber we want

40. As to the regulation of supply, I think you said that since getting a mill of your own you have been able to buy lines of timber a little cheaper?—Yes.

40A. That is to say, the associated millers cannot afford to ignore your mill?—They give it to us a little cheaper, because they saw that we were determined to have it. We had to do it to keep our business together.

41. *Mr. Morris.*] Touching this question of cheaper timber that you just mentioned, would it not be owing to the fact that you would be able to get your own supplies if you did not get them from other millers?—It came a little cheaper when we had a mill of our own.

42. Do you consider the present price of timber too high?—I do not think the price is too high; I think it is too low.

43. How do you get at that?—Simply from a sawmilling point of view. There is not sufficient margin to make a fair profit.

44. You have just told us that you use Oregon for certain classes of work in the factory. Do you find it suitable for that class of work?—For certain classes of work it is suitable—that is, where it is not exposed to the weather. We use it for the cross-rails. Oregon stands better in that position in a sash. Local architects will take it in preference to the other because it does not rot so quick.

45. I suppose it is not due to the fact that it is about half the price of Baltic?—No, it is not, although that may be a factor in it.

46. Have you used it long enough to be able to say that it is much more desirable than other timbers?—I have used it for ten years, and have seen sashes that I have come across decayed. If it is not sound good timber it is no good. It is only certain Oregon that is good for that. We buy the best quality.

47. You told us just now that rimu is not fit for doormaking?—I did not say so. I think you are wrong. I said that kauri was more suitable for inside doors than rimu. We use rimu here, but it is specially selected stuff. It is difficult, however, to get a sufficient quantity to make the number of doors required.

48. Have you any market here for rimu doors?—Yes. You may have a good quality of it on the West Coast. Some of it is inclined to warp in the sun.

49. *Mr. Barber.*] Do you take the whole output of your mill or do you sell it?—We take the whole output.

50. You deal in timber as a timber-merchant. Any one can go and buy it from you?—Yes. We kept timber for our own use, but people began to come and ask us for timber, and so we opened a timber-yard.

51. Your factory could not use the total output of your mill. Are you not giving your evidence from the miller's point of view?—Yes, more so than from the manufacturer's.

52. *Mr. Ell.*] What is about the cost of kauri for cabinetmaking purposes?—We do not use it here for that purpose. It is too dear. It costs us from £1 3s. to £1 5s. per hundred feet landed here. There is, moreover, a certain amount of waste with it. The price mentioned is that landed in our yard.

53. I have been told by cabinetmakers in Christchurch that kauri runs them into between 3½d. and 4d. a foot?—It would cost that if you bought small quantities. We get it down the very cheapest way we can. We buy it for cash, and then charter a small vessel to bring it here.

54. You make no furniture largely. You are aware that the majority of homes are furnished with New-Zealand-made timber?—Yes, that is so down here. The furniture is chiefly rimu.

55. Now, supposing the manufacturers of furniture in New Zealand have to use imported timber, I am given to understand that some of the harder woods—oaks and so forth—run to about 8d. a foot?—More than that.

56. If the people had to depend upon imported timber of that character it would vastly increase the cost of furniture?—Yes.

57. Kauri and rimu are suited for that purpose?—Yes, rimu especially.

58. Because of its beautiful grain. I notice that the furniture in the homes in Christchurch is made almost exclusively from rimu?—No doubt.

59. Do you think, seeing that we shall have furniture-factories in this country for years to come, and that rimu is adapted for cabinet-work, that we should make some reserves for a steady supply, and thereby become independent of foreign importations for the purpose in question?—There is something in what you say, but I have not looked at it in that light. It looks as if something of the sort should be done. You see, there is such a small quantity of that rimu timber suitable for cabinetmaking work and for inside finishing, such as architraves, doors, and mantelpieces. If you are to reserve the bush you would not be able to get sufficient suitable timber for present use—that is, if you locked up the bush.

60. Are you not referring to figured rimu?—Yes.

61. I am speaking of rimu generally?—I think we should have a small supply to keep for future use.

62. You think it would be desirable that we should conserve a supply of timber necessary to preserve the continuity of the furniture-making business?—I think it would be advisable to do that, as a manufacturer.

63. Now, how is it you have a difficulty in obtaining rimu here suitable for doormaking?—It seems to me that the Wanganui rimu is superior to the class supplied down here. It has a softer nature. Our rimu is much more liable to warp than that from the North.

64. How about the West Coast—there is plenty of rain there?—It is not the wetness of the climate that affects it here. It is our very cold and our very hot weather.

65. Has the want of proper seasoning anything to do with it?—I do not think so. The stuff that we use we cut in winter. We always keep the winter and the summer stuff separate. The winter stuff is more valuable, because it is not so liable to warp, and it is much easier to work.

66. For manufacturing purposes, then, it is desirable to have logs cut in winter instead of summer?—Yes.

67. With regard to the use of Oregon, do you not think that it would be better to use Oregon, say, for stringers, heavy beams, and pillars, in large buildings, such as warehouses, &c., than to use our rimu for that purpose, seeing that the rimu is more suitable for fine work?—Yes, that is so; but when we use rimu for large beams now it is the rough stuff that is cut for that purpose—the finer quality is used for internal fittings, and there is a larger proportion of rough timber to be got rid of.

68. Do you experience any difficulty in getting seasoned timber?—If you want it, you can get it. Nobody seasons it.

69. They charge 1s. a hundred extra for it?—That is not sufficient for seasoning timber.

70. They charge 2s. in Christchurch?—That would pay.

71. If a house was constructed of seasoned timber, would that add very much to its life?—Very much.

72. Would it add £100 to the life of a house?—That depends on the size of the house.

73. Say a six-roomed house?—No. It would not add £100. Given seasoned timber, if kept well painted, it would add at any rate about a quarter to the life of a house, or, say, 25 per cent.

74. Say that there were 10,000 ft. of timber in a house which cost 2s. per hundred feet additional for seasoning, which would make a difference of £10, would it not be a good thing for the general public if the timber in every house were seasoned?—The general public would be much better off than at present. You could not, however, compel a merchant to season timber and sell it at a loss.

75. Would it not be a good thing to get our architects to specify for seasoned timber?—Yes, the sooner the better.

76. Can you give us any information regarding beech and its uses?—I have not had much experience in beech. We use it for some parts of furniture. It has only lately been introduced here—within these last four or five years.

77. I hear that some of the most handsome suites are made of it?—It is very beautiful, and we use it for similar purposes. It is very tough, although to look at it one would think that he could break it with his finger.

78. A few years ago it was practically valueless?—We did not cut it.

79. Is that so down here?—There was no demand for it.

80. *Mr. Arnold.*] You spoke about the manufacture of doors. What class of timber do you say your doors are chiefly made of?—Inside doors are chiefly made of kauri.

81. Are they all locally made?—Mostly locally made, but some come from Dunedin.

82. Are our doors being imported from other places?—A few are being imported occasionally, but very few.

83. Where from?—Mostly from America and from the Baltic.

84. Do you know that some thousands are at the present time coming in from Sweden to New Zealand?—No; I was not aware of it.

85. Is there any danger of manufactured goods of that kind coming here in great quantities?—I am certain there is. The labour laws are different there, and the men are different. The men stick to one line, and get very expert in it. Here you have a man who is a blacksmith

to-day, a benchman to-morrow, and the next day something else. Our men will not stick to the same job—we are troubled with flighty notions, and therefore do not get expert enough. Again, wages are high here. In England I used to see these doors before I came to New Zealand years ago. I would not care to use them now, because I should prefer the locally made doors any day.

86. There can be no gainsaying what I say with regard to these importations?—Not in this part of the country, but I hear there is a firm in Dunedin named B——, S——, and Co. who are importing.

87. That is the firm. Having some experience in that class of doors, do you think that they would really come into competition and that the builders would care to use them?—Some builders would not care to use them here. I do not think there is much fear of them taking the place of the local article. Moreover, they are too expensive. The locally made door really costs less than those imported ones.

88. You do not think that it is necessary to increase or put a duty on?—There is a duty of a few shillings a door, and that seems to me to be sufficient to keep them out, provided the wages do not increase and hamper us in that way. We do not know when an award may overtake us. I would not, however, suggest any increase at present.

89. You know something of the firm you mentioned?—No. They have only just lately opened a warehouse here.

90. They are fairly keen business people?—I know that.

91. You hardly think that they would bring out doors in large bulk unless there was a market for them?—There may be a market for them farther north, but very little locally at present. Prices are different in Wellington. They get there half as much again for their timber as we do down here, and it does not cost them any more.

CHARLES JOHN BROAD sworn and examined. (No. 18.)

1. *Hon. the Chairman.*] What are you?—I am a hardware-merchant, sawmiller, and timber-merchant.

2. Have you a statement to make before the Commission?—Yes. As I have said, I am both a sawmiller and timber-merchant. We have been in the timber business for a great many years—in fact, we are the oldest timber-merchants here, and it is not so easy to run a timber-yard as has been said. We employ three yardmen, and pay them £357 altogether; we also employ two draymen at £2 5s. a week each; we have three horses to work those two drays, and it is fair to estimate the amount for feed and depreciation at £1 a week. That comes to £747 per year—£62 a month for five men and three horses. Our turnover averages about 1,000,000 ft. a year, or 80,000 ft. a month, and that at 1s. 6d. per hundred feet comes to £60. In addition we have to pay £60 for the rent of a siding, and we should have to pay, I suppose, £2 for the timber-yard if timber-merchants only, and that would be £104. We have an acre of ground altogether, and provide half of that for the timber business. The taxes would amount to £20, clerical assistance £100, and the discount on the timber would bring it up to 2s. 2d. per hundred as the cost for running that yard.

3. Is that the discount on your sales?—Yes, for cash. Now, the best we can do in buying timber is 25 per cent. off the list. We credit our mills with the amount, less 25 per cent. Any merchant buying from a producer cannot get more than about 25 per cent. off. The producer has either to sell at 20 or 25 per cent. off to middlemen, or start a timber-yard, or else employ a traveller, and that is very expensive. If you hold the timber and wait till an order comes along it would simply rot—you would not sell it. I can assure you there is very little profit in running a timber-yard in Invercargill.

4. Is it not much better to run a timber-yard when you run a timber-mill as well?—No; it would take 25 per cent. off—that decreases the selling-price to the mill.

5. Do you think it costs you the full amount to mill it that the timber-merchants sell theirs for?—No.

6. You must have a profit there?—The mill makes a profit.

7. How much?—From 1s. to 1s. 6d. a hundred. In fact, we do not make that at our Waihuka mill. We have 2s. 2d. railage to pay on that, and cartage is a very heavy item in delivering timber. If you have to cart a couple of miles it will cost you 9d. per hundred feet.

8. Do you cart all you sell?—Yes, practically all we sell.

9. You handle all classes of timber in the bush, I suppose?—Yes.

10. For milling purposes?—Yes. Of course, as far as we are concerned, in our mill at Longbush a good third of the timber is second-class, and there is a good demand for it here. I might say that in two-thirds of the cottages erected here second-class scantling is used.

11. *Mr. Hanan.*] What is the cutting-capacity of your mill?—About 80,000 ft. at Longbush, and 85,000 ft. at Waihuka. That is the average for last month.

12. Have your orders fallen off during the last six or seven months?—Very much. We are only working two mills out of three, and piling up more timber now than with the three mills working.

13. To what do you attribute the falling-off?—Tightness of the money-market.

14. Where is the best market?—We confine ourselves to Southland, but we sell pretty well two-thirds of our timber in Invercargill, and Invercargill is about the worst market in Southland for mills at a distance.

15. What is the reason of that?—We are only allowed 1s. on the mill price for railage and cartage; and, as I say, it costs us 2s. 2d. from Waihuka, and cartage 4d., and therefore we lose 1s. 6d.

16. Have you lost money?—We have made nothing at Waihuka. We bought it four years ago, and after working it for two years we found the grade too much. It was a grade of 1 in

3½ in places, and after looking round we found we could get a grade of 1 in 6, and we shifted the mill about a mile and a half, and we have now a grade of 1 in 6½. To do that we had to do a great deal of excavating, and had four men continually on the tramway. We have gone pretty well a mile up now, and are still a quarter of a mile from the summit. We work it with six horses, and I am afraid we shall have to put on more before we accomplish what we want to do. Then there is a down grade on the other side.

17. In your opinion then, it does not pay to invest money in the sawmilling industry at the present time?—Not in broken country. It cost us £600 to move the mill from one site to another, we had to construct two bridges which cost £200 each, and put up a stronger hauler to work difficult bush.

18. You have been a long time in the timber industry?—Yes, sawmilling for four years.

19. You know something about the Seaward Bush district?—Yes.

20. What are the conditions there in the way of settlement?—I have not been there for years.

21. Have forest-fires occurred there?—Yes, a severe one about two years ago.

22. Do you find that the building trade is falling off here?—Very much so. In fact, two years ago it was not a question of selling timber but rather a question of getting timber to sell.

23. *Mr. Field.*] Is the present depression in the building trade in any way due to the increased price of timber?—No. If money was plentiful the building would proceed.

24. Do you think the price charged now is too great?—Not under the present conditions.

25. Have many millers in this part of the Dominion made money?—Yes, a few in the early days.

26. How many are piling up money now?—I could not tell you of any one.

27. Do you think they are paying handsomely?—I do not.

28. We had it in evidence that only two men made money in this part of the Dominion out of sawmilling since it began?—Two get credit for having made money; others have come to grief. I am in business otherwise than milling, and I know sawmillers who have been in business during the last ten years who still pay their accounts by promissory notes.

29. About Oregon?—I am in favour of the present duty being retained. I am quite indifferent whether it is increased or not—sawmilling is a side line with us.

30. What would be your opinion if it were shown that it was going to compete successfully with our rimu?—It would be a bad thing for sawmillers and workers generally.

31. Have you got any opinion as to the conservation of timber lands for future generations?—I think the Government should go in for afforestation.

32. You think we should use our own timber for our own purpose?—I think we should. It will go in time, and a few years do not make much difference one way or the other.

33. Do you think it would be fair to ask private owners to hang up their timber for an unlimited time?—It would not be fair.

34. If it is to be conserved at all it should be done by the State?—Yes, they are the proper people.

35. You know nothing about the conditions prevailing in Wellington?—No.

36. You know something about sawmilling: supposing a price-list was shown to you which showed that ordinary rimu was purchasable in Wellington at 14s. 6d., what would you think?—I do not know what railage they have to pay on it in Wellington. Rents and such other expenses are very stiff there.

37. Do you think that would be an unreasonable price?—I should say that they are doing better than we are here.

38. *Mr. Leyland.*] In giving us your estimate of 2s. 2d. as the cost per hundred feet, I do not notice that you make any allowance for the waste in measuring it. We find in handling timber that we have never yet been able to measure it out at less than 5 per cent. loss on the quantity charged?—We do not check the mill's tally.

39. Because it is your own mill?—Yes.

40. If from another timber-merchant's yard?—Yes.

41. I do not see any provision for bad debts either?—No.

42. That estimate of yours should have some more added on to it?—Yes.

43. Do you make any bad debts?—Rather.

44. I do not notice any provision for depreciation, horses, harness, and all these things?—I put down £1 per week for these things.

45. I do not notice any item for interest on stocks?—No, I let that go.

46. If it could be shown to you that Oregon was not likely to increase, or to affect local timber very seriously, do you think it would be wise to put on an extra duty under those circumstances?—No.

47. *Mr. Clarke.*] Do you belong to the Sawmillers' Association?—Yes.

48. Is it a fact that supplies can be obtained from sawmillers who are not members equally rapidly with those who are members, or are there difficulties?—The timber-merchants mostly deal with the unassociated millers.

49. Are there not a good many who have no planing-machine, but simply cut rough timber?—Not many now—a few small millers.

50. In that case they would only be able to supply a limited order?—Yes.

51. Is it not a fact that one of that class of sawmillers uses a traction-engine on his own bush?—That is correct. There is a miller doing that, cutting white-pine.

52. In that case the outside millers are those doing a small line of business?—A number of them; some of the outside millers are in a fairly large way.

53. *Mr. Morris.*] Does your association here fix the selling-price of timber?—Yes.

54. You are not able to control those small millers outside the association as to the price at which they sell?—No.

55. They sell to anybody they please?—Yes, mostly to timber-merchants; but they do sell otherwise.

56. They sell mostly to timber-merchants?—A number of them do. I think one or two may be getting orders where they can.

57. You said you made practically no profit in sawing at the mills?—During the last two years we had a fire.

58. Would it enable you to do better if you had a larger area of bush?—We had a fair start; we have been working three mills. We have 1,200 acres at Waihoaka, but whether we shall be able to work the whole of it or not time alone will solve. It is a very broken country. We have the roughest in Southland; in fact, if the price of timber is reduced we should shut the mill down.

59. *Mr. Barber.*] Have you got a printed price-list?—Yes.

60. The same as the Southland Timber Company?—Yes.

61. What do you say it costs to mill timber?—Five and twopence at Waihuka for wages; we put down 7d. for royalty, and as we have spent £4,000 there the interest on that is 6d. per hundred feet.

62. And you sell the timber to any one in small quantities?—Yes.

63. *Mr. Ell.*] You are a manufacturer?—A furniture-manufacturer.

64. What kind of timber do you use?—Mostly red-pine, but also a quantity of birch, which we buy. We have none on our area.

65. Do you know of any imported timber that is as useful and as easily worked as rimu or kauri for manufacturing purposes?—I do not know of any. We use kauri, birch, and red-pine.

66. Do you know of any imported timber as useful as New Zealand timber for furniture purposes at the same price?—Not at the same price.

67. Or anything like it?—I do not know of any.

68. Then, if we depend upon the imported timbers for the timber for our factories we shall greatly increase the cost of the furniture to the public?—That is so.

69. That being so, do you think it is necessary to have reserves made to preserve the timber?—The supply we have cannot be permanent.

70. Why not?—There is not sufficient of it. At the rate the population is increasing there will be more consumed every year, and it will be gone in forty years.

71. What about coming generations?—I say that the Government should go in for a system of afforestation.

72. You do not think it is desirable to attempt to preserve, particularly rimu for furniture?—You could not reserve it unless you allow the foreign timbers to come in now.

73. If foreign timbers are more adaptable than rimu, is it not in the interests of the public that rough timber should come in?—If you take it that way it is—if you want the native article for furniture-making.

74. Which you admit is more suitable?—It is cheaper than the imported timber.

75. *Mr. Mander.*] One witness stated here to-day that the increase in the cost of labour in the last seven or eight years had only put the cost of production up about 5d. per hundred feet. Is that your experience?—One shilling per day all round means about 5d. per hundred feet. That is about correct. Every extra man you employ adds about 3d. per hundred feet on to the cost of the timber.

76. Then, you do not agree with him that the cost of production has only been put up 5d. per hundred feet?—At 1s. a day he is right, but he is taking from one award to another. He overlooks the fact that a great many men get over and above the award. In fact, not many men care to tackle our bush.

77. Do you think, in fair good country, it will pay the Government to conserve the timber for fifty years when that land could be turned to profitable use in other ways—for cropping, and so on?—No. I think the sawmiller should precede the settler. The felling of the forest improves the land. The land is more valuable after the bush is cleared.

78. That is, provided fire does not get into it?—Yes.

INVERCARGILL, WEDNESDAY, 31ST MARCH, 1909.

ALFRED JAMES MCCREDIE sworn and examined. (No. 19.)

1. *Hon. the Chairman.*] What are you?—District Engineer for Railways in Southland.

2. The Commission desires information with regard to the creosoting-works here, and also the process through which the timber goes, and your opinion in regard to whether the process should be further utilised?—The creosote-works at Kew have, since the Government purchased in July, 1901, put through a total of 298,854 sleepers. The sleepers are not cut by the Railway Department, but contracts are let for the supply of the sleepers. The contracts are let and called for as they are required. I find that since the works started we have called and accepted tenders for the supply of 439,700 sleepers. The number which I previously mentioned to the Commission as being put through the works represents the supply out of those contracts.

3. Do you expect to get the full number?—I do not. My contracts are closed now.

4. Can you tell the Commission what the result is with regard to using these sleepers as against other sleepers?—The sleepers are impregnated with from 2 to 2½ gallons of creosote to each sleeper, and the result of that undoubtedly is to increase the life of the sleeper with respect to probable decay, but the sleeper is not strengthened by the process in any way. The fault which is found by

myself, and doubtless by others in my position, in the use of New Zealand timbers for sleepers is that these timbers, except for one of the rare timbers in New Zealand, are very soft; and, as a result of that, they are not economically useful for railway sleepers. The rails cut into the sleeper very badly, more particularly with the softer timbers; and the dog spikes which fasten the rails will not hold as well as they will in harder timbers. I presume that can easily be seen. Undoubtedly the life of New Zealand timber is very much increased by the use of creosote. I am quite prepared to see this class of timber which we have been creosoting last at least twenty years.

5. *Mr. Arnold.*] An extended life of twenty years?—No.

6. Twenty years against what?—As against perhaps an average of six or seven. Of course, the works were only purchased in 1901—that is, eight years ago—and we have still got to go through the balance of that twelve years to see whether my estimate is right or not, but that is what I expect it to be. A life of five or six, or perhaps seven years at the outside, is what I consider the average life of a sleeper cut from the bush in this district. I think I made it clear that we have not been using the colonial timbers uncresoted for some years. We have not only to consider the durability, but we have to consider the wear on the sleeper. It is not only that a sleeper decays with us, but there is the fact that it is worn out in other ways by the rail and the fastenings. Technically we call it cutting in—the rail cuts into the sleeper.

7. *Hon. the Chairman.*] How do the prices compare, including the creosoting, as against the other timbers you use for sleepers?—Do you mean imported timbers?

8. Well, imported or others?—Of course, we are using no colonial timbers in this district except that which is creosoted. The price which I have worked out for creosoted sleepers completed at the works at 3s. 1½d. each.

9. *Mr. Leyland.*] Does that apply to 8 in. by 5 in.?—Yes. The average cost of jarrah sleepers landed here is 3s. 9d.

10. *Mr. Field.*] How much of that 3s. 1½d. is for creosoting?—1s. 8d. for the sleeper and 1s. 5½d. for the creosoting. The cost of the jarrah sleeper is 3s. 9d., but they have varied from 3s. 6d. to 4s. I consider 3s. 9d. a fair average price delivered at the Bluff.

11. *Hon. the Chairman.*] What do you consider the difference in the life of a jarrah sleeper from a creosoted sleeper?—I consider that a jarrah sleeper should last twice as long as a creosoted sleeper. I consider a first-class jarrah sleeper such as we buy should last forty years.

12. What price do you pay for these sleepers before creosoting?—We pay 1s. 8d., and the creosoting costs us 1s. 5½d. I may mention, perhaps, that in buying sleepers for creosoting we do not demand the best timber. We are willing to take half sap. The contract is for sleepers. The price of 1s. 8d. is a recent increase. For many years the price was 1s. 6d., and when the works were first purchased by the Government I could get sleepers as low as 1s. 3d. There is a little less than 25 cub. ft. in a sleeper: actually there is 23⅓ ft., which at 1s. 8d. is equal to about 7s. 2d. per hundred feet.

13. Would the Department use more of them if they got them at a less cost?—Personally I cannot say, because that is a matter that rests with the Head Office. I only purchase subject to approval from the Head Office. It would be for the Head Office to say in what proportion they would be used.

14. We can get that information at the Head Office?—Yes; it is a question of policy. Personally, I do not mind saying that, from my point of view, I would have as few as possible of New Zealand sleepers. I would not make any mystery about that. The more hardwood sleepers I can get, the better order I can keep the railway-track in.

15. On straight runs, would they not do fairly well?—No, we are still troubled with cutting-in, and the difficulty of making the fastenings hold. I think the jarrah sleeper would last twice as long as the softwood sleeper. I mean that there is actually more in it than the time it would last, because I should not have the trouble with the hardwood sleeper in keeping the track during the life of the sleeper that I should have with the softwood. The hardwood sleeper will, of course, eventually have to be taken out on account of decay, pure and simple. The softwood sleeper will have to be taken out because I can make no further use of it, although in many cases the timber is good. That would particularly apply to totara sleepers.

16. What would you substitute—steel?—No; personally, I prefer the hardwood-timber sleeper to the steel sleeper. I may say, however, I have had no experience of steel sleepers, and I am depending for my opinion on what I read.

17. Are you using some beech sleepers?—No, except experimentally last year. I have had a few put through the creosoting-works to see if the process will do anything to improve them. Our experience of the beech sleeper has been a very unfortunate one. The beech that you get splits very badly, and is therefore unsuitable.

18. Would not the splitting depend a good deal on how it was cut?—It might. I have seen a few cases where beech sleepers lasted very well, but generally the result has been very unsatisfactory. From my experience, I could not possibly recommend the use of beech for sleepers.

19. Which of the New Zealand timbers, in your opinion, is the most suitable for sleepers?—Of the New Zealand timbers puriri is the best. The totara is really the only timber in Southland suitable for sleepers.

20. *Mr. Jennings.*] Do you get any puriri sleepers?—Not now. In the north, doubtless, they still get them. The matai sleepers have been used considerably of late years; but we have had to abandon them altogether, because, although you would occasionally get consignments of matai sleepers that would turn out all right, you would as a rule get very much worse results from matai sleepers than from other sleepers. I have taken matai sleepers out of the track in less than two years after they were put in, totally decayed—not one, but hundreds of them. At the same time, I have seen matai sleepers that have been in the track for twenty-five years and are perfectly sound. It is a very disappointing timber to deal with for sleepers. Even the best experts that I have known

are unable to tell beforehand whether matai is going to turn out good or bad. It takes the dry-rot, and very rapidly too.

21. How do your creosote-works compare with the Woodville?—I cannot say. I have not seen the Woodville works. They are more modern and larger than mine.

22. If your works were on a more modern basis would not the cost of turning out creosoted sleepers be very much lessened?—I do not know that you could lessen it very much. The actual labour costs only 4d. and a fraction, so that you have not much to work on in the matter of reducing the cost. The sleeper costs 1s. 8d., the creosote between 1s. 2d. and 1s. 3d.; and therefore there is only a matter of between 4d. and 5d. left for you to make any decrease in. I have reason to believe, although you will probably be able to get the information from the Head Office, that the works under my control are as cheaply run as the Woodville works.

23. Do you take sleepers from others outside of sawmillers?—Yes, from anybody who will supply them.

24. You state that the creosote increases the ordinary life of our softwoods: that while the average life of a sleeper is about seven years, by creosoting it will last twenty years more?—I hope so. We only started these works in 1901, and the life has yet to be proved.

25. You state, also, that the life of jarrah would be double that of creosoted timber?—Yes. Of course, we do not creosote jarrah.

26. Would you be surprised to know that at a meeting of architects held in Australia dealing with the subject of jarrah and ironbark sleepers they state the average life of an American oak sleeper in the States is about seven years, whilst that of such timbers as jarrah, wandoo, and ironbark and many others is from fifteen to twenty-five years. The superiority is therefore evident?—My experience is totally opposed to that. I have been only twenty-five years in this service. I consider jarrah sleepers will last as much as forty years.

27. How long is the life of an ordinary softwood sleeper here, provided it is creosoted?—I should say about twenty years. We only started the process in 1901—that is, only eight years ago. Therefore I cannot speak definitely, but from observations of those already treated I think they will last twenty years.

28. Does the fact of creosoting, in your experience, have any bearing on the strength and tension of the wood?—None whatever.

29. *Mr. Field.*] These were private works up to 1901?—Yes.

30. How long had they been in existence prior to that?—Roughly, twenty years. Of course, they have been very much improved since the Railway Department took them over.

31. Do you think the machinery and methods are up to date?—They could be a little improved upon, but not very much. I consider that the plant is not bad—it is small. When you speak of improving I presume you mean replacing with more up-to-date plant. On that point I would say I doubt if it would be profitable to do it, as the cost would not compensate for the very slight decrease in the expenses.

32. Would it be too much to say that if you put in an up-to-date plant you could get the work at half the cost and better done?—You could not do it. In answer to a previous question I pointed out that there is only 4d. or 4½d. to work upon, and you would only make a very slight reduction on this amount.

33. You say that creosoting will increase the life of a sleeper from a decaying point of view, but would not strengthen it. Would it not have the effect of holding better?—I do not think so. Of course, now that we are using both New Zealand and hardwood sleepers we use the creosoting in the most suitable places. I do not put creosoted sleepers on curves if I can avoid it, nor on heavy grades. I am giving them every chance. I want to get as much life out of them as I can. If I can avoid doing so I do not put them on soft ground.

34. Do you use local sleepers mostly, or decrease them?—I have no intention on the matter. I can only take the sleepers as they are given to me.

35. Is your opinion entirely in favour of hardwood sleepers?—Professionally, it is.

36. You were talking about the effect of the local sleeper on the rail. You say it cuts into it, and has more injurious action than others on the rail?—Totara has. There is something in it that occasionally eats into the rails very badly. It does not always occur, but in some cases it has a very bad effect.

37. And that effect is not noticeable in the case of any other timbers?—I have not noticed it.

38. As to old sleepers that are useless for railway purposes: to what use can you put them—hardwood and others?—My practice is to divide the old sleepers into three lots. One lot is used for firewood pure and simple, the second-class for fencing, and the third for repairs to sidings. You can understand that it often comes to this: that when repairing a track you are compelled economically to take out sleepers that are not quite done, but that you cannot keep under the track. You can use them in a siding.

39. Do you not draw a comparison between the value of Australian timber and ours that is used for railway purposes?—It has not come to that point yet that we have got much West Australian sleepers. We are not yet in the position of taking out Australian sleepers to the same extent as our own.

40. I suppose there are heaps of sleepers to be got here to supply our needs for many years?—Undoubtedly the timber is here, but I have a certain difficulty in getting it. I do not get a great percentage of what I contract for. Of course, naturally I have to depend upon the state of the timber-market. I do not suppose that sawmillers lay themselves out to do business for railway-sleepers.

41. You can get them just now?—I think I could. In fact, I got the greater proportion of my last contract. I have not a contract at the present time.

42. One can imagine there would not be a satisfactory outlet for them?—That is so.

43. *Mr. Leyland.*] Have you any opinion as to puriri?—I think it is as fine timber for sleepers as any I have ever seen—as good as an Australian hardwood.

44. If you could get puriri you would take that in preference?—I should be very glad to do so.

45. With reference to the cost, seeing that you have to rely entirely upon sawmillers who have gone to other sources of production, the cost has risen materially. Perhaps that may be charged against the sawmillers—the increasing of that cost?—I should not like to put it in the way of laying a charge; but the fact remains that it has increased from 1s. 2d. to 1s. 8d.

46. But those who are not sawmillers have also raised the price?—That is so.

47. Would you not take that as a proof that the rise cannot be helped?—I would; I know the price of timber has risen.

48. The point I want to make is that independent of the sawmiller the price has risen?—That is so.

49. I heard something of a new system of creosoting whereby the bulk of the creosote is withdrawn. If you could reduce the amount it would materially reduce the cost?—It would indeed.

50. But you have not tested it?—No; and to the best of my knowledge it has not been tested in New Zealand.

51. They have a plant in Australia now?—I understand so.

52. That would materially reduce the cost?—It would, certainly.

53. *Mr. Clarke.*] From a professional point of view, in the construction of railways and the point of view of public safety, do you consider it advisable that a supply of hardwood sleepers should be always available, even though they come from abroad?—We must have hardwood for sharp curves and bridges. The weight of the trains we are running now in itself demands that.

54. *Mr. Morris.*] Can you tell us anything about the difference in cost between puriri and jarrah?—I cannot; I have been away from Auckland for ten years, and could not tell you the cost at the present time. In my time in Auckland the cost was about equal to the Australian hardwood: but now I would expect the cost of puriri has risen.

55. *Mr. Barber.*] Are you extending the railway here with a view of opening up further timber areas?—It is being extended in the timber areas; the Orepuki branch particularly.

56. Will that bring much timber into the market?—It should do so. There are very large areas of bush in part of the country that the line is going into.

57. Is it a good timber country?—To the best of my knowledge it is.

58. With regard to the creosote, you import that?—Yes; it is all imported from London.

59. Is it of English make?—I have no doubt it must be.

60. Is there no chance of getting it locally?—I do not think so.

61. Would it not pay to put in a plant for making it?—I see no reason why it should not be done; but, of course, it would be a matter for private enterprise.

62. Up to the present no gas company has gone in for it?—No.

63. *Mr. Ell.*] About how many sleepers have you in your district lying under the track?—One million, approximately.

64. In this one district?—Yes.

65. Do you know if your Department are making any provision for supplying the needs of the Department?—At the present time I have a sufficient stock to keep me going.

66. I mean about the future?—Of course, the creosote-works are still standing there.

67. I want to know whether the Railway Department is making any provision for supplying the railway system of New Zealand?—I do not know, personally.

68. At present you are entirely depending upon hardwood from Australia?—Yes, all our hardwood sleepers come from there; but, although I have no contracts for local sleepers at the present time, I might to-day get an order to contract for anything up to 50,000 or 80,000.

69. Why I am asking you is because in America the great railway systems there have immense areas of country planted with timber suitable for sleepers?—I know. Of course, tree-planting is being done in New Zealand, but to what extent I cannot say.

70. Do you know of any timbers in New Zealand which are suitable for this purpose?—I have always understood that some are. I have not examined them very closely. There is a small quantity of hardwood in New Zealand that has been planted probably forty or fifty years now, but it is a very small quantity.

71. Have you any knowledge at all as to the growth of puriri?—No; but I should imagine it was a very slow-growing tree.

72. *Mr. Arnold.*] You say there are one million sleepers now in this district laid down in the track?—Yes.

73. Do you know how many feet of timber there are in each sleeper?—Twenty-three and a third feet.

74. *Mr. Stallworthy.*] Have you any idea of the proportion of creosoted sleepers in that million?—Roughly, one-fifth.

75. What timbers have you creosoted?—Rimu, miro, kahikatea, matai, and a small proportion of totara.

76. Are they all equally serviceable when creosoted, as far as lasting is concerned?—No, I do not consider matai is serviceable. When I was speaking before of matai I was referring to ordinary-grown matai; but appearances have shown that creosoted matai is not going to last as well as other creosoted timbers.

77. *Mr. Mander.*] You said that creosoting increases the life of the timber, roughly, about fifteen years?—Fourteen or fifteen years.

78. It will not actually increase the life of the sleeper as far as the railway is concerned—it will not harden it in any way?—No. As I have already explained, we are using the sleepers

to the best advantage in the places where we shall get the best results. They will not suffer as much from the cutting-in in proportion as the uncreosoted sleepers have done hitherto, because we are not using them in hard places.

79. I understood you to say that the life of an ordinary sleeper would be seven years before wearing out?—No, from all causes. I have seen matai sleepers, which we consider the worst we can get, taken out of the track twenty-five years old and perfectly good.

80. Will creosoting increase the life of an ordinary softwood sleeper materially?—Yes, it will, because it will improve the quality of the timber. It would increase the average life, because you would not suffer the loss by decay as if they were not creosoted.

81. You said some hardwood timber has been planted for forty years?—Yes, but the quantity is very small. I can remember in my father's place, when I was a boy, there were large gum-trees growing.

82. But would trees planted forty years ago be of any use now for railway-sleepers?—I do not know; I have no experience of that, and would not like to say.

83. *Mr. Hanan.*] With reference to Orepuki and Waiau, can you tell us if there are any reserves there vested in your Department?—None to my knowledge.

84. In the Public Works Department are there any?—I do not know. To my knowledge there are none.

85. A witness said here that he had cut a large quantity of sleepers, and that a large number was left over, and he complained about the Railway Department not taking them. Do you know anything about that?—I cannot call to mind the particular case. I cannot take more sleepers from a man than I have contracted for; but I think very few men would have cause for complaint, because I have always made it a practice to remember those men, and when the next contract was let to see that the sleepers are taken from them.

86. Have any contracts been let to farmers—farmers in good positions, with large farms?—None that I remember. Small farmers have had small contracts for sleepers, but I know of no case of a large farmer having had a contract.

87. To whom do you let the contracts in the Waiau district?—I cannot remember the names now, but to numerous small settlers. They are not very large contracts as a rule, probably from two to three hundred.

88. What is the principle on which the tenders are allocated?—Most of them are allotted according to the price offered; but, of course, always subject to this: that myself and my Inspectors know the capabilities of each man, and we do not allow dummyism. If a man put in a tender that we knew was fictitious, and that he could not possibly supply what he was offering, of course we would reduce it in accordance with our knowledge of what he was actually able to supply. We have to be very careful on that point.

89. *Mr. Jennings.*] Do you have many disputes?—No, I am thankful to say I have had very little trouble.

90. *Mr. Hanan.*] You have been asked with reference to the railways in Southland: how long have the majority of them been constructed and completed?—Well, the first railway in Southland was opened in 1868.

91. And the next?—I should have to turn up my statistics to find that out. Of course, they have gone on constantly.

92. And begun years ago?—Yes.

93. *Mr. Arnold.*] In estimating the cost for the jarrah sleeper the Government has not added the duty on to that cost?—No, we have not.

94. Then, in addition, there is the 6d. royalty that has to be paid?—I have allowed for the actual cost to me.

95. *Mr. Morris.*] In regard to the cutting-in of the rails, is that the reason why you substituted 10 in. by 5 in. for 8 in. by 5 in.?—No; 10 in. by 5 in. sleepers are used for a particular class of rail. The 70 lb. double-headed rail requires a wider sleeper.

96. Do you not think the 10 in. by 5 in. sleeper would minimise a large amount of this cutting-in—the weight would be spread over a larger surface?—Probably, but it would be a very costly thing to do—you would increase the cost of each sleeper 25 per cent.

97. Is that the difference in cost to you?—Yes, there is 25 per cent. more timber in it. I have difficulty in getting 10 in. by 5 in. sleepers very often—they are more difficult for the cutters and millers to produce.

98. You cannot give us any information as to the advisability of increasing the width of sleepers in order to get better results from native sleepers?—I do not see that any advantage would be gained by increasing them.

CHARLES ALBERT PIPER further examined. (No. 20.)

1. *Hon. the Chairman.*] I understand you have something you wish to add?—Yes, I should like to explain with regard to this Oregon timber. I stated that the figures I gave were the figures given to me as the amount of timber going over the railways, but on making inquiries I find there has been a considerable quantity of Oregon brought over from Melbourne, and that has been shown on the ships' papers as so many pieces of timber. Our people are not concerned with the nature of the timber, and it is shown on our books as Australian timber, and it would be a very difficult thing to say exactly what quantity there would be, but I should be nearer the mark in putting it down at 215,000 ft. instead of 15,000 ft. Our people would take it from the Melbourne ship's manifest as pieces of timber coming from the other side, and treat it as such.

2. *Mr. Jennings.*] It has come here?—Yes. The returns supplied by the Customs will give it as nearly correct as you can get it.

3. *Mr. Field.*] Does some of this timber come in by some of the smaller boats to the wharf?—Quite possibly. Small boats tranship it from Dunedin. They might bring timber down that we should know nothing at all about.

4. And land it at the wharf here?—Yes. Of course, that might be entered in the Customs returns in Dunedin or here, but so far as the imports to the Bluff are concerned, the Customs returns would be far more reliable than ours. There is another matter that I did not make quite plain with regard to the reductions in the freight on ordinary timber from the Southland mills to Dunedin and North. The regulation states that timber from sawmills in Southland consigned to Kensington and Dunedin will be charged 1s. per hundred superficial feet less than the classified rates, and the timber from sawmills in Southland consigned to stations north of Dunedin is charged the rates I have already mentioned.

DUNEDIN, THURSDAY, 1ST APRIL, 1909.

T. SCOTT sworn and examined. (No. 21.)

1. *Hon. the Chairman.*] What are you?—I am a venetian-blind and revolving-shutter manufacturer.

2. You are asked here to give evidence on some of the points that were submitted to us for consideration?—My principal reason for asking to be heard is on account of the anomalies in the present tariff upon imported stuff. The bulk of the timber in connection with my trade is imported, as none of the colonial timbers are suitable for this class of work. The anomaly that I principally want to bring under the notice of the Commission is the difference, the very slight difference, if any, in the timber in the bulk and timber manufactured. I can show it to you by these few pieces that I have brought with me. The duty on rough sawn timber is 2s. per hundred feet, and the duty on dressed timber is 4s. per hundred feet, no matter what size—that is, per hundred superficial feet. Here is a case in point where you have six surface feet for one superficial foot. That is, for every hundred superficial feet of dressed timber, as the tariff interprets it, you have six times that, and there is no extra duty on it. As a matter of fact, there are several plants in New Zealand and in all big towns for the manufacture of this stuff, and with one exception they are all abandoned and standing idle, because they are getting this timber over from Sydney, and getting it in at 4s. per hundred superficial feet. As a matter of fact, in importing it from Sydney already dressed you save 1s. 3d. in freight and 1s. 3d. in duty. One-third of this timber goes to sawdust in the process of manufacture. That is the reason why the importation has taken place. The work is all done in Sydney.

3. *Mr. Arnold.*] How long has that duty been on?—As long as ever I can recollect. It is only lately that it has interfered to such an extent, as previously the stuff was manufactured in New Zealand. If you go to places in Christchurch, Wellington, and I believe in Auckland you will find the plants that they formerly used lying idle.

4. Your point is that if the duty were altered it would encourage the local manufacturers?—The duty on bulk timber—that is, on large sizes—is 2s. per hundred feet, and that is quite sufficient, but no matter how small the timber is cut up outside the colony the duty is still the same. The duty should be on the face surface or at a higher rate.

5. Is there any New Zealand timber that could be used in your business?—None whatever. It has all been tried and abandoned.

6. Why is that?—Because it has to stand a large amount of sun-heat in the window, and New Zealand timbers warp far too much. That has been the difficulty so far. For certain classes of work there is no New Zealand timber suitable.

7. *Mr. Hanan.*] Do you use much Oregon in your business?—None at all.

8. As a finishing-timber does Californian red-pine come into much competition with New Zealand timbers?—No. The price is too high. The lowest landed here is something like £1 3s. per hundred.

9. Speaking of the cost and sale prices of venetian-blinds in your business, have the prices increased during the last seven or eight years?—No; they are still the same as they were eight years ago.

10. As to the cost of material?—That has increased in cost. The timber alone has increased 25 per cent., although still imported.

11. With regard to the cost of labour?—That has increased, but I do not think it would make a difference of more than 10 per cent.

12. Do you think it is desirable that all hard timbers should come into this country free?—I may say that we use a certain amount of kauri for the thick part of the blinds, but the price of kauri now is prohibitive, and it is absolutely necessary that you should import some timber to replace it. The last quotation was £1 12s. per hundred feet, less the usual discount to the trade, which is 10 per cent. and 2½ per cent. That price is simply prohibitive.

13. Have you any views with regard to placing duty on Oregon timber?—I think it would be a mistake to place a duty on any imported timber. It would be an undoubted mistake. In fact, my own impression is that it would pay us handsomely to place an export duty on kauri.

14. Do you find much difficulty in getting good red-pine here?—We do not use it. It is unsuitable for our class of work.

15. *Mr. Jennings.*] Are there many men employed in your industry?—At present there are not a great many. I suppose thirty altogether in the town.

16. How many manufacturers of venetian-blinds are there?—Only two in Dunedin.

17. I am speaking of the Dominion?—I am only acquainted with the factories in the chief centres. The D.S.C. and others are taking it up and working it as part of the furniture trade in Auckland. In Wellington I know of two. In Christchurch all the furniture-manufacturers are doing it. There is White, Strange and Co., and others.

18. Is it necessary for your business to have the timber imported?—We tried the West Coast timber, but found it was not suitable.

19. *Mr. Field.*] With regard to the duty on timber, do you think it should be imposed on the large pieces of timber rather than on small pieces?—No, the small pieces rather than the large. I have given considerable thought to this subject, and I have gone into it with several members of Parliament at different times.

20. Do you know very much about our other New Zealand timbers?—I was managing a sawmill in Greymouth at one time years ago.

21. Would you admit foreign timber for building purposes free at the expense of our own timber industry?—Yes. I am satisfied that the amount of work that would be given in the building trade alone would more than compensate in the other direction.

22. Supposing you got New Zealand timbers at a reasonable rate, what would you do?—In that case the foreign timber would not be used.

23. Would you be in favour of foreign timbers, if they killed our own legitimate industry, and in that case would our timber not then have to be burned off?—If it was retarding building I should, certainly.

24. Only if it was retarding building?—That is all.

25. Do you know enough about the subject to say that the price of timber has had any material effect?—It has undoubtedly.

26. Has it a large effect?—Building in Dunedin has increased 25 to 50 per cent. during the last five years.

27. Do you think the general depression has had anything to do with it?—It may have had during the present year, but not before that. The building trade has been steady up to about a year ago.

28. What prices are they paying for building-timber?—Kauri is the only timber I use.

29. *Mr. Leyland.*] You agree, Mr. Scott, that timber should be imported to replace the shortage of kauri when it is suitable?—Yes.

30. Is the shortage of kauri relieved by the importation of Oregon pine?—Undoubtedly.

31. With reference to your orders for kauri, do you find any difficulty in getting your supplies from Auckland?—Yes, at a price. I import from Auckland now, and save about 5s. per hundred.

32. With reference to export duties on kauri, are you aware there is an export duty of 5s. on logs and 3s. on flitches, so that it keeps work in the country?—Yes, but at the same time if you took the duty off imported timber altogether you could land kauri cheaper here from Sydney than from Auckland.

33. That is a mistake. The Sydney people are willing to give 19s. on the wharf. How can it be cheaper, if you get it for 18s. 6d.?—We never get it at that price.

34. If you get 19s. per hundred from the Auckland people, and if you can import other timbers—say, Oregon—for the prices that are stated—say, 10s.—and it is just as good for certain purposes as kauri, do you not think, seeing that the Dominion would make 9s. profit on the transaction, that it would be good business?—It is a question of the limit of the life of the kauri forest.

35. More kauri is destroyed by fire than by the axe: do you not think, therefore, that my proposal would be a benefit to the colony?—A benefit to the part of the Dominion where the kauri grows.

36. *Mr. Clarke.*] With reference to the proposal to increase the duty on small sizes, seeing that we are absolutely obliged to use this timber, would not the only effect be to increase the cost here?—No, it would give more labour in the colony.

37. Would it not increase the cost to the general public?—Very little.

38. It would of necessity increase the cost to some extent?—No. I manufacture everything myself, and I am competing successfully against all others.

39. Is it not a fact that the prices would be regulated by the amount of duty, and if the duty went up there would be an excess and therefore an increased price?—The price has not varied for eight years now.

40. Have the conditions varied during the last eight years?—Very little.

41. Not so much as it would be if the increased duty was on it, I suppose?—I do not think the duty would make much difference. It is one of the hardest things to alter an established and fixed price.

42. In view of the fact that it has been proved that prices have gone up 8, 10, and 20 per cent., would such increases not affect the price?—It would modify my opinion in respect to house-building, but where you have a regular fixed price for a certain manufactured article, say, so-much a foot, it is very hard to alter it.

43. If I told you that I have myself paid 10d. a foot for venetian-blinds at one time, and within a reasonable time thereafter I bought at 6½d., would not that show elasticity in prices even in connection with venetian-blinds?—No, it would not, because some firms can turn out blinds for 6½d., and it is a dearer blind than one at 10d. It is merely a question of painting. If they are painted by machinery then you can get them for 6½d.

44. If you assume that I am a practical man myself and know what I am doing when I buy a blind, you would not conclude that I would go to the dearest place, but that on the contrary I would look out for the cheapest rate. Would the duty in such a case increase the price?—No, I do not think so.

45. *Mr. Morris.*] You consider it is in the interest of the country to keep your business going here as a source of employment for our people?—Yes, or any business that is using timber for manufacturing purposes.

46. You said building operations were retarded owing to the increased cost of timber?—Undoubtedly.

47. Is it not more due to the improvement in the style of building that is being erected in the country than to the increase in the cost of timber?—That may be to a certain extent. I know that tenders were called for a cottage just a few weeks ago with very little variation from a cottage that could have been built seven years ago for £250, and the lowest tender was £325.

48. *Mr. Jennings.*] What timber?—Principally red-pine.

49. *Mr. Morris.*] Will you tell us what is the cost of building-timber now as compared with seven years ago?—I could not tell you, because I am not in the habit of buying timber. My knowledge of the cost comes from being chairman of the Star Bowkett Society.

50. Of course you, being a practical man, are aware that the increased price of timber could not possibly make more than £15 of a difference in the building of a house between now and seven years ago?—Oh, it is more than that. Seven years ago you could buy red-pine in the yards for 8s.—it may be a little more than seven years ago.

51. What is the price now?—Somewhere about 12s. or 14s.

52. That may possibly make a difference of £30 in the cost of the house you have mentioned?—Yes.

53. That does not account for the whole of the increased cost?—But labour-conditions make a difference.

54. You think it is better to employ our own men, and cut the timber in our own forests in preference to going into the American market?—Of course, that is so; but you can overdo that sort of thing.

55. If the men were not employed in the bush they would not be wanted in the town?—There are more carpenters employed in the timber trade than sawmill hands.

56. The money of these men—being large consumers—assists very materially in the prosperity of any town?—If the building trade is good the general outcome is that other trades are good.

57. Have you felt a depression owing to the tightness of the money-market?—To a certain extent. I am doing as much as eighteen months ago.

58. You say this is American wood, yet imported from Sydney?—We cannot get it direct. Since the San Francisco fire we have been unable to import it direct from there. I understand that sailing-vessels are running from Newcastle to Fr'isco with coal, and they bring this as return cargo.

59. Could not New Zealand compete in the matter of dressing this timber?—Yes, so far as the actual labour is concerned; but we are paying duty on one-third of that timber. If that is left in Sydney you do not pay duty on it.

60. How much labour would be employed in working this material?—That would be a very hard matter to tell. Of course, I do not know what the output of the other places is. I dare say the ships' manifests would tell what comes in.

61. Is the consumption of this article sufficient to keep the machinery employed in the chief centres?—Pretty well. The effect it has is that it fills in the time. You can put them on to that when they are not busy with anything else; otherwise we should be importing from Sydney like the rest.

62. What was the original cost of this cottage?—£250.

63. And this account was for 75 per cent.?—Yes.

64. Considering the rise in the price of timber the amount that was given—£15 to £30—is an underestimate?—I think £30 is not an underestimate. Of course, there is another effect—the price of timber affects the joinery-work.

65. Seventy-five per cent. would amount to considerably more than £30?—I do not know that it would. There is joinery, rough work, plastering to be considered.

66. I quite understand that?—Of course, you can get the exact increase from one of the builders.

67. *Mr. Ell.*] Is the timber you use kauri for the frame?—Yes; clear-pine or yellow-pine for the shutters.

68. How many years have you been in business?—About twenty-five, I think.

69. You have had ample opportunity of testing whether New Zealand timbers are suited to your trade or not?—Yes.

70. And after all that you say New Zealand timbers are not suited to it?—Yes.

71. Therefore you consider that the timber necessary for your trade should come into this country duty-free?—Yes.

72. With regard to the increase in the price of kauri, here you say you pay £1 12s.?—That was the price paid in the yard.

73. You heard Mr. Leyland say that it could be obtained in Auckland at 18s. 6d.?—Yes; but my last quotation was 19s. 6d.

74. There is a big percentage?—There is 10 per cent. and 2½ per cent. off that.

75. Having regard to the fact that kauri is such a high price in the country, and our kauri forests are very limited, and that we require kauri for many important woodworking industries, do you think the time is ripe for an export duty on kauri?—Undoubtedly.

76. In order to preserve it for our own industries?—Yes. For the purpose for which I use kauri Oregon would be absolutely useless; I do not know any timber so suitable as kauri.

77. *Mr. Stallworthy.*] Can you tell how much Californian or red pine is imported?—I could not say.

78. Can you say the quantity you yourself use?—We have imported 14,000 ft. in one year. I think that is the largest quantity.

79. How much kauri do you use in a year?—About 2,000 ft. in blinds. I use a good deal in other ways. At the present moment I am using close on 1,000 ft. in machine-work for casing electric light—about 500 ft. a month.

80. How many men do you employ in the factory?—Seven.

81. Do you think that to put an export duty on kauri would reduce the price in this country?—I do not know that it would, but it would stop it from going any higher.

82. I understand you to advocate a lower duty on Californian redwood?—On any imported timbers.

83. Yet you advocate an export duty on kauri, which would throw out of employment hundreds of men?—If you increase the cost any more it would be prohibitive.

84. Would it not throw some hundreds out of employment?—I do not know about the number: I do not know what the export figures are.

85. Do you know of any reason why you should import into Dunedin kauri, and that the merchants should charge you 5s. more than you can sell for?—No reason.

86. You think there is a ring amongst the timber-merchants?—I do not know about the ring, but they have the price fixed amongst themselves.

87. You think the price too high?—Undoubtedly.

88. *Mr. Mander.*] You said you had to pay £1 12s. for kauri purchased in Dunedin?—Less the discount.

89. What would that be?—Three shillings and ninepence.

90. And you can buy it from Auckland for 19s., and have discount off that?—No discount off that.

91. That would be practically 10s. difference in the retail price in Dunedin and the wholesale price in Auckland?—You have to pay wharfage dues.

92. What are they?—Freight, 3s. per hundred feet; and wharfage, 9d.

93. Cartage?—Even if you buy it here you have to pay cartage.

94. That would leave the retailer 5s.?—It would leave him more.

95. You consider he gets too great a profit?—Undoubtedly.

96. Seeing that Oregon does not come into competition with first-class kauri, do you think the introduction of Oregon in large quantities would reduce the price of kauri?—It does come into competition in joinery-work.

97. Are you aware that Melbourne to-day is the best market for kauri?—I could not say.

98. Are you aware the Oregon has come into competition in Australia for a great many years?—I believe it has.

99. And it has not reduced the price of kauri?—There are certain things it cannot compete with kauri for, such as the making of doors, and things like that.

100. You are aware that it has been competing with kauri for a great many years, and yet Australia is the best market for kauri?—I am aware that it has been competing with kauri.

101. Have you ever used timber called kawau?—Yes.

102. Do you find that unsuitable?—Totally unsuitable. The trees being small you cannot get it so clean.

103. *Mr. Leyland.*] Would you tell us the price of redwood imported—what it costs per hundred feet?—The last quotation gave the cost as £1 6s. 6d.

104. Do you run the laths from the rough timber?—Everything, unless the flitches.

105. *Mr. Field.*] Did I understand you to say that you were in favour of taking the duties off all imported timbers?—Yes, off imported timbers in balk.

106. Do I understand you to favour putting a duty on small sizes coming from foreign places?—Yes, not on any log or balk, as they call it.

107. *Mr. Mander.*] Are you aware that logs are free now?—I know that I pay 2s. a hundred on them.

108. *Mr. Leyland.*] You mean in balk?—Yes.

109. *Mr. Ell.*] You say kauri has gone up very high in price?—Yes.

110. What were you paying ten years ago?—I can give you the difference in the Auckland price. Some years ago we were getting it for 13s. 6d., and it has now risen to 19s. 6d.

111. In ten years?—In less than ten years.

112. *Hon. the Chairman.*] You made a statement that if the timber was cheaper you thought the building would go on just now as actively as it did before?—Hardly that; it would go on to a greater extent than it really is going on. I believe the price of timber has to a certain extent kept back building.

113. I thought perhaps that if it was the same price as some years ago the building would increase?—It certainly has some effect on the trade; you cannot ignore that fact.

JAMES CRAWFORD, President of the Builders and Contractors' Association, sworn and examined.
(No. 22.)

1. *Hon. the Chairman.*] Kindly tell the Commission what you know about these questions we are to inquire into here?—I will first read a resolution passed by the Builders' Association: "That importation of foreign timber would facilitate building operations, and we wish to emphasize strongly the necessity for the import duty being removed. Oregon can be obtained at a uniform rate on sizes up to 14 ft. long and 14 in. wide. For beams, principals of roofs, joisting, framing, and scaffolding, owing to its rigidity, lightness, and its being procurable in long lengths it is preferable to local timber. Hardwoods, such as jarrah, ironbark, blue-gum, stringybark, have no substitute in the Dominion. City Councils, County Councils, and Harbour Boards

use these timbers very largely for bridges, sleepers, &c., and these timbers are already protected by an additional railway tariff over local products. Totara, black-pine, heart of red-pine, or rimu are all difficult to obtain in South Otago. Kauri is the most valuable timber in New Zealand, if not in the world, and is invaluable for stairs, shelving, fittings, &c. In our opinion kauri should be conserved as much as possible, as it is almost impossible to obtain wide planks and boards in any other timber to take its place. For beams and roof-work it is now not used, as Oregon timber is quite as suitable, if not more so, and is very much cheaper and lighter to handle."

2. You see the questions we have been inquiring into. Some of them will be connected with your business. Can you give us your opinion on these?—I think our principal reason for wishing the duty removed from foreign timber is not so much the price of local timber—but if the building trade is brisk it is very difficult to obtain local timber—and we are very much hampered that way by loss of time. Two or three years back it was a common thing to be stuck for several weeks—in fact, months—sometimes to obtain red-pine, more especially when we are getting into long lengths. The price of ordinary red-pine in cottage size does not make very much difference, but when you go into larger sizes over 12 in. wide there is an extra price on it; and, of course, up to 20 ft. long, I think for every foot over that there is an extra charge of 6d. per hundred, and so on. In regard to Oregon, you can get that in any length, and at shorter notice than red-pine. As far as hardwoods are concerned, we have no hardwoods here, and it is very hard to get totara or any timber that would take its place. Two or three years ago I had a contract for the Government for which I required about 30,000 ft. of totara, and none of the mills in Southland cared about taking it on. At last I got it from one miller, but it was all condemned. I had then to substitute jarrah. The Government recognise now that it is hard to get totara, and they are calling for tenders for a similar contract, and specifying that jarrah may be used.

3. *Mr. Arnold.*] How long have you been in business?—Nine years.

4. In Dunedin?—Yes.

5. Building during the whole time?—Yes.

6. How long have you been president of the association?—Nine months, since July last.

7. And a member of it for how long previously?—Eight years.

8. Do all the builders in Dunedin belong to the association?—Not all; we have a membership of between eighty-five and ninety.

9. What is the basis of your association?—To protect the building trade, to regulate the rates of wages as far as we can in the Arbitration Court.

10. To protect yourselves against the worker? But in addition to that have you got no understanding as to the price of tendering?—None at all.

11. You are given a free hand as far as tendering is concerned?—Quite a free hand; there is too much competition for that sort of thing.

12. Do you try to get outside builders to join your association?—No; they have got to be proposed, and if they do join they have got to abide by the rules.

13. Do you try to get them to join?—No.

14. It is quite free with them whether they come in or not?—Yes, quite free.

15. Are the builders who are not members of your association treated in the same way as those who are members by the architects of the city?—Just the same.

16. No discrimination whatever?—None at all.

17. There is an association here amongst the sawmillers, is there not?—I believe so, but I have no evidence of it.

18. Is there no relationship between that association and your own?—None at all.

19. They do not give a larger discount to members of the association than to outside builders?—No.

20. Now, with regard to building, you heard Mr. Scott's evidence a few moments ago?—Yes.

21. Is it correct that building-material has been raised in price to the extent that he mentioned?—It has certainly gone up during the last six years. I suppose the price for scantling has increased 3s., and some particular lines perhaps a little more than that.

22. That is rimu?—Yes.

23. And the present price is 11s.?—No, the present price of scantling in the yards is 13s. 6d. in Dunedin.

24. That is for first-class?—Yes.

25. Is the price of the timber the chief cause of the falling-off in building operations?—I do not think that has altogether to do with it. The shortage of money is to a certain extent the cause of it.

26. Do you not think the tightness of the money-market has more to do with it than anything else?—Yes, I dare say it has.

27. The building trade is not the only trade that is at the present time suffering from slackness?—I could not speak with regard to that.

28. Do you as a builder find any difficulty in getting seasoned timbers from local sawmillers?—It is almost impossible to get it—they do not stock it.

29. If you had a contract for a large building and the specification specified that the timber should be thoroughly seasoned, how long in advance would you have to give your order to the mill?—You cannot season timber properly under six months, and even then it is not properly done.

30. So that it would almost be necessary to have the contract six months before the timber was required?—Yes.

31. And that would be impossible, of course?—Yes.

32. You say you find a difficulty in getting rimu and other timbers?—When the building trade is busy.

33. And so it is necessary to use imported timbers?—Yes.

34. Do you find it very difficult to get large timber?—Yes.

35. Long lengths?—Yes, we always have trouble in getting long lengths even now when the mills are not busy—they do not seem to be able to get them.

36. Therefore you use Oregon pine?—Yes.

37. And do you think Oregon especially should come in free whether the other timbers do or not?—I think Oregon and all hardwoods should. We have no hardwood in New Zealand.

38. Of course, as a builder and, I presume, at one time a working-man on wages, you believe in encouraging local industries?—Yes, as much as possible—as long as you have not to pay too much for it.

39. Do you know the extent of the sawmilling industry in the Dominion?—No, I could not give you the figures.

40. You know that there are some thousands of men employed in the industry?—Yes; but in my opinion if the Oregon and hardwoods did come in free it would not interfere with the milling to any extent. The red-pine at present is suitable for flooring and lining and doors of dressed timber, and it would always be used for that. Oregon pine would never replace it for that.

41. You think the industry would still go on?—Yes, I do not think it would hurt the industry at all.

42. Now, you heard a question this morning with regard to the increase in the cost of a workman's cottage. Is the advance in the cost owing to the price of the timber or in consequence of the superior buildings that are being erected now—the extra fittings that are put into the buildings now in comparison with those a few years ago?—There is really so little timber in a four-roomed cottage that it does not make a great deal of difference. The cottages are now finished so much better than they were twenty years ago. Most people now want a bath and hot water and drainage, and all that adds to the cost of the building.

43. More fancy work inside and outside?—Yes.

44. If anything from a four- to a seven-roomed house were erected now on the same style as fifteen years ago, would there be a very great difference?—On a building that took, say, 15,000 ft. of timber I suppose you could estimate a rise of 3s. a hundred feet, and on a four-roomed cottage that would be £21 10s. The joinery has increased a good deal on account of the kauri. Kauri doors have increased during the last six years by 5s. or 6s. a door.

45. We have in New Zealand very large areas of bush country, which is a very valuable asset to the Dominion. If it could be shown to this Commission that the bringing-in of timber free will cripple the industry and that this valuable asset is being destroyed by fire, would you still ask that hard timbers of all kinds be permitted to come in free?—Well, we cannot get the large timber at anything like a reasonable cost. When you want over 30 ft. in length in red-pine it is very difficult to obtain it.

46. Of course, you buy locally?—From Southland.

47. When bringing timber from Southland, to what railway-station would you bring it?—Dunedin Station.

48. Not Pelichet Bay?—No, Dunedin.

49. Do you know that it costs considerably less for freight on the railway to bring it to Pelichet Bay than to Dunedin?—Well, the cartage would make the difference. Of course, it depends upon where you are going to take the timber to. If you are down at the north end it would be all right.

50. Do you not think it a peculiar thing that the Railway Department should charge less to Pelichet Bay from Southland than to Dunedin?—They may have more room at the siding. It may be more handy for them to get the timber there than at the yard here.

51. *Mr. Hanan.*] Can you say if any builders have gone to the wall in Dunedin during the last seven years?—There have been several, but I could not say the reason for it.

52. Have the number of builders increased in Dunedin during the last five years?—Yes, considerably.

53. What do you attribute that to?—There has been more work going on than previously.

54. Has there been a building boom in Dunedin?—No, there has never been what you might call a boom, but there has always been plenty of work.

55. Do you know if any timber-merchants have closed up business during the last three or four years?—No, I cannot think of any that have closed up.

56. Have they increased in Dunedin during the last five years?—No, I think they have just remained about the same.

57. Do you import much timber?—No, I have never imported any.

58. Do you use much kauri?—Well, we use it principally for window-frames, stairs, counters, and that sort of thing.

59. Did you hear the evidence given by the last witness in regard to imposing a duty on it?—Yes.

60. Do you agree with him in that?—Well, we ought to conserve it as much as possible, because it is the only timber we have got that is suitable for stairs, counters, or anything of that sort. For beams Oregon is quite as good, if not better, and much cheaper.

61. Do you think, by allowing the Oregon to come in free, it will tend to increase the building trade?—Well, it will certainly make it cheaper in big buildings, but it will not affect the trade in any way.

62. Do you use much Oregon in Dunedin?—This last few years a good quantity has been used.

63. Do you consider it is better than rimu?—For special purposes.

64. For what purposes?—For tie-beams, roofs, and heavy joists.

65. *Mr. Field.*] Do you consider the prices for ordinary timber charged here by the timber-merchants too high?—If it was paying the millers three years ago there has been nothing that I know of since to cause any increase unless it is that they have to go further back into the bush.

66. Assuming it costs 8s. 6d. to produce it and put it on the trucks and 3s. for railage from Southland, do you think it is too much for the timber-merchants to be charging 13s. 6d., taking into consideration the charges for rent, keeping horses and carts, &c.?—If it costs 8s. 6d. on the trucks I do not think it is an unreasonable charge.

67. I mean the cost of production without allowing anything for profit at all—you think 13s. 6d. is not unreasonable?—No, not if that is the cost of production.

68. You think the builders would not complain if that were the basis?—No. I think the dressed lines are rather heavy.

69. More than they ought to be?—Yes.

70. Assuming that 13s. 6d. is a fair price in Dunedin, would 14s. 6d. be a fair price in Wellington, the conditions being the same and with railage 1s. more?—They may have different conditions in Wellington. The rents would be higher than they are here.

71. You think 13s. 6d. is not an out-of-the-way price in view of the facts mentioned?—No.

72. Are you aware that timber throughout the world generally has gone up about 50 per cent. during the last ten years?—I did not know that. I believe it has gone down in America.

73. Perhaps a temporary fall in price?—Yes.

74. Speaking generally, during the last ten years has not the price gone up 50 per cent. all over the world?—I could not speak on that question.

75. What do you pay here for rough Oregon timber?—There are various prices just now. There is hardly a fixed rate just yet. It varies from 15s. to £1 2s.

76. Now, if it was a fact that Oregon pine is already in some places affecting prejudicially our local industry, is it not to be supposed that it would still further affect it if the 2s. duty were taken off?—I do not think so. I think the consumer would be getting the benefit of that, and the money would go through different channels.

77. Are you aware that Oregon is being used in other parts of the colony for flooring and other work that it would not be used for here?—Yes. Perhaps they cannot get red-pine as they get it here.

78. But even where they can get red-pine are you aware it is being used?—There must be the same conditions ruling, but it would never compete with red-pine here.

79. Do you get a discount on the price which the timber-merchant charges you for timber?—Yes, 10 per cent. and 2½ in addition for cash.

80. That reduces the 14s. 6d. by about 1s. 6d.?—Something like that.

81. The net price is under 13s.?—Yes.

82. And the builders are not complaining of that price?—Not generally.

83. I suppose you would agree that if a duty is to be imposed on imported timber it should be imposed on the large sizes?—I do not think so. I think if it is to be brought in it should be brought in as cheap as possible. You can buy timber on the wharf at sizes to suit yourself and pay the extra charges for cartage into the mill.

84. You would not encourage the protecting of any of the large sizes?—No, I do not think it would be worth it.

85. With regard to supplies, I suppose you are aware that large timber-forests have been opened up in the North Island by the Main Trunk Railway?—But it makes the timber very expensive bringing it from the North Island down here.

86. What is the freight, say, from Wellington to here?—About 2s.

87. Are you aware that the men employed in the sawmills in Otago and Southland alone number something like a thousand?—I have seen something in the papers about it.

88. Have you heard anything of a complaint in respect to the timber-merchants grading the timber, buying a low-grade timber and grading it so as to sell the lower grade at a reasonable price, and picking out the best and selling it at a high price?—I do not think that it done here.

89. Do you know anything about the importation of Baltic-pine doors?—No, I do not know much about that.

90. Are they being imported in Dunedin?—There has been very little so far. I think there is a cargo here now, but it has had no effect.

91. *Mr. Leyland.*] In regard to the kauri-supply, have you found any difficulty in obtaining kauri promptly?—I have never done a great trade in kauri, only in small lots. We always buy locally.

92. If Oregon pine was permitted and encouraged to come here, do you think it would materially help to conserve the kauri?—Oregon would be of no use for joinery in the way the kauri is.

93. But if Oregon was used for joists and beams instead of kauri, do you think it would relieve the kauri to the extent that you require?—Yes, it should do that.

94. With regard to Oregon competing with rimu, I understand you to say that it did not compete with rimu in the sizes for which rimu is suitable, but only those sizes for which it was difficult to obtain rimu?—Long lengths and big sizes.

95. With reference to seasoned timber, are you able to obtain seasoned timber from the merchants here?—No; it is very difficult to get it here from the yard—they keep a very small stock of it.

96. If the timber-merchant did keep it he would be entitled to an extra charge?—Yes.

97. Well, speaking of the duty on large or small sizes, if a duty is to be imposed on small sizes, do you not think that 9 by 3 and all sizes above that should have a corresponding reduction of duty?—I should be in favour of the duty coming off altogether.

98. But, supposing it was found as a result of taking evidence that it was advisable to keep the duty on, the question would arise as to where the line should be drawn, bearing in mind the purposes for which Oregon is specially used—starting with joists?—I would take the red-pine when you get to 10 in. wide.

99. And thickness?—One inch thick.

100. Joists are generally 2 in.?—Yes.; 10 in. wide is dearer than 8 in. wide—8 in. is the minimum.

101. Do you think the price charged here for Oregon—15s. and upwards—is a fair price?—I suppose they would not sell it at that if it did not pay them.

102. Do you know anything about the port charges in Dunedin?—No.

103. You spoke about the carting of timber, but do you not think it would be cheaper to cart the timber to the yards than to pay the demurrage charges on the wharf?—There are yards right alongside the wharf.

104. But still it has to be handled?—Yes.

105. *Mr. Clarke.*] With reference to the resolution that was handed in to the Commission, I suppose we are to understand that that, of course, represents not only your own opinion but the opinions of the Builders' Association generally?—Yes.

106. It is not the opinion of the individual?—No.

107. With regard to the price of timber, you quoted 13s. 6d. per hundred, and that is the very lowest basis. I have here a Dunedin price-list, the first three items being 8 in. by 1 in. 13s. 6d., 10 in. by 1 in. 14s. 6d., and 12 in. by 1 in. 15s. 6d. Now, is it not a fact that a large amount of the building-timber that is used is of the wider sizes and not the 8 in. by 1 in.?—Yes, a large amount of it.

108. And it is also a fact that the standard idea of measuring timber is by the superficial foot—say, 12 by 1?—Yes.

109. And therefore it is only fair to take 12 by 1 as the average standard measurement in timber. You are charged at that rate, are you not?—Yes.

110. Now, 12 by 1, instead of being 13s. 6d., according to the price-list, is 15s. 6d., so in reality the average price is 14s. 6d., and not 13s. 6d.?—Yes.

111. Is there not a large amount of timber used over 20 ft. in length?—Yes, in every building, apart from sizes.

112. In the matter of tonguing and grooving there is considerably additional. You use large amounts?—Yes.

113. So that it would be a fair thing to assume that the average price for timber is much over 13s. 6d.?—Yes, I would say that it would average considerably more than that. That is the lowest.

114. Touching the difficulties in obtaining supplies, it is the custom in the building trade to limit the time in which the contract shall be done?—Yes.

115. Does that not sometimes put you in difficulties?—Yes, when the trade is busy here it is hard on us.

116. Assuming you want 200 lengths of 12 by 2, could you get them in Dunedin?—No, I do not think so.

117. With regard to the extent of building operations, have you any idea of the value of buildings that have been put up during the last twelve months in this city?—For the last year, ending about Christmas time, it was about £96,000.

118. *Mr. Morris.*] Mr. Clarke has just spoken respecting timber in buildings. For instance, the price of dressed timber would be increased. Would that increase not apply to imported timber if you had it dressed here?—There would be very little dressed timber used in imported timber.

119. Thirteen shillings and sixpence does not represent the average price?—It depends on the class of building. In a cottage it would be a fair average. On a big building it would average more than 8 by 1.

120. I am talking of the average cost of a cottage?—In a cottage there would be very little over 8 by 1.

121. Not 10 per cent.?—Oh, no!

122. I thought that. Is there any great demand in Dunedin at present for cottage property?—I do not think there are many empty houses.

123. Is there any demand for houses in the building trade?—Not so much as there was twelve months ago.

124. That means that the demand has fallen off?—It is a little bit quiet just at present, but it is not bad.

125. You find rimu and our native timbers unsuitable for joists and studdings and the general framing of a building, and I think you said that rimu was very suitable for flooring and lining. You thought Oregon superior for framework?—It is lighter and more easily handled, and when you get into bigger sizes it is cheaper.

126. For general house-work do you consider it necessary to import Oregon at all?—For framing in a plastered houses it is preferable to red-pine.

127. Is it stronger?—It does not twist so much.

128. Is it a good class of red-pine that you get here?—Yes, fair. The dressed timber is very good. They seem to use the best timber for dressing.

129. *Mr. Barber.*] You said there was a timber association?—Yes.

130. Of what is the association composed? Is it a combination of merchants or sawmillers?—I could not say. I know there is an association. I do not know what they call it.

131. Are all the timber-merchants in the association?—As far as I know.

132. Do you know how long the association has been in existence?—For seven or eight years.

133. It has been stated that timber has gone up during recent years from 8s. to 14s.?—Something about that. I was speaking of the last six years. It has gone up in that time about 3s.

134. You said there was no justification for the increase?—Unless it was that the milling-conditions down South were different. I know of no reason for it going up by 3s.

135. Do you believe that the rise in the price of timber interferes with the building trade generally?—It has to some extent.

136. Do you know of any cases where it has prevented the erection of buildings, or has been a means of reducing specifications?—It is a common occurrence that the tender is regarded as too high. It has to be reduced, and the specification altered.

137. Do you think the high cost of buildings has had any effect on high rents?—Rents are not high in Dunedin.

138. Can you give us any idea of the price of rents in Dunedin?—You can get a four-roomed house at from 7s. to 10s. a week.

139. Convenient to the city?—Yes.

140. On the penny tram section?—On the twopenny tram section.

141. Would that house be provided with proper sanitary arrangements?—Yes, from 7s. a week to 10s.

142. With regard to the future prospects of imported timber from Wellington by the opening of the Main Trunk line of railway, do you think there is any chance of your taking your supplies from Wellington?—Not while we have got timber in Southland, we will not go to the North Island for it.

143. Considering the freights, harbour dues at both ends, &c., and the high prices maintained by builders in Wellington, do you think there is any prospect of the Main Trunk timbers coming on here?—While we have timbers here I think they will cost less.

144. Mr. Field asked you if 14s. 6d. for ordinary building-timber is a fair price with the addition of freight?—No, I do not think so.

145. *Mr. Ell.*] You say you have a great difficulty in obtaining timber?—Yes.

146. Your experience as a builder shows you that a house built of seasoned timber is of much more value than a house built of green timber?—That is a very difficult question to answer, because there are so many different conditions. A house will last longer in one position than another. If it is in a nice sunny situation it is bound to last longer than if it is in the shade.

147. Assuming similar situations, what would be the difference in the life of a house built of seasoned timber as compared with one built of green timber?—I could not give you an estimate. The seasoned-timber house would certainly last longer.

148. Would it make the difference in the life of a house equal to £40 or £50, say, on a £450 or £500 house?—Well, I think I should be quite safe in saying that it would.

149. So there would be a distinct gain to the general public of New Zealand if their houses were built of seasoned timber?—Yes.

150. What would be the difference in the cost, say, at 1s. per hundred on the ordinary price charged?—It would make about £7 10s.—that is, if you could season it for 1s. per hundred, which I doubt.

151. Well, say 2s. per hundred?—Yes, it would be a great gain to the public of New Zealand.

152. Do you use beech now at all?—Very little. Only for furniture-making, chairs, &c., but not in the building trade.

153. Why is it not used in the building trade?—Because it is very bad for twisting.

154. Do you think if it were properly cared for and seasoned that it would be suitable?—I understand there is a big loss in seasoning.

155. Now, with regard to the requirements of this country not only in respect to ordinary rough building-timbers, but for the finer inside work such as cabinetmaking, &c., I want to ask you, as a citizen and a business man, whether you do not think it is desirable to make reserves for future needs of our forests?—Yes, I think it ought to be done. The Government are now planting forests. There is one at Naseby, and it will be many years before it is of any use if it is ever any use. It must have cost a considerable sum to have put it there.

156. With regard to our planted timbers and our native timbers, what do you propose?—I think it would be better to reserve timber.

157. You think it desirable in the interests of the public of New Zealand for future needs that there should be certain reserves made?—Yes, certainly.

158. And held and worked as demand is made upon them?—Yes.

159. All we have in New Zealand up to the present is 9,465 acres in the way of forest plantations. In view of that is there not all the more necessity for making reservations?—Yes.

160. How long will it take for these planted trees to mature?—I should say fifty years, at any rate, at the earliest.

161. Do you think from your knowledge of our existing supplies, when you take into consideration our increasing population and constantly increasing demands, that our standard timbers are going to last fifty years?—From what I have read I do not think they will.

162. In that case we shall soon have to depend upon outside supplies?—Yes.

163. You are aware that our population is increasing, the price of timber going up, and the quantity diminishing?—Yes.

164. You understand that the population of Australia is increasing also, and that the quantity of timber is diminishing?—Yes.

165. Does that not point to the necessity for our preserving our own timbers?—Yes.

166. *Mr. Stallworthy.*] How many members are there in the association?—There are eighty-five members in the association. There are about two hundred builders. The principal builders in Dunedin are in the association.

167. You said in your evidence that it took about six months to get timber?—No, I did not say six months. I said months.

168. Is this because stocks are not kept in the yards?—Yes. When we have a building here we never get the material out of the yards. We get it direct from Southland.

169. How many timber-merchants are there in Dunedin?—About seven or eight, I should think.

170. Are these timber-merchants also sawmillers?—Some of them. Not all.

171. How many are not timber-merchants?—One, anyway, is not.

172. Seeing that you get your timber direct from the bush in Southland for the construction of a building, and we are informed that 9s. 6d. is the average selling-price of the timber at Riverton, do you not think that the merchant is asking rather too high a price when he gets 13s. 6d. at the lowest?—We do not pay 13s. 6d. for that timber in Southland.

173. What do you pay for the timber that you get from Southland?—It costs us about 12s. landed here. The railage is 3s.

174. *Mr. Mander.*] I understood you to say that you would take all duties off imported timber?—Yes.

175. Do you not think it would be a better business principle to lessen the duty on timber that we cannot produce in this country, and increase it on timbers that we can produce here?—We cannot produce Oregon here.

176. Do you not think it would be better to reduce the price on the long lengths and the widths that we are unable to produce here, and increase it on those timbers that are coming into competition with us?—No, I think if you take it off the whole lot you would get it much cheaper than if you restricted the sizes.

177. Seeing it costs about 13s. to deliver Oregon here and you can purchase rimu for about 14s., the introduction of Oregon would reduce the cost of building?—It might, but not to a great extent. It will help to conserve the red-pine we have got here.

178. The red-pine is 1s. less than Oregon?—It would save the red-pine in this way: that the Oregon would be used for scantlings, and the red-pine would be used more for dressed lines.

179. Are you aware that the scantlings accumulate most in the mill, and are most difficult to get rid of?—Well, perhaps they might be able to sell it cheaper then.

180. How much timber does it take to build an ordinary four-roomed cottage in Dunedin?—That is not a fair question. You may build a four-roomed cottage for £200, or you may build one for £400.

181. I want to know much much timber it takes?—There is a difference in the timber.

182. What is the average?—Anything from 15,000 ft.

183. You say the increase in timber is equal to 3s. during the last six years?—Yes.

184. That would amount to about £21 extra in a cottage of that size?—Yes.

185. Do you think that would retard building operations in Dunedin?—It would affect any one with small capital, because, in addition to that, there is an increase in other lines, such as mantelpieces, doors, frames, &c.

186. How do you account for a four-roomed cottage costing £47 more than it did to build a few years ago?—Of course, it may be a different cottage. There is drainage, &c., now which costs money; moreover, painting and plumbing have gone up. I may say, however, that carpenters' wages have not increased during the last few years.

187. You tell us you could not understand why the price of timber has gone up lately?—During the last three years I said.

188. Are you not aware that timber each year has become more difficult to get?—I made that stipulation.

189. You are aware that the longer you hold timber the interest on the money becomes an increasing factor, and fire, in the matter of kauri, is a very big factor, and puts the price up very much?—Yes.

190. Now, you said that if Oregon was delivered on the wharf here that builders could buy it in suitable sizes in lengths, &c., to suit their purposes?—Yes. You can order it that way and get what sizes you like, suitable to put into yard or store.

191. Do you find any difficulty in getting red-pine?—The large sizes you cannot get.

192. Do you not think the price of land in places like Wellington is a very large factor in the cost?—There is no doubt about it.

193. *Hon. the Chairman.*] You stated, Mr. Crawford, that you got all your stuff from the Southland mills?—That is when we have a contract, but for jobbing purposes we get it from the merchants.

194. For contracting you apply to the mills in Southland, to whichever mill you think will supply you best and cheapest?—Yes.

195. Do you know that there are a certain number of millers in the association in Southland?—Yes.

196. It is in evidence that rather more than half of them are associated, and that there are a number who are not. Altogether there are somewhere about twenty-five to thirty mills associated, and the balance are not. Do you find any difficulty in applying for orders to one or the other? Do you get it cheaper from the association mills than from the other mills?—I do not think there is any difference. We are guided more by the mill that can supply us quickly with good timber.

197. You think there is no difference in the prices quoted by the timber-people?—I have never found any difference.

198. With regard to the timber being seasoned, what do you think would be the value of seasoned timber in a cottage in preference to the ordinary timber from the mill?—Of course, we have to season timber ourselves.

199. When ordering a cottage from you one would have to give you a certain time to cut this timber and season it?—Yes.

200. What would be the average time?—Weatherboards, flooring, and lining get about three months' drying; it depends upon the size of the job. Sometimes we get six months, but we just have to season it as we can.

201. And if you have not time it goes in without being seasoned?—It has got to.

202. I suppose, in the bulk of cottages there is no architect?—Yes, but they only specify timber to be on the ground within two weeks of the contract being signed.

203. *Mr. Field.*] As to the possibility of rendering timber from the North Island saleable down South, you seem to think it impossible to buy it at a reasonable price? Are you aware that they are bringing timber from the Baltic, 15,000 miles, and from Oregon, 7,000 miles, and selling it reasonably?—Yes, I am aware of that.

204. What does it cost to take timber from the railway-station in Wellington and put it on board ship at the wharf-side?—About 4d. per hundred feet.

205. And stacking aboard ship and wharfage?—That would be included in the freight—putting it on board ship.

206. Assuming this to be so—that I am prepared to take your order for 1,000,000 ft. or 10,000,000 ft. at 10s. per hundred, that the freight down here is 2s., and the cartage is 1s., is is possible for our timber there not to be available for use down here?—You could not do that on a small order.

207. Yes, I could?—Take 20,000 ft.

208. In truck-loads. I am prepared to do it to-day. You say it is impossible?—No, not a bit.

209. Assuming the cost of production for sawmillers down Southland was from 8s. to 8s. 6d., you would not doubt their word?—I do not think so.

210. I do not include in that dressed timber—only rough sawn timber. I do not mean to include timber for which I understand you are paying here 12s.?—Rough timber.

211. And you can buy it in the yards at 13s. 6d. and 10 per cent. and 2½ per cent. off?—Yes.

212. *Mr. Morris.*] I should like to ask what is the percentage of the cost of timber used in an ordinary five-roomed worker's cottage—the total cost of the building and of the bare rough timber?—That is rather a strange question to answer.

213. Do you think it is 25 per cent.?—I should think more than that.

214. Thirty per cent.?—Perhaps 33 per cent.; I would not be sure of it.

ALEXANDER MACPHERSON, Timber-merchant, sworn and examined. (No. 23.)

1. *Hon. the Chairman.*] Can you give us evidence as a timber-merchant on the points referred to here in the order of reference?—I will give you any information as far as I can.

2. We want to hear in your own way the information you can give. Have you any connection with sawmilling?—Yes.

3. You are both a timber-merchant and a sawmiller?—I have no connection practically with sawmilling. My firm has taken up a piece of bush, but we have not started on it yet. It is chiefly beech.

4. What supply do you intend to provide?—We have had considerable inquiry from Australia and shipped a fair quantity over there, until they imposed a duty of 2s. 6d., which practically shut us out.

5. What do you propose to do now?—I wish to bring before the Commission the fact that kauri and white-pine are allowed into the Commonwealth for a duty of 6d., whereas the timber which we can supply is charged 2s. 6d. Perhaps something might be done to put them on the same footing.

6. As a timber-merchant, have you been satisfactorily supplied by the millers in Southland?—I have been satisfied. I may say that our firm is placed rather differently to the majority of firms in Dunedin, in that we do not stock but simply distribute.

7. Then, one going with an order to you would be supplied from where you could get it cheapest?—Yes.

8. Do you intend to stock when you start sawmilling?—We did at first, but we would not think of stocking now.

9. You think stocking does not pay?—Not for local wants.

10. What is your opinion about the addition to the price of timber—this last increase of 3s. per hundred in the past six years?—All I know is that the sawmillers as a body are not making much out of it—just working from hand and mouth. There may be exceptions.

11. Still, you think it is a payable business to enter on?—We took it up with the prospect of selling the beech, but that has been practically knocked off.

12. What is your intention now?—To do the best we can.

13. *Mr. Arnold.*] Where are you opening your mill?—In the Wairio district, Souhtland.

14. Have you any knowledge of bush country?—A fair knowledge.

15. Did you personally inspect the various bush areas before you selected your site?—My partner has done so.

16. There is a difficulty, is there ont, in getting rid of birch timber—in building up a trade in it?—For building purposes there is; but there is a certain quantity required for other manufactures.

17. As a merchant you are going into all classes of trade?—Yes.

18. Were there special reasons for going into the birch trade?—We had opened a good market and had orders coming in every week, but the duty was put on, and the trade has practically stopped since.

19. You think that the duty should be taken off in some way?—Yes. I think it should be placed in the same position as kauri and white-pine. It appears that kauri is brought in on the

back of white-pine, as it were. White-pine is required for butter-factories, and owing to agitation they got the duty reduced to 6d. Beech, unfortunately, not being classed as a pine has a higher duty.

20. You know the duty is put on by the Federal Government, not by the New Zealand Government?—I know that, but, still, I think something might be arranged.

21. Do your people visit the Catlin's district?—Not much, chiefly Southland.

22. You are aware, of course, that Catlin's has a large amount of pine, rimu, and other timbers there, but very little birch?—Yes, a good deal of beech also.

23. Would it not have been better to have gone into that country than where there is a bit of difficulty in exporting it?—The timbers are better as a whole in Southland than in Catlin's. I do not say better quality, but easier-worked.

24. With regard to kauri, we have had evidence to the effect that it would be wise to put an export duty on it?—I feel that if they will not take our cheap timber they should not get our dear timber.

25. Do you not think it rather inconsistent to ask them to take a duty off one class of timber, and recommend our own Government to put a duty on another class?—Yes, that would be inconsistent, but it would not be inconsistent to ask to have the duty brought down on our cheap timber.

26. With regard to Oregon, have you had much to do with it as a merchant?—We are just beginning to import some now in small quantities.

27. What is your opinion in regard to Oregon?—As far as Otago and Southland are concerned it does not appreciably affect them. I could not speak for further north.

28. It is chiefly large timbers that are brought down?—Lengths that we cannot very well get—that it is difficult to get here.

29. But if it is competing in the North Island occasionally it is only a matter of time until it comes this far?—It will be a long time. It cannot possibly compete here. It is going up now—has an upward tendency.

30. Do you think it is likely to go up further?—It is scarcely possible that it should come down, and it would be a long time before it can compete with our local timber.

31. If it does go up still further, it is not to be feared even as much as at the present price?—That is so.

32. You do not think there is any necessity for putting a duty on Oregon?—Not as far as Otago and Southland are concerned.

33. What is your opinion with regard to letting hardwoods of other kinds come in?—I think the present arrangement is reasonable.

34. You would not make any alteration?—I do not think it is necessary.

35. As a merchant you have been simply dealing between the miller and the user?—Yes.

36. As a middleman?—Yes.

37. Have you discriminated in any way between the association and those outside?—No, we are millers and sawmillers and timber-merchants.

38. Were you previously?—Yes, we have been all through.

39. Do you deal always with the association?—Oh, no, we go outside also. It is scarcely an understanding—merely a sort of friendly association, which is not hard and fast.

40. It is admitted that the cost of building has very much increased, and we have got evidence from builders and millers on that subject. Do you think the increase has been caused in any way by a close combination?—I do not think so.

41. Of course, you are speaking as far as Otago and Southland are concerned?—Yes.

42. You do not stock timber, although a merchant?—No, we sell off the trucks or off the wharf.

43. If you were to stock timber, would it require a very large amount of capital?—It would require increased capital. It depends upon the extent of the operations.

44. Do you think it is possible for the mills, either in the city or country of which you have a knowledge, to stock the whole of their timber so that it may become thoroughly seasoned before being used?—I do not think so; it would require a great amount of capital to do that.

45. *Mr. Hanan.*] You were in the sawmilling business before you came to Dunedin?—Yes.

46. Did you find that it paid you?—Well, we were not long enough in it to judge fairly.

47. Did you sell out to advantage?—No.

48. Have you found the timber-merchant business in Dunedin a success?—Fair.

49. You have not regretted entering upon it?—No.

50. Has your business increased in the last three years?—Yes.

51. Substantially?—Yes.

52. Have you known any millers who have given up business in Southland?—I know that some have, but I cannot recall them at the moment.

53. Would you say that the majority of them have done well?—No.

54. You say they have lost money?—The majority have not made any.

55. Would you swear that on your oath?—I would rather not, but from the dealings I have had with them they do not appear to be any better off. I do not see any indications of their having made money.

56. Why do so few give it up?—I do not know. If people get into a business they hang on to it if they are making a living.

57. As a rule, if it is not paying they will get out of it as soon as they can?—Yes.

58. The number of mills has increased down there?—Yes.

59. Does that show that the business has not been a profitable one?—I could not say. A number are very small mills.

60. Would you say that the large mills pay and the small do not?—The large ones have large areas of bush convenient.

61. As to the small?—They do not do much.

62. Do the small cut for the large?—In some instances.

63. Can you give any information as to the prices paid by the large to the small for cutting?—No, I cannot.

64. That is done, is it not?—To a certain extent.

65. Do you know why they have to go to the small millers? Is it because they have too much to do?—Sometimes, and sometimes to conserve their own woods.

66. Have you found any falling-off in your own business?—Slightly during the last three or four months.

67. Building orders?—Yes; other orders have not fallen off.

68. In regard to what class of timber have they fallen off?—Building red-pine.

69. As to imported woods?—Well, our trade is just growing in that respect; we are just beginning; it has shown no falling-off as far as we have gone.

70. Is this true, that nearly one-third of the timber—as stated by Mr. Riddell, proprietor of a factory—was not up to standard for woodware work, and there was consequently a considerable loss?—I do not know his experience.

71. Have you had any complaint?—No, we have noticed no difference in the quality.

72. Would you favour the removal of the duty altogether from Oregon?—I have not considered that question. I do not think it would affect matters here.

73. With regard to reciprocal duties, do you not think that New Zealand would lose more than she would gain?—It would depend upon the arrangement.

74. You do not think, looking at the question, that we are more likely to lose at the game?—It would all depend.

75. *Mr. Jennings.*] How long have you been a sawmiller?—About fifteen years.

76. Have you up-to-date appliances in your mills?—We are not milling just now.

77. Can you tell me the output of the largest mill in the district?—I dare say anywhere from 10,000 to 15,000 per day. I am not quite sure on that point. The average mill in Southland would turn out five or six thousand feet.

78. If your mills are not up to date in regard to appliances, would not that be a factor in increasing the cost of timber?—The mills are quite costly enough for the nature of the bush they are working, and the areas they hold. It would not pay to put up too expensive a plant.

79. What is the average area?—Eight hundred acres to each mill.

80. *Mr. Field.*] You are not a miller now?—No.

81. For how long past have the millers been just earning a fair living?—Well, I do not think there has been much difference in the last two years.

82. Say ten years?—I do not think there has been very much difference, because at that time timber cost very much less than it does now to produce.

83. It is not a fact that they were making a handsome profit out of it, and only lately felt the depression?—A few mills have been making a good thing, but I am speaking generally.

84. Has the increase in the price of timber materially increased the price of buildings in this part of the country?—I do not think so.

85. What difference has the increase in price of timber made in a house compared with the previous cost?—I have thought it over several times, and in a five-roomed house the difference would be from about £7 10s. to £10. That is for the difference in the price of the timber alone.

86. That is the increase in what period?—The last four or five years.

87. Of course, you are aware that timber has practically gone up in price all over the world?—Yes.

88. Is it likely to rise still further?—I think the tendency will be slightly in that way.

89. All classes of timber?—I think so.

90. As a timber-merchant, would you say the price charged here by the merchants who keep yards—namely, 13s. 6d. for ordinary building-rimu, less 1s. 9d. discount, is a reasonable price?—I should say that is very reasonable.

91. From your knowledge of the cost of milling, after making an analytical investigation, would you say it was a fair thing to estimate 8s. as the cost of production?—Yes.

92. In regard to Oregon pine, you say it is not likely to affect you down here?—No, not much.

93. Have you any knowledge of the conditions prevailing in other parts of the Dominion?—Only what I have read.

94. Have you heard that Oregon pine is being used for all kinds of purposes in house-building, weatherboarding and flooring?—Yes.

95. That being so, do you not think it is likely to affect the ordinary rimu industry in places where it is so used?—Yes, it may to a certain extent.

96. Are you aware what price Oregon pine works out at here, landed at the wharf?—About 12s. for small parcels, but larger parcels may be less.

97. That being so, do you not think it is likely to compete successfully?—Not here.

98. And in other parts of the Dominion?—It will in the cities, I believe, but not in the country districts.

99. Are you in favour of conserving our timber, or do you think it should be used as it is wanted?—Use it as we want it.

100. I suppose you would be in favour of the Crown keeping certain timber areas?—Yes.

101. *Mr Leyland.*] Mr. Scott in giving his evidence here said that timber-merchants had a profit of more than 5s. per hundred feet?—He is mistaken.

102. Do you get more than 5s. per hundred feet profit on the timber you sell in Southland?—One shilling on the average. Sometimes we sell it for less. We have to keep travellers in the country, and there are bad debts and the risks we have to take.

103. An indent firm would charge 5 per cent. for indenting alone, would it not?—Yes.

104. That would be more than equal, considering he got the order direct from you without employing travellers?—Yes.

105. With regard to beech, in Australia they only charge 6d. duty on the bulk of their importations from New Zealand, and it seems very hard that we should charge 2s. on all their timber?—I quite admit that. It seems strange that beech should be outstanding from all the rest, except that it is not a pine.

106. In regard to Oregon, you say that it is already increasing in price?—Yes, that is the tendency.

107. The timber that is being landed now is timber that was bought months ago when prices were lower?—Yes.

108. The landed price of timber that is landed to-day does not give a fair idea of what Oregon pine can be bought at?—No.

109. Then the price is likely to increase?—Yes, I think it will, but I do not know whether it will increase much.

110. Do you not think the extra increase that is likely to take place would be quite sufficient of a handicap without increasing the duty on Oregon?—I think so. In a few isolated places just near the ports it may still compete for a time with the local timbers, such as Christchurch, where they have to bring the red-pine a considerable distance.

111. They have a big handicap of 1s. 6d. on account of it having to go through the tunnel?—Yes.

112. Where Oregon pine is used for framing, is it not a fact that people pay more for it than for red-pine?—Not here—they won't use it.

113. If they do use it they have to pay more for it?—Yes.

114. That is because they think it more suitable?—It is practically not used for that.

115. You said you are a member of the association?—Yes.

116. The last witness was a member of an association, and you would infer from that that he is quite agreed with the existence of associations?—Yes.

117. *Mr. Clarke.*] With reference to the association, does your association adhere to this printed price-list marked "McCallum and Co."?—No, we have nothing to do with that.

118. You do not sell on that price-list at all?—No, we sell at a cheaper rate than that.

119. With regard to the operations of your association, is there any distinct understanding that if a member of the association sells below a certain price he is subject to any penalties either written or implied in any way?—No, no penalties.

120. *Mr. Morris.*] In reply to Mr. Field you said you had 800 acres allowed you here for milling purposes?—Yes.

121. Do you not consider that an increase of area would reduce the cost of production and enable the miller to sell at a reduced price?—I do not think so.

122. But he would have a larger area on which to recover the cost of the mill?—I do not think it would make very much difference. It may in some cases where a man could afford to put in an expensive plant.

123. Then you consider that 800 acres is a sufficient area for a man to recover the cost of a mill and the whole of his outlay?—No, I do not say that, because when it is worked out he has got the whole cost of shifting to some other place—it is too small so far as the cost of putting an ordinary mill in is concerned.

124. To shift a mill it costs a lot of money?—Yes.

125. Do you buy any timber at all from Greymouth or the West Coast?—We get some—not a great deal.

126. What freight do you pay on it?—Three shillings.

127. That is more than the freight paid on Oregon from America?—About the same.

128. *Mr. Barber.*] Have you got a printed price-list?—Yes.

129. Can you supply the Commission with a copy?—Yes. [Produced and put in.]

130. You said that the increased cost of a six-roomed house would be from £7 10s. to £10?—That is, without going into the thing carefully—that is, judging from the increased price of the timber.

131. How many feet of timber is there in a six-roomed house?—Fifteen thousand feet. It depends on the house.

132. What is the increase that has taken place in the price of timber during the last five years?—On an average about 2s. That is, 2s. in seven years. Then the question of the price of timber is very intricate—there are thirty or forty different prices.

133. You say that it is not correct that the price of timber has gone up 3s. in five years?—I think it is overestimated.

134. Surely you know what the increased price is. Can you give the Commission a price-list of five years ago?—I can produce one for four years ago. It is often varied by the discount. [Price-list produced and put in.]

135. *Hon. the Chairman.*] Are the discounts more liberal now than they were?—Yes, since the last seven years.

136. *Mr. Barber.*] Evidence has been given that the increase on 15,000 ft. of timber in a four-roomed cottage has been £21, and you think that is incorrect?—Yes, as far as the last four or five years is concerned it would be.

137. You could not speak with the same authority as a builder could?—No, not as to the increased cost of a house.

138. You are of opinion that in some cities Oregon pine would compete with red-pine?—Yes, in the cities distant from the source of supply.

139. Do you think it would compete with it in Wellington?—It should not. It would compete more with it in Christchurch than in Wellington.

140. And for what reason?—Because they cannot rail the timber into Christchurch, but you can from the mills to Wellington.

141. But that applies to red-pine also, because the railage applies equally to red-pine in Christchurch as with Oregon pine?—I am speaking of railage from the mills.

142. How much timber is supplied from the mills in Southland to Christchurch?—Practically none.

143. It has to be railed in from the port?—Yes. They can rail it into Wellington from the mills, but there is the shipping as well at Christchurch. They have to ship it first from the West Coast, and then rail it. What I mean is this: the mills in Wellington district can rail the timber into Wellington direct, but there are no mills that can rail the timber direct into Christchurch.

144. Considering that timber, according to the prices that have been given, can be put into the Christchurch port at the same price that it is put into Lyttelton and also delivered at the Wellington Railway-station, ought there to be any difference between the Oregon pine and red-pine?—I could not say that.

145. *Mr. Ell.*] You say that the local timber does not pay to stock?—I did not say that. I said it was not profitable enough for one to stock it.

146. If the timber-merchants in Christchurch fourteen years ago only charged 1s. between the ordinary green timber and seasoned timber, why can they not do it now?—I could not say.

147. Have the wages gone up very materially so far as labour is concerned in the yards?—It has gone up to a certain extent.

148. But not to any great extent?—No.

149. What do you pay your workers now?—I have no yard now.

150. Do you know what is paid?—No, I do not.

151. Now, in regard to beech, you say that practically the trade is knocked out through the duty of 2s. 6d. being imposed in Australia?—Yes.

152. Are you aware that, if beech is cut in the winter, the sap is down, and it is not so liable to crack and warp?—It is not quite so liable.

153. And the millers say it is a much better timber if cut in the winter?—Yes, I believe that.

154. Then, do you think that, if you had your cutting in the winter and the sawing in the summer, it would enable you to get your beech on to the market with a greater chance of selling it?—No, because we should have to charge more for it then.

155. You are selling it now at 1s. less than rimu?—Yes.

156. If you charged the same price as rimu could you do it?—I do not think it would cover the cost of cutting it all in the winter.

157. *Mr. Stallworthy.*] Can you give us the extent of your importation of Oregon?—We have only had one small lot.

158. You have recently sent away some orders?—Yes.

159. You said you have been a sawmiller, and you are again proposing to be a sawmiller?—In a small way.

160. Do you expect to produce the timber at a cheaper rate than the sawmillers are charging you?—No.

161. Then what is your object in going into sawmilling?—Well, we had got the market for this birch, and we wanted to make sure of a supply.

162. But there are other persons who supply birch?—Yes, but we may not be able to buy from them.

163. What are the charges on timber between Riverton and here?—The railage is 2s. 9d. per hundred from Riverton to Dunedin. Those are the only charges.

164. What is the average price charged you by the millers?—For rough timber up to certain sizes 7s., but the prices vary.

165. But the lowest price is 7s.?—Yes.

166. And the highest price for timber is, what?—The highest price is 10s. for flooring.

167. We have heard a good deal about bad debts adding to the cost of timber; can you give us any idea what the percentage would be?—About 2½ per cent., roughly, but I have not gone into it exactly.

168. You are a timber-merchant in this respect: that you secure an order in Dunedin or elsewhere and purchase the timber at the mill and deliver it. What else do you do?—That is all.

169. But you stand the racket of bad debts?—Yes, and all expenses.

170. What do you estimate is the cost of a small mill plant turning out about 5,000 ft.?—From £1,500 to £2,000.

171. And the life of that mill in one area is, what?—You never get two areas alike—it may last ten or fifteen years.

172. You have two areas of 800 acres each?—Yes.

173. How long do you think the mill will take to cut that out?—From ten to twelve years—it depends on the rate of cutting.

174. It has been, I think, the almost unanimous testimony of millers that they are clearing on the average 1s. per hundred feet on the output of their mills: taking a 5,000-ft.-a-day mill, the owner would be clearing £2 10s. a day. Is there anything to put against those charges other than the whole cost of production?—I could not say—I have not gone into it.

175. The depreciation is all allowed for?—I do not see how they can allow for that—the profit of a large mill must be different.

176. At any rate, according to your evidence the smallest mill turns out 5,000 ft. a day, and other millers have told us it costs 8s. a hundred to produce, and it is sold for 9s. 0½d., making a

profit of 1s. clear, so that the smallest miller would clear £2 10s. a day. Is that so?—You do not work every day in the year, and there is a lot of lost time, and it is impossible to arrive at it neatly.

177. *Mr. Mander.*] Do you think a reduction of the duty on Oregon would cheapen the cost of an ordinary workman's cottage to any material extent?—No, it would not affect it at all.

178. Now, is it not a fact that there is a great deal of loss in stacking the timber in the yard and holding it, and the risk of splitting?—Yes.

179. What would you consider a fair price between the wholesale and retail price after stacking it and the expense of the yard?—About 2s. 6d.

180. Do you think that would pay?—Fairly.

181. Is it not a fact that some of these small millers may be very good bushmen, and may be able to produce timber cheaply, but yet not be able to handle the timber apart from the mill?—It would not pay them to sell here in the country. They nearly all want a cheque at the end of the month to pay the men. They get the cash in a lump sum from us, and they very often want their cheques in advance. There is one thing I wished to mention that would cheapen the price of timber, and that is a reduction in the railage. I think the railage is too high.

GABRIEL HODGES sworn and examined. (No. 24.)

1. *Hon. the Chairman.*] In what way are you interested in the timber business?—I am a builder. I cannot give you any information as to the cost of cutting and felling at the mill. I was present at a meeting of the Builders' Association, and the resolution which was submitted and agreed to has my approval.

2. What was the resolution?—That we favour the importation of Oregon or other foreign timbers. I may say that the importation of Oregon provides for a felt want in this portion of New Zealand. As a builder I have had great difficulty in procuring long lengths of either red-pine, totara, or kauri at a price that compares at all favourably with Oregon.

3. As a builder, do you consider the present prices in any way detrimental to the volume of work?—You mean the present prices charged in New Zealand?

4. Yes?—Prices have gone up, but those charged in Dunedin compare favourably with the prices in any other centre in New Zealand.

5. If the prices were lower, do you think that would add to the volume of work?—I suppose if you can buy an article 10 or 15 per cent. cheaper than the current prices it must tend in a slight degree in that direction.

6. You are not aware of the cost of dressing timber?—No, I cannot say anything on that question.

7. Is the building trade in Dunedin proportionately going on as formerly?—There is a dull time. The man in the street says it is financial pressure, but I do not think that that is so. We recognise there is a slight depression, but to what it is due I cannot say. Taking the trade generally, the orders are not so numerous.

8. *Mr. Arnold.*] How long have you been in business?—About thirty-five years, and most of the time in Dunedin.

9. Has there been a time in your experience when the building trade was slacker than at present?—Yes, I believe there was.

10. About how long ago—seventeen years ago?—Yes, I remember in Dunedin it commenced to fall off about 1890. Then there was a slump.

11. Can you recall the prices of timber at that time?—Not offhand.

12. Were they higher than now?—No, certainly not.

13. Lower?—Yes.

14. Considerably lower?—Yes, they would be.

15. And yet there was less building going on than there is to-day?—Naturally so, because the population was less. There was not the volume of output that there is to-day.

16. Even in proportion to the population was there not less building then?—Certainly not. Not in the boom days. Of course, there was a depreciation during the slump, but that was not due to the price of timber.

17. So that lowness in the price of timber does not necessarily mean more building?—The price of timber must regulate the number of buildings that will be erected. I am speaking of buildings for speculative purposes. Of course, if a building has to be put up it will go up.

18. If the money-market is tight it naturally follows that there will be less building?—Oh, yes!

19. Do you not think that the slackness at the present time is more in consequence of the state of the money-market—perhaps lack of confidence in speculation—than the high price of timber?—In my opinion, the price of timber compares very favourably with the price paid in other centres in New Zealand.

20. But the same thing exists right through New Zealand?—But perhaps more pronounced in other centres.

21. We are desirous that this slackness should be removed—can you suggest anything?—As I have already said, I am strongly in favour of the resolution submitted to you by the association—viz., that the import duty on junk timber be removed. It seems to me that the members of this Commission generally have not grasped the situation. It must be understood that the importation of Oregon or Australian hardwood provides for a long-felt want, and supplies us with a class of timber that we cannot get amongst our native timbers. Take Oregon, for instance, it comes here better seasoned than the local timber. We can get it in long lengths and bigger sizes, and it is cheaper to handle. It maintains its size and shape better than our local timbers. If I

wanted timber from Southland 40 ft. in length, or 18 by 10, I should have considerable trouble in getting it, and when I did get it its greenness would show that the kaka had been nestling in its branches a few weeks earlier.

22. Suppose, then, that the hardwoods are to come in free, do you think that in five-and-twenty years the conditions of our local timber will be any different?—Of course. If you are going to restrict the importation of foreign timbers—it does not matter whether it is Oregon pine or Australian hardwood—you must always be cutting from a limited quantity of your native timbers, and consequently every year will reduce the total. I understand that the steps the Government are taking will not replace the native timbers. The rimu or red-pine is one of the finest timbers in the world; so also is the kauri, but the price of kauri is prohibitive.

23. So you think that, even though those other timbers were imported free of duty, there would still be a demand for rimu and kauri?—Yes, certainly.

24. What about pine and birch?—I have never used any of the birch. Any that I have seen, if you lay it down it runs, twists, and warps in every direction. I do not think it will ever be used much.

25. What about black and red pine?—Very good, but can you get it?

26. Do you find any difficulty in getting orders supplied?—We find a difficulty in getting any native timber of any size in lengths.

27. *Hon. the Chairman.*] Will that not apply more to large constructions than to ordinary cottages or buildings?—Well, I am speaking more particularly in respect to buildings in the centre of Dunedin than to small buildings. The demand we hope will increase.

28. Is there much cutting in the building trade here?—I got a specification for a small job this week and we had seventeen tenders, and some of them were below the actual cost of material. They really gave the labour for nothing. You cannot have more competition than that.

29. How do the wages paid to men to-day compare with the wages paid some years ago?—If you are referring to carpenters, I was paying in 1879 13s. a day, and then their wages came down to 10s.; now we are paying 10s. 8d. We do not, however, get the same amount of work in respect to either quantity or quality.

30. What do you think is the cause of that?—There are too many politicians here to answer that question.

31. You do not care to answer that question?—We are hedged in with too many restrictions, too much nonsense.

32. Do you mean to say that the men are inferior as mechanics?—Speaking of twenty-five years ago, we had a good many men in the colony who were members of the Amalgamated Society at Home. Young men who have grown up in the Dominion have not the same facilities to acquire a thoroughly practical knowledge of the different classes of work. Machinery, to a certain extent, too, has superseded hand-work.

33. Are builders using as good a class of timber in ordinary dwellings now as they did, say, ten years ago?—We are putting in, perhaps, a better class of material, but under different conditions.

34. As to timber?—No. A few years ago the majority of the timber-merchants in Dunedin would supply us from the yard. If you booked an order with them you would get your timber cut from the junk into the sizes you required. To-day, if a man secures a contract, the first thing you do is to go to the timber-merchant, and he sends the order down south to the bush mill.

35. As a matter of fact, you are not, then, using seasoned timber—that is, you are not putting it in?—You cannot get seasoned timbers.

36. Speaking of the cost of a building, am I right in saying that it has increased by 40 per cent. compared with a few years ago?—Does that mean the total cost of the building, or only so far as the rough timber is concerned?

37. Rough timber?—No. I think, myself, if you put it down at 20 per cent. you would be on the outside of it. You must remember this: that if you come to cottage buildings, the quantity of proper timber in them is very small. The actual cost of rough timber has not increased in the same proportion as dressed timber. In Dunedin the extra cost is put on sundry things, such as mouldings, cornices, &c.; it is not on the rough timber above a given size and a given length.

38. Can you give us any reason why there should be such disparity?—Possibly it is due to altered conditions. They have to pay more in wages, rents may have gone up, and special machinery is required to get the timber from difficult places in the bush to the mill. This all adds to the cost.

39. Do you think it better to obtain your timber from the timber-merchant than from the miller?—I find it pays me better to deal with responsible persons, and that is the timber-merchant. I am told there are people outside who would quote perhaps a cheap price for certain lines, but they are not in a position to execute the order entirely, and consequently you get very little sympathy from the sawmiller if you go and ask him to supply you with an article that does not pay him so well as the rough stuff.

40. You find it better to deal with the merchant than with the sawmiller?—I do not know that you can call him that, because they are all directly or indirectly connected.

41. Do you find any combine to force up prices?—They tell me there is a price-list, and I believe it is a fact.

42. Do you think it desirable that we should import Oregon here free?—It would provide for a felt want that our native timber does not supply.

43. From your knowledge of the trade you would say that that want is likely to continue?—Yes.

44. *Mr. Jennings.*] Has your association made any inquiries regarding timbers that grow in the North Island—that is, outside of kauri?—Not that I am aware of.

45 If you could get lengths of timber suitable from that district, would you take them?—I shall be very glad to get your address if you can supply me with anything in good lengths and sizes at 15s. a hundred—if you can do that I will give you an order.

46. In regard to seasoning, are you acquainted with any of the artificial methods that are adopted?—In my opinion, there is nothing better than to fall the tree and allow it to remain for a certain time before it is broken down. The trouble with us in Dunedin is that we cannot get seasoned timber. You book your order and it is sent down, and the timber is cut for you and sent along as soon as possible. You have to pay them for stacking and the sap.

47. There is no artificial method?—Not in any quantity.

48. *Mr. Leyland.*] With reference to the depression and the tightness of money, do you not think the falling-off of £4,000,000 which we had in our exports last year has something to do with the depression?—Yes, I should feel the pressure if I lost £4,000,000.

49. With reference to the increased cost of sawn timber, if you had evidence before you that the cost of production had also gone up very much, would you not agree that an increase in the cost would be justified?—I think the price of timber in Dunedin is fair compared with other centres. I expect that it should rise in price.

50. You have no real complaint against the increased cost?—In my opinion, the increased cost is justified. I would, however, ask this Commission to supply us with an alternative that would answer our requirements better.

51. Have you had some difficulty in getting kauri supplied?—Oh, yes! I wanted a line of about 200 ft. and I could not get it.

52. You are certain that the importation of Oregon should be encouraged, and not checked by the imposition of a duty?—Yes, it should be encouraged.

53. In reference to the building of that fence that was tendered for at less than cost-price, do you not think the timber-merchant would lose it. If a man tendered for less than cost-price he would get his timber from the timber-merchant?—I have nothing to do with that.

54. The timber-merchant would be entitled to make some allowance for bad debts?—My experience is that the timber-people in Dunedin are quite able to take care of themselves.

55. I think I gathered from your remarks in reference to the increased cost of cottage timber that it only occurred quite recently?—We pay for the stacking.

56. In the North we only supply the builder?—We may be misunderstood. If we were booking an order to a timber-merchant that would be booked to a miller in Southland, and that would be agreed with him, except I made special provision to stack the timber on the site, and for that I should be charged 1s. per hundred feet.

57. When put through the machine there is some provision. It is more expensive in proportion?—Oh, yes! but perhaps the biggest increase comes from the dressed material, and not the raw material.

58. You understand this 4½—that goes into the machine?—It does.

59. But if he has to take 4½ in. to make your 4 in., how is he to be paid?—How was he paid for all those years?

60. You get more than 4 in. for your 4 in.; it covers 4 in. on the face?—Oh, no! we only get 4 in. face measurement, and we pay for 4½ in.

61. I speak of the time they did not charge you for the 4½ in.?—We got it for nothing.

62. Often that was cheap enough for you?—Yes.

63. *Mr. Clarke.*] Your evidence as to the proposal to get our red-pine from the North Island: can you tell me what would be the result to the small builder if he places a certain portion of his trade with one, and a certain portion with another? Would he not have a great difficulty in getting rimu from the people with whom he had placed the mouldings?—He would get it where he got the balance of the order.

64. The idea of getting the stuff here, there, and everywhere would not do?—No.

65. With regard to joinery, do you have to pay a high price for seasoned timber now?—If you were taking a job you would take it to the factories, but we know that the price has increased very much. It would be approved by the architect as seasoned timber.

66. With respect to the standard prices—it is quoted in your list at 13s. 6d.: do you not find that a large amount of the timbers in a large building here run above that, on account of extra lengths?—Oh, yes! and that applies more particularly in warehouses and factories.

67. So that would not represent the actual price in large works?—Oh, no! only in small stuff.

68. With regard to future supplies, is there any prospect here?—There is not. Dunedin and neighbourhood have been depleted long ago.

69. If foreign timbers were not easily available, do you think something should be done to secure the supplies locally?—Conserve to the fullest possible extent.

70. *Mr. Morris.*] I would like to ask if you have any knowledge of the milling of timber?—No.

71. There seems to be a prevailing opinion that our native timber is suitable for finishing-work, but not required for rough work?—I do say that you have here as good timber as you can get in any part of the world for finishing-work, but any imported timber such as Oregon would stand much better even for cottage-construction than red-pine, because you can always get it better-seasoned, and it is not liable to shrink. I do not anticipate that Oregon will take the place of the small sizes here. I only speak of where I use the smaller sizes.

72. Only a percentage of our native timber is fit for finishing purposes?—Yes.

73. Hard timber is generally rough and a great deal is not suitable for dressing purposes, and local millers could not possibly supply you with timber for finishing and building if they had no market for the rough timber?—Oh, yes! but I do not think that the importation of hardwood or Oregon in large sizes would interfere very much with local timber in smaller sizes.

74. I am not opposed to the importation of Oregon in all sizes, but I want to conserve our local timber?—I am pleased to hear it; but you are sacrificing a national asset. Why not put the men into more profitable employment and conserve your natural asset?—The importation of Oregon would help that.

75. You recognise that our crop of timber is fully matured?—My opinion is that it would not give us a renewal of our native timber.

76. *Mr. Barber.*] You are a member of the Building Association?—Yes.

77. And approve of the resolution?—Yes.

78. Do you think it fairly reflects the opinion of all the builders outside the association?—Of course, there are builders and builders. The majority are what would be considered builders, but there are plenty of journeymen to-day who will be builders to-morrow.

79. Do you think it reflects their sentiments?—I think so.

80. Do you think the quality of the timber supplied by millers and timber-merchants to-day is equal to the quality of ten years ago?—I think it is fully equal to it; but it does not get the same chance to-day. It is not held in junks in the yard to-day, as it was ten or fifteen years ago. It is felled, brought into the sawmill, and handed to the builder before it gets seasoned.

81. What I mean is, have you found in your experience that a larger percentage of the log is cut into timber now than years ago? Are they sending in bark and sap-wood?—I say the builders would not take it. We pay for timber coming to Dunedin, and approved of by the architect.

82. If timber-merchants in other parts of the Dominion were offering this class of timber, do you think it is fair trading and such as would insure the erection of a substantial building?—It would not be permitted in Dunedin.

83. *Mr. Ell.*] You say that timber is not held in junk in quantities in the yard, as it was ten or fifteen years ago?—Yes.

84. Can you give us any reason for that?—It may be that better facilities enable them to draw in supplies.

85. The result is that you cannot get sufficient seasoned timber for the requirements of the trade?—No.

86. As an experienced builder and citizen, is that in the interests of the country?—No.

87. Do you think it would be a wise thing if the architects made it a rule to insist upon seasoned timber being put into buildings?—Of course, you would be adding on to the cost again.

88. Say a building contained 15,000 ft. of timber—an ordinary cottage?—Well, half or two-thirds at the outside is rough timber, and the balance is dressed timber, and you do not expect to see that. There is provision in many specifications in Dunedin where if you were building you would put up a frame, and let it season for six or eight weeks before you went on with your inside work.

89. The builder stands the racket of holding timber for seasoning purposes?—That adds to the cost of the building.

90. In Christchurch they charge 2s. per hundred over for seasoned timber, and that would mean £15 increase on a £1,000 building. Would it pay them?—It might. The people in Dunedin grumble at paying what they have to pay to-day. It would be better for all concerned.

91. I want to get from you, as a practical builder, what is the best for the community?—That is one of the strongest reasons for the importation of Oregon pine—that it comes here in a seasoned state.

92. With regard to rimu and kauri, you say that they are adapted for the finer description of work?—Yes. In my opinion Oregon is suited for internal finishing.

93. Seeing that we have chair-factories and joinery-works, would it not be desirable to make reserves of these native timbers which are suitable? I am referring to kauri and rimu?—I did not say that kauri was suitable for inner work.

94. Seeing that sideboards and duchesse dressing-tables are made from it?—I could not get the backs of chairs from kauri.

95. In regard to timbers that are adapted for this finer work, is it not in the interests of the general public that there should be considerable reserves?—Oh, yes!

96. Further, in regard to water-services and climatic purposes, is it not desirable to have them?—Yes.

97. I am only asking for reasonable reserves?—The climate of Dunedin has changed very materially in the last thirty years. In my opinion that is due to the cutting-down of the bush.

98. Seeing that the forestry operations in this country resulted in covering 9,465 acres, is not that all the more reason for making reserves?—Certainly.

99. In regard to beech, have you had any experience?—No.

100. You know nothing about it?—Except that in my opinion it is no good for house-building purposes.

101. If I were to show you a letter in my possession in regard to a house built in Canterbury thirty years ago, and the building is as sound to-day—the builder was Mr. Thomas Keogh, who has had as good experience as Mr. Hodges had—would you be surprised?—That goes without saying, that he had the experience.

102. *Mr. Stallworthy.*] We have been told that Oregon is more seasoned?—Yes.

103. Would it be an advantage to use West Coast or North Island timber for the same purpose?—Can we get it?

104. Have you tried?—The price would be prohibitive. The trouble is that we cannot get native timbers of the length and size that we require.

105. Are you building chiefly for the owners of buildings, or those who rent to others?—I do not do very much cottage-building, but my impression is that there are a great many houses built for workers who are not proprietors.

106. I take it that the mills are simply cutting for requirements, and that you cannot get orders delivered at once—that you have to wait?—I mean to say that if I were booking an order with a timber-merchant in Dunedin, and that was sent to Southland, the probability is that it would be six or eight months before I got it.

107. It would have to be cut first in the bush?—Yes.

108. There are not too many employed in the bush?—Many closed down at the New Year on account of having overstocks in hands, but these are the smaller sizes.

109. I think you advocated a while ago that it would be better to turn some of these sawmillers into workers of another class, and so conserve our timbers, yet you have to wait a long time to get an order supplied?—That is no answer to the question at all. I want to get timbers of a certain size and length, and when an order goes into the bush mills, men have to be put on to cut it. You might have a 2 by 4 size and not a 12 by 2.

110. Is there a large stock of desirable sizes?—I do not know. I am not acquainted with the stock they carry, except by newspaper report.

111. You told us a while ago that the workmen to-day are not as good as from other countries?—I qualify that by saying that twenty years ago many of the men were members of the Carpenters and Joiners' Society at Home. In the colonies machinery has superseded hand-work to a very large extent in the putting-together of joinery. Certainly, the young colonial has never had the same opportunity, and we do not get as much out of the men as twenty years ago.

112. Do you think the colonial is as good as the English worker?—We do not get the same all-round training.

113. Have you had experience of the emigrants?—We have experience every day. They come to me as qualified tradesmen. If they do not suit, I put them off.

114. Have you not said that emigrant carpenters are no use?—I have not said that.

115. You have seen the price-list produced by Mr. Macpherson?—No. I have seen a price-list, but I was not present when Mr. Macpherson was giving evidence.

116. Do you think that there is sufficient competition amongst timber-merchants?—Yes.

117. *Mr. Mander.*] You do not have any difficulty in procuring ordinary building sizes?—No.

117A. It is only in the bigger sizes?—Yes.

118. Do you not think it would meet the case if the duty on the larger sizes were reduced, and the smaller sizes left as they are?—Yes, but would it pay any person to send away a lot of smaller sizes? I never anticipate that there will be a big importation of smaller sizes.

119. Are you aware that they are building houses in Auckland of Oregon timber to-day?—I am not at all surprised to hear it.

120. If there is a great difficulty in getting beams, if the duty on these sizes were reduced, and the duty on the smaller sizes were increased, would not that meet the case?—It is possible that the Government might consider the advisability of charging import duty on the smaller sizes, but I do not anticipate that the need will ever arise. I think that the resolution from the Builders' Association applies to junk timber, not to smaller timber.

121. It has been said that a house built with green timber will not stand as long as a house built with seasoned timber—that the house will decay very rapidly. Is that your opinion?—It will never be as good a job. Of course, if you can dry timber in three months, if there be plenty of ventilation, there should not be more than six months' difference in the life of a house, provided it is properly drained and a current of air passing through.

122. It would not affect its durability?—It all depends upon the conditions under which the house was built and its situation.

123. Do the builders here prefer a framework of green timber to red-pine?—If you had a house two or three stories high, you would prefer dry timber every time.

124. What about driving the nails?—They drive just as freely.

125. *Mr. Ell.*] With regard to the rising price of dressed timber, I have here the price-list of 1904 in Christchurch and one of 1894. I want to give you a few prices and see how they compare: "Flooring, T. and G., 6½ in. by 1 in., 1894, 11s. 9d.; 1904, 18s. 6d.?—You see, your timber in Christchurch is slightly higher than here.

126. There is an increase of 50 per cent.?—Yes.

127. There is another: "Lining, dressed, 6½ in. by ½ in., 8s. 3d. to 13s. 3d.; weatherboards, 18s. and 13s."?—Your Christchurch prices ar dearer than ours.

128. And advances about the same proportion?—No, your price-list is nearer. If you are buying 100 ft. of scantling you get 100 superficial feet. If you get 100 ft. of 4 in. by 8 in. tongued and grooved, you only get 100 superficial feet of ⅝ in. It is a bigger increase in 100 lineal feet than 100 superficial feet. Mr. Scott mentioned to-day that in venetian-blinds they would get 600 lineal feet to 100 superficial feet.

129. Do you think the advance in the price of material is justified by the increase in the price of timber?—It is more than justified in Dunedin by the price in Christchurch. Our prices in Dunedin compare very favourably with those in Christchurch.

130. I want to know whether the increase in the price of timber has justified the bigger advance in dressed material?—I am not in a position to say what the merchant has to pay the sawmiller. I can only say what the sawmiller charged me fifteen years ago and what he charges me to-day. Whether he is making more money I do not know.

131. You say the advance in the price of building-material has not been very much?—Yes. I am not quoting from Christchurch prices, but from Dunedin.

132. Has there not been too great an advance?—That has not been my experience in Dunedin.

133. *Mr. Field.*] I understand you are opposed to placing a duty on imported timber?—Yes.

134. But you are prepared to admit it may be right in the case of small sizes?—I never anticipated it would pay to import small sizes.

135. If you were satisfied that we were selling our building-rimu at a reasonable price, and the Oregon pine was to come in and spoil our trade, would you still be in favour of not protecting our timber industry, even although our policy is one of modified protection?—I would say, as long as you have sawmills in New Zealand there must be a proportion of good timber which would be utilised in large sizes, and, secondly, if cut up into smaller sizes would employ labour in doing so, and it is very much better to utilise the timber in that way than to pay the men in America for the cutting.

136. If, of course, the Oregon pine or any other timber did successfully compete with our red-pine it would mean the shutting-up of our mills, and a loss of capital and also a lot of timber lost and spoilt?—I do not think that would necessarily follow. That is a question of policy with the Government. They are not obliged to open up timber areas and burn the timber off.

137. But I am speaking of private land?—I should think it would be a great mistake for any private owner to fell his timber and burn it.

138. What would you do as a private owner?—If I had the Government at my back I would prevent the man doing that.

139. Supposing you were a poor man and had 600 acres covered with valuable timber, and you saw no chance of milling it profitably, and you had to get something out of the land, what would result?—Do you not think that a man in that position has a more valuable asset with native bush and good timber by conserving that timber for a few years than by felling the bush and burning it?

140. But if he had to hold it he could not put it in grass. I know a man who has been waiting twenty years to fell his timber, and now he will have to wait another twenty years, as far as he can see, and all he can do is to fell the timber and burn it?—I say more is the pity.

141. There are a good many in that position, where a mill has been put in and lost. It is a great pity that the timber should be destroyed, and also that the money should go out of the country and the workers be dismissed. Assuming that was so because imported timber was competing with our own, would it not be reasonable to have some measure of protection?—Yes, but I have no doubt that there will be sufficient intelligence in the House to meet an exigency of that kind. I never expected that the small quantities would be imported into New Zealand. It applies more to the junk timber.

142. You are aware that Oregon pine is being used in Auckland for all purposes?—I do not believe it will be used in Dunedin to that extent, and I am surprised at that, seeing the good quality of timber you have in the North Island.

143. Are you satisfied with the price of timber here?—Yes.

144. *Mr. Leyland.*] With reference to the cost of thick and thin timber, I have here a price-list, and I notice that the timber-merchants make a difference: $\frac{1}{2}$ in. is 14s.; matched $\frac{5}{8}$ in., 15s. 6d.; and $\frac{3}{4}$ in., 17s., and so on; so that, although it is thinner, bearing in mind the extra cost to make it thinner and the extra loss in sawdust, the difference in price should be pretty nearly equal?—Are you a relation to a sawmiller?

145. I am a sawmiller?—I thought so.

146. You conveyed the impression that you paid the same proportion for half-inch as for inch timber?—I want to convey to this Commission that if you bought 100 ft. of timber you get 100 superficial feet, and that if you were to buy $\frac{5}{8}$ in. you do not get 100 superficial feet, and that is where the sawmiller beats the builder every time.

147. And he charges you less for five-eighths than for inch?—Yes, of course he does.

HENRY VINCENT HADDOCK sworn and examined. (No. 25.)

1. *Hon. the Chairman.*] What are you?—Manager for John Murdoch and Co., timber-merchants.

2. Can you give the Commission any information in regard to the matters into which it is inquiring?—I have no statement to make. I was not aware that a statement was required.

3. *Mr. Arnold.*] What is the business of Murdoch and Co.?—Timber-merchants.

4. Are they interested in any sawmills?—Not directly. Mr. Massey, of course, is.

5. You have a sawmill in the city in connection with your yard, have you not?—Yes.

6. Does the timber come from Southland to be dressed, or is it re-dressed in your yards?—It comes just in the rough.

7. Now, you have heard the evidence given with regard to Oregon timber?—Yes.

8. What difference does it make to the mills such as yours, whether the timber is imported or whether it comes from Southland or the Wellington District?—In connection with imported Oregon, very little.

9. Is there much imported Oregon that goes through your mill that has to be recut?—There has been within the last two or three months more than there has been in the past. Of course, there is always a certain amount of Oregon which comes from "the other side" for beams and long lengths.

10. So that the amount of labour that is utilised by the importation of Oregon is increasing?—Well, slightly, but to a very small extent.

11. Do you think it likely that Oregon will be imported in large sizes, recut, and used in small sizes?—Yes, very likely. They generally come here in 14's and 12 by 12, and it is very rarely that we are asked for those sizes. They are generally cut to 12 by 3 and 12 by 4.

12. Did you hear a previous witness say that there was no local timber to compare with the hardwoods that are being imported?—No, I did not hear that.

13. Do you think that that is so?—No.

14. You think we have local timbers that can compare with the others?—Yes, certainly. Of course, we import hardwoods to a very small extent—there is very little used. That is, blue-gum, ironbark, and that is very rarely used in buildings now.

15. What timbers do you import?—Blue-gum, Oregon, Baltic, yellow-pine, clear-pine, and hickory and ash.

16. And practically all those come under the heading of "hardwoods"?—Yes.

17. What New Zealand timbers have you that can compare with them?—New Zealand timbers can compare with them in a certain amount of work in which they are used. With regard to hickory and ash there is nothing we have that can be used in place of them. Take the hardwoods now in the buildings, I do not suppose there is one-fiftieth part used as compared with red-pine. Blue-gum used to be very often used for the basement piles, but now they are practically cement piles, and it is very rare now that any blue-gum is used. Black-pine and totara used to be utilised, but that has all given way to concrete.

18. So that on that account there is not the same necessity to import hardwoods?—No.

19. Do you find a greater difficulty in getting New Zealand timbers such as red-pine and black-pine?—I have had no difficulty whatever in getting my requirements.

20. Is there a greater difficulty in getting the large sizes?—No, we have never found it so.

21. Take beams of 14 ft., 16 ft., and 18 ft. in length?—No, there is not the slightest difficulty.

22. You are connected with the Southland Sawmillers' Association?—We are supposed to be members of that, yes.

23. How often do you meet?—Once a month.

24. When was the last price-list arranged?—I think, from memory, it was a year last June.

25. Are you positive there has been no revised list brought out within the last three months?—There has been a revised price-list in regard to some of the timbers, but no so far as the local timbers go.

26. Has that come about since the agitation with regard to the importation of Oregon pine?—No, the red-pine, kauri, black-pine, blue-gum, and other timbers have never been altered. We made an alteration in the Baltic. We had large shipments brought here, and we found we could land it much cheaper than previously, and we gave the benefit of the extra cheapness to the consumers.

27. Was the setting-up of this Commission and the likelihood of evidence being brought forward with regard to the importation of timbers, and the high price of timber here, the cause of a revision of your price-list?—There has been no revision at all further than what I have mentioned—the Baltic and the Oregon.

28. You say that that is absolutely not so?—Yes.

29. *Mr. Hanan.*] You say you are supposed to be members of the association: do I understand by that that you adhere to their prices?—Yes, we adhere to their prices.

30. What did you mean by saying that you were supposed to be members?—We never attend the meetings down there—we have our own meeting here. We have what we call an Associated Timber-merchants' Association, which is really similar to the association down south.

31. Who fixes the prices for Dunedin?—They were fixed at the meeting down in Invercargill.

32. As to the railway freights from south, are they reasonable, and encouraging to the trade in Dunedin?—Yes.

33. Have your mills been losing money within the last three years?—I do not think that is a fair question to expect me to answer—we are not before the public.

34. Have you any objection to answering the question in committee?—No.

35. If Oregon is allowed to come in here free, will it mean the shutting-down of your mills?—Certainly not.

36. You heard of the complaints coming from the West Coast as to what injurious effects will take place if Oregon is not subjected to an increased duty. What is your opinion about that?—It would not make the slightest difference to me whether it is put on or taken off. As far as Oregon goes, I bring a lot of it here now not to compete with red-pine, but against other timbers. As you are aware, kauri is so expensive now that we can use Oregon now in many instances where we have been using kauri in the past, and that is chiefly why we bring Oregon pine here.

37. In your opinion, is it a desirable thing to conserve our forests?—I should think so, to some extent.

38. Have you any suggestion to make in that direction as a citizen?—As a citizen I should say import as much as you can, and conserve our own.

39. As an individual sawmiller would you think differently?—Yes.

40. Can you give us any information with regard to the cost of building in brick as compared with wood in Dunedin?—I could not give you any information in regard to building in brick; I can only tell you what I have heard from the different contractors, that building in brick costs very little more than timber.

41. Is the building in brick increasing in Dunedin?—Yes, it is.

42. Have you heard any complaints here about the white-pine borer affecting your houses?—Yes, there have been a lot of complaints. We cannot sell white-pine here now for shelving.

43. Do you find it in other timbers?—I have never had much complaint about it.

44. Only in regard to white-pine?—Yes, but I have seen it in other timbers.

45. What class?—In hardwood and in ironbark and jarrah, and in different classes of hardwood.

46. Would you say that many houses are affected here?—I could not say.

47. *Mr. Jennings.*] Is your Timber-merchants' Association here a local organization, or combined with similar associations throughout the Dominion?—It is a local association.

48. And does that also apply to the Sawmillers' Association?—Yes.

49. *Mr. Field.*] You say that the importation of Oregon pine even in great quantities would not affect your mill at all?—Yes.

50. Are you prepared to say how it would affect the mills in other parts of the country?—I could not say. I should think that in regard to Oregon imported in large quantities in Auckland, and Wellington, they are in a position to sell as cheaply as red-pine, and cheaper.

51. That being so and there is a large increase in the quantity, and the price does not increase materially, will not that affect our industry?—Naturally it would.

52. Are you aware that it is used in the North Island for other purposes besides, such as flooring?—Yes, I heard that.

53. The present duty is 2s. per hundred feet, and it would naturally follow that it would affect the industry if the duty were taken off?—Yes.

54. Do you think any good would be done by increasing the duty on the smaller sizes so that it would make more work for those employed in the work here?—Supposing you put an increased duty on your small sizes and reduced the duty on the larger sizes, no timber-merchant would bring the small sizes here but would bring it all in the large size, and it would be cheaper for them to resaw it than to pay the duty.

55. Do you mean they would import it in the larger sizes with a duty larger than the one at present?—Yes.

56. Have you had any complaints from the builders that the timber-merchants are charging too much for the timber?—No, never. Of course, we always recognise that we are a growling lot, as a rule. You will find the timber has not increased in price so very much in the last ten years. If you go by the price-list you will see that in 1900 the price of red-pine up to 8 in. wide or 8 in. thick was 10s., with a trade discount of 5 per cent., and now our list is 13s. 6d., less 10 and 2½ per cent., so that the increase is not very great. In fact, we are selling it much cheaper than that now from our yards.

57. Can you supply those prices from the price-list?—Yes, I have it here. [Produced.] Timber has fluctuated many times. I can take my memory back thirty years nearly, when I was connected with a mill down in Southland, and we were then getting from 7s. 6d. to 8s. per hundred feet at the mill, and the cost of getting this timber was a great deal less than it is to-day. [Price-list produced for 1900.] Of course, it does not show on the list that there was a trade discount of 5 per cent. on that as against 10 per cent. now; but, further than that, our price-list here shows 13s. 6d., and we have been placed in such a position by the Southland sawmillers coming into Dunedin and supplying timber direct to the contractors. We really had to reduce our price to practically about 11s. 5d.

58. At present?—Yes.

59. The price-list I have here quotes it at 13s. 6d., less a trade discount of 10 per cent. and 2½ per cent. for cash?—Yes, that is so. I have all the expenses. We do not want the Southland mills to come here and supply direct to the contractors.

60. Do you know anything of the cost of milling timber?—No.

61. Do you know anything of the position of milling about twenty years ago?—It is about twenty years since I came here from Invercargill.

62. Do you remember a time when prices were very low and when millers were selling as low as 3s. 9d. and 4s.? That is in Southland?—No, it was never done at any time. I notice that it was stated that 3s. 9d. had been charged for timber at a certain time. I happened to be in Invercargill at that time. In fact, I think I drew out the agreement for the purchase of that timber, and the contract that was made was with William Dawson, miller, of One-tree Point. We bought the output at 3s. 9d., but it was not retailed at 3s. 9d. We bought it for resale.

63. We had a witness in Invercargill, Mr. Bain, who said that he had bought timber thirty years ago in Invercargill at 3s. 9d.?—There is no truth in that.

64. If you saw a stamped receipt for it?—I would think it was second-class stuff and useless.

65. *Mr. Field.*] You know Mr. Massey, of course. He gave it in evidence that timber came down as low at 5s. 6d.?—That was about the price then.

66. He said it came down to even 3s. 9d. and 4s. for a time?—I do not know anything about that time.

67. Mr. Massey would be likely to know?—Yes.

68. Respecting the railway freights on timber, do you consider that they are reasonable?—Yes, I consider them reasonable.

69. You are aware that it costs as much to rail timber from Riverton to Dunedin as to bring it from the Baltic to Dunedin?—That is so. You might say the same about Wellington, which is the same as the freight from Melbourne to Dunedin.

70. Have you had occasion to compare and consider the price charged on timber by the Railway authorities with that charged generally on goods?—No.

71. I mean, are you able to say that timber is bearing more than its fair share as alleged?—No, I cannot say.

72. With regard to building in brick, you say it does not cost so very much more now than building in timber?—So I am told.

73. Do you think that building in brick will always be an effectual check on the price of timber—that is to say, it will always prevent an exorbitant charge being made for timber?—Yes, always.

74. I think you said that you were in favour of timber land being conserved: would you make that principle apply in cases where land was owned by private persons or individuals who perhaps might not be able to afford to keep it?—Unless the State bought the land from them I do not see how you could do it.

75. *Mr. Leyland.*] Do you recut and match timber here in Dunedin?—Yes.

76. Can you in recutting take three $\frac{5}{8}$ in. boards out of 2 in.?—Not very well. We take two out of $1\frac{1}{2}$ in.

77. You have to go to the cost of cutting?—Certainly.

78. It will take you as long to plane, tongue, and groove a five-eighths board as it would an inch?—Yes, just as long.

79. You differentiate in the charges?—Yes, of course. We charge less for half-inch, and proportionately increase the charges on five-eighths, three-quarters, and an inch. I think we have met the trade in that respect.

80. I think you stated that you are not in favour of increasing the duty on Oregon, but you have stated that possibly it might be wise to increase the duty, or keep the duty on the small sizes if the duty was taken off the larger sizes?—Yes, for our own interests.

81. As regards large sizes, what would you call large? If there was a demand for joists would you include at 12 by 2 in the large size?—No, I would take from 10 by 10 upwards.

82. Is it not a fact that in getting a quotation from America for Oregon you are quoted on the basis of the "E" list?—Yes.

83. If you take long lengths you increase your costs?—Yes.

84. You already put a duty on by altering your specifications—in effect, you increase the cost?—You increase the cost under the "E" list in certain cases, but if you come to the 12 in. width you do not increase your cost under the "E" list very materially.

85. You are going to put extra duty on those?—Yes.

86. It would not be a fair thing to compel an importer to import only large sizes unless you assisted him by removing the duty?—Yes, that is so.

87. *Mr. Clarke.*] You said that Oregon was required as a timber to supply a deficiency in our own timbers?—I said that we were importing Oregon here as against kauri. We can use it in our factories for many things in place of kauri.

88. Has not the agitation for increased duty on Oregon been something like an agitation in one province as against another?—Yes.

89. One question with regard to the Sawmillers' Association: Assuming one of your fellow-citizens decided to start to sell timber and he determined to sell under these list prices, would he have a chance of getting reasonable supplies from the Southland mills?—Oh, yes! If one did so the rest would follow suit the next day.

90. You say that any one could do so?—That is so.

91. With regard to the question of former prices in Invercargill, I think you stated that timber had never been sold there at 3s. 9d.: now, if receipted bills and invoices were produced before this Commission showing that timber was sold at that price, would that not modify your opinion?—I should be surprised to see it, because I have never heard of timber being under 5s.

92. *Mr. Morris.*] Do you know of any proposed buildings in Dunedin being kept back owing to the high price of timber charged here?—No. I have spoken to one or two of our principal architects lately on this subject, and they assured me that even if it were possible to reduce the price of timber by 2s. 6d. or 3s. a hundred it would not make any difference whatever to the volume of the building trade.

93. We have been told to-day that builders often experience great difficulty in obtaining their supplies from the local mills?—Not from the local mills. They may find a difficulty in getting it from Southland. Southland sawmillers now make this their principal market. They have their own agents and travellers seeking orders. The contractors send all their orders direct to the Southland mills, and possibly they have a difficulty in getting supplies; but if they had to treat with the people here, they would have no difficulty in getting their supplies straight away.

94. You tell us you had to reduce your price to compete with the millers who were not in your association?—No, we had to reduce our tender rates here to compete with the Southland Association.

95. I understand they are part and parcel of yourselves?—We could not get the prices laid down by them, and we had to bring our prices down to the rates that the Southland people were supplying for.

96. Your association cannot be accused of fleecing the public by charging prohibitive prices for timber?—If you take the different costs and the charges we have in handling the stuff, and the price we sell at, you would see that there is a very small margin left.

97. What would be the price of resawing Oregon here if it came in in the junk free?—I would put it down at 1s. a hundred, as I think it would cost that with handling.

98. If the duty was taken off junk stuff, I presume you would resaw the whole of your requirements?—Possibly. I think it would pay if junks were brought in free—that is, it would pay us to resaw it into small stuff.

99. Having in view the fact that there is a great deal of capital invested in sawmilling in this country, that it is a large source of revenue in the way of freights on our railways, and both directly and indirectly employs a large amount of labour, do you think, looking at it from a colonial standpoint, that it would be wise to admit foreign timbers into New Zealand free and thereby close our great native timber industry?—No, I do not think it would.

100. *Mr. Barber.*] Where do you get your timber from?—We get it from different places—Stewart Island, Waikawa, Tautuku, Southland.

101. You said just now you had to reduce your prices?—The principal amount of timber that I take into my yard is purchased outside from numbers of mills.

102. You purchase from a number of Southland millers?—No. I purchase from Waikawa, Stewart Island, &c. They are outside mills, and I thereby get water carriage, which is much cheaper than rail.

103. What harbour dues do you pay?—We pay 3d.; there is no pilotage.

104. What is the freight from Stewart Island?—Two shillings; it is the same as from Waikawa.

105. With regard to the Baltic which you sold cheap, what price did you get for it?—We sold very little of it. We used practically all of it in the factory.

106. I think you said you reduced the price?—Yes, we reduced it 15 per cent. The price at one time was £1 17s. 6d.

107. What do you pay for timber at Stewart Island?—For the rough timber 6s. 6d.—that is, f.o.b. You have to add to that 2s. freight, 3d. dues, 2d. handling, 1d. measuring, and 4d. into the yard for cartage.

108. These mills are able to produce the timber and put it free on board for 6s. 6d.?—Yes, but you must take into consideration that we take all their output.

109. You classify it when you get it?—I should explain here that the 6s. 6d. rate is a low rate. It is really the basis, because we pay more for the finer and cleaner timbers. These cost us 7s. 6d., not necessarily heart, but good clean timber.

110. You say there has been no rise in the price of timber for the last twenty years, or, rather, you said there was not a very great rise?—In 1900 you will find it was 10s. less 5 per cent. To-day we are sending it out of our yard at 11s. 5d.

111. When it was mentioned that timber was being sold twenty years ago at 3s. 9d., you questioned the truth of that witness's evidence?—I cannot conceive it even now. It never came down here in a corresponding way.

112. You said that you were in Invercargil twenty years ago?—Yes.

113. Do you think your knowledge is sufficient to justify you in making a statement in direct contradiction to the evidence tendered by Mr. Bain on oath?—I said it must have been second- or third-class timber.

114. Are you aware that a report on the timber industry was prepared by Professor Kirk twenty years ago. He is an unbiassed man, who went into the thing very thoroughly and fully, and in that report he bears out exactly the evidence of Mr. Bain. He says, "First-class rimu for building purposes is now loaded in the railway-trucks at 4s. per hundred superficial feet. This can only be done under thoroughly systematic management. The average yield of timber per acre varies considerably in different districts. Good virgin forest in Southland yields over 20,000 ft." That is in Southland?—That is a thing that I cannot understand, nor can I answer it.

115. Well, do you think what Professor Kirk states is reliable?—I have never given it a thought.

116. I do not want you to depreciate the evidence given by Mr. Bain and now confirmed by Professor Kirk. Now, with regard to the price of red-pine—I mean first-class red-pine, not second-class?—The price is 10s. 6d. for first-class red-pine in the yard. That is the cost of it.

117. It can be loaded at that?—It cannot be sold at that. It is the selling-price that you were asking me about. That is merely the cost of loading.

118. *Mr. Hanan.*] Now, what do you say regarding that bill?—On these invoices here, it is the first time that I saw such prices. It is mentioned from 3s. 9d., and red-pine scantlings 4s. 4d., and then there is another line at 5s. 6d. You will see there is no mention whatever of 3s. 9d.

119. Do you say there is no increase in the cost of timber during that period?—There has been a great increase in the cost of production.

120. *Mr. Stallworthy.*] What quantity of timber do you put through?—It varies.

121. Roughly?—Do you wish me to answer that question here?

122. *Hon. the Chairman.*] We wish to know?—I do not like my opposition here to know. I should be pleased to give it to you afterwards.

123. *Mr. Stallworthy.*] You will give this information as to the quantity of timber you pass through your mills and the quantity of red-pine?—It will be difficult, because a city mill is different to a bush mill.

124. What are you doing? Making mouldings?—Anything.

125. Can you explain why it is so difficult to get kauri here while there are millions of feet going into the other colonies?—We have a great difficulty in getting it from the mills, and a great difficulty in getting it from Auckland.

126. Have you ever imported kauri from Australia, because it has been stated that it can be bought cheaper in Melbourne than here?—Oh, no, no!

127. Do you think it would pay to buy Oregon in long lengths and recut it into short lengths?—No, no. I would not take it on any time.

128. Do you think it would be fair to take the duty off lengths over 30 ft.?—It would not make any difference to me.

129. Have you got any seasoned timber in your yard?—We have at times a good stock of flooring. At one time, when the contractors used to deal with the yards, we used to keep supplies.

130. Would they give you a good price for seasoned timber if they could get it?—They would give their order at the same time as they order scantlings—possibly for a couple of months while doing other works. If they post the orders around we would cut it green and charge no extra.

131. Do you think it would be reasonable to expect timber to be sold at the same rate as twenty years ago?—It would be impossible to produce timber at the same price as twenty years ago, because there would be extra cost of production, the cost of going further for it, and wages have gone up very much.

132. *Hon. the Chairman.*] Do you think the difference between the prices then and now would be fair? Taking into consideration that they have to go further back for the logs, and that the wages have been raised, do you mean to say that there would be more profit now than at that

time?—I could not say what the profits are: I have never seen their balance-sheets. As far as we are concerned our profit is less.

133. Are you talking as a timber-merchant or as a miller?—I am not a miller. I do not know the difficulties you have to contend with down south.

134. *Mr. Hanan.*] Supplying the timber-merchants?—Of course, we have to pay the extra money. We do not get greater profits. It has reduced our percentage of profit every time.

135. *Hon. the Chairman.*] You stated that you did not think it would be any incentive to building if the timber was reduced in cost?—I got that information from some of the principal architects.

136. You would not suppose that the architects would be anxious for a reduction, because they get paid a percentage on the full price?—I suppose they do, but if they had an increased trade at a reduced price it would be better than getting a large price in isolated cases.

137. *Mr. Hanan.*] Do you expect to obtain to any extent your supplies from the Auckland District?—No, I have got my supplies for some years without considering Auckland.

138. Do you know anything of the nature of the timber as compared with other timber?—I have heard that it is rougher.

139. With regard to obtaining orders for the mills from Stewart Island, comparing the water carriage *via* the Bluff to Invercargill and Dunedin, what is the difference?—It would cost pretty well 1s. 6d. to the Bluff; then it is 2s. 7d. from Invercargill here; then you would have railage from the Bluff to Invercargill, say, about 1s. It costs over 5s. anyway.

140. I understand from your evidence that timber can be obtained from the mills in Stewart Island cheaper than from the Southland District?—I save so much in the carriage.

ARCHIBALD MCCALLUM, Sawmiller and Timber-merchant, sworn and examined. (No. 26.)

1. *Hon. the Chairman.*] Do you wish to make any statement with regard to the questions we are inquiring into?—I have not very much to say, that is the fact of the matter.

2. Do you purchase much outside your own mill?—About one-third my consumption.

3. About two-thirds is your own sawing, and you get the remainder from other mills?—About one-third from other mills.

4. Have you an establishment in Invercargill, and one in Dunedin?—Yes.

5. Any other one in Oamaru?—I could not tell for Oamaru. I think not.

6. About what amount do you produce per year in your mills. Have you more than one?—Four mills.

7. What is about the average output?—I could not tell.

8. Could you not tell approximately?—No.

9. Then we have nothing to go upon as to what you purchase outside?—About one-third.

10. What is the amount?—I do not know what the mills produce.

11. You do not know what you get from outside?—One-third.

12. Do you know the price you get here?—Yes.

13. And in Invercargill?—No. I have an idea, but I am not positive. They do not interest me very much, because I am never there.

14. Is there more in the company than yourself?—Another party.

15. Does he look after the Invercargill business?—Yes.

16. And you look after the Dunedin?—Yes, and Oamaru.

17. Can you tell us about the amount you put through in Dunedin and Oamaru?—No.

18. Can you tell us about what price you have been charging, and the price now charged?—Yes; 13s. 6d. for rough timber, less 10 per cent.

19. What would that be?—12s. 3d.

20. Is that rough or dressed?—Yes, rough.

21. What would the dressed timber be?—4 in. by 1 in., 18s.; 6 in. by 1 in., 17s.; 4 in. by $\frac{5}{8}$ in., 15s. 6d.; and 8 in. by 1 in., 15s. 6d.

22. *Mr. Stallworthy.*] The same discount?—Yes, 10 per cent.

23. *Mr. Hanan.*] Can you give us any information about that account put in by Mr. Bain, in which the timber was sold at 3s. 9d. It was from your mill the timber was obtained?—I have not seen timber sold at 3s. 9d.

24. *Hon. the Chairman.*] If we have a stamped receipt from Mr. Bain, would you take it as correct?—I would want to see the timber as well as the price.

25. He stated it was fair building-timber, second class?—That does not figure out.

26. *Mr. Hanan.*] You were one of the oldest sawmillers in New Zealand, and know a great deal about the forests in Southland?—Yes.

27. Speaking as a practical sawmiller, and having regard to the rate at which the timber has been cut out in the past, how long would you give the existing areas before they are cut out?—I could not tell: I have been away fifteen years.

28. Do you know anything of the Catlin's Bush area?—No.

29. We have been told that it is exceedingly difficult to get a good class of timber now?—That is all over Southland.

30. Where do you expect to get supplies from?—They say there is a lot across the Waiau River, but I have never been there.

31. Seeing that that is further away, does it not point to the fact that the price of timber is going to increase?—Of course, the more difficult it becomes to get it, the higher the price will go up.

32. You have made and lost money?—Well, I have stuck to the most I have made.

33. During the last three years, have the millers been making money?—No.

34. Do you say that they have been losing money?—No, holding their own.
35. You heard something about Stewart Island?—Yes.
36. Can they produce timber there cheaper than in Southland?—No, but the freights are much cheaper.
37. Is not the cost of production greater there?—No, because the timber is not so far back as on the main line.
38. The cost of production is less?—Slightly.
39. Are you a member of the association?—Yes.
40. Can you account for the reason why millers have increased during the last five years?—Well, the rise in price brought them in, and now there are a lot of them idle.
41. Since when?—Christmas, at all events.
42. This slump that has taken place since Christmas has not been due to the importation of timber?—No.
43. As a citizen of New Zealand, do you advocate placing a duty on imported timber?—Yes. Once they bring wages down to the levels of the Americans and the Baltic, then we are upon equal terms. I am a Free-trader on equal terms, but you cannot compete against them now.
44. You do not think that duty on Oregon would conserve our own forests?—Of course, you can import it cheap enough.
45. Seeing that timber has gone up in the last ten or fifteen years owing to the increased cost of production, and that every day our forests are going back, is it not desirable that the price of timber, in the interest of the building trade, should be kept down?—Yes, but there is a bed-rock price you cannot get over. You must look at the awful cost to produce it.
46. You are aware of complaints now by the workers of the increased cost of making homes?—Yes.
47. That being so, is it desirable that the cost should be increased, and timber having to be got at greater distances?—It might be brought in cheaper by sea by large vessels at less than we are paying now.
48. You can bring it by sea cheaper from Sydney than by rail from Colac Bay and these places?—Yes.
49. Do you advocate a cheaper rate on timber?—The miller says he cannot do it.
50. Do you not think that the rates are low enough now?—I could not tell.
51. How does it compare with fifteen years ago?—I could not say.
52. There has been a reduction recently made?—It does not affect Dunedin.
53. And I take it that no profit has been made by millers in the last two years?—Very slight.
54. It is not as payable a business as ten years ago?—No.
55. *Mr. Leyland.*] In quoting the price of 4 in. by 1 in. T. and G. as 18s. the impression is conveyed that it is a very high price. Have you not to match 300 ft. for 100 ft.?—Yes.
56. Have you not found a difficulty in getting kauri supplied?—One difficulty is that you want more vessels down here.
57. Could you sell Oregon?—Yes.
58. That is taking the place largely of kauri?—That is only lately.
59. In the consumption of timber here it has taken the place of kauri, but has not injured the rimu very much yet?—It is only in its infancy yet.
60. But if the price goes up it may fall off?—Yes, and I expect it will.
61. Is it not a fact that very few orders are going forth?—I do not know.
62. You spoke about lower wages; would you be surprised to know that the wages paid to the workers who produce Oregon are higher—that they average $3 per day?—I should be surprised to hear that.
63. *Mr. Morris.*] We have been told by some gentlemen here that there is a difficulty in obtaining supplies in order to carry out work expeditiously? Can you give us the reason?—They give orders here, take them to the mill, go to the bush to cut it, and you can get it in about fourteen days.
64. You belong to the Associated Merchants and Sawmillers here?—Yes.
65. Is it a fact that your association is raising the price to a prohibitive degree?—We have got to follow the lead of the sawmillers in Southland.
66. These men are not controlled by your association?—No.
67. There is no combination between you and the sawmillers in the district?—We cannot dictate to them what they must do.
68. You do not buy the whole of their output?—No. There are a lot of mills in which the whole of the output is bought.
69. There seems to be an idea abroad that the big millers buy the output from the small millers, and so prevent them competing in the market?—Some of those here have taken the output of some of the mills.
70. What is your opinion in regard to the duty on Oregon pine?—I think there ought to be a duty on it—on all sizes.
71. *Mr. Stallworthy.*] Are you increasing your imports of Oregon pine?—We have some coming direct, which is the second we have had. Previously to that we always bought from Sydney or Melbourne.
72. Are you increasing the quantity you were buying?—It has only been in existence about six months, so far as our direct imports are concerned.
73. What does Oregon have to go to before you cannot compete with the local timber?—I could not tell you.
74. Will you undertake to supply the information as to the quantity of output of each of your mills, and the cost of putting it on the truck?—I could not tell.

75. Will you supply it confidentially to the Chairman?—You had better apply to the Southland mills.

76. *Hon. the Chairman.*] Will you supply it if we ask for it in writing?—I have no doubt it will be supplied.

77. *Mr. Mander.*] What price have you to pay for Oregon delivered in Dunedin?—My memory is very defective, but we have some at £1 1s.

78. Have you got Oregon here cheaper than red-pine?—Certainly not.

79. Do you think Oregon is likely to reduce the cost of buildings?—I do not think so.

80. Therefore the introduction of Oregon will not be of any benefit to the working-man in regard to the reduced price of his dwelling?—I do not think so.

DUNEDIN, FRIDAY, 2ND APRIL, 1909.

EDWIN BROAD sworn and examined. (No. 27.)

1. *The Acting-Chairman (Mr. Arnold).*] What are you?—Manager of the Dunedin Timber and Hardware Company.

2. Can you give the Commission any information in regard to those subjects which it is inquiring into?—The only information I can give is from the retail point of view. I know nothing about the sawmill.

3. Will you tell the Commission what your experience in that connection is?—Well, I have been manager of the Dunedin Timber and Hardware Company for the last ten years, and previous to that I was chief clerk and accountant in the firm of McCallum and Co., which was then the Dunedin Timber Company.

4. Has there been much change since you first commenced in the timber industry in regard to the quantities and prices?—Yes, there has been an all-round change, and more timber is selling now than then. The prices are higher, and there are more merchants in the business in Dunedin than there were at that time.

5. Is the business just as good as it has been?—Yes, a fair amount of business doing.

6. Can you say how much the prices have advanced—what the ruling prices were when you began and when the rises took place?—Well, I cannot carry my memory back twenty years, but about ten years ago timber was being sold at 10s. a hundred feet with 5 per cent. discount, and to-day it is 13s. 6d. with 10 per cent., and against that we have to compete with the Southland mills, and our prices for rough red-pine is 11s. 6d. net.

7. Then, do you not deal with the Southland sawmillers?—Yes, we buy our timber from them.

8. I thought you said you have to compete with them?—We have to compete with them all the same. They compete with us in Dunedin. We do not buy the timber from the same people.

9. Is your firm connected with sawmilling themselves?—Our firm is connected with a sawmiller, but we do not take our timber from him unless he is as cheap as any one else. The bulk of our timber is bought outside.

10. You do not think the advance that has taken place within the last four or five years is too much?—I think not. There has been just as much building done during the last two or three years as previously.

11. But if the timber had been cheaper would it not have encouraged more building?—I think not.

12. You say there is just as much building being done as previously?—Yes.

13. What about the last twelve months?—It has slackened a little within the last twelve months, but there is still a fair amount of building being done.

14. Is your company a Dunedin company?—Although it is called the Dunedin Company it is owned by a private individual.

15. And you say you have no sawmills?—Personally I have no sawmills, but the owner of the company has.

16. And your company goes outside that mill when they can do better business?—Yes.

17. Then, is not your proprietor a member of the Millers' Association?—So far as I know, he is.

18. Then, to get better terms he can go outside the association?—That is so, but not exactly to get better terms; but he cannot always supply, and I go where I can get it cheapest.

19. How do you think the other millers are able to supply you on better terms?—We take the whole of their cutting, and they bring it coastwise. We do not get the timber much cheaper, but we bring it by sea. It comes from Stewart Island and Waikawa.

20. Has your company never received a communication from the Sawmillers' Association to the effect that if you deal with the outside millers they would not supply you with any timber?—No.

21. Do you know of any merchants or builders who have received any such communication?—No, never heard of it.

22. You do not know of the Sawmillers' Association ever having taken such action?—I have not heard of it.

23. And you would not believe that such a thing is being done?—No.

24. What timber do you deal in chiefly?—Red-pine.

25. Do you deal at all in kauri?—Yes, we use a good deal of kauri for the manufacturing business—for making doors and suchlike.

26. Have you any difficulty in getting kauri?—I have to give an order a long way ahead to get it.

27. But you can get it in all sizes?—Yes.

28. Do you manufacture all the doors that you require yourselves?—Yes.

29. You do not import any?—No.

30. Do you know of any doors being imported?—Well, I heard there were some doors imported, but I cannot speak from my own personal knowledge. I think they came from Canada.

31. Do you think those imported doors are likely to come into competition with the local article?—So far they have not come into competition with them.

32. Do you know anything of doors being imported from Sweden?—No, I have not heard of any.

33. Do you know there is a great amount of feeling at the present time with regard to the importation of Oregon pine?—Yes, I have seen a lot of letters in the paper.

34. Do you deal in it yourself?—Yes, we use Baltic deal and Oregon.

35. To any great extent?—I suppose we would use 100 ft. of Baltic deal in a month.

36. Is that trade increasing?—Well, I could not say. We used to get it in monthly instalments across from Melbourne, but it is hard to say whether it is increasing, because we are getting it in bulk now, although I suppose we had the same amount in the previous twelve months.

37. Do you think it is likely to interfere very much with the local building trade?—I do not think so. We must have Baltic deal for sashes, for which red-pine would not do.

38. Do you say no New Zealand timbers will do for sash-work?—Kauri would do, but it is very seldom used—people seem to go in for Baltic deal.

39. You do not know much about Oregon?—No, not a great deal. In the last six months perhaps a million feet came in direct.

40. Is it not a fact that the importation of Oregon is increasing very considerably?—Well, it is not increasing a great deal down this way.

41. But if it can be shown that it is increasing throughout New Zealand, and at the present moment there are a number of mills closed down and between six hundred and a thousand millers or employees thrown out of work, do you think the putting of a duty on Oregon would be for the welfare of the State?—If it is going to keep our population employed there should be a certain duty put on it. They should be protected first.

42. If a duty is placed on Oregon sufficient to keep it almost out of the market and these mill hands employed, what effect would it have upon the building trade?—I do not think it would have any effect on the building trade—it would simply mean that more of the local article would be used in place of Oregon.

43. Would not the result be that the price of the timber from the mills here would be raised considerably?—No, I do not think so, because Oregon does not compete with the red-pine now.

44. You think it would still be necessary to import Oregon?—You must get Oregon for certain purposes. You really cannot get heavy red-pine 30 ft. or 40 ft. long.

45. Can you get it in smaller lengths—14 ft. to 18 ft.?—Yes, any amount of small stuff, say, up to 12 by 12.

46. You do not know anything, I suppose, about the rapidity with which the New Zealand bush lands are being worked out?—No, I could not say anything about that. I know they are getting less, because I used to live in Southland many years ago, and now I can see a big difference.

47. How long have you been in the trade?—About twenty-four years.

48. You find a greater difficulty in getting big timbers than you did twenty years ago?—Yes.

49. If Oregon is entirely kept out of our market those timbers would be worked out very much more rapidly?—That is so.

50. Have you thought what the effect will be when we have to import the whole of our timbers?—No, I cannot say that I have. I do not expect it will come about in my time, and I am not bothering about it.

51. If it could be shown, however, that at the present rate the whole of our bush lands are likely to be worked out in fifty or sixty years, do you think that we should assist the importation of other timbers?—Yes, we should conserve our own timbers.

52. But you would not conserve the timbers that are now matured and ready for cutting, and which will depreciate from being permitted to stand too long?—No, because if the timber is taken off you can get the use of the land afterwards.

53. And that question has to be taken into consideration?—Yes, I should think so.

54. With regard to Oregon, you do not recommend that the present duty should be taken off?—As a timber-merchant I am not particular whether it is taken off or not.

55. But for the welfare of the country?—I should like to see it put on to keep the Oregon out.

56. Do you know anything about the rents of houses here?—No, I cannot say I do.

57. You do not know whether they are increasing or not?—No, I cannot say.

58. How many hands do you employ?—About fifty.

59. How many did you employ ten years ago?—I could not say exactly, but less than we do now.

60. Say, 10 per cent. less?—Yes, fully 10 per cent. less. I should think 20 per cent. less ten years ago.

61. Now, to what extent has your output increased?—I could not say offhand. I do not know that to-day it is any further ahead than ten years ago, because things are a bit quiet. In the interval it has increased, but now it is dropping off again.

62. And is your machinery quite up to date?—Yes.

63. And in consequence of that machinery your output has necessarily increased?—That is so.

64. In consequence of that should not the price of timber be lower to-day than it was ten years ago?—As I say, I am a timber-merchant, and we regulate our prices as we have to pay for it.

65. You are dependent for your prices upon the mill?—Yes, we reckon it up according to what we have to pay.

66. *Mr. Hanan.*] During the last twenty years what increase has taken place in the price of timber?—I cannot take my memory back twenty years, but since ten years ago it has increased, roughly speaking, 2s. a hundred feet.

67. If in that time it has increased to the extent you say, and, seeing that the population will increase, the bush is going back, and the cost of production is increasing, is it not reasonable to suppose that the price of timber will still further be increased?—That is so.

68. You said that at the present time there is a falling off in regard to orders for building purposes?—Yes, for the last few months.

69. The conditions in Dunedin, generally speaking, have geen good?—Yes.

70. The prices, judging by the orders you have got, have been such during the last four or five years as to be within the reach of the majority of people?—Yes.

71. Assuming that the prices go up for the reasons you have stated, does it not point to the fact that building in wood is certainly not going to increase to any substantial extent?—If the price of timber goes up I should say it would decrease.

72. Will the buildings increase?—If there is a greater population here they must have houses to live in.

73. That is, if it is within their means to pay?—Yes. Everything else will increase accordingly with the increase in the price of timber.

74. Is it not a fact that in Dunedin and other places the increase in the building that has taken place has been due to the cheapness of money?—I dare say that has had something to do with it.

75. Now in consequence of money not being so cheap, as it were, there is a diminution in the amount of building?—Yes, I think the tightness of money has more to do with it than anything else.

76. Is the timber-merchants' business in a fairly good condition? Do you hear of them going to close down?—No, I do not think so. They are in business, and going to stick there whether in a good condition or not.

77. If you are losing money would you not try and get out of business?—But if you are losing money you cannot sell.

78. How are you going to carry on at a loss?—It depends on how much money you have at your back.

79. You think you would carry on a losing concern?—Sometimes.

80. Have the timber-merchants been doing fairly well in New Zealand—I mean those not having a sawmill connected with their businesses?—Yes, they have done fairly well.

81. Can the timber-merchant who has no mill of his own compete successfully against the sawmiller?—Yes, he can.

82. If the timber-merchant who is not a sawmiller can compete against the sawmiller who is a producer, is there not something wrong?—I suppose the sawmiller wants to make a profit on his mill.

83. Then, we have this position in Dunedin: that the timber-merchant who is a middleman can sell cheaper than the sawmiller who is a producer?—I cannot quite follow your question.

84. Can the timber-merchant who is not a sawmiller compete with the sawmiller who is not a timber-merchant?—I cannot follow your question.

85. I mean to say this: You have timber-merchants in Dunedin competing with a man who is a sawmiller—that is, with a man who produces the article: can he compete successfully with him?—Well, we do it.

86. Would not the sawmiller desire a profit?—Yes.

87. There are two profits?—Yes.

88. And yet the sawmiller obtaining only one profit cannot compete against you with two profits going on?—I have explained to Mr. Arnold that the sawmiller sends his timber into Dunedin by rail. The timber-merchants, however, buy it and bring it in coastwise, and thus effect a good saving in freight, which to a certain extent is the profit.

89. Have you known sawmillers who are also timber-merchants?—Mr. MacCallum is a sawmiller, and I am competing with him.

90. You are not a sawmiller, and yet you can compete with him?—And we obtain timber from the same place.

91. Do you favour an export being placed on kauri?—I am not interested.

92. Do you get any kauri here?—A little.

93. What is the price of it in Dunedin?—The retail price is £1 12s., less 10 per cent.

94. Do you know the price in Auckland?—We pay 19s., and we sell it for £1 12s., less 10 per cent.

95. Can you give us any reason for the disparity between the prices?—Yes, we have to pay freight and harbour dues. We have got to bring it to the yard, and then cut it up, and there is waste.

96. Do you know at what price it is sold in Auckland?—No.

97. Having regard to the fact that kauri is such a valuable timber, would it not be desirable to put an export duty on it?—Yes, I expect it would be.

98. Are you still getting as much timber from your mills and from the Southland millers as you did twelve months ago?—Yes, I think so.

99. *Mr. Jennings.*] What is the extra cost of building a house of six rooms to-day as compared with ten years ago?—I am not a builder.

100. I mean in the charge for timber?—The difference is 2s. per hundred feet. You can easily reckon that up.

101. That is on the local timber?—Yes.

102. There have been assertions that the men do not work as well now as formerly?—I think that is correct. My experience is that there is not so much work done as there was twenty years ago.

103. For what reason?—They do not do it.

104. Are they inferior in physique?—They do not look like it, but they do not do their work.

105. Has there been any increase in the wages paid to them?—Yes, as far as factory men are concerned.

106. *Mr. Field.*] You are a timber-merchant: did you work some time ago for Mr. Tapper?—Yes. That was in 1885.

107. Did you know anything about the condition of things in this part of the country?—No, I cannot say that I did.

108. Did you know what the miller was receiving twenty-five years ago?—No, I cannot say.

109. As to the price of timber here charged by the timber-merchants and also the price charged to the timber-merchants and consumers, do you say those prices are fair and reasonable?—I think they are.

110. In view of the cost of production at the mills, do you think the millers are getting an undue profit?—I cannot say. I know nothing about sawmilling.

111. Are there any complaints down here from the users of timber?—No.

112. There appears to be general satisfaction?—Yes.

113. You talked about Oregon just now: you said you thought it was not on the increase?—No, I did not say it was not on the increase. I said that during the last six months we got about a million feet.

114. Do you know anything about the "Elsa"?—It is said there is 6,000,000 feet on board her, of which 600,000 ft. is for Dunedin.

115. That does not look as though it was falling off?—No.

116. Have you any idea what price it can be brought alongside the wharf at in the ship before you begin to handle it?—I think it is somewhere about 8s. 6d. per hundred, and then there is duty and dues.

117. You would not be surprised to learn that it was even less than that?—I do not think it is less than that.

118. What would that Oregon cost put into your yard after paying duty, wharfage, and cartage?—About 13s.

119. And what can you afford to sell it at?—£1 1s., less 10 per cent.—that is, 19s.

120. What purposes is it used here for, other than in large sizes, big beams, and so forth?—It has been used for sashes and work of that kind.

121. Is it used here for the framing of buildings?—I have never heard of any.

122. Do you not think that is a very undue profit to make on Oregon?—You must recollect that it is big stuff and requires a terrific lot of handling, and that the bulk of it has got to be resawn. It takes five or six men to handle these big sticks. Moreover, you have got to keep it in the yards for twelve months.

123. Supposing it comes ashore in small pieces?—Then you could sell it very much cheaper.

124. You are in favour of a duty on Oregon?—That is so.

125. You are aware, of course, of the disastrous results that would accrue if the timber industry failed in this country?—Yes.

126. They would build in brick in this part of New Zealand: is it much more costly than building in timber?—I could not say.

127. Do you think that building in brick, stone, and cement will always form a limit to the price of timber?—Brick buildings in the future will be on the increase, and such buildings will be a check on the price of timber.

128. Have you considered that a great number of men would be thrown out of employment if Oregon pine came in free?—That is so.

129. The closing of our mills would be a great loss of capital?—Yes.

130. Are you in favour of protecting our industries and keeping our money in our own country?—Yes.

131. What do you consider a fair profit for a timber-merchant to receive over and above the price he pays to the sawmiller for his timber: he has, as you are aware, to pay rent for his yard; then there is the upkeep of horses, carts, interest, rates and taxes, and labour?—About 25 per cent.

132. If you pay 10s. for timber you think 2s. 6d. a fair profit?—That would give us something.

133. *Mr. Leyland.*] With reference to the importation of Baltic, is it comparatively of recent date, or have we been importing it for some years?—A shipment about a month ago was the first for years.

134. It has never assumed any important proportions until quite recently?—That is so.

135. Is it partly owing to the difficulty in getting kauri supplies?—The people down here do not care about kauri.

136. Are you interested financially in rimu-milling?—No, I am not.

137. I suppose you are aware that the importation of Oregon last year was considerably less than 5 per cent. of the output of our mills?—It may be so.

138. If that is so it cannot affect our mills to an extent of more than 5 per cent. on their output?—That is so.

139. So that it is not really a very serious matter so far as it affects the employment of sawmillers in New Zealand?—Not very serious.

140. You admit that it is necessary that we should have some Oregon?—I admit that.

141. *Mr. Clarke.*] In reference to the increase in the cost of timber you stated that ten years ago the price was 10s. per hundred, less 5 per cent.: at that time were the differences in the widths of the timber and in the lengths subject to an increased price the same as now?—I think the width then was for 12 in., whereas now it is for 8 in.

142. So that represents the exact amount of increase?—That is so.

143. You spoke about getting your timber on different terms from other sawmillers: do you say that you do not pay the same price all round to sawmillers?—We practically pay the same price all round. There is a distinct understanding as to the wholesale price. The difference is only in the matter of freights and other things—freights, railage, &c.

144. You said that any increase in the erection of brick buildings would have a tendency to keep a check on the price of timber: do you not know that in brick-built areas the proportion of timber used is much greater than in wood-built areas—have you never heard of that?—No, I have not heard of that.

145. It has been stated by yourself that you thought the building in brick would have a tendency to keep a check on the price of timber: now, if it is an established fact that in large areas built chiefly of brick the proportion of timber per head of the population is greater than it is in places where the areas are built of wood, would that not modify your opinion as to building in brick being a check on the price of timber?—Yes, if that was correct, but I very much doubt it. I am satisfied that a wooden house takes more timber than a brick one. I would believe it if I saw it in plain official figures.

146. With regard to the price of kauri, the retail price is £1 12s.?—Yes, less 10 per cent.

147. Do you know what the royalty on kauri is?—No.

148. Assuming that it is 2s.—in some cases it is more—do you not think that from 2s. to £1 12s. in six hundred miles of transit and for handling is rather too much difference?—It looks like it, but we do not get all this difference.

149. With regard to the future, you stated that you thought that you should cut our own timbers to the exclusion of foreign timbers as much as possible?—Only to give employment to our population.

150. You do not advocate the conserving of anything for our future use?—No.

151. *Mr. Morris.*] You told us you could compete with the sawmillers in the supply of building-timber here: is it not due to the fact that a builder can get the whole of his requirements from you?—They have an option.

152. Do you get a preference?—No.

153. As to the Oregon you use, is it second- or third-class timber?—I do not know first-, second-, or third-class. We get "merchantable" and "select."

154. That is practically a second-class wood. Do you use any timber at all from Greymouth?—No.

155. *Mr. Barber.*] What price do you pay to the mills for their output?—We pay 6s. 6d. for scantling sizes up to 8 in. wide and 7s. 6d. for timber clean for dressing but the same size.

156. What does that cost you to get up here?—Two shillings, freight; 3d., duty; 1d., measuring; about 4d., cartage—that is, roughly speaking, in all about 2s. 9d. on the dray in the yard. There is 2s. profit.

157. You say 2s. 6d. profit on that?—It would be about 2s. profit.

158. The price of Oregon is 8s. 6d.?—In the ship's slings.

159. How does it cost you 13s. to get it into the yard?—Two shillings, duty; 6d., harbour dues; exchange on draft, about 6d. per hundred feet: there is also handling on the wharves, measuring, and cartage.

160. Yes, it would come to about 13s. in the yard. You sell this timber at £1 1s.?—Yes, less 10 per cent., which brings it down to 19s.

161. You told the Commission that you have to give your orders a long time ahead?—That has been my experience.

162. Have you had any experience where your clients have been in the timber trade, and where you have been unable to supply lengths?—Not lately. A couple of years ago things were brisk, and there was some difficulty.

163. Is it not absolutely impossible to supply long lengths for such buildings as warehouses, &c., in New Zealand timbers?—It would be hard to get a 30 ft. or 40 ft. red-pine. Anything up to 20 ft. is easily enough got.

164. Is kauri not used for some of these lengths?—We are never asked for long lengths in kauri.

165. Referring to New Zealand timbers, you say that, although it costs you 13s. in the yard, 2s. 6d. per hundred feet is a sufficient profit, and yet you want 6s. profit on Oregon?—The explanation is that Oregon comes in big sizes—it has to be recut, and it takes a dozen men to handle it.

166. Considering it is necessary to have Oregon in place of kauri, do you think it is fair to penalise those who are erecting buildings in the difference between 19s. and £1 12s. to keep Oregon out?—The difference is £1 9s. 6d. after taking off the discount.

167. Considering that Oregon is taking the place of kauri, which is difficult to get, do you think it fair that Oregon should be kept out and that those who are erecting buildings should be penalised to that extent?—We do not sell it. As a timber-merchant I believe in buying as cheap as I can—I would rather use Oregon than kauri; as a private individual I would keep it out.

168. Do you think it fair that any one who wants to erect a building should be penalised to the extent I have indicated either through the expenditure of capital, if he builds the house for himself, or in rent if he is a tenant, by keeping Oregon out?—It is not fair.

169. *Mr. Ell.*] You said you thought that brick buildings coming into competition with wooden buildings would act as a check on the price of timber?—I think brick would act as a check.

170. Would the use of brick for building purposes lessen the demand for timber?—Yes.

171. Are you aware that, notwithstanding the introduction of steel, cement, brick, and stone, and all other substitutes in place of timber, the demand for timber is greater in the world to-day than it has ever been before?—I can only suppose that there is more building going on.

172. *Mr. Barber.*] A far greater demand than ever in the history of the world?—There is more building going on.

173. What kind of timber do you use?—Red-pine principally.

174. For building purposes?—Yes.

175. With regard to the manufacturing branch?—The bulk would be red-pine and kauri.

176. For what purpose do you use red-pine in manufacturing?—In making casings for window-frames, wardrobes, &c.

177. You manufacture furniture?—No; but in every house there is nearly always a wardrobe.

178. How do you find the rimu serves you as a finishing-timber?—For finishing I prefer figured red-pine; I think it is most durable and ornamental.

179. Is there any imported timber equal in beauty with red-pine for finishing-work, at the same price?—I do not think so.

180. There is no imported timber likely to compete with rimu for such purposes?—No.

181. Seeing that this timber is a product of the country, and that we require it not only for finishing but for furniture-manufacture, do you think it is desirable to have some set aside for the future?—That is a matter of sentiment. If I had a timber bush I would cut it as quickly as I could.

182. And leave the country to import all it wants?—Yes.

183. Seeing that America now is turning her attention to the conservation of her own forests for her own needs, and that different other countries are doing the same, do you not think it desirable to conserve our own timber for our own needs?—I suppose our own timber will be wanted—we cannot import everything.

184. Is it desirable that we should have reserves set aside for future woodworking industries?—It would be desirable certainly to preserve a certain proportion of our forests.

185. With regard to Oregon, you are in favour of a duty on Oregon, and yet you say it is absolutely necessary for certain building purposes—that you cannot readily get native timbers to take its place?—I said I would favour a duty simply as a means of giving employment to our own workers.

186. Supposing the sizes necessary for our work are imported free, and we place a duty on the smaller timber, so as to constrain the workers to do the sawing, would not that conserve the country better?—Of course, it all depends upon how much you put on. If it was not too big it would pay better to pay the duty than to cut it up.

187. *Mr. Stallworthy.*] You would be in favour of putting obstacles in the way of the future being up to date?—I am in favour of the present.

188. *Mr. Mander.*] Do you find any difficulty in getting lengths up to 30 ft. in red-pine?—It is difficult to get red-pine in those lengths.

189. Is there any other timber?—The only other timber in New Zealand is kauri.

190. Can you not get them in totara down here?—No; it is a very scarce timber.

191. Do you not think the duty should be taken off the long lengths only and kept on the smaller sizes, or increased on them?—If the duty was taken off the long sizes that would have a tendency to stop the smaller from coming in. That would be a good idea.

192. Do you think that Oregon is likely to reduce the price of building-timber—rimu?—No, I think not.

193. You say that there should be an export duty put on kauri?—I do not know whether I did or not.

194. Do you think it would be fair for the Government to sell kauri to private individuals at 3s. per hundred, and expect private owners to hold their timber for an indefinite period?—As I stated, if I had bush I would cut it down straight away.

195. There are very big reserves of kauri timber?—Yes.

196. Would it not be wise for the Government to say that the timber should not be let out of New Zealand?—I do not think that there is a demand for all the kauri in New Zealand.

197. With regard to what the State holds at the present time, would it not be wise to say that it should be sold for consumption in New Zealand?—That would be a wise idea.

198. You are aware that there is already 5s. duty on kauri logs exported and 3s. on flitches?—No, I was not aware of it.

199. Do you think that that is a sufficient handicap?—I think it is.

200. Are people likely to put Oregon into ordinary buildings at a cost of 19s. when they can buy rimu for 13s.?—No.

201. To buy at this price they must use it for special purposes?—Yes.

202. *Hon. the Chairman.*] If the Government were to enact that in future kauri should be sold only in the Dominion, would not that be giving too much of a monopoly to those who have already bought kauri bush?—I do not know.

203. At the present time half of the kauri is in the hands of millers, and if the sale of that were restricted to the colony it would allow those to have a monopoly of the outside sale, because none of the owners could do it?—Every miller would be in the same position, as far as I can see.

204. No, the man who has signed is not in the same position as the man who has paid a price and got possession?—I do not understand—I thought everybody was to be restricted.

205. Do you take all the produce of that mill that is connected with your business?—No, just all we require.

206. Then, there is this mill that you mention: does the timber come by rail or by water?—Stewart Island and Waikawa come by water.

207. Is the mill connected with other places?—Not on the main line.

208. Do you find that you can make better terms with Stewart Island and the other to come by water?—We practically pay the same money for it, but make a difference in railage and freight—the railage is 2s. 11d., and the freight and dues are 2s. 3d.

209. Virtually you make 7d.?—Between 7d. and 8d.

210. *Mr. Arnold.*] I understood you, in reply to myself, to state that you bought timber from the cheapest market, and in answer to the question you said that was from non-associated sawmillers, and that the cheaper price from non-associated millers, together with the water freight, enabled you to get this timber cheaper. Now you say you pay the same price to all sawmillers. What is the explanation?—I must have misunderstood your question. We practically pay the same money to everybody, but there is a difference between the steamer fares and the railage.

211. And you do not get better terms from the non-associated millers?—No.

212. With regard to the question of one profit and two profits, McCallum's mill was mentioned. If you had a city mill and also a bush mill you would have capital invested in both cases?—Yes.

213. And you would expect the management of each to show its own profit?—Yes.

214. Therefore it is fair to assume that Mr. McCallum gets two profits as well as you?—I suppose so.

215. That enables you to compete?—Quite so.

216. *Mr. Barber.*] You say you pay the same price to a mill at Stewart Island owned by one of the proprietors?—Yes.

217. That is 6s. 6d.?—Yes.

218. Where are these others situated?—One at Colac, Woodend, and different places.

219. They are working different places?—Yes.

220. They sell at 6s. 6d.?—Yes.

221. So they are making a profit when selling at 6s. 6d.?—I do not know.

222. *Mr. Field.*] Could you tell me what millers sell to you at 6s. 6d.?—Two or three different mills at Waikawa, Stewart Island, and the New Zealand Pine Company, Southland.

223. Is that rimu?—Six shillings and sixpence is for ordinary building-timber.

224. And you buy on the trucks there?—Yes.

225. From the Southland Pine Company?—And the New Zealand Pine Company.

226. Anybody else?—Moffatt and Co., Waikawa, and the Magara Sawmilling Company, Waikawa.

227. Have they all got their places of business at Invercargill?—I think Moffatt's have; I do not know about the others.

228. *Mr. Mander.*] But you pay a higher price for some timber?—Yes, we pay 7s. 6d. for stuff for dressing.

ROBERT CRAWFORD, Builder, sworn and examined. (No. 28.)

1. *Hon. the Chairman.*] Will you give us some evidence on the matters we are here to inquire into—those you are conversant with? If you do not understand sawmilling you need not trouble about that?—I do not know anything about sawmilling.

2. Well, you are dealing with sawmillers—you can tell us about that?—As a builder I deal with sawmillers in the usual way. As I have not any particular statement to make it might be just as well to draw out any information I can give you by asking questions.

3. You heard the last witness's statement as to prices?—Yes.

4. Six shillings and sixpence for ordinary building-timber and 7s. for superior timber for dressing. Is that the price they sell to you for as a builder?—I think so. We generally deal with the timber-merchants in town here; that means that the freights, &c., are added on to that price. The price here, of course, for rough 8 in. wide is 13s. 6d. with the usual additions; 10 in. 14s. 6d.

5. And the discounts?—Ten per cent. and 2½ per cent., if you pay your account within the proper time.

6. Is there no variation of these prices? You understand there are some of the Southland millers having a union or association?—Yes, I understand that.

7. And there are a number not in the association?—Yes.

8. Does it make any difference in price whether they are in the association or not?—In my experience it has not, so far.

9. With regard to the building trade, is it as good as it was three or four years ago?—Not quite.

10. Can you account for the falling-off?—I suppose there are various causes. I should think the principal cause was the tightness of the money-market.

11. The price of timber has nothing to do with it?—The price of timber would hinder speculative building, but I do not think it would hinder necessary building.

12. The term "speculative" would apply more to people who build for letting houses?—Yes.

13. *Mr. Arnold.*] You say that so far the association has not discriminated. What do you mean by "so far"? Do you anticipate in the future that there will be a close combine?—I do not know. In the past we have had fluctuations of that sort; then something has arisen which would bring about some modification in prices. I do not think it is likely to happen though.

14. Were you here when I asked another witness with regard to being refused supplies if they dealt with a non-associated party?—Yes.

15. Are you acquainted with anything of that kind in the past here?—I cannot recollect any instance at the present moment.

16. There is nothing of that kind being done now?—I am not aware of anything of the sort going on now.

17. Can you tell us about what is the increased cost of building a five-roomed house between ten years ago and to-day?—I could scarcely say definitely. It would be whatever the difference in the cost of material would amount to, which might be 2s. per hundred or thereabouts. The labour conditions would be pretty much the same. The chief difference would be in the actual cost of the timber.

18. Would you say £12 per room?—I do not think it would exceed that anyhow.

19. From £50 to £60?—I think that is as much as it would possibly be.

20. You are sure it would not be £100?—Not in ten years.

21. Have you any difficulty in getting timber from the millers in the quantities you require?—Not recently, but sometimes there is a good deal of difficulty, especially in large sizes—in rimu and kauri over 30 ft. in length. It can be got, but it generally means delay, and means that there is a good deal of hardship, and some will be condemned as unsuitable. The difficulty is to get the big sizes and get them sound.

22. What difficulty have you in regard to 20 ft. lengths?—No great difficulty in getting it up to 20 ft.

23. If you had a large contract specifying that timber must be highly seasoned what would you do? Would you find a great difficulty in getting that?—I do not think I could get it here.

24. You would have to import it?—Yes; it could not be got here seasoned; it would be impossible, in my experience.

25. What would you suggest could be done to enable a building-stock of seasoned timber to be kept?—Of course, I do not know. At present we have to get our dressed timber on the job as quickly as possible. Usually there is a stipulation to that effect embodied, and while the heavier portion of the work is going on the stuff for finishing is being dried. If we cannot find room where the building is going on we generally find a vacant section. It would take about three months to season.

26. How much does it require to season?—It would be all the better for six months; but you can generally get passable results for three months with 1 in. to 1¼ in. stuff. Of course, it is not so important if the framing of walls or joists is put in unseasoned, because they are drying as the progress of the building goes on.

27. You pay an extra price for seasoned timber?—As a rule, in making arrangements with the miller it would be considered proper that you ought to allow something for him stacking the timber for you.

28. I understand that there is an extra charge?—Only according to arrangement, according to the facilities he had for stacking it.

29. If there was a by-law, or architects were to provide, that in every case only thoroughly seasoned timber was to be used, what would be the effect upon the building trade?—I do not know that it would affect it very greatly; to some extent it would have an effect, but if people want work done they would have to have it done. It would be a matter of the work being of a better class if the stuff were seasoned. I do not think that the public would take very kindly to any increase on the present rates. The general impression is that they are high enough.

30. Do you think any such interference would be justified or desirable?—I do not think it is wise to hamper any trade with too many restrictions. I do not know that it would be wise to have a by-law to that effect. Of course, the architects generally make what stipulations they think necessary in the conditions of contract in regard to those things. With large jobs, going to last six or twelve months, you have time to season your timber thoroughly. With a smaller class of buildings you may have to wait or be delayed in some instances putting up the framing and letting it stand for a few weeks. That is sometimes stipulated for in the specifications.

31. Do you build for speculative purposes?—No.

32. Have you any idea of the rents in Dunedin at the present time?—No, I am not much in touch with the rentals charged for houses at the present time.

33. *Mr. Hanan.*] Has there been much speculative building in Dunedin?—During the past ten years there has been a fair amount of it.

34. Any building to any extent that has taken place has been due to the money being borrowed at cheap rates of interest?—I think the building societies have had something to do with it. Of course, if people get money on advantageous conditions it would help building as a rule.

35. Do you know how much has been lent by the societies?—No.

36. Are you a member of any of the societies?—No, I am not.

37. Do you think the building that has taken place meets with the general requirements in Dunedin?—So far as I know, it does.

38. Do you think the demand has been met?—Yes, I think it has.

39. What is your experience with the timber-merchants who have mills and those without mills in regard to prices? Can you buy cheaper from the timber-merchants than from those who also have mills?—No, the prices are the same all round, in my experience.

40. Do you know what the bush-mill prices are in Invercargill?—I have heard the evidence here, but I do not keep much in touch with them. We deal mostly with the merchants.

41. Do you know anything about the builders' prices in Invercargill?—No.

42. What is your opinion in regard to Oregon timber coming into New Zealand?—Of course, I consider it is necessary we should have a certain amount of Oregon coming in. It is much easier to get it in the long lengths that we require for heavy beams. It is better seasoned than the local stuff as a rule, and it is not so much inclined to warp and shrink and go out of shape as the colonial timbers. It is very difficult to get colonial timbers in large sizes suitable for beams. There are such things in connection with machinery as hoist guides, and we have nothing here that will suit. It is necessary we should have some Oregon for special purposes.

43. Does not the importation of Oregon tend to conserve our rimu timber?—Yes, to some extent.

44. You say you find it extremely difficult now to get rimu timber?—In long lengths—not in sizes up to 20 ft. or 30 ft., but beyond that there is a considerable difficulty.

45. What do you expect to find in ten years' time?—I would expect to find it rather difficult. As time goes on it will be more difficult to get rimu of suitable sizes.

46. Do you use kauri?—No; the cost is prohibitive to some extent. I know of one instance in a shop not 250 yards from here where the counters were made in Melbourne of kauri and brought back here.

47. *Mr. Field.*] What do you say has been the increase in the price of timber during the last five or ten years?—I should say something like 2s. I have not lately seen the price-list of ten years ago.

48. Do you think the price of rimu is a reasonable one?—I have no reason to think it is excessive. I can appreciate there is more difficulty in getting it. The tramways have had to be extended, and the more accessible part of the timber areas have been cut out.

49. Are you aware that throughout the world generally there has been an increase in the price of timber of about 50 per cent. during the last ten years?—I am not aware of it, but I am willing to believe it is so.

50. And therefore it is not unreasonable to find an increase of 10 per cent. in our timber?—No.

51. You buy from the cheapest sawmillers?—Yes.

52. What do you pay for your ordinary rough building-rimu?—I pay up to 8 in., 13s. 6d.; 10 in., 14s. 6d.; and 12 in., 15s. 6d.: and then, of course, it rises for sizes above that for width and length. There is 10 per cent. off, and if you pay your account within the proper time you get a further 2½ per cent. for cash.

53. Do you carry on business to a fairly large extent?—Fairly large.

54. And always building something?—Yes, kept going pretty constantly.

55. You are paying for the cheapest timber 11s. 9d.?—Yes.

56. If you could get it for 6s. 6d. would you not buy it?—Yes, I think so.

57. If the timber-merchants could buy from the sawmillers at 6s. 6d. is there not a very profitable business in selling it at 11s. 9d.?—Yes, it seems there should be a living in it.

58. Do you know yourself of timber being bought at 6s. 6d.?—I could not get it at 6s. 6d. The timber-merchant might get it cheaper, but the sawmiller would not sell to me at the same price that he would sell to the timber-merchant.

59. Do you think it would not be sold to all at the same price except for the discount?—I do not think it would.

60. Do you know anything of the cost of the production of the timber?—No, I do not.

61. If a number of reputable sawmillers came here and swore that it cost them 8s. to produce it and put it on the trucks at the nearest railway-station, would you have any reason to disbelieve it?—I do not think I would disbelieve it. I know that twenty years ago I had timber delivered on the job here in town for 6s. 6d. for rimu. I do not think any profit was being made out of that, but, of course, that included cartage to the North-east Valley—over two miles' cartage. Unless there was a very big loss then, and unless the increased wages are sufficient to show that it could not be done for 8s. now, I should be inclined to think it could be done for a little less.

62. Have you seen the conditions under which the sawmillers are working in Southland?—No.

63. Do you know that timber is very sparse?—I can understand the best bush has been cut, and also the easiest to get.

64. Do you know Mr. Massey?—Yes.

65. Should you say his evidence would be reliable?—Yes, I should think so. I should not say his statements are wrong.

66. I suppose you are generally in favour of working our own industry in a reasonable way?—Yes.

67. What do you use Oregon for here—in ordinary buildings?—For beams, very often in large sizes. I am doing a job just now where we are using it for sash and door frames and staircases, and that class of work.

68. You do not use it for ordinary framing?—No, not as a rule.

69. Are you aware that in the North Island they are using it for flooring and outside work?—We have used it for flooring many years ago—it was not an unusual thing years ago, but not in recent years.

70. Would you agree that, where there was competition with the Oregon which was spoiling our only building-rimu industry in this country, we should protect our own industry?—I think

our local industry requires some protection, but I would not be inclined to shut out timber which we find to be so useful as Oregon.

71. Referring to the price paid for our own timber, do you not think that, if the timber-yards can buy our ordinary building-timber at 6s. 6d., they might reduce their price?—Yes, there seems a pretty fair margin between 6s. 6d. and the rates we pay here.

72. Have you heard of their buying it for 6s. 6d.?—I cannot say I have. I have seen the bush price-lists published by the bush sawmills, but I do not think the mills would sell to a builder at the same rate as to a timber-merchant who is taking perhaps the whole output.

73. But you agree that if they could do it at that they would make a very handsome profit?—Yes.

74. Are you aware of the conditions existing twenty years ago?—Yes.

75. You say the timber was very much cheaper then?—Yes, very much.

76. Have you any knowledge of the fact as stated by Mr. Massey that some of the sawmillers had become bankrupt owing to the low price at that time?—I quite believe that.

77. Supposing you saw receipts for timber at a very low price, would you regard that as conclusive evidence that that was the local price of the timber at that time?—It might be a specially low quotation under special circumstances. If it was very cheap I should be inclined to think there were some special circumstances.

78. *Mr. Leyland.*] I should like you to give me the address of those imported counters?—Mr. J. R. McKenzie, in Wardell's Buildings, George Street, Dunedin.

79. Do you think the duty on Oregon should be increased?—No, I think it should not.

80. Do you think it should be decreased?—Yes, I think it should be decreased. In the large sizes I think it should be brought in without any duty at all; but at all events I should be against increasing it.

81. So far as the large sizes are concerned, you would be in favour of abolishing the duty?—Yes.

82. You stated that the timber-merchant buys at 6s. 6d. and sells at 13s. 6d., less 12½ per cent. for cash?—Yes.

83. That is 1s. 8d., and that leaves 11s. 4d. for the timber-merchant?—Yes.

84. He does not get it for 6s. 6d., because the transit charges and wharfage are equal to 2s. 9d.?—Yes.

85. He has to take it to his yard, and has rents, rates, and taxes to pay; insurance, both accident and fire; and he has the trade risks and the bad debts?—Yes.

86. When you have deducted all that, do you think he had a very exorbitant profit?—No.

87. As a matter of fact, the timber-merchant does not buy at 6s. 6d.—it is only at some distant point?—Yes.

88. *Mr. Clarke.*] With regard to the alleged controlling of prices, I think you heard a witness state that it cost him the same wholesale rates wherever he bought timber?—Yes.

89. And you have also yourself stated that you have to pay the same retail price wherever you buy it?—Yes.

90. Whether you call that a combination or a ring, would it make much difference?—I would not like to explain the difference.

91. It is merely ringing the changes?—There seems to be a general understanding that there is a fixed price, and we find we have to pay those prices wherever we go.

92. If you as a builder started to cut your timber up and run it into mouldings and sell it below the fixed scale, what would you expect to happen—would you expect to get a request to please explain?—I should expect to find some remonstrances coming along before very long.

93. *Mr. Morris.*] Is the increased cost of building to-day not due more to the improved style of the building than to the cost of the material used?—Yes, I dare say that is a fact. That has an influence on the increased cost undoubtedly.

94. You mentioned the fact that you preferred the Oregon because you got it seasoned?—Yes.

95. Is it a very material advantage to have the long tie-beams, 30 ft. or 40 ft., seasoned? You say you cannot get them in local timber?—Yes, there are advantages, of course. Take rimu, for instance, and big beams: if you use paint and cover them in, that means the life of the timber is only two or three years. I know an instance in this town where rimu has been cased in, and in the course of two or three years it has been so bad with dry-rot that you could tear it out with your hands. It is an improvement to have these large beams very well seasoned, or to allow a free access of air to get at them.

96. As a rule, in large buildings, they do not get covered up very quickly?—No, it may be several months; but if you get a 12 in. by 4 in. beam, you do not get the sap out of that timber in six months.

97. You said you would be in favour of abolishing the duty in long lengths and large sizes of Oregon?—Yes.

98. Do you not think that would tend to let it come into the country and be recut?—Yes, it would have a tendency that way. Of course, a certain amount of recutting goes on in any case.

99. *Mr. Barber.*] You said an increase in building-material would affect speculative building?—Yes, to some extent.

100. How far would that affect the employment of tradesmen concerned in the erection of a building—not only the carpenter, but the bricklayer, plumber, and paperhanger, &c.?—Of course, it would affect them to some extent detrimentally, but it is rather hard to say offhand the exact extent.

101. If speculative building was to stand still there would be a scarcity of work?—Yes.

102. And would it not at the same time affect the rents paid by the working-man?—Yes.

103. Do you know of any kauri being imported into New Zealand from outside?—Well, there is the case of those counters I mentioned a few minutes ago.

104. Do you know of any kauri being sent away and imported back made up?—I did hear of a case in Christchurch of some flooring that had been imported, and it cost 1s. 6d. less than they could get it for in the ordinary market here.

105. Can you give that individual's name?—Well, it was the gentleman who bought those counters here that gave me the information, and I dare say he could give the names of the concern in Christchurch.

106. You heard the evidence of Mr. Broad here to-day?—Yes.

107. Were you present yesterday when he gave evidence?—Part of the time.

108. Did you hear Mr. Haddock give his evidence?—Yes.

109. And you heard those two say they had purchased timber at 6s. 6d?—Yes.

110. Do you think there is any reason why they should misrepresent the fact?—No, I do not.

111. Would it not be to their advantage to have quoted an increased price rather than have quoted a low price?—Yes, I suppose it would have made a better case for them.

112. So that you do not think there was any reason for saying 6s. 6d. if they did not actually get it for 6s. 6d.?—I think they spoke the truth so far as they are concerned.

113. *Mr. Ell.*] If rimu for flooring is put into a building and covered over with linoleum, what is the result?—If you exclude air from below and also cover it with linoleum, I think you would find it perish with dry-rot unless properly seasoned. Even if it is fairly well seasoned and you exclude air all round, it has the effect that any natural sap in the timber would kill it very quickly.

114. So that, by putting unseasoned timber into a building you lessen the life of that building?—Yes, certainly.

115. How long have you been in business as a builder?—As a builder actually about twenty-four or twenty-five years. Of course, I had been working as a carpenter some years before that.

116. Seeing that there is 15,000 ft. of timber required for a cottage, and that it cost 2s. a hundred feet more for seasoned timber than for unseasoned, that would make a difference of £15 in the actual cost of the building?—Yes.

117. Would the building gain considerably by having seasoned timber as compared with green timber?—I should say it would be worth his while to have seasoned timber. Of course, in a small cottage the matter of dry-rot would not be a fact to be considered as in a large building, but the work itself would, of course, come to pieces, and he would have a bad job as long as the house did last.

118. It would have a longer life with seasoned timber?—Yes.

119. And you have a difficulty in obtaining seasoned timber?—Yes, a great difficulty.

120. If the architects require seasoned timber to be put in, and it only involved £10 or £15 at the outside in the increased price, do you think that would check the building in any way?—I do not think it would have any very great effect.

121. I think you said that when there was a combination among the timber-merchants prices hardened?—Yes.

122. And that when the combination broke up prices eased?—Yes.

123. You were asked with regard to the price of building a four-roomed house?—I cannot tell offhand.

124. I would like very much if you would get a price-list of, say, ten years ago, and work out the cost of a house in comparison with the cost of a similar house to-day. I should like to see the difference, and if you can do that it would be something like accurate information?—It would take a little time to take out the quantities. You would require to get accurate measurements, and you would have to be very careful, otherwise the information would be misleading.

125. *Hon. the Chairman.*] How long would it take?—I cannot say very well.

126. *Mr. Ell.*] I really want this question of the difference in cost settled?—There may be some gentlemen here who have already done that. I may say that I am to some extent neglecting my business while I am here, and any one undertaking to give information of that sort would want to take time to do it thoroughly.

127. With regard to these counters that we are importing?—That was owing to the prohibitive price charged here. I am unable to assign it to any other cause.

128. Have you heard of any kauri being imported into New Zealand from Melbourne?—Not of my own knowledge.

129. Would you be surprised to hear that kauri, 12 in. by 1 in., is listed in Melbourne at £1 2s., whilst the New Zealand price-list which I have here is £1 7s. for the same timber?—I have heard about that.

130. *Mr. Hanan.*] Do you consider it legitimate for sawmillers and others to combine for the purpose of regulating prices for self-protection?—So long as they do so within reason.

131. Do you not think that competition would usually regulate matters sufficiently?—Yes, I find it so in my line of business.

132. You said you could not quite understand the increased cost of production during these last ten years in respect to timber?—I do not know that I said that. I said I could understand that the more accessible parts of the timber lands had been worked out, and that, therefore, the cost of obtaining the timber was now greater, owing to additional tramways, &c., and I assigned that as a reason for the increase.

133. Those people have now to pay a railage of 2s. instead of being able to deliver it for 4d. as they used to?—I do not understand that.

134. From Riverton and such places they have now to pay 2s. railage?—Of course, every charge must account for something.

135. There are also greater difficulties in getting the timber out of the bush?—Yes.

136. You are aware that the timber is not so good as in former days?—Yes, I have heard gentlemen giving evidence making that statement, and I have no reason to doubt but that the statement is correct.

137. In reply to Mr. Ell you spoke of the advantage it would be to have seasoned timber in buildings?—Yes.

138. If you put in a tender for a cottage and you could get seasoned timber at 2s. extra would you as a builder put that timber in unless it was specified by the architect?—I do not think I would put the stuff in actually green if there was time to season it to some extent; it is, however, questionable unless the specification distinctly said it was to be dry stuff. Two shillings per hundred is a consideration. I would do my best in such a case, and it would be better for me to put in the dry stuff rather than be disgraced by a bad job if the timber was very green.

139. Could you be so generous as that?—You generally have time to dry the stuff, especially for cottage work. In a month or six weeks or a couple of months, properly stacked, it would dry almost sufficiently to make it in fairly decent order, and it would go on drying as the work went on. It is all the better to stand a little.

140. How much sooner would a house decay if built of green timber as compared with one built of dried timber?—If you do not paint the house for a while and cover it in, apart from the joints, the timber would season just as well in the house. If, however, you painted the house whilst green, you would find you could pull it apart with the hand in a couple of years.

141. The studs you use in ordinary cottages are inch and a half?—About 4 by 2 is the usual size for cottage-construction. Inch-and-a-half studs do not take long to season.

142. *Mr. Field.*] About the cost of production and the price of timber, you threw some doubt as to whether the cost of production would be 8s. or over: what do you include in the cost of production?—I take the 8s. to mean probably on the trucks.

143. What does it cover?—Cutting down timber in the bush, dragging it to the mill, cutting it up, and the handling of it generally until it is placed on the truck and sent to the siding.

144. Of course, you are aware that royalties have to be paid for timber; then you have to remember that there is depreciation to be accounted for, also salaries paid, interest on capital, and interest on bank accommodation?—As a general rule all these things have to be included. Royalty has to be paid in one form or another, because if it is freehold land there is interest on the capital which has to be accounted for.

145. Do you think it possible when giving an order for a house to a sawmiller that you could get the timber for 6s. 6d.?—Six shillings and sixpence I should say would be a minimum price for ordinary scantling sizes. The small sizes often accumulate about a mill.

146. *Mr. Barber.*] With regard to your opinion as to the cost of production?—I could not give an opinion as being worth much.

147. With regard to the 6s. 6d. which you mentioned. Was that the output of the mill for ordinary building-timber?—I understand that 6s. 6d. was in reference to ordinary building-timber, and 7s. 6d. for clear, and in purchasing that they took the whole output of the mill?—Yes.

148. *Mr. Ell.*] Do you use kauri to any great extent?—I have not been using much kauri for a number of years. It is used extensively in some parts of joinery, and for counter-tops.

149. Is the price against it?—Yes.

150. Seeing that it is a fast-diminishing quantity in this country do you think it desirable in the interests of the people that an export duty should be placed upon kauri?—Yes.

151. Especially when we can import counters from Australia cheaper than we can make them here?—There is certainly something wrong when our timber can be taken away and sent back to us at a cheaper rate than we can buy it in New Zealand.

A. R. WALLIS sworn and examined. (No. 29.)

1. *Hon. the Chairman.*] What is your occupation?—I am a sawmiller at Invercargill.

2. We want you to give evidence in this inquiry on the points set out in the order of reference as far as you know?—I was invited to come here, and I am prepared to answer any questions that you may put to me.

3. You have heard the witnesses this morning? Can you give us some evidence with regard to this association that was referred to? Do you belong to it? Is there an understanding with you or those outside the association as to prices to which you strictly confine yourselves?—I am not a member of the association, and there are no fixed prices outside the association.

4. You vary your prices according to circumstances?—Exactly.

5. Would you tell the Commission how long you have been in business?—I have been connected with the business for about twenty-five years, but not actively until recently. I was interested in a mill in 1884.

6. Would you tell us what your prices were in 1884?—I closed the mill down in 1887, and the prices then were 3s. 9d. per hundred feet.

7. That was the worst time you had?—It was a very bad time indeed.

8. The ordinary price was 3s. 9d then?—Three shillings and nine pence for rough red-pine.

9. Was it on account of low prices that you closed down?—Yes. Well, perhaps not that altogether. I had too much else to engage me.

10. Had it been otherwise you would have continued the mill?—I might have if I was engaged in that only.

11. Was there any difficulty at that time with regard to contracting for getting your logs into the mill?—Yes, the bush used to be let by contract for supply on to the trollies, and, as near as I can remember, the price was about 1s. 6d. per hundred feet for producing the logs.

12. Was the price paid for sawing—that is, for benchmen—different then to what it is now?—A sawyer was paid 8s. per day in those times.

13. What were his hours?—Eight hours a day.

14. What do you pay them now for the same class of work?—The award rate is 10s. 6d., but we absolutely pay more than that to sawyers. We pay 11s. and 12s.

15. Do they do much more work now than they did then?—No, they do no more.

16. Do they do as much?—It depends. The difficulty is to get good sawyers. Labour is scarce, and we have to give more than the award even if the man is not expert.

17. So that there is actually a difference of 4s. in wages for this class of labour by way of increase betwixt the present and twenty years ago?—Yes, so far as sawyers are concerned, their wages have increased.

18. What was about the output of your mill in the first instance?—The output was about 5,000 ft. a day.

19. And the output now in the mill you are engaged in?—Well, it varies from 4,000 ft. to 5,000 ft.

20. It would vary a little formerly too?—Yes.

21. So that there is not much difference in the output?—That is so.

22. So that the work you got for 8s. at a former period now costs you 11s. or 12s.?—Yes.

23. What is the average price at which you sell your building-timber now—I refer to building-rimu?—About 7s. per hundred feet.

24. Speaking of twenty years ago and comparing dressed timber and weatherboards then with those of to-day, is there a greater increase in respect to the dressed timber?—Dressed timber is far dearer to-day than it was twenty years ago.

25. I mean in proportion to the rough timber: has the price of dressed timber increased more proportionately?—In proportion to rough timber, not greatly.

26. Do you say that your profits are not much greater now than they were then?—Well, it is hard to say that. It is so long ago. I do know that the prices were very low twenty years ago. I think things are slightly better now than then.

27. *Mr. Arnold.*] Where is your mill at present?—In Grove Bush.

28. Where was your mill of twenty years ago?—On the railway-line near Edendale, at the top of the Edendale cutting.

29. In those days you were very adjacent to the railway?—Yes, very handy. In fact, the mill was on the road.

30. You are not in the same position now—you are farther back?—Yes.

31. Has that anything to do with the increased cost?—Yes, it has a great deal to do with it. The farther back you get the more tramways you have to construct to the railway-station, and consequently the greater becomes the cost of production.

32. The fact of the bush-work being done by contract in those days was part of the reason why timber could be sold so cheaply?—Yes.

33. Have you any idea of the wages made by men in those days and how the men lived?—The wages were less, but everything was cheaper, and I believe the men were better off than they are to-day.

34. Under present conditions you would not like to see the men go back to the old system—that is, so far as the rate of wages is concerned?—Under present conditions men receiving the old rate of wages could not live.

35. You do not belong to the association?—No.

36. Would you mind telling us why?—Because it is not to my interest to belong to it, although I did belong to it at one time.

37. Are these men not associated to some extent for self-defence—I mean the millers?—They are to some extent. There is the Sawmillers Association, but I am not a member of it.

38. About two years ago they had a case in the Arbitration Court with the workers?—Yes, but that affects every one—those outside and association millers as well.

39. Do you pay the same wages as they do?—Yes.

40. But if by the association their wages are kept down you participate in the benefit?—Yes, certainly.

41. If by the association prices are kept fair you also participate?—Yes, certainly.

42. Do you not think it is a fair thing that you should carry some of the responsibility of the association?—Truly, if everybody in the association would keep to the rules; and it was because they did not honestly keep to them that I retired.

43. Then, the members of the association are not all true to themselves?—That is my opinion and my reason for being outside. I prefer a free hand.

44. *Mr. Hanan.*] Are reasonable profits being made now in the sawmilling industry?—I think so.

45. Is it the large miller or the small miller who is doing the best?—The large miller undoubtedly, because his bush is far better situated. It is much more handy. The large millers have really possessed themselves of the most valuable bush, and so the small millers have to go back. That is the position in Southland.

46. So the large millers hold the best areas and the largest areas?—That is so.

47. Would you say that those areas were mopped up?—A great part of Southland is held under the regulations of 1886, and the areas so held comprise the very best positions in Southland. The whole of Seaward Bush is held under the 1886 regulations, and also most of the valuable sites in other localities.

48. You have referred to the regulation of 1886. Do you mean under the Act of 1885?—Yes.

49. How have these regulations been administered in Southland? If a holding is not worked within the time prescribed, you do not allow it to remain unforfeited?—That is a somewhat diffi-

cult question to answer, because the regulations are somewhat ambiguous: they admit of different constructions, and I think that the Department hold that the person in possession can hold in perpetuity—both land and timber.

50. Is that under the regulation that takes three years?—Oh, no!

51. The regulation was made previously?—Yes, I have a copy of the regulations here.

52. Do you know of any holdings not worked out according to the regulations that are still allowed to be held?—Plenty.

53. Where are they?—I dare say I can tell you some of them here.

54. Is that compliance with the regulations—to have holdings not worked according to the regulations, and still held by the original licensee? No; I say that they are illegally held, that the regulations provide that a licensee must put a mill on his area, and continuously work his mill for the first three years, after which he is entitled to his reserves or to extension of time if been worked out in three years, the Board has power to extend the term; but where no mill has been erected, and no work done, yet the licensees are allowed to retain possession, although the regulations are mandatory, and the privileges have lapsed.

55. Of course, the Board has power to extend the time?—Only where work has been done.

56. Within the six months?—In cases where a mill has been erected and the area has not been worked out in three years, the Board has power to extend the term; but where no mill has been erected the rights of the licensee lapse.

57. What is the reason that they have not been forfeited?—I cannot say; some have been forfeited, but why others have not been I could not tell you.

58. Have any license fees been returned, do you know?—Yes, there is quite a recent case in which a licensee under the regulations had his area forfeited, and it was granted to another applicant.

59. Why was it forfeited?—It was forfeited for non-compliance with the conditions—no mill had been erected, and no work done on the area. It was applied for by another applicant and granted to him, and the fees paid. The fees paid by the original applicant were returned.

60. Whose fees were paid? Those of the last man who took it up?—The first licensee got his fees returned, the fees having been paid by the last man who took it up. I could give you the area.

61. *Hon. the Chairman.*] Could you give us the names?—You can discover the names from the areas.

62. *Mr. Hanan.*] Are not the areas very much the same?—I mean the numbers. There is an area No. 462, which was applied for on the 7th December, 1903; the license was granted on the 23rd August, 1904, and it is still held, although nothing has been done with that area.

63. *Hon. the Chairman.*] Do you know if anybody else has applied for that area?—I do not think so, but I am not aware. There is another area close by, 465, held by another party. The license was dated 17th January, 1905. It had been forfeited and granted to another, although the two licenses were in exactly the same position—both had expired by effluxion of time.

64. *Mr. Hanan.*] Was the money returned to the original applicant?—Yes; it had been collected from the new applicant, and paid to the original one.

65. How do you account for that being done?—I cannot. It seems to me that the fees should have been paid into the consolidated revenue. It is a usurpation of the prerogatives of Parliament.

66. *Hon. the Chairman.*] This is in the Southland Land District?—Yes; this has been done within the last two or three weeks.

67. *Mr. Hanan.*] There is a distinction between the bush on Crown lands and in State forests. Can you tell us the distinction?—The bush on Crown lands is administered by the Land Board, the bush in State forests by the Commissioner of State Forests.

68. Can you give us any information as to small mills working for large mills, and the prices paid?—There are numerous cases in which small mills cut for bigger mills.

69. What do they get: can you give us any illustration?—The average price varies from 3s. 6d. to 4s. per hundred feet, put on the trucks.

70. Carry that on to the market—the profits made by the big miller?—The big miller, in addition to that, has to pay 6d. royalty to the Government, and interest on any capital he may have invested in his business; but I mean that where an area is cut by contract the price is 3s. 6d. to 4s.

71. Do you know of any case in which that has been paid?—Yes.

72. Within the last six or eight months?—Within the last two years.

73. Do the big millers get better profits than the small millers?—It is very hard to answer that. The small miller can sell at a far less price and make a living than the big one. Whether he makes a better living I cannot tell.

74. Can the small miller get the business?—He cannot, because the associated mills have practically collared the building trade. It is very hard for the small miller to get a footing. Several of the big millers are associated with timber-yards and the joinery business. If a builder purchases from an outside miller, he finds very considerable difficulty in getting joinery-work done at payable prices.

75. Do you think that the importation of Oregon ultimately means the destruction of the sawmilling industry in this country?—I do not think so.

76. Am I right in assuming that in the future the small mills will be wiped out?—They will be in a short time unless they go very far back—too far back to enable them to make much profit out of the business.

77. Then, you foresee large mills having a monopoly in a few years' time?—Yes.

78. As to State forests, do you believe in conserving our timber resources?—Certainly, to some extent.

79. What line would you suggest?—Do you mean conserving the timber we have?

80. Yes?—I do not see that there is really very much reason for doing that.

81. There is no reason?—No great reason.

82. Not if the timber is increasing in price?—It is simply a matter of economy as to whether it is not better to clear our timber lands for grazing and agriculture, and obtain our timber-supplies from countries that can produce more cheaply than we can.

83. You are aware that there is a timber-famine all over the world?—Yet there are vast areas not touched.

84. All advanced countries are going in for a system of afforestation?—They certainly are. As I understand, in pine countries like Norway and Sweden, and parts of America, the forests reproduce themselves—that is, if Oregon bush is closed up, in fifty years a new forest will grow up.

85. You think the mill should precede the settler in the case of bush lands?—I do think so. It is a waste of the resources of the country to burn timber if it can be profitably milled.

86. *Mr. Jennings.*] What is the output of your mill per day?—From 4,000 ft. to 5,000 ft. per day.

87. If a mill turned out 30,000 ft., would not that lessen the cost of the timber?—It should, undoubtedly.

88. Is that the greatest capacity of any mill down here?—No, there are mills that cut 6,000 ft. and 7,000 ft., and, I believe, 8,000 ft.—one or two of them—when working full-handed.

89. Have you any knowledge of the extent of bush country twenty-five or thirty miles from Invercargill?—Only what I have been through. There is a good deal of bush across the Waiau, but it is patchy, I think. The most of the bush on the east side of the Waiau is practically held, except the hilltops.

90. *Mr. Field.*] Do you think that the areas the Government has granted to millers are sufficient—800 acres of sparsely scattered bush?—I think, from a Southland point of view, they are quite sufficient.

91. If a miller cuts it out in six years?—I do not know of any case in which a miller has cut out in six years.

92. We have it in evidence from a dozen sources that it only takes six years to cut out 800 acres of sparsely covered timber land in the vicinity of Riverton?—I have no knowledge of any place where that has occurred.

93. You do not think six years is a sufficient time to cut?—I do not think it is sufficient. Providing the 800 acres is insufficient to last more than six years, the regulations do not confine you to 800 acres.

94. You mean you can get more than 800 acres straight away?—Certainly.

95. There seems to be some difficulty in getting more?—It is because there is no bush to be got. There was one extended area granted lately of, I think, about 2,000 acres.

96. You are an expert at this business: Have you any suggestion to make on the subject of sawmilling generally?—I think the existing regulations are reasonable and very fair. I do not see any reason to find fault with them. From a Southland point of view the regulations are quite sufficient.

97. You spoke of it costing 3s. 6d. to 4s. to put timber on trucks: what does that cover?—Bush-work, milling operations, trollying to the siding, and loading on the truck.

98. You are a large miller?—I rank as a small one.

99. What does it cost you to put timber on the truck in view of everything—logging, hauling, cost of trams, horse-feed, insurance against accident, loss by conversion, sawing, yarding, depreciation of plant and buildings, fire risks, salaries, charges of various kinds, wages, interest on capital, bad debts—what do you consider is the cost?—I am engaged principally in cheap timber—white-pine. I used to look actively after the mill, but recently I have employed a contractor. I contract the mill, and I get my timber cut by contract.

100. What does it cost you to put it on the trucks?—White-pine costs an average of 4s. 9d. per hundred feet.

101. And other timbers?—Red-pine, rough timber, costs 6s. per hundred feet.

102. We have had a statement of the cost of milling from the Longwood Bush—about 8s. per hundred feet on the trucks. Do you think that is a fair estimate?—I would not like to say it is, because I do not know their circumstances; but I would say that in my bush, which is principally white-pine, it costs me about 4s. 9d. per hundred feet for white-pine—that is, timber from $\frac{3}{8}$ in. thickness to 1 in. thickness. I pay the contractor 6s. per hundred feet for the red-pine. In addition to that there is royalty to be considered.

103. Which is 6d.?—Yes, my man who runs the mill employs the men, and I pay him on the output.

104. Is you bush rough?—Level country; I have rough country, too.

105. Where you are milling now?—Some is level and some rough.

106. Can you say whether your conditions compare favourably with Longwood?—Longwood is rougher.

107. To whom do you sell your timber?—I sell it myself.

108. To whom?—Direct to the customers.

109. You do not care whether they are timber-merchants or not?—I do not sell to timber-merchants—direct to the consumer.

110. Even if you are selling white-pine?—White-pine principally.

111. What are you getting for your white-pine?—It is nearly all box-timber: the average price is about 5s. 6d. per hundred feet at the mill on trucks.

112. Then, to the customer in Dunedin?—That is to the customers in Dunedin; they pay rail.

113. About the increase in wages, it was 8s. per day twenty years ago: now it is 11s. and 12s. How many are employed in an ordinary-sized mill?—About twenty.

114. And the man gets nearly as much as he did?—No, 25 per cent. to 30 per cent. more.

115. You say the small millers have not got a chance with the large ones. Is it a reasonable combination, or is there anything unfair done by the millers?—I would not like to say it is unfair in them to combine to protect their own interests.

116. We had it from Mr. Massey that when timber was low there were a number of failures —bankruptcies. Do you recollect that?—I do not know really whether they were amongst millers. I did not remain long in the milling business. I shut the mill down six weeks after I bought the property.

117. You are not a red-pine miller?—No, I do very little in red-pine; there is only a small quantity in my bush.

118. *Mr. Leyland.*] You stated that when you closed your mill down the prices were low. That was in Invercargill?—It was absolutely at the rails; you could have thrown a stone from the mill to the railway.

119. Where is the mill now?—About five miles from the railway.

120. What is the distance from Invercargill?—Twelve miles.

121. What does it cost you to get your timber from the mill to Invercargill now? I want to know the difference in cost?—Eight pence per hundred feet.

122. That means an increased cost of 8d.?—If I sell the timber in Invercargill, which I do not.

123. With reference to the refund of these license fees, do you not think that the Crown Lands Board may have had very satisfactory reasons for that, which have not been published?—I am only speaking on general principles.

124. Would it not be rather harsh on the part of the Government to insist on being paid twice for the same timber?—It is the usurpation of parliamentary rights that I object to.

125. Just now you stated the royalty was 6d.?—Yes.

126. Do you mean the sawn output?—Yes.

127. The loss in conversion has been stated to be about 40 per cent.?—Not in white-pine.

128. In rimu?—I believe it is.

129. We ought not to say the royalty costs 6d., but about 8¼d. on the sawn timber?—Yes, that is so; we estimate the royalty on the log.

130. Do you know if this association is a registered union of employers under the Conciliation and Arbitration Act?—I could not tell you.

131. Is it not almost necessary that it should be?—Yes.

132. *Mr. Clarke.*] I wish to ask a question with reference to what you said with regard to clearing off the timber, and the idea was expressed that it was desirable to make use of the forests and the timber at once at all hazards. Did you ever consider the value of the forests in relation to the rivers and watersheds?—It has been said they exercise a great influence in connection with the rain.

133. And it would be evident that if we cleared all the timber from our country we could not reasonably expect the rivers to be so high?—I would not like to say that the clearing-away of the timber absolutely diminished the rainfall.

134. But the question is whether the clearing-away of the timber would not prevent the rainfall being conserved for a good length of time: would it not have the effect that the rivers would be diminished by the outflow of the water so quickly?—That might be the case, but I have no experience in New Zealand to say so, but I may say that in Australia, where the timber has been cleared away, rivers that never existed and creeks that never ran ran freely after the bush was cleared away. I can assure you that when I first went to reside in Melbourne it was impossible to get a drink of water from Melbourne to Lilydale, and when the bush was cleared away there were dozens of streams.

135. Are you aware of the fact that it is considered by experts that a forest in its natural state will hold a large amount of water—that 12 in. in depth in the soil of a forest may contain 6 in. of water?—That may be the case. I can quite understand that the forests conserve the water in so far as they conserve a large quantity of it and prevent rapid evaporation.

136. And that being the case would it not be wise to exercise some care in preventing the rapid running-away of our rivers?—Yes, conserve the forests upon the hilltops, but not on the low lands. Let them be cleared away and the lands used for agricultural purposes so that we may get an annual return from them.

137. *Mr. Morris.*] You said you considered 800 acres a sufficient area of bush land for a man to erect a mill upon?—I was speaking from a Southland point of view only. I do not know anything about the West Coast or the North Island. I say that 800 acres is quite sufficient holding in Southland to erect a mill upon.

138. What has been your average per acre of timber of Southland bush?—About 6,000 ft. to the acre.

139. Well, I suppose it is not too big an estimate to consider that some of those mills have cost £5,000 to erect, with the tramways and the railway sidings?—I dare say some of them have, but I do not see the necessity of putting up such a mill. There are plenty of mills that have been put up for as many hundreds which will cut as much timber.

140. You wish us to believe that the men who spent this money in installing these big mills did not understand what they were doing?—I do not wish to say that, but I do say this: that a cheap sawmill is equal to the larger one. A mill that costs £5,000 does not necessarily have a greater output than a mill which costs £1,000.

141. At an average of 10,000 ft. per acre, and you say you are getting 5s. 6d. per hundred?—Yes, face measure—not superficial inch.

142. You could not possibly recover the cost of your mill off 800 acres. How are you going to make it up?—That is 6,000 ft. to the acre.

143. With 10,000 ft. to the acre you would only get about £3,000 out of it at 9d. a hundred?—Yes, but the mill does not cost £3,000.

144. The tramways we went along, I am sure, cost nearer £1,000 to put down than anything else?—Oh, no! you can get tramways laid at 6s. a chain.

145. With iron rails?—No, not with iron rails. I am speaking of ordinary bush tramways from bank to bank. They do not cost more than 6s. or 7s. a chain to lay, but the timber is extra, and the timber is cut out of second-class timber which is not for sale. I am just about to lay a considerable stretch of tramway, and I am quite sure I shall not be asked to pay more than 6s. a chain for laying it.

146. It is worth at least twice that amount to clear the land of the bush?—In the bush there is a little extra work, certainly. There is an occasional stump to take out.

147. *Mr. Barber.*] In reply to a question you stated that in your early mill experience your mill was practically in Invercargill?—No, just on the top of the bank from Edendale.

148. How many miles from Invercargill?—About twenty miles on the Dunedin side.

149. And how much further is your mill from your market now?—About thirty-two miles.

150. Further than you were in those days—further from Invercargill?—Yes.

151. And is that where you send your timber to—to Invercargill?—No, not 100 ft. in a year.

152. You ship it away?—All over the north of Dunedin.

153. You are probably no further away from the market than you were by rail?—No. The railage charge is calculated from Riverton.

154. You do not have to pay any more railage?—No.

155. You said you were paying your sawyers 4s. a day additional to what you were a number of years ago?—Yes.

156. How many are employed in a mill with 4,000 ft. of timber a day?—About eighteen hands, but only one sawyer.

157. So that the increase on the output of that mill would be only a fraction over 1d. per hundred feet for the increased wages on that one item?—Yes, but, of course, all other wages have gone up.

158. But not to the extent of 4s. each?—No. The sawyer is a skilled man, and he commands a better wage, and even better than the award.

159. *Mr. Stallworthy.*] I think you said that the small millers are cutting for the larger millers, that the larger miller pays a royalty of 6d. and also interest on the capital. Now, is it not a fact that the smaller millers are put on to these large areas practically as dummies for the large millers?—No; the bush belongs to the miller, and it is let by contract, and the small miller cuts it.

160. The small miller has no bush of his own?—No.

161. *Mr. Mander.*] You said the cost of producing your timber was: white-pine 4s. 9d., and red-pine 6s.?—Yes.

162. Does that red-pine not include royalty?—Yes.

163. And also the cost of the mill and incidental expenses connected with the business?—Yes. It does not include the sale of the timber and bad debts. That is the cost of production on the truck.

164. Are there any other millers in Southland who are so favourably situated as yourself in regard to timber at the same price?—I do not know. That is the price I pay the contractor who runs the mill. It would cost me more to do it.

165. That is what you pay the contractor to produce it?—Yes, I pay the contractor 6s., and the royalty is 6d.

166. Does the contractor supply the material?—Yes, and lays his own tramways.

167. In your experience, does it take more men now to do the same work than it did ten or fifteen years ago?—It takes more men on hilly country, but not on flat country.

168. Then, according to your experience, the men are quite as competent as they were ten or fifteen years ago?—I think so. I think they are just as competent. It is thought they do not do quite as much.

169. If they did not do quite as much would it not take more men to do the work?—It depends upon who is bossing them. One man could get more work out of them than another.

170. You account for the difference in the cost between 6s. and 8s. as stated by other millers partly on account of doing the work themselves and employing labour?—Yes.

171. And you think if they let the work out by contract they could get it done cheaper?—I think so.

172. Now, in regard to the conservation of forests, do you not think there is plenty of rugged, hilly country that it would be advisable to conserve containing much marketable timber in this country?—Certainly. I say, with agricultural land carrying timber it is better to clear the timber off, market the timber, and utilise the land for agricultural purposes. Keep the timber on the hilltops by all means, and, if you wish, carry on a system of afforestation, but I think good agricultural land is turned to far better purpose when used for agriculture.

173. *Mr. Jennings.*] It is a lasting asset?—Yes. If you devoted that land to growing timber and replanted it you would have to stand out before you got any return, whereas agriculture gives you a return every year.

174. *Hon. the Chairman.*] In regard to the leases mentioned, you said that lease No. 465 issued on the 17th January, 1905, ran for the whole of the three years, and nothing was done with it?—Yes.

175. And it was then relet and the money paid to the man who held it for the three years without doing anything. How much did he get?—He got a refund of the full amount of the royalty that he paid.

176. He paid a royalty for three years and got it returned to him?—Yes. My contention is that the regulations should be administered justly. The regulations are very clear and distinct, and if a man does not show his *bona fides* and erect a mill and work his area his rights lapse without any forfeiture. They simply cease, and it should be distinctly understood.

177. Do you not think there should be some penalty besides if a man monopolizes timber land to the exclusion of any other settled worker?—I do not see that any penalty is necessary since he has paid a royalty for the privilege and he has not benefited by the privilege.

178. Do you think that that would be a sufficient punishment for a man who took up an area of that class and held it for years without doing anything?—Well, it is a pretty stiff punishment to forfeit royalty and fees paid. It is taken up in the hope that they will not be put off at the end of the three years, and therefore there is a lot of country held in dummy fashion. The regulations are not complied with, and yet the parties are not dispossessed.

179. Is that in Southland?—Yes.

180. There is another area you mentioned, No. 465, issued in January, 1905. What position is that in?—That is the area that I say has run its three years. There has been nothing done upon it, and it has been forfeited and relet to another party.

181. And what about the former area?—It is in the possession of the former party. He is still in possession; yet he has done nothing. He has held it for four years and going on for five. I might say that that obtains in a great many other cases. There is another case I know of. I think the area number is 467. A license was issued for it in May, 1904, and nothing whatever was done with the area, and in May, 1908, four years afterwards, it was applied for by another party, whose application was declined. This area is in State forest, and the original holder was given an extension of time in which to commence operations. He still holds it, and is working it now. He has absolutely no title whatever to the area; his original license has lapsed.

182. Are you aware if that applies to areas under the Land Board jurisdiction?—No, I cannot say that I am.

183. Then, you think the State-forest management is not equal to the Land Board?—It is hard to say that. Apparently it is not.

184. You would have no fault to find?—Practically there are very few applicants on Crown lands. I do not think there are any except in Grove Bush. I think I was misunderstood in saying that I was satisfied with the regulations.

185. That was more as to the area that was allotted?—No. What I wished to infer was that I am perfectly satisfied with the existing regulations if they are properly carried out. I think they are quite sufficient for all requirements in Southland, but I am not at all satisfied with the 1886 regulations and the manner in which they have been administered.

186. It is hard to deal with those, and I do not see that you can upset them?—It is a matter of interpretation. There is no right of appeal, and we say we should have the right of appeal to the Supreme Court.

187. *Mr. Hanan.*] That is in the old regulations?—All we ask is for that right. We are not satisfied with the administration of the 1886 regulations, and contend that they are wrongly construed. There is a very large area held at the Gorge Road, practically 4,000 acres. These areas are held under the 1886 regulations, and it is claimed by the holders that they possess a right in perpetuity—to lock up the land and timber in perpetuity if they so choose. Our contention is that the 1886 regulations give a limit of time within which the privileges granted to the grantee operate, and we contend that that time has long since expired. The regulations say that the area of a sawmilling license shall not exceed 200 acres, but that the licensee may apply for a reserve of 600 acres—that is, 600 acres in three 200-acre blocks. The time specified is two years for each 200 acres, but there is no time specified for the first area—that is, the original area. But the regulations say you can only hold one area at a time in connection with a sawmill license. The license, remember, is not for the area, but for the mill. The area is simply a portion of Crown lands allotted for the purpose of obtaining timber for the mill, and the regulations say you shall not hold more than 200 acres in connection with a sawmill. Therefore when you apply for a second area your first area is cancelled.

188. The Board hold an opposite opinion?—Yes; but what we contend for is that we should be able to appeal to the Supreme Court for an interpretation of the regulations.

189. *Mr. Hanan.*] Is there no appeal from the Land Board to the Minister?—No.

190. Can you give any reason for the fact that in the case of State forests the Minister should have the administration solely in his hands, whilst in regard to bush on Crown lands it is invested in the Board, subject to the regulations?—Yes, I can. We had a case recently in which we applied to upset certain areas in Crown bush in respect to Crown lands under the 1886 regulations. The result was that we gained our point, and the licenses were all upset. The Land Board then proceeded to deal with these areas, and they dealt with them in a way which I think was very unfair and unjust. The original holder, who had the enjoyment of his privileges, was regranted half of the original area, and the other was thrown open to public competition. The areas were all revalued. Those that were granted to the original applicant were valued at less than they were originally, whilst those that were granted to the public were all valued considerably above the original value. We think, therefore, that we ought to have a right to appeal to the Minister against such a proceeding, which we think is very wrong, and yet under the law we are compelled to accept it. These valuations were increased as much as 75 per cent. I may say that the areas were all valued by a surveyor in the first place, but they were afterwards revalued by a Crown Lands Ranger, who agreed with the surveyor in respect to certain areas, whilst he increased the royalty very considerably on others.

191. *Hon. the Chairman.*] Perhaps the first valuation was not a fair one, and the second might rectify the omission?—It might, but then one man valued the whole of the original areas, and the second man agreed with him in the main, and it was only in two or three areas that he disagreed.

192. Was there anything apparently in respect to those licenses to justify him putting on a higher value?—Nothing whatever, because we say that the timber is not there, and we say it is overvalued. Here is a schedule which shows the whole thing.

Mr. Mander: Is this within our jurisdiction?

Hon. the Chairman: I think it is. It relates to timber, and it is a very serious and most important matter.

[The witness handed in the schedule, showing the original and present values.]

Witness: You will see, Mr. Chairman, that this gives the quantity, the royalty, and the rate, together with the names of the grantees. As I have said, it gives the increases and decreases.

193. *Hon. the Chairman.*] What are the dates—there is no date apparently?—No, the date is not there, but that is not required, as it was only estimated within the last few months.

194. I shall be glad if you will add the date of the valuation to the schedule?—Yes, I shall now do so, and put the schedule in.

Hon. the Chairman: This wants looking into.

195. *Mr. Field.*] Are you personally affected by that?—Yes, I am personally interested, and I pay the amount under protest. I claim that the matter should be looked into and a revaluation made by another person.

196. Has any one else complained of this matter?—Yes, Mr. Cox, the other holder, has also complained. He considers the royalty greatly in excess of the timber on the ground.

197. *Mr. Leyland.*] I do not know whether I misunderstood you. I understood you to say that when 800 acres were allotted to a man the others were in reserve for him. Do you mean that he has to shift on to the other area?—Oh, no! What I say is that the license is for the mill. The area is simply a portion of Crown land allotted for that mill in order that the mill may obtain a supply of timber. There is power under the regulations to give the licensee rights over his tramways, and those rights are always reserved; but the lands otherwise may be made available for settlement. I say that a sawmill licensee can only hold 200 acres at one time—that he cannot hold two areas at the same time in connection with one sawmill license.

198. Then, in order to justify him in constructing a railway they give him another 600 acres in the way of a reserve?—Yes, that is the position.

FRANK WILLIAM PETRE, Architect, sworn and examined. (No. 30.)

1. *Hon. the Chairman.*] Mr. Petre, I understand you are an architect?—Yes.

2. Can you help us to solve any of these questions within our order of reference?—I cannot give you any expert opinion as to milling, and nothing in connection with the raw material in the bush, beyond my own opinion as to the conditions in which the timber comes into the market from the sawmills.

3. Have you practised long at your profession?—I have been practising in Dunedin for thirty-five years, and during that time I have always suffered from the same difficulty—viz., the want of seasoned timber. As far as the mills are concerned, the objection that we have to their handling of timber is that the timber is felled at the wrong time of the year—that is, it is felled in summer-time instead of being felled in winter-time. The winter here is generally used for breaking up the timber and trucking it to the mill. Speaking of our local timbers, I can only say that they are really quite useless for building under the conditions under which they come into the market, if you wish to make a permanent work of the building. One of the great mistakes we have been making, particularly in our southern towns, where the rimu is not so good as that of the north, is that we have been putting up houses, particularly for the workers, which must in the very near future produce very bad consequences and great and bitter disappointment. A man, perhaps in his early youth, who has concentrated all his resources to establish a home for the benefit of his old age, must suffer bitter disappointment when he discovers at fifty that his house is in a state of decay. Owing to the unseasoned condition of the timber none of the wooden houses which we are now putting up, and which we are finishing with paper and scrim, are worth more than twenty-five years' life. I regard this as a very serious matter, because it overtakes a man at a time of life when he can least afford it. The home which should be his shelter in old age will prove a delusion. If built for renting purposes it will prove a loss of capital, and if for personal residential purposes the upkeep in the way of repairs will equal a rent. When a man arrives at that time of life it is hard to find that his home is perishing over his head. The whole of our future must depend upon a settled and contented race of workers, workers settled in their own homes. Nothing can be better than for all workers to possess their own homes, because men under such conditions will not seek to upset things with communistic notions. Men will feel the responsibility of citizenship when they get their own homes, especially if they do not get dry-rot into them. I say that a man on the flat here, with a red-pine cottage, papered and scrimmed, has not got a permanent home. At the time when he wants it most it will fail him, because he will find that it requires constant repair. The valuator rates twenty-five years as its life, and the owner will find that the only value he has got is the land. We have great difficulty in getting seasoned timbers here, even for joinery. I am aware, of course, that it is worse in the South than in the North. In the northern towns you will find some fine joinery done out of rimu, whilst here in the South we have to condemn doors in all directions. The timber is dried, but it is not seasoned; when it is dried the sap-cells still remain full; they are consequently expanding, but time contracts them and the timber shrinks. Timber that is cut full of sap in the summer-time,

particularly in November, cannot be seasoned. It is always subject to the shrinking of the sap-cells afterwards. Another difficulty is that if we want long lengths for big beams we cannot get kauri, and the price is prohibitive when it is procurable. The red-pine we rarely get in long lengths. You cannot get 40 ft. in red-pine, and I only knew of it once, and in all the other cases I have had to use imported timber—either Oregon or some Australian timbers. We frequently specify a choice, including kauri, but the kauri does not get used, because as soon as the contractor comes to take out his costs he sees that he must take some other of the specified timbers in preference to kauri, not on account of its quality, but on account of its cost. For the purposes I refer to Oregon is most used now. There is no doubt but that the building trade of New Zealand must have a large quantity of imported timber, and the more you tax imported timber the greater our difficulties will become. The taxation will produce two results—firstly, the tax will fall on the consumer, and secondly, it will lead to the depletion of our forests, with the result that whole tracts of country will be thrown into waste or turned into desert. Climatic changes will be constantly occurring, and the country will become more liable to droughts. Then, you will steadily increase the cost of buildings, with the corresponding increase in rents which must follow. A man who builds to let his house must get a return for his expenditure. Obviously this state of things must result in a scarcity of houses, which will tell particularly on the worker, who has got no great margin to come and go on. The worker has to parcel out his weekly wage carefully, and if you put on another shilling or two of rent it has to come out of something else, and probably he will not be able to save what he should save for the maintenance of himself and family when he is out of work. Now, a condition such as this affects the whole country, and particularly so that large section of the population who are the workers. If a state such as I have mentioned is produced, the country cannot prosper. Speaking for my professional brethren in Dunedin, and I believe for all of them throughout the Dominion, the more facilities we can get for procuring cheap, well-seasoned timber the better it will be, not only in respect to the buildings that we put up, but it will be ever so much better and cheaper for the whole of the population. A few timber mills, when first closed down, might suffer to a certain extent; but I believe it is the opinion of a great many people that we are cutting our timber a great deal too quickly. If you can throttle that pace of cutting timber you will be doing a distinct benefit to the whole country. We are not only opposed to anything in the shape of taxing timber in order to prevent it being imported, but we are also quite in favour of anything that will hold our own good timber in the country, in the shape of an export duty. The difficulty of that is, however, when it comes to a question of reciprocity. We are wanting our neighbours' timber, and if we do not let them have ours they may pay us off in our own coin. We must have the Australian hardwoods, and we must also have the American softwoods. We want the Oregon for all strappings, as well as for beams, &c. The Oregon is a perfectly dry timber, free from any acid. All our timbers here are not. They are resinous, and they are all charged with acid in the sap, which discolours the plaster. When so many metal ceilings are put up that must have battening and plastering, the timber used must be perfectly rigid and in good condition, so that it will not twist, by warping or contraction, the sheets of fibrous plaster or the sheets of metal. For these reasons we are quite opposed to anything that would tend to throttle the importation of suitable timber. We are all of opinion that the rate at which our forests are being depleted will become a very serious thing for the country. We are producing a bad style of building for the very class that should have a durable and lasting building. In a word, we are producing a house that is not durable. It is a house that has only a twenty-five-year life.

4. *Mr. Jennings.*] You are speaking generally of local timbers?—Although it is a timber in itself, it is a good timber; but it does not come to the market in a proper condition, and any amount of drying will not put it in a proper condition. The shrinking of timber you will see in connection with furniture. It is very difficult to get properly seasoned timber for furniture. Those who are consumers using locally made furniture, though tolerably well made, are discovering that it does not last on account of the shrinking and twisting.

5. *Hon. the Chairman.*] You said something about the time that timber should be felled?—It is decidedly wrong to fell timber in the summer-time, and it is absolutely not allowed in European countries. It is not allowed in England, and in Germany nobody is allowed to fell timber without permission from the proper authorities, and then if timber has to be felled out of season for clearing purposes a permit has to be obtained—and it is the same in England—but the timber so felled is not marketable. Here it is common enough to see the sap oozing out at the nail-heads, or suggestive of the common saying—which is a fact—that the birds were singing in the branches of the tree from which the timber was taken a week previous.

6. *Mr. Arnold.*] How do you suggest that this difficulty should be got over?—The same as in other countries. I say that the State should forbid the cutting of timber in the summer-time.

7. Have you much knowledge of our bush country?—I have seen a great deal of it. My only experience in sawmilling was when I came here originally in 1873 as engineer for the railways here. We had a sawmill at Waipori.

8. Have you been through Catlin's Bush?—No, I have not been through it.

9. Have you seen the Longwood Ranges?—Not for many years—not since 1874 or 1875.

10. Have you seen much West Coast bush country?—A little, around Greymouth and Hokitika, over the range.

11. From your knowledge of this country, do you not think it would almost cripple the building industry if they were confined to winter work?—Yes, if you did it by anything like a sudden enactment, to country being milled now. You could set certain tracts aside as forest that must be only cut in the winter-time. You would not be touching the present industry; you would leave the forest required for mills going now in full swing, but there are huge tracts all over the Dominion that could be conserved in that way. Restrict the cutting of them. Have that regulation that they were only to be cut in the winter-time.

12. You would have a Government official to report on areas suitable to be cut in winter?—On areas at present not in use, so that you do not touch the industry as at present, and gradually it would grow up under these conditions. There is provision of this kind in all the European countries and in the Old Country. I know that, in my experience there, now and then an oak-tree had to be felled. Permission was granted by the proper authorities; then the tree was cut down and split up into firewood.

13. You are an architect by profession?—I am president of the local body and a member of the Council of the Institute of New Zealand.

14. If your society were to agree that all specifications should provide for only seasoned wood would not the difficulty be met in that way?—No, because you cannot get it. We put it into our specifications—the interpretation is dry timber—and we put it in that the timber must be delivered within a certain date after the signing of the contract, but we rarely get that carried out. We cannot get local timber quick enough, and where time clauses come into play that is the first point that is made—that the timber cannot be got. We specify that it is to be on the job by a certain time, but we cannot get it. There are many reasons why it is extremely difficult to enforce the penalty clause. It has never been successfully done yet. It is a good clause, but hard to enforce.

15. Has the difficulty in getting seasoned timber anything to do with the increase of the import?—No doubt of it.

16. You know that the importation of foreign timber is increasing?—Yes.

17. Do you think it is necessary?—As far as has come to my knowledge, you could not have done without it. Buildings I have had could not have gone on without the Oregon beam, and the ceilings and so forth could not have been put up. We have tried the red-pine battens, and it is not successful for metal or fibrous plaster. You frequently see a cheap building with the mark of the lath showing through the plaster.

18. So that if these timbers were not imported the building industry would be crippled?—It would be delayed, and there would not be the value in the building owing to the timber not being in a proper condition.

19. If the duty on imported timber were increased, do you think it would have a detrimental effect?—Unless it were increased to a prohibitive degree we should still specify it for good-quality work, and the difference would be on the consumer.

20. Whom do you mean by the "consumer"?—The proprietors of the buildings. They would have to pay more, and if they are building for speculative purposes the people taking their buildings would have to pay high rents.

21. So that it is passed on to the general public?—Yes, and it is felt most by the portion of the general public who can bear it least.

22. From your large experience, you think there should not be an increased duty on imported timber?—It affects the whole population to such an extent, and if there is any injury done it is to a small class. If there was free trade in timber it would be better. It would improve our buildings. They would be more durable, cheaper, and there would be less trouble in future in connection with them.

23. Would you not recommend a duty on smaller sizes so as to encourage labour in this Dominion?—If you have to have a duty at all you could put it more safely on small than on large sizes. For instance, in framing; it is not so much in joisting, but in finishing, planking, &c., and the joinery-work, so that if you put a duty on small scantlings required for these things you would not be doing an injury to the building trade, and the larger beams would not be touched. They do not take away from the output of the local bush mills so much as the small scantlings. If you are to have any duty at all put it on the smaller scantlings.

24. Except that there is always a tendency to cut up scantlings?—Well, the labour in the country is employed on that, and it is good to encourage that.

25. With regard to manufactured goods—doors and sashes—is there much of them being imported?—I think there is a tendency to increase the importation of manufactured goods. It is very difficult to get local doors good.

26. Have you had these doors put into buildings?—I have trouble at this moment with red-pine doors, without mouldings, showing daylight through them in some places; in fact, it would pay to use American doors.

27. Have you seen doors from Sweden?—Yes, they are very soft wood.

28. Are they to be compared with rimu?—Not for appearance, but for standing they are better.

29. We have had evidence that they are inferior?—They are inferior in this respect, that they are very soft; they are rather too thin in the panels, but that is done for purposes of freight, of course. If you import a door you have got to take it as it stands.

30. You think that trade is likely to increase?—It is increasing.

31. You think it is desirable that it should increase?—I do not think so. I think if we imported the proper material and the joinery was done here it would be better, because we should have complete control over it ourselves, and we have machinery and men here capable of producing as good, if not better, articles as in the world.

32. If rimu is seasoned it is quite good enough for ordinary purposes?—I have seen excellent doors from it in Wellington, Christchurch, and the northern cities.

33. You think, having the machinery and the labour, we should do all we can to encourage our own industries?—Yes, but you do not want to put a shilling in one of our pockets and take 1s. 6d. out of the other. You must not increase the cost of the house. The most important thing is durability.

34. Can you tell me the increase of cost of an ordinary five- or six-roomed house within the last ten years, as a building or per room?—I should say—take a four-roomed cottage—we used to

build that very much the same style as now—a few things may be better—for £250 to £260; you cannot build that now for another £100. A properly finished four-roomed house costs £350 or £360 at the very least.

35. That is about 25 per cent. more?—Every bit of it. I have in all my contracts a schedule of prices with the rates set down. The tenders are sent in, but only the schedule of the successful tender is opened. I have been looking up a tender of the early "eighties"; the timber, framing, joisting, &c., in 1885 and 1886, including labour and material, was set down at 12s. 6d. and 13s. 6d. per hundred feet. Then it rose up to about £1—the cost of ordinary red-pine frames, joisting, and roofing. Now it is £1 4s. and £1 8s. If you take that, the cost is nearly doubled in that one item. Flooring used to be scheduled at 18s. per hundred feet, and now it is up to £1 8s. and £1 10s.

36. Having gone so closely into the question of the framing and flooring, have you taken the trouble to take out what proportion of the difference belongs to labour and what to the rise in timber?—Of course, when the framing was running up to 14s. the timber was 7s. 6d. per hundred, and is now still about half. The labour runs about half, because it runs 13s. to 14s., and the flooring £1 10s.; flooring was then up to 15s., and it will now run up to £1 10s. Framing was 13s. 6d. for timber delivered in town here, and it now runs up to £1 6s. or £1 8s. The timber is about half the cost, and the labour is the rest.

37. So that you hold that the proportion of the cost of timber to the total cost of a building is about the same ratio now as at that time?—It is. Of course, labour has gone up. In those days carpenters were getting 9s. and less, and a good deal of labour was let by contract, and men were quite willing to take 8s. Now, of course, the wage is 10s., and some builders have to pay more. The builders have other expenses, too, that they did not have then—larger expenses in the matter of scaffolding, which is very expensive now, but it is better.

38. I understand from you that the higher cost of building is not in consequence of the rise in timber—that the price of timber bears the same proportion to the cost of the building as at that time?—Yes.

39. *Mr. Hanan.*] Referring to comparative cost to-day and that which obtained some years ago, is it not a fact that the buildings to-day are of a better class? You have more conveniences indoors—pantries, &c.?—Yes, in the shape of cooking-stoves, and fittings generally of that sort; but that does not account for the cost, because the few poor conveniences you had in those days were more costly then than now. To go back to the cheapest grates, you had to pay £1 or £1 5s.; you can get as good a grate now for 14s. Of course, a great many houses did not have grates. Then the ranges: A large number were imported; now they are locally made, better, more convenient, and not very much dearer.

40. There is also hot- and cold-water service, bathroom, and so on?—You have hot-water service in a great many houses; of course, it is a great improvement.

41. Do not these items add to the cost of a building?—It adds £10 or £15 to a cottage, but it does not account for the great disparity. When it comes to larger buildings it becomes very much more apparent. In the matter of brickwork, for instance, it is very much more costly now than it was; the raw material is more costly.

42. Is it cheaper to build in brick or in wood?—There used to be a larger difference between brick and wooden buildings than now. I reckon that a plain brick building and a plain wooden one has a difference of something like 12 or 14 per cent.

43. Which would you recommend?—Brick. A good brick building of that kind is worth ninety years' life; a wooden building is not worth more than twenty-five years' life. At the end of twenty-five years the upkeep of that building is so expensive that it is practically dead. The upkeep of a brick building may last for a couple of centuries.

44. Then you would recommend the Government to build in brick?—Certainly.

45. If Oregon is imported, to the extent which now obtains, does it mean the destruction of the sawmilling industry?—No.

46. Why?—Because the Oregon we are using in large material—battens and suchlike—is comparatively small as regards amount when compared to the huge quantity of local timber—so much so that it does not account in the first place for the increase. There is an increase going on in all these towns, larger this year than last, and unless you increase the number of sawmills in proportion you cannot say that the whole increase of the importation is taken from the sawmills. There is no necessity for increasing the sawmills that are now established. There is a slackness of the building trade here, but it is only a temporary slackness, and I have no doubt the sawmillers are feeling it the same as anybody else. But to say that because timber is imported they are going to put up their shutters would be ridiculous. You have an opportunity of considering the whole situation and looking to conservation for the future. If you are going to multiply the sawmills, you would be doing the country a huge injury.

47. To increase the duty on Oregon would be a national calamity?—It would be a great mistake. "National calamity" is rather a heavy word.

48. *Mr. Jennings.*] Have you any knowledge of the area of timber in the Dominion?—No.

49. Have you any knowledge of the amount destroyed by fire?—No, but I have seen huge tracts that have been destroyed.

50. I do not mean settlers destroying?—By cutting and burning. I suppose Invercargill has suffered as much as any other district.

51. Have you any knowledge of the artificial seasoning of timber?—Well, we tried it years ago.

52. Anything of the new processes?—We had that process: we had creosote in the sleepers: this is passing the creosote through the timber. I had a little experience in London—Bethel's Works. He was the inventor of the creosote process. There it was simply driven through the ends

of the timber: pressure-caps were put on the end. That has been abandoned: it was too expensive. Then the next move was a pressure bath in which the timber was packed, and the creosote forced in by a force-pump; that is obsolete now.

53. Do you know what timber has been used in the house in Stuart Street, opposite the Wesleyan Church? I was in one of these houses nearly forty years ago, and it appears to be in as good condition to-day?—There is a large house there, but it has been repaired a good lot.

54. They were getting a rental in those days of £1 10s. per week, so it must have been a good investment?—But the £1 10s. for this class of house is gone.

55. I think you answered the difference between a brick house and a wooden one?—From 12 to 14 per cent. in a plain building.

56. *Mr. Field.*] You have been a leading architect here?—I have been a long time in practice.

57. Do you come here to voice their opinion?—I was asked to do so. Of course, I have given you my own views also. It was more confined to the inadvisability of an import duty on foreign timbers and an export duty on kauri. We are all agreed that to prevent foreign timbers coming into New Zealand is a mistake, and that something should be done to prevent the exporting of kauri. These are two points we are agreed upon.

58. Now, you said the cost of a four-roomed cottage had gone up in Dunedin from £250 to £300 or £400?—Yes, from £250 to £260. I had in my mind certain cottages.

59. How many feet of timber would there be in those cottages?—They vary. I suppose, taking the timber all round, in a cottage of that size there would be 6,000 ft. of timber in it.

60. The timber in that case is only about £30?—Yes, from £30 to £50; but that does not include the joinery. The quantity of timber and joinery is comparatively small in proportion to the cost.

61. What proportion does the timber bear to the whole cost of the cottage—what fraction of the total cost including the joinery?—I should say that it is perhaps from a quarter to as much as three-fifths.

62. I thought Dunedin was a fairly cheap place, and that materials were much cheaper than in other places?—It is the cheapest building-place of the four cities.

63. Would you be surprised to know that I had a five-roomed cottage built with 7 ft. verandah, double chimney, bathroom, scullery, and outhouses for £250?—Yes, in Wellington. I have always been impressed with the cost of buildings in Wellington as compared with the other cities. You must have had some favourable circumstances.

64. What do you think is the increased price of undressed timber in the last ten years?—It got to 8s. about twelve or fourteen years ago. It rose then gradually about 6d. a time, till it stood at 11s. 6d., and then went up to 12s. 6d. and 13s. 6d.

65. Then the evidence we had that it had increased 2s. in ten years is about right?—Yes.

66. That would mean that in a house containing 5,000 ft. of timber the increase would only be £5?—Yes.

67. What do you think has been the increase in the cost, so far as the timber is concerned, in dressed and undressed?—Labour, mostly.

68. In a house containing 5,000 ft. of timber the cost has gone up £5 in undressed: what has dressed timber gone up?—It is hard to say, because the joinery is a large part of the labour. A builder could tell you that. In my contracts each item included everything such as waste, labour, and contingencies of all sorts. One does not trouble to cut out the different items.

69. Now, in regard to Oregon pine, did you notice in last night's paper there was a ship here with 4,000,000 ft. of timber on it?—I was told that was so.

70. That indicates that Oregon pine is coming in here in fairly large quantities?—It will, I dare say, providing it is not throttled. It will come in for some years, but we cannot look to them for the real trade because the Americans will want all they have got; they will be running short of timber very soon themselves.

71. Do you think Oregon pine is likely to go up in price because the Americans will want it themselves?—I think so, in the very near future.

72. Are you aware it is being used in the northern part of the Dominion for outside work?—I have heard it has been used for flooring and weatherboarding. It is a very good timber for weatherboarding, but very poor for flooring.

73. You have heard it has been used for framing?—Yes, I have heard so.

74. And that means practically that the whole building can be made of Oregon pine?—Yes.

75. Do you think it is fair that timber from a foreign country should be brought in here to compete with our timber—it is, of course, competing with our timber?—Yes.

76. Do you think any disaster is likely to result?—No, no disaster whatever.

77. I understand you to say that you are in favour of conserving our timber?—Yes.

78. Supposing you are the owner of 500 acres covered with timber, and you cannot mill it profitably because the people are building their houses of Oregon pine, what are you going to do with it—is there any option open to you?—No. I should suffer for the good of the country. I should be a bit of a martyr.

79. What form would your martyrdom take?—Seeing my forests there unutilised.

80. What about the mortgagee?—He would be another martyr.

81. Do you not think he would probably sell it for what it would fetch?—He may.

82. And then if it got into the hands of a person not like yourself he would cut the timber down and put it in grass?—I do not know. If it was good timber country it would not pay him to put it in grass.

83. But it is being done every day?—I think the best timber is taken our first.

84. Oh, no?—Well, I think they are very wasteful people.

85. What else is there for him to do?—If he cuts it down he utilises the ground, and he becomes a farmer at great cost to himself.

86. That is a good reason for cutting it down?—Yes, if the land is sufficiently good.

87. Is it not a disaster that that timber is wasted?—Yes, no doubt.

88. You said you could not see any disaster?—Not to the country.

89. Is not that a disaster to the country?—No. In order to prevent that timber being wasted you create a greater disaster. You would make every man requiring timber pay higher for his building. If you legislated in such a way as to make that timber of such value as to put a man in to cut it up to keep out the foreign timbers, you would be taxing the whole country for that bit of timber.

90. That is not so. Assuming that the man who owned that timber was prepared to mill it at a reasonable price—probably under the price that people would have to pay for Oregon pine—nevertheless he cannot use it because Oregon pine is shutting him out?—If he could mill it and sell it at a price cheaper than Oregon pine it would go into the market.

91. The experience at the present time is that up North the architects are specifying Oregon pine for buildings for which we believe our timber is more suitable?—There is this to be said so far as the building in the Dominion is concerned: that two-thirds of it is put up in the colony and never has an architect near it. It is done by the enterprising builder, and if he could get timber cheaper than Oregon pine he would put it in. If you were to put red paint on all the houses round Dunedin that have had an architect's hands about them, you would see very little paint about Dunedin.

92. Supposing I am prepared to mill and deliver it on the works in Wellington—first-class ordinary building-rimu—for 10s., is that too much?—No.

93. We cannot sell it because Oregon is shutting it out. It has been selling there at 11s., which is an unduly low price. You see the difficulty?—The difficulty really at the back of it is that there is a slump in the building trade in Wellington—that is the real trouble. It has nothing to do with the Oregon pine. If you can sell good rimu for 10s. out of your bush you are all right.

94. But you cannot sell it?—You have only to wait.

95. Now, come to the question of the destruction of the 500 acres of timber I have mentioned. The timber is destroyed and a farm takes its place. What next happens? It is not good for the country. Is not the railway freight lost to the country?—It would be, but there is the freight on the farm-produce.

96. The same thing would happen if you milled your timber—you lose that freight absolutely. You still have the produce to sell after you have lost the freight of the timber?—Yes.

97. Then, if you have been unfortunate enough to put in a mill with trams costing, say, £5,000, that is a loss?—Yes.

98. Well, then, what about your labour which you lose?—Suppose a mill employs twenty-five or thirty or more hands—these men lose their employment?—Yes.

99. Take another aspect of it—the fact that the money for the timber, apart from the labour, goes out of the country?—That happens in all trades.

100. Summing it all up, would it not be a fair thing if we could adjust it so that we could buy as cheaply as possible, import without a duty or with very little duty, such timber as we really need in this country that does not cut into our own timber, and we should put a duty—not an absolutely prohibitive duty, but a good round sum—on timber that competes with our own? If we sell such timbers as matai and rimu at a reasonable price in this country, would it not be a fair thing to protect that industry? Would it not be a fair thing to put a duty on such timber as that from outside, and take the duty off altogether, or reduce it, on the class of timber we absolutely need, such as large pieces?—I will answer you from my own personal opinion only. I think anybody who talks about protecting or taxing the importation of raw material to a country which depends on its work is making a mistake. The more raw material you can bring in for the workers to work up the better.

101. If my proposition is right, there would be just as much labour in the country, because I am working on the basis that we are selling our timber at a reasonable price. Now, on that basis your argument as to the loss of labour falls to the ground?—No, because why do you want protection if you are selling at this price?

102. Then, with regard to the question of cutting trees in the summer-time, is it not true that your argument cannot have nearly so much weight in the case of trees that are not deciduous as in the case of trees that are deciduous?—Certainly it is not nearly so marked—there is always sap in our timber, but the great flow of sap takes place in the summer-time.

103. Is it not in the deciduous timbers that the swelling-out of the buds takes place in the summer-time?—Yes. There is more sap in the summer, and there is a greater loss of sap in the winter-time, and sap of a different nature.

104. Do you think it would be a fair thing to restrict it?—Yes, if you could restrict it without hampering the industry.

105. Then, in regard to cutting down the timber forests, you said something about droughts resulting. Are you not aware that that is a very debatable question?—I have heard it debated, but I am not going on my own experience. This City of Dunedin used to be as wet as any place you could get on the face of the earth when the forests were existing, and, although we have had this wet weather lately, we have not had 4½ in. in six hours. Water that used to run down rivers has now ceased to flow.

106. Can you tell this Commission authoritatively whether there are laws prevailing in other countries against cutting timber in the summer-time?—Yes. It has been so in the Old Country, but whether a local law or a general law I do not know. In Germany it is the case—you are not allowed to cut timber. By "timber" they do not mean trees. If you cut trees you do so under regulations, but you are not allowed to send it to the market as timber; you are not allowed to impose on the public a bad tree. You may cut it up for firewood, or what they call log-timber.

107. Can you tell us of any countries which have laws of that kind?—That was the old law of Prussia, and I think it was so in Germany. They have very strict regulations there, and I have not the slightest doubt but that that is one of them. In the eastern counties district in England that law obtained there. Late in the summer the timbers were marked, a ring being placed round all those trees that were to be cut, and then they were left. Anything that we wanted to cut before we had to get permission to do so.

108. With regard to the cost of building in brick, would you not say that the fact that you can build at only a slightly increased cost—you said 12 to 14 per cent.—that that would always be an effective check on timber going to an unreasonable price?—I do not think so. You will always require a certain amount of timber in building, and you only save the walling-timbers. Then you have to have better timber for your plates, and you must have totara or matai floor-plates in brick walling.

109. But the millers and timber-merchants could not be expected to get more than a certain price for their timber if people could build more cheaply in brick?—I cannot see that it would make as great a difference as that.

110. *Mr. Leyland.*] With reference to imposing a duty on the small sizes of Oregon pine and admitting the large sizes free, where would you suggest we should draw the line between the large sizes and the small? It has been suggested that framing-sizes should be the small sizes, and that the large sizes should be those used in the construction of big buildings?—Yes, the lengths should have something to do with it if you limit the length to, say, 18 ft., and call that scantling.

111. You would not limit the length as well as the size in imposing a duty?—Yes.

112. Supposing you wanted an 18 by 12, as you often want, if all the other beams were Oregon you might also like that to be Oregon?—If you wanted a beam that size you ought to get red-pine.

113. An area of 6 in. by 4 in. is 24 in., and that is getting on to a large size for house-building. Would you approve of a sectional area of 30 in.?—A sectional area is rather a bad system, because you may get a sectional area and a man may import a beam and get it in free. All he would have to do would be to cut it up into these sectional areas, and very little sawing would do it. Supposing you took 6 in. by 6 in., that would be 36 in., and a 36 in. sectional area represents a fairly good beam. I would include that in the small sizes. To keep it entirely on framing sizes, I would not allow anything to come in over 6 in. If I wanted to put a duty on scantling I would say 6 in. deep and 6 in. wide, 4 by 2, 5 by 2, and 6 by 2, with no greater measure than 6 in. any way.

114. The object of imposing a duty on the small sizes is to keep the labour in this country for cutting it up?—If you give a larger area, a man could import a beam and put a saw-cut through it just once and practically get it in free. He would then get two areas and two beams. If you keep it to the depth he cannot get it in; it would not pay him to cut his beam up three or four times.

115. You mentioned the matter of battens for steel ceilings. It is the custom in Auckland for architects to insist that all battens for steel ceilings must be of Oregon?—Yes.

116. That means a tremendous amount of cutting?—Yes.

117. That would all have to be done out of the large sizes?—Yes.

118. And there would be plenty of work for the sawmiller there?—Yes, it would run into a good lot.

119. In comparing the value of houses, is it not very difficult to convey an adequate idea to a number of men like ourselves unless we had some plans and specifications? Mr. Field has told you that he built a five-roomed house for £250, and, to show you the difference, I might say I have just put up a seven-roomed house that cost me £1,000?—Yes, you add to the cost of a house without increasing its size.

120. Supposing railway freight is 4s. per hundred, and the timber is not carried, it is not a dead loss, because it costs the country all but 2¼ per cent. in expenses of the 4s. to do it?—Yes, pretty well.

121. So that the only loss is 2¼ per cent.?—Yes, it is not all dead loss.

122. In reference to the money going out of the country, we are able to substitute Oregon pine for kauri exported, and we are able to get for the kauri possibly 9s. per hundred feet more than we pay for Oregon pine, so that instead of the money going out of the country we make a profit of 9s. per hundred feet. Is it not a fact that money is coming into the country?—Yes.

123. *Mr. Clarke.*] In view of what you state with regard to reciprocity, if we refuse to admit foreign timber without a heavy duty, and we want to send our timbers abroad, do you not think as a community we should immediately take some steps, in view of our declining forests, to insure a permanent timber-supply for the Dominion?—Certainly.

124. *Mr. Morris.*] I am not going into the economical side of the question like my friend Mr. Clarke. I hold this: that if we get ten shillings' worth of somebody else's property and send half-a-crown's worth out we are on the wrong side of the ledger. You spoke about seasoned timber—have you any knowledge in connection with the felling of rimu and the cutting of it up?—Yes.

125. Does not decay set in in the log?—It should be sawn up and seasoned in the stacks. You cannot keep it in the log, because the rot that sets in is very rapidly coming on, penetrating to the heart, and that is traceable to the acid in the sap. What you have got to do is to saw it up, cut away the soft sap, and season it in scantlings.

126. That would involve an extra cost?—Of course, your capital is lying idle all the time, but they ought to have plenty to do in the summer months if they were cutting it from the logs into scantlings. In any case, everybody would be in the same boat.

127. It would increase the cost of timber?—Certainly, but it would at the same time increase the quality.

128. Do you not consider rough heart of rimu first-class timber for ordinary cottage-building purposes?—It is too good for that.

129. I mean the rough heart—not timber that would be used for dressing purposes?—Oh! It is very good timber indeed. It only wants proper treatment.

130. This is a question that affects the miller, who has very little trouble in selling his millable timber, but he finds great difficulty in selling his rough timber. I know that is the experience of a great many millers, and that is my experience, and so if Oregon is allowed to come in it will take the place of this rough timber?—I do not think so. The Oregon we have had lately was very cheap, and the odds are we shall never get it so cheap again. The Americans will soon discover that they want the Oregon themselves. I am aware that the Oregon will always be used here for special purposes, but the staple timber of the Dominion will be red-pine for ordinary building purposes.

131. I know from my own experience that there are any amount of small cottages being built of Oregon timber in both Wellington and Christchurch?

Mr. Barber: None in Wellington.

Witness: They will be very good cottages, too. A cargo of Oregon timber came here in the early "eighties," and I used the weatherboards for weatherboarding, and they are as good now as the day they were put up.

132. *Mr. Morris.*] I think you were the architect for a church that was built in Greymouth some years ago?—Yes, about twenty years ago.

133. There was a tower built about four years back?—Yes.

134. Do you know what kind of timber was used in the construction of the tower?—I specified for kauri.

135. You do not know, then, that the timbers used were rimu?—No. I specified kauri on purpose to get the lengths.

136. I can assure you that rimu was put in, 60 ft. long and 9 in. by 9 in.?—Very good stuff indeed. I did not think we could have got the lengths.

137. That shows you that it is possible to get long lengths in rimu?—No doubt it is possible, but it is not easy.

138. In reply to one witness you said there was a scarcity of houses in Dunedin at the present time. Is that due to the cost of timber?—There is no scarcity of houses; there is a scarcity of building operations.

139. Is that not due to the scarcity of cash?—Very likely.

140. *Mr. Mander.*] How long does it take to season timber properly, I mean red-pine especially?—I think twelve months would make good timber.

141. Have you any proof that Oregon is cut in the winter-time?—Yes, they cut it in the winter-time, when the snow is on the ground, and it is then sent down the frozen shoots, and as soon as the river is open it is sent to the various mills.

142. Is it not often cut in summer, to be in readiness for the winter?—I do not think so.

143. *Hon. the Chairman.*] Referring to miro, it has been stated here that if you cut it in large sizes it will take dry-rot?—I understood the question to be that, if you left it in the logs, not squared into large sizes with the sap taken off, it would rot. It is the soft sap that starts the rotting.

GEORGE CLARK, Builder, sworn and examined. (No. 31.)

1. *Hon. the Chairman.*] What is your profession, Mr. Clark?—I am a builder.

2. I shall be glad if you will give the Commission some evidence that may assist them in arriving at a conclusion regarding these questions?—Of course, I know the rates I buy timber at, and that is all I can say. I do not know anything about cutting timber at the mill.

3. I gather, therefore, that you know something about timber as it relates to the consumer?—Yes.

4. Of the middleman's part in the business, and whether he is underpaid or overpaid?—I cannot say.

5. Is he underpaid?—I purchase my timber for 9s. 6d. just now, and I have to pay railage on it. It costs me about 10s. in my own yard. I stock as much as ever I can myself, and it is mostly clean timber for dressing. Anything in the nature of jobbing I have got to get from the mills here, for which I have to pay 13s. 6d., less 10 per cent. trade discount, and 2½ per cent. for cash. The same thing applies to timber purchased direct from the mills at 9s. 6d.

6. Do you find that it pays you to purchase direct from the mill and stock it?—Yes.

7. Would it pay you to extend your stock to include building-timber?—I do not know.

8. And season it?—Not ordinary building-timber. The dressed timber we have got to keep. I stock all my dressing-timber for mouldings until it is about half-dry before I mill it.

9. Do you dress it when it is half-dry?—Yes, there is not so much loss in that way. The shrinking of mouldings is so unequal that there is a great deal of loss in that way when it is milled green.

10. Not so much when it is half-dry?—No, not nearly so much, and it makes a much better job.

11. Would it be much more expensive if you allowed it to dry?—It saves a little. There is a better surface when it is dry. Speaking of West Coast timbers, I have had a good deal to do with them, and they look all right when they go through green, but the surface rises afterwards. The West Coast rimu is a splendid timber, and is very fine when dressed half-dry.

12. *Mr. Field.*] Have you any complaint to make about the price charged for timber?—I buy from the timber-yards, and also from the millers. I have complained. I have got several friends in the timber trade, and from conversation with them I am almost certain that there is not a great deal of profit in it. There are a great many contingencies in the timber trade. For instance, a brother-in-law of mine got burned out, and on one or two occasions he lost a boiler which cost him

£400 to replace, to say nothing of the loss of bullocks. He has had to introduce a log-hauler, owing to the increasing roughness of the country. All this costs money, and there is not a great deal out of it in the way of profit.

13. I was told in Southland, the other day, that there were only two millers there who were making money?—That is quite possible. I think it is more than likely that millers like Mr. Massey and McCallum and Co., who have a steady output here, and who have got command of the trade, with the means of getting the stuff ready, are doing very well. A man, however, without the command of trade is in a very different position.

14. Have you any idea what it costs to produce timber?—No.

15. You say you buy at 13s. 6d. less the discount?—I do not get a great extent of that; that is merely for jobbing.

16. What do you pay for sawn timber?—Nine shillings and sixpence. I cannot say that just lately, presuming that you give an order to a sawmiller here for the timber for the job, he will carry you on—presuming you did not order sufficient—he will carry you on at Southland rates through the job. It is only on this last job that I am at now that I found that.

17. What do you call Southland rates?—Nine shillings and sixpence rates.

18. We had it on evidence to-day from a timber-merchant that he could buy ordinary building-timber at 6s. 6d.: do you know what kind of timber that would be?—We have all had promises of certain things. I was offered red-pine at 7s. 6d. to-day from a Southland mill, but that was from a small mill, and some of us have had a little experience of those small mills, and do not wish to repeat it. I regard 9s. 6d. as a fair price, which does not give too much profit to the miller.

19. *Mr. Leyland.*] With reference to seasoning, do you think it is better to work timber up when it is three-quarters dry than when it is fully dry?—That is my experience.

20. We do not do that in Auckland—we season it first?—I might say that in Dunedin I find that if the timber is worked green it shrinks, and you cannot match it. The hard timber does not shrink.

21. *Mr. Morris.*] Do you pay anything extra for seasoned timber here?—You cannot get seasoned timber, and the mill will tell you it is factory stuff. There is very little timber seasoned here. The sawmiller, however, will help you in this way: if it is a decent order he will stack it in his yard for you. I must say they are fairly good that way for a special job, and they charge nothing extra for it. That has been my experience.

22. *Mr. Barber.*] Where do you purchase your timber from?—From any of the agents, or from the sawmillers here.

23. You purchase your timber for 9s. 6d.?—Yes.

24. Where is that purchased?—It is purchased here, and, as I have said, we get it from any of the agents here.

25. Is that the price after railage is paid?—No, railage has to be added. It is the ordinary red-pine, and it will stand me 12s. in my yard.

26. Do you consider yourself a good business man?—Yes, I think so.

Mr. Barber: I may tell you, according to the evidence that has been produced, no man has paid 9s. 6d.

Mr. Field: They said 13s. 6d.

27. *Mr. Barber.*] You know Mr. Murdoch, of Dunedin?—Yes.

28. Are they working in opposition to you?—They consider I am in opposition to them in joinery.

29. Do you resell timber, or do you buy it for your own use?—For my own use.

30. I understood you were putting this in the yard for sale?—No.

31. You cannot buy on the same terms as a merchant?—I do not take the quantities they do. If I could take a shipload or trainload as they do I might be able to buy at the same price.

32. Mr. Field tried to get you to say that the timber that was purchased for 6s. 6d. was an inferior class of timber?

Mr. Field: Mr. Clark is too smart to be misled by me.

33. *Mr. Barber.*] I understood you were putting it into the yard for sale? Then, you do not get the builders' discount?—I get the builders' discount, but not the discount of the man who has the almighty dollar at his back and buys shiploads and trainloads of timber.

34. Messrs. Haddock and Brand and Mr. Massey gave us evidence that they purchased at Stewart Island, Waikawa, and several mills on the main line in Southland at 6s. 6d. for ordinary building-timber, and 7s. 6d. for second quality?—Yes.

35. Do you consider the timber they have got is inferior to what you are buying?—There is a lot of that timber that goes down by the boat of a very inferior character. They take a greater amount and buy better than I can.

36. You do not think that the statement they made is untrue?—No.

37. And the class of timber coming from these is a fair class?—I do not think that the timber that comes on the wharf is equal to the timber that comes on the railway.

38. In that case the timber areas on Stewart Island must be inferior to where you are getting yours?—I cannot say.

39. This is coming from Stewart Island, and they take the whole output of these mills. If the timber is inferior, then the timber you are getting must be superior?—I do not know.

40. It has been said that the reason they can sell for 6s. 6d. is because they have got better timber areas?—Better facilities for getting it.

41. Do you know anything about these areas?—No, I am only speaking of the timber I see on the wharf, and I do not think better timber comes there.

42. Do you say that the timber sent by the Dunedin Timber Company is inferior to yours?—The best timber I have met for many years is from the Catlin's district. I would like to say

with regard to the duty on small Oregon that I fail to see the object of that. What is the use of carting sawdust here, and how can you prevent a sawmiller from converting it into small stuff when he gets it here? It only costs about 1s. per hundred to convert it into small stuff. If I get it in very large sizes it prevents me from using it. For those reasons I do not see why there should be any distinction made. A builder or anybody else has a better idea from the small timber that is cut than from what is in junks. Very often when it is cut up there is a knot in it that spoils the whole thing. In small timber you can see that. I have not said anything about Oregon, but I agree with the statement put in by the Builders' Association, and I think that to restrict the importation of Oregon would be a mistake. It would be to the advantage of the colony if we were to go slowly in the matter of cutting up native bush. Kauri fills a place in our trade which it would be very hard to replace. In ordinary household work kauri is invaluable as a timber—the best that I have met. The popular opinion is that the rise in timber is mostly responsible for the increased cost of buildings, whereas the cost of labour has more to do with it than the timber, and so far as work in the City of Dunedin is concerned the sanitary work has increased about fourfold. We have to do the plumbing and drainage work for a four-roomed wooden cottage just as well as the highest class of brick building, which could easily be shown to be unreasonable.

FRANCIS WILKINSON, Builder and Contractor, sworn and examined. (No. 32.)

1. *Hon. the Chairman.*] Can you give us any information that will aid this inquiry?—From the Builders' Association you have already got pretty good ideas of the ideas of the members of that association. I do not think it will be necessary for me to enter into any long statement. You have had a good deal of evidence which covers anything I have to say, but I am prepared to answer any questions that may be put to me.

2. Can you give us any information with regard to the price of timber during the last ten years?—There has been a rise in rough timber of from 2s. to 3s. within the last two or three years alone.

3. Has that had any deterrent effect on the industry?—I do not think so; people always want something cheap, and no matter how cheap it is most people want a gold watch for a cabbage. I have had in my experience fifteen or sixteen years ago when timber was down to about 7s. 6d., that no matter what the cost of the timber is they will always want to get it cheaper. Timber will never be cheaper; there is going to be a shortage throughout the world. In a few years' time when we are all dead, there will not be sufficient timber. I do not think the price has had any effect on the building industry here. I think the greatest effect has been that land has been too dear.

4. Could you tell the Commission any way by which they could prevent this dearness in land?—Well, I am not prepared to enter into politics just at the present time.

5. Do you use very much of this timber in your business?—I have not a very large business. I am a small builder, but have a fairly good turnover. During the last year I must have handled in the way of timber close on 90,000 ft.

6. Do you stock the timber?—I do not.

7. Give the orders as they come in?—Yes.

8. Do you feel any difference in orders between the associated millers and those outside?—None whatever.

9. What is the ruling price that you generally get now?—Rough timber 13s. 6d., with the usual discount. Of course, if I buy it direct from the south it is 9s. 6d., the southern price, and you have to add railage to that, with discount off the timber-price.

10. What would it save you?—About 1s. per hundred feet getting it direct. You save the yarding charges, but I can get it out of the yard at the Southland price—in fact, we do that now. The public get the benefit of the discounts all the time.

11. *Mr. Arnold.*] That is caused by competition?—Yes.

12. How many builders are there in Dunedin?—I cannot say.

13. About how many?—About three hundred.

14. How many in the association?—Eighty-five.

15. Less than one-third?—Yes.

16. Can you give me any reason why the remainder do not join?—I cannot, I am sure.

17. You do not take any steps to persuade them to come in?—No.

18. Why was your association called into existence?—To keep in touch with the laws of the land as they are going on, alterations to building by-laws, labour laws, to keep an eye on the Government, and all that sort of thing.

19. Of course, there is considerable expense attached to the association?—No, there is not.

20. You exist for self-protection?—The same as every other trade-union exists.

21. Do you not think it very unfair that these other people should remain outside it?—I do, because the Builders' Association is really a patriotic association; they sacrifice a good deal of time for the good of the community at large.

22. Especially the building community?—And the guiding of public bodies, like our own City Council here.

23. While your association exists for self-protection it does not in any way preclude competition between its members?—No.

24. It is unlike the Millers' Association as far as that is concerned?—Competition is very keen.

25. Just as keen among the members as those outside?—Just as keen.

26. Your association has passed a resolution with regard to the importation of Oregon and all foreign timbers?—Yes.

27. Was that passed unanimously?—Yes.

28. Do you think that the two-thirds of the builders outside the association would agree with that resolution?—I cannot answer for them; I do not think they have got time to think.

29. If it is in the interest of the trade they should be favourable to it; if not they would not be?—You are going by numbers, but I look upon my association as quality.

30. Give us capital if you wish?—Capital and quality. There are builders and builders. The most of those outside are workmen who take small cottage contracts, who do not employ many hands, who have no stock, and a man running a large business cannot compete against them.

31. Would you say that two-thirds of the building is done by your association, or what proportion to the capital amount of work?—That would be rather a bold statement to make, but I think it was mentioned here yesterday that during the last nine months about 96,000 pounds' worth of work went through the association.

32. Would that represent half the work?—I believe it would.

33. The building trade is slacker now than in the past. Are there many out of work?—I have not been to the Labour Bureau to see. A few contractors are slack just now.

34. It has been represented that the trade is not so slack here as in other parts of the Dominion?—I have heard so.

35. Do you know anything about the timber that comes from the Catlin's district?—I cannot say that I do. I have seen some lying about in a promiscuous sort of manner in a yard at Milton, but that is all I know about it.

36. The evidence we have had is rather contradictory. Some say it is inferior to Southland timber, and the last witness said that from around Rakanui it is not superior?—I could not say.

37. *Mr. Field.*] Your association does not band together to keep down wages or keep up the prices of timber?—No.

38. Is the association satisfied with the present price?—There have been some complaints made about the price of timber, especially in the dressed lines.

39. Not in the ordinary building lines?—No, except that quality is not so good as formerly. I have not heard many complaints in regard to the price of the ordinary building-timber.

40. *Mr. Clarke.*] With reference to the extent of the opinion of builders outside the association, is it not fair to assume that if the builders who are not members of the association had the contrary opinion they would have taken some means of expressing it? You have not heard that?—No.

41. With regard to the use of Oregon, is it the custom where plaster-work is done to specify Oregon pine? Is it the general practice to use it, in preference to red-pine?—As far as I know it has not been done yet.

42. With regard to the proposal to increase the duty on Oregon pine, we know what the opinions of the association are, and we know that the yearly consumption of timber is increasing all the time?—Yes.

43. Do you not think that the annual increase in consumption will account for the amount of Oregon that is likely to be brought in, supposing the millers do not increase their mills and their plants, and will not dislocate their trade?—Certainly.

44. *Mr. Barber.*] The witness said he believed the tightness in the timber trade was due largely to the high price of land. What is the price?—It all depends on the locality. In High Street, Roslyn, a half-acre was sold a year ago for £1,360; that is within eight minutes' ride of this hall. Quarter-acre sections in High Street, Roslyn, are valued at £400. Sections of ⅛ acre are valued at £130. Land almost anywhere is very dear, and you cannot do speculative building on it.

45. What is the price in St. Kilda?—Half the price of Roslyn.

DUNEDIN, SATURDAY, 3RD APRIL, 1909.

DAVID BARRON sworn and examined. (No. 33.)

1. *Hon. the Chairman.*] What are you?—Commissioner of Crown Lands for Otago.

2. We wish to obtain from you information as to the number of sawmilling leases under your jurisdiction in this province, the names of the lessees, the terms, and the time they have to finish; also the amount of bush available for leasing in the future, and the estimated quantity and quality of the bush?—Statements in reply to one or two of the items you have mentioned will require to be completed. We have the number of sawmillers, but I do not know about their names.

3. It has been stated that people obtained leases and held them for three years without complying with the conditions in any way; that they were then put up to auction again at the end of three years, and the money paid over to the man that had the offer, instead of going into the revenue of the colony?—I might say that this district is somewhat different from Southland, in this respect, that considerable areas of unsurveyed Crown land have been taken up and turned into sawmilling areas. So far as Otago is concerned, there are only a certain number of sections taken up, and it is a matter of a man taking up one, two, and three sections for his area.

4. Taking the land and timber, or only the timber?—I must explain in connection with that by-and-by. As to the position of the bush in the Catlin's district, these returns I have will, I think, supply all the information you have just referred to. I find I have the names of the sawmillers, the various areas, and the amounts paid for them. I have not the dates, but they can be supplied.

The timber throughout the bush of this district upon the whole is somewhat patchy in its distribution, the first-class timber being scarce and consequently expensive to bring to the mill and market. This is further aggravated by the fact that the best timber is situated either some distance from a railway, or near a port where the loading is somewhat hazardous and the size of vessels limited on account of the shallow nature of the harbours (Tautuku).

When I came to this district about eight years ago I found that practically the whole of the district was open for application under the various land tenures. It seemed to me then that if it were left in this way it would be a matter of a very short time when all the land carrying milling-timber would be taken up either for settlement or speculation—if for the former the timber would be ruthlessly destroyed, as the position of the greater portion, pending completion of the railway, would not be favourable to its removal to market.

After going carefully into the matter, I asked the Ranger to make a careful inspection of all the timbered land in that district, and after receipt of the report I obtained the approval of the Land Board to a recommendation to the Minister of Lands to have all the land carrying timber of any commercial value reserved for milling purposes.

I may here remark (as the position of the Tautuku Milling Company may be brought before the Commission) that one man (Clark) secured a substantial block before the reservation could be made.

The Queenstown district includes Lakes Wakatipu, Wanaka, and Hawea, and Martin's Bay district.

Ranger Mackenzie had charge of all of these localities with Assistant Ranger McDougall, resident at Wanaka. Since Mr. Mackenzie's retirement, about a year ago, the new Ranger, who is resident in Dunedin, has had little opportunity to make himself familiar with the timber question (having had so much to do with Crown lands since his appointment). Mr. Mackenzie's evidence would therefore have been of value to the Commission. Taking these districts as a whole, I find that the returns furnished from time to time give the following results:—

Martin's Bay district } Wakatipu district }	49,000,000
Wanaka and Hawea	12,000,000
Comprising the following:—	
Martin's Bay,—	
Red-pine	10,000,000
White-pine	11,000,000
Black-pine	9,000,000
Miro	8,000,000
Totara	2,000,000
Red-birch	2,000,000
Silver-birch	7,000,000
Wanaka and Hawea,—	
Totara	1,000,000
Matai	50,000
White-pine	50,000
Birch	11,000,000

5. You are putting that statement in?—Yes. Very little was taken up for speculation, but a great many who did take up land were unable to carry on, others required to fell a certain amount of timber in order to grass the land, but all that timber was practically burnt or destroyed. There was no way of taking it to the market, the mills were too far away, and the roads too bad. Fortunately, the Minister of Lands approved of the recommendation referred to in my statement, otherwise this land would have been selected probably and held over for speculation or for farming, and the bulk of the settlers would be unable to carry out the important conditions. There is always the danger, if they do not carry out the conditions, that in six years their holdings will be forfeited. As a matter of fact, nothing of that sort has been done, but the settlers always had that difficulty. They were afraid that the Land Board might come down upon them rather severely and cancel their holdings if they did not carry out the conditions. In order to prevent that, I thought it better to preserve the whole of the bush, pending the completion of the railway. At that time it had only reached Catlin's, and it seemed to me a matter of time (and also in the opinion of the settlers and others) when the railway would be carried through and the bush utilised, so that it seemed advisable to reserve all that which carried milling-timber. That land which carried only scrub, of course, remained open for selection, but any land with milling-timber of any quality, although some was scattered, we thought best to reserve for that purpose. What brought this more particularly before me immediately after I came to this district was this: one or two men came down from Canterbury, and, as the land was open for application, one of them applied for a block of something like 1,200 acres, and we had to grant to him this particular area, which was very good milling-bush. Another man came along from the same locality, and I saw also from the description he gave and from his calling that he was a sawmiller. I then induced the Land Board to refuse his application, and from that time to this we have never granted any land with milling-timber on it. Of course, since that we have had some applications for milling-timber land only for the timber itself.

Mr. Arnold: You purpose opening up the old areas when the railway is through. Of course, if a settler had the railway running alongside he would utilise the timber, even although he got

the land at less than the value of the timber, and it would assist him to carry on and still have the timber utilised. It would be a benefit to him and a slight loss to the country, but the benefit to him would be greater than the loss to the country.

6. *Hon. the Chairman.*] You have also to take into consideration the value of the timber in cutting it up?—It was all valued before I came to the district, but the upset price was not put on. It will be only after the sections carrying timber are opened for application that they will be reconsidered and revalued. I may say the timber throughout is patchy in its distribution, first-class timber being scarce, and consequently expensive to bring from the mill to the market. The only thing I have not been asked is the average yield per acre. I estimate that to be from 3,000 ft. to 4,000 ft. only, so that you see the timber is very much scattered. The latest figures show the average output per acre to be from three and a half to four million feet in this district in a year. Of course, there has been great destruction of timber by settlers in the past, a large quantity having been felled and burnt, but during the last six or seven years the destruction has practically ceased on account of the land being to a great extent locked up. As I mentioned before, it is necessary for the settlers to destroy the timber in order to comply with the conditions.

7. *Mr. Arnold.*] Now, a number of those settlers destroyed about two-thirds of the bush, and then, for various reasons, they permitted their leases to fall in?—Yes, in a very few cases, but not so much as it was in Southland.

8. I was speaking principally of Catlin's?—Yes.

9. Now those areas are growing wild; there is an undergrowth springing up all over the place, the areas are useless to-day, and will become more so as time goes on in consequence of this growth?—Yes.

10. There being noxious weeds in addition to the ordinary growth that springs up after bush-felling?—Yes.

11. Now, can the Department do anything to prevent that?—When the settlers have deserted the land, as you mentioned, it is impossible to do anything except at very great expense—perhaps at greater expense than the land is worth.

12. Are you willing to let those areas, or are they amongst those areas you mentioned?—I do not think there are many holdings in this district deserted. They appear to be deserted, but they are held in some way.

13. But there are hundreds of acres of such land as that?—Yes, but there are very few that are actually deserted.

14. Will you let the Commission know the number?—Yes, I will make out a list of those deserted. [Subsequently supplied: 32 sections; area, 4,079 acres.]

15. *Mr. Jennings.*] Is the land around this district suitable for agricultural purposes when the bush is removed?—No, some of it is very poor indeed.

16. Speaking generally, what is the average?—It is fair average to medium, but there is none that could be called first-class.

17. What is your experience in regard to the destruction of bush, apart from the destruction of timber by the settlers. Taking into consideration the reserves and so forth—has the fire got into the bush?—Not to a great extent. In the lakes district it has got into the bush, but, fortunately or unfortunately, the bush is not of very good quality.

18. Can you furnish the Commission with particulars as to the amount of bush destroyed outside during the last fifteen or twenty years?—Yes, I could do that.

19. *Mr. Field.*] Have you jurisdiction over Southland?—No. The reason I referred to Southland just now was because I was there three years before I came to Otago, and I knew the conditions well.

20. How long ago?—Eight years.

21. Do you know anything about the grievance of Mr. Wallis?—Yes.

22. Do you think he has personally suffered any injury?—I do not know that he has suffered any personal injury.

23. Can you say whether Mr. Wallis has done fairly well out of his dealings in Government land?—I do not know that. Of course, he was engaged in sawmilling before I went to Southland, and during the greater part of the time I was there he was engaged in farming, and took up sawmilling afterwards.

24. You said that the timber industry had a good deal to contend with?—Yes.

25. Do you know whether or not the timber industry in Otago and Southland at the present time is in a flourishing condition?—I do not think they are making much money in Otago.

26. *Mr. Ell.*] With regard to the land in the Catlin's district, you say a good deal of it is not fit for agricultural purposes?—Yes, it is fair to medium. It depends on the man who works it, but the land on the whole is only from poor to medium right throughout the district.

27. I understood you to say some portion of it was not fit for settlement?—Yes, there is some of it not fit for settlement; it is too rough, too broken, and when the timber is cleared and burnt the grass will live for a year or two, and then the scrub and weeds take possession.

28. Is that due to the climatic conditions?—To the poor nature of the subsoil.

29. Was any such land open for settlement?—Yes. When all that land was opened for settlement the bulk of it was understood to be first-class land, but a great part of it turned out to be very bad land.

30. Did an expert officer examined it to see whether it was fit for settlement?—It was before my time. I have only been here eight years, and the bulk of it was surveyed before I came to this district.

31. And, so far as your knowledge is concerned, that was not done?—I do not think so. If I may be allowed to say, I think the mistake made at the start was this: that part of the bush was surveyed in the very centre, and instead of working it from the outside gradually, and perhaps taking the railway with it, it was surveyed all over, and settlement put into the middle of the

bush without roads and without conveniences. In the case of the Heathfield Settlement, it was surveyed half-way between Catlin's and Waikawa, and the farms were laid off in small lots, with the result that three-fourths had to go under.

32. Do you think, in view of the unfortunate experience of those who have attempted settlement and made failures, that there should be a very careful examination of the whole of that district?—I think it would be well to open it up very slowly, and from the railway.

33. So that those on the land will have a means of marketing their produce?—Yes, and get rid of the timber at the same time.

34. Then the land has been cleared of its best crop?—Yes.

EDWARD O'NEILL sworn and examined. (No. 34.)

1. *Hon. the Chairman.*] What are you?—Crown Lands Ranger for Otago.

2. Can you give the Commission some information with regard to the amount of land deserted in the Catlin's district which has been referred to by Mr. Arnold?—A casual observer going into the Catlin's district would imagine that the sections which are producing what we call an undergrowth were deserted, but those sections are still held, or a good many of them. It is not only the deserted Crown land that is growing the undergrowth, but a good many of the settlers are allowing it to come up on their own land without making any attempt to prevent it. They maintain that the second growth is very much more difficult to clear than the original timber, but there is practically only a small area of deserted land in that position. I could not give the actual figures. I can quite imagine that any one going into the district would naturally be struck by the appearance of a lot of those sections, and without having any one to point out whether they are held or not it would be difficult to say whether it is Crown land or land that is held under lease.

3. *Mr. Arnold.*] But if the conditions compel those people to clear the best timber, should not something be done to compel them to keep it clean?—The conditions of the lease do not exactly compel a man to fell the timber; they say a man must effect certain improvements within a limited time, and he could effect those improvements by fencing or building, but he would then have no means of living. It is his means of living that forces him to fell the bush in order to get grass to graze the cows.

4. We heard a few moments ago that some of this country is not fit for agricultural purposes; but is it not all splendid dairying country when it is cleared?—A good deal of it is very good dairying country, but a portion of it is land that will never be fit for the plough.

5. *Mr. Hanan.*] The railway is being constructed down there?—Yes, the Catlin's Branch.

6. From timber and agriculture, do you think there is much to be obtained in the way of traffic on the line?—Yes, from timber there is considerable traffic to be obtained.

7. What class of timber is it?—I should say it is fairly good timber.

8. How does it compare with Southland?—I do not know Southland timber.

9. Where is the closest bush that is not cut out in the radius of Dunedin?—That is the closest bush, and it is roughly about eighty miles away. I am referring to Catlin's Bush.

10. Have you had bush nearer?—In the early days we had bush in the City of Dunedin.

11. Has it all been cut down?—Yes. Around Dunedin there is very little timber now. In the Waipori there is a little, but it is practically valueless.

12. Have you had any sawmilling experience?—No.

13. *Mr. Ell.*] We have heard from Mr. Barron that some land that was opened up for settlement in this district proved to be entirely unsuitable?—No; he did not say that it was entirely unsuitable.

Mr. Jennings: That is not so, Mr. Ell.

Mr. Ell: He said that the land generally was fair to medium, and some land would not take the grass because the subsoil was so cold. That was in Catlin's.

Mr. Jennings: He did not use those words.

14. *Mr. Ell.*] I am not in the habit of misleading. Is Mr. O'Neill aware of the fact that some of the land has proved entirely unsuitable?—That is so; some of it has proved unsuitable for settlement.

15. From your knowledge of some of the land which has not been opened up, do you think there is any of the land which has not already been opened up likely to prove unsuitable not only with regard to the subsoil, but with regard to the climatic conditions and bleakness?—Yes, I know there is some of it.

16. Is it not growing the best crop it will ever grow?—Of course, the best of the present crop could be moved and another young crop would be coming on. It could in time be used for milling or for firewood.

17. With regard to those holdings that were isolated, how many settlers were put on the blocks?—About sixty.

18. What was the size of their holdings?—From 100 to 150 acres.

19. They were entirely isolated?—A road was cut to them eventually, but it was not a good road.

20. The men, then, practically wasted their labour?—A number of them have been forced to abandon the position, and the place has resolved itself into much larger holdings.

21. Even now presumably there is some difficulty?—They are getting on better now. The original holders depended on milking, but now those remaining are going in for sheep.

22. Do you indorse what Mr. Barron says, that settlement should proceed very slowly—that is, only so far as it is made available by good roads?

Mr. Jennings: That is a question of policy.

23. *Mr. Ell.*] I am perfectly justified in putting the question?—I think, certainly, that roads and railway should be made first. A great many of the earlier settlers were forced to leave the district.

24. *Mr. Stallworthy.*] What quantity of timber will be tapped by this railway?—Something about 400,000,000 ft.

25. What does it carry per acre?—The average would be between three and four thousand feet.

26. *Mr. Jennings.*] Can you furnish the Commission with the number of settlers who have thrown up their land since they went on it owing to its unsuitability?—Yes, I think so.

27. In your opinion, was it owing to the smallness of the areas that they took up, seeing that some of them have now taken up larger areas?—Yes, to some extent, it was due to the smallness of the holdings, because the men with larger holdings now are making their living there.

28. *Mr. Arnold.*] This land was first opened up to meet the requirements of a certain class of people, was it not—viz., to meet the requirements of some coal-miners?—I believe it was. I understood afterwards that that was the reason.

29. Were these areas permitted to fall in in consequence of the unsuitability of the land, or was it not rather in consequence of the unsuitability of the settlers who first went there? They were men not adapted to the work?—I can only say that some good men went there, and they could not make a do of it. The particular soil that they were landed on was the cause of their failure.

30. *Mr. Mander.*] Is it always easy to tell in the centre of a dense bush whether the soil is suitable for grass before it has been cleared and tested?—I think a man with some experience of the bush land can give a very fair idea.

ALFRED MILLER HOGG sworn and examined. (No. 35.)

1. *The Acting-Chairman (Mr. Arnold).*] Mr. Hogg, what is your business?—I am a timber-merchant and general merchant in Dunedin.

2. Have you been in business here long?—About ten years.

3. You know the purport of this Commission: do you wish to make a statement in connection with this matter?—I did not come with the idea of making a statement, as I expected to be questioned regarding the business.

4. Do you deal with the local mills?—We deal with the Otago and Southland sawmilling people as a whole. We also do a good bit in foreign timbers, and also with the Auckland timbers.

5. Do you find a difference between dealing with the associated millers and those that are non-associated?—No.

6. They all sell at one price?—No. It is like every other business. Occasionally you can do better in one quarter than in another.

7. Has the association got a uniform price?—Well, they are supposed to have one.

8. A lot of evidence has been taken with regard to imported timbers?—We import a lot of timbers.

9. Do you think it is necessary that these timbers should be imported?—Yes, they come in for purposes for which our local timbers are not suitable, especially in joinery-work. Deal is used where our local timbers could scarcely be used. Oregon is also used. The price is materially better in the imported article. Oregon, for example, can take the place of kauri, and you can save, roughly speaking, nearly one-third of the price.

10. So that the importing of these timbers encourages the building trade?—Yes, in a large measure it does. Then there are certain other points. Elsewhere I hear the small sizes of Oregon are competing with red-pine, but down here they are not doing so at all. I do not think that during the last twelve months 100,000 ft. of Oregon has gone into competition with red-pine. Red-pine is holding its own except in a few isolated cases, and for a few long lengths.

11. You do not think it would be a good thing from a public standpoint to put a heavy duty on these timbers?—No, I do not think it would. So far as that goes, my own impression is, if any alteration was made in the duty on Oregon, that the duty might be slightly reduced on the larger sizes and increased on the smaller sizes, for the reason that the smaller sizes are the sizes that are competing with red-pine. By this means you would keep the labour of sawing in New Zealand. You would be making work for your local workmen in the recutting.

12. It has been said that it is difficult to get local timbers seasoned, and that the imported timbers are necessary on that account?—That is very largely true, but I think it is, to some extent, consequent more upon the fact that people here want things cheap, because if you season red-pine you will get very little more for it seasoned than unseasoned as it comes in from the bush.

13. You think seasoned timbers could be procured locally if the people cared to pay the price for them?—Yes, in a large measure.

14. There is a very large shipment of Oregon in town at the present moment?—Yes, it is coming through me.

15. Is it not a fact that this timber is cut green, and not seasoned at all?—How do you mean? Do you mean quite green?

16. I mean that it comes straight from the tree on to the boat?—That is so; practically speaking, these timbers are brought down in the log, resawn, and put on the ships. They lie in water for some time, which is the best way to take out the sap at the outset. Of course, they are cut in winter, and they are subsequently put through the mill.

17. Practically, when they are packed in the hold of a boat they do not season?—They are sufficiently seasoned not to go wrong during the voyage. Our native timbers would not stand that.

18. Does it not follow that as the demand for Oregon increases there will be a greater tendency to ship these kind of green timbers?—Well, now you are asking me to deal with the policy of the sawmillers in Vancouver, but I should imagine so. It is a natural deduction to make.

19. So that in time there will be very little difference between local and imported timber in the matter of seasoning?—Both will have to be seasoned after arrival. All we use of Oregon here is such an absolute drop in the bucket that our taking a little more or less will not affect the position.

20. *Mr. Hanan.*] What amount of timber has this boat brought to Dunedin?—Five hundred and sixty thousand feet.

21. Can you tell us when the last shipment arrived here?—Yes. About three or four weeks ago 200,000 ft. arrived. The only shipment prior to that was some 350,000 ft., which arrived about four months ago. These are practically all the shipments of Oregon to Dunedin worth speaking about.

22. Does it come by rail here?—No.

23. What is Oregon sold at?—We sell Oregon at £1 1s., less 10 per cent. and 2½ per cent., which is practically 18s. 6d.

24. Do you know what you paid in freight?—That is not our concern. We buy at a price c.i.f.—that is, free on board and the freight; the freight may be to us an unknown quantity. We deal with a merchant who makes his own freight arrangements. The freight, however, is about 3s., I should say. It may be 3s. 6d. in this present instance, but the freight is not a thing that worries us, because, as you have seen, we buy on a c.i.f. basis.

25. Who is the vessel owned by?—I do not know. The captain is a Norwegian, and I have made no inquiries into the *personnel* of the crew. In the last vessel they were all Norwegians, and they were a fine type of men; in fact, if compared with some of our crews, the comparison was entirely in their favour. You should have seen the way they worked.

26. What did you pay before for your shipment of Oregon?—Am I obliged to state that here?

27. *The Acting-Chairman.*] You can give it to us privately?—Certainly, but I do not care to put a thing like that in the papers.

28. Do you get much timber from the North?—Yes, kauri.

29. What do you pay for it?—Nineteen shillings lately.

30. What is your selling-price?—Thirty-two shillings less 10 per cent. and 2½ per cent.

31. Do you know the prices paid for it in Auckland?—Yes, 19s., which is the f.o.b. price.

32. Do you know why there should be such a difference in the price?—There is freight, 3s.; wharfage, 6d.; labour on wharf and measuring, costing from 2d. to 3d.; cartage, 4d.; receiving or yard charges, which include delivery and stacking, which may be put at 1s. Then there is deterioration, remeasuring and resawing, and waste. Kauri is apt to split, and in this respect alone you are liable to drop 10 to 15 per cent. of the original quantity. There is, further, a certain amount of waste in remeasuring that is equal to 1s. On the whole, therefore, we get about 1s. 6d., roughly. We have to pay our office staff, our canvassers, and travellers. Further, I may mention there is interest on capital, not to mention high fire insurance and insurance on our men. Our profit is, roughly speaking, from 1s. 6d. to 1s. 9d. That is not a big profit. As a matter of fact, kauri is a bad line for us. I saw a statement in the papers the other day that we had a big profit, but that is not so.

33. Have you difficulty in getting kauri?—Yes. Orders will stand for months and months, and we cannot get it. Owing to the difficulty in getting kauri supplies in anything like reasonable time, we are in a large measure compelled to look round for Oregon to take its place. Auckland tells us that they have got as much business with England and Australia as they want, and they will not bother with us.

34. Do you favour an export duty being placed on kauri?—Well, I think it might be wise. It is a matter of policy that does not affect us here materially. If the kauri-supplies are to be exhausted in twenty years, it is a great pity they should go out of the country.

35. Do you think the increased importation of Oregon will destroy our sawmilling industry?—No. Certainly it would have some effect on it, but not much so far as Otago and Southland are concerned. On the other hand, in the North they are getting it in larger quantites, and it will react on us.

36. It is not sufficient to justify an increased duty being put on?—What I suggested before was that the duty might be increased on the smaller sizes. I think that would be a good idea. By big sizes I refer to those above 30 in. to 36 in.—that is, on the square—a 12 by 3 is 36 in. Sizes below that I think might bear a somewhat heavier duty, and thus retain the sawing and work in the country. The duty then should be slightly reduced in the large sizes.

37. Have you considered the effect the importation of Oregon will have on our railway freights and upon the revenue of the Dominion?—I do not think it would have a very serious effect in those respects. There is one point which I think is an absolute anomaly: I refer to the charge of a rate and a half by the railways on Oregon, which is simply putting money into the coffers of the railway. The other day a coal-mine required certain stuff for its work, and they ordered in kauri, but when I gave them the price they were staggered, and they took it in Oregon at a price of one-third less than kauri. They had, however, to pay a rate and a half on the railway as freight on the Oregon, but that did nothing to protect the timber industry of New Zealand. Such a rate only makes our local industries pay more heavily for their requirements than they should.

38. Do you sell much timber for coal-mining purposes; and, if so, is it increasing?—Yes, a fair amount. It is steady.

39. What class?—A good deal of local timber, and occasionally Oregon.

40. For dairy purposes?—Nearly all local timber, except for odds and ends.

41. *Mr. Jennings.*] Do you stack timber for any length of time? Do you charge more for seasoned timber?—Yes, we do, but we cannot get an extra price for it, except in a few instances.

42. You say that people were not paying the price for seasoned timber?—Yes, jobs here are generally taken on a contract basis; the contractor comes here and wants it on a cheap basis. So he gets it direct from the mill usually. It is the architect's business to see that the timber is seasoned. The builder is trying to get it to the best advantage.

43. *Mr. Field.*] If a man wants to build a house he can stack it on his own ground?—Yes.

44. Do you know if there are better pines on the West Coast?—From general knowledge. Yes.

45. If Oregon is competing, might it not affect our industry at 10s.?—They cannot sell Oregon at 10s.

46. Assuming that it is being sold, as against the timber we sell in Wellington?—If a man wishes to resell he pays a higher price for a house in Oregon, and that is his affair; but I cannot see that Oregon can be sold at 10s. I think on the whole the industry should be protected as far as possible. On broad principles it should be protected.

47. Seeing that they are being faced with this position, that they are now forced to burn the timber, is that a condition of things that should be encouraged?—They have a right to be protected.

48. You are a timber-merchant?—Yes.

49. You buy from sawmillers in Southland?—Yes.

50. How do you manage to buy from the millers?—We manage to make a living. We are buying in large quantities, and every trader knows the difference in buying retail and buying wholesale.

51. Would it be fair to say that you timber-merchants are getting 3s. per hundred more than it costs you?—We cannot get it.

52. Would you be making more than a fair living?—If we got it; in isolated cases we get it.

53. I want to know what is a fair thing for a timber-yard to get?—Is that gross profit or net profit?

54. The gross profit, in order to cover cost of yard, rents, rates, and so forth?—You would want about 2s. for that.

55. It is estimated that we have got some as high as 3s. 3d.?—A good deal depends on how a man handles his timber. We work other business in combination with our yard, to make a good business; another might not.

56. Supposing you buy the whole output, what is the price?—That is, as a rule, a matter of arrangement.

57. There is, of course, a good deal of difference in the price?—About 6d. to 1s.; that varies with the arrangement.

58. Is it not true that if a timber-merchant buys the output of a mill, the miller effects large savings under various heads, because he has not to bother himself over different orders?—Yes, he is saving very considerably by going straight ahead on his logs.

59. The benchman has not to watch the board?—With a slight restriction, you take a man's bulk—*i.e.*, you take all the log will cut—you give him a broad outline of sizes, in order to cut his logs to the best advantage.

60. Is he not saved expenditure by not having to saw his timber to specification?—He is saved considerably by not having to do with lengths and sizes.

61. I am informed that the difference would be at least 1s. 9d.?—Yes.

62. Is that a fair proportion?—It would not be far away from it. It is difficult to put the exact figure, but I should say from 1s. to 1s. 9d., according to the mill cutting.

63. Do you know anything about Stewart Island and Waikawa? Are the mills there all near the water's edge?—Yes, generally speaking.

64. What is the freight charged consumers for bringing it round to Dunedin?—Two shillings.

65. And the railway freight?—Two shillings and ninepence from Riverton.

66. They save 9d. there?—No, there is wharfage, 3d. Then, again, if you bring it over the railway you bring it ready to be carted on to the job, whereas from the mill it has got to be sorted there and delivered; so that, although having saved in the one direction, you have got to cart it into a yard and recart it on the other side.

67. We find some mills are selling their output at 6s. 6d.?—At 6s. 6d. for their rough.

68. And 7s. 6d. for their clean?—Yes.

69. I want to show that there is a difference?—I do not think Mr. Massey was very far out in that estimate. These are figures regulated by what you can buy at.

70. I should like to know whether the millers who are selling at 6s. 6d. are doing any good?—They are not making a fortune out of it. I happen to be interested in one or two mills, and they are not making a fortune.

71. Have you heard any complaint about the price of timber?—No, any more than in any other line of business, except that people lately have an idea that there is a gold-mine in timber; they had better try it.

72. *Mr. Leyland.*] In regard to kauri in Auckland, and the selling-price there, there was a gentleman who said there was more than 5s. in kauri. I tried to follow where the price came in; first of all I put down the price at 19s. 6d., 6d. more than you put it?—I saw the evidence: he would probably pay more, because he was buying special lengths.

73. That is a point that has not been brought out?—That is quite apart from the extra charge on wide and long timber.

74. I have got down 19s. 6d., to which must be added freight, wharfage, cartage, and checking on wharf?—That is a regulation estimate, as anybody knows.

75. I make that total £1 4s. 6d. I conclude that you would hold that timber in stock for at least three or four months?—Often longer than that, in a case of kauri.

76. At 5 per cent. a modest amount to put down would be 3d.?—Yes.

77. Then the measuring-out or waste, I put that down at 1s. 3d.?—I said 1s.

78. Then there is sawing and loss on conversion?—Which would often make a considerable difference. Then there is another factor: perhaps a man wants a 7 by 5, and the nearest size you

have in the yard is 10 by 6, and the waste is heavy. It may vary 2 ft. in the length. It is a very moderate estimate.

79. Then I put the selling-price at £1 12s., less 10 per cent. and 2½ per cent., being £1 8s. 1d., that leaves 1s. 7d.?—That is about what I have.

80. Out of which you have to pay for travellers' expenses, rates, taxes, insurance, fire, and accident?—You have missed one important factor—bad debts.

81. Is there any exaggeration in that statement?—No; we have got to work for a very small margin, and to turn over very big quantities to make a profit.

82. Is kauri an important factor in your business?—As a matter of fact, I would not mind if I never saw kauri.

83. You say Oregon takes the place of kauri?—Yes.

84. Also in manufacturing purposes?—Yes, in some instances.

85. And you have to supply long lengths?—Yes.

86. Touching the duty as between small and big sizes, do you say that it would be fair to reduce the duty on big sizes of Oregon?—Yes.

87. There is a rate and a half on the railway?—Yes, just introduced.

88. The point I want to show is that it would be a fair thing to take the duty altogether off the large sizes?—Yes, for the same reason that in the case of a mill going straight ahead, you will certainly buy better if you are getting the bigger sort.

89. These sizes are charged more; they come up as much as two-thirds increase?—Yes, in the longer lengths.

90. Is not Oregon going up in price?—Yes.

91. We should practically prohibit the importation of long lengths in Oregon?—Yes, but there is still rimu as against Oregon.

92. With reference to the seasoning, you expect to get all your timber here?—Yes.

93. It is the sap that is so very important to be seasoned?—In all timbers.

94. The orders that are going forward now, and the question of what it costs you now, would not give the Commission an idea of what it would cost you to buy it to-day?—No.

95. With reference to the effect of Oregon on the sawmilling industry, the output is 432,000,00 ft., and the import is 20,000,000 ft.—that cannot affect the industry of the colony more than 5 per cent.?—That does not require proving.

96. If it be proved that the bulk of the Oregon is only taking the place of the shortage of kauri, the effect is infinitesimal?—If it could be proved, yes. As far as Otago is concerned, that is correct; as far as Canterbury and further north are concerned, I could not say.

97. Then this is a bogey. The output of the colony for 1895 was 191,000,000 ft., in 1907 it was 413,000,000 ft. Do you think that the importation of the quantity of Oregon I have mentioned is likely to interfere with the sawmilling industry in New Zealand to any appreciable extent? It has been proved in all countries that the ratio of output is out of proportion to the ratio of increase in population. In view of that fact, and the fact that it is taking the place of timber that is rapidly decreasing?—No, and for another reason, too: that the price of Oregon has been lower for the last year or two than ever before, but it is gradually going back again.

98. When you buy the whole contents of the log and go to sell it again, have you not some lines still left on your book?—There is always waste.

99. So that you do not get your price for the whole contents of the log?—No.

100. Then, bearing in mind the easy way a sawmiller has of getting rid of his timber, might it not be fittingly described as sawmilling made easy?—Undoubtedly.

101. *Mr. Clarke.*] With regard to seasoned timber, is it your experience that the Oregon you have imported has been fairly dry?—Yes.

102. Then the fears that were expressed by the Chairman are not warranted by your experience?—What fears were those?

103. Do you think there is any likelihood of any worse timber being cut now from America?—As Mr. Leyland pointed out they are dealing largely with heart-woods; in New Zealand we are dealing with sappy woods.

104. *Mr. Leyland.*] I want to point out that if you hold large stocks it entails further seasoning all the time?—I might point out that some has to be seasoned for a long time.

105. *Mr. Clarke.*] Assuming that Oregon was 14s. 6d., that would not alter the circumstances?—It would.

106. *Mr. Morris.*] Can you give us any idea of the quantity imported or used in the City of Dunedin?—I could not give that only approximately, but you can easily get it from the Railway and Customs returns without difficulty and without my making a hazard.

107. Do you think Oregon will increase in the future?—I do not think so materially, as far as we are concerned down here.

108. I think we might presume that the reason why you could import dry Oregon lately was owing to the large stocks held?—That has assisted.

109. Do you generally get dry kauri when you get it down here?—Not as a rule—sometimes; but, practically speaking, it is not fit to use; it has got to be seasoned.

110. I thought you put down three months as the time?—That is so.

111. I find that I have to keep kauri for twelve months before I could use it for joiner's work?—Even then it will alter.

112. Do you not think that for the small sizes mentioned here rimu would do as well as Oregon?—No, it does not retain its shape; it twists and curves more than Oregon does. That is where the difference between that and red-pine is noticeable.

113. Do you use any West Coast timbers round here?—Yes.

114. What is the freight?—Three shillings. It rises on the widths and lengths.

115. Do you find the West Coast timber twist about in that manner?—Not quite so much as in Southland, but still it does so. It is of a milder nature, but it will twist all the same if you give it a chance.

116. *Mr. Barber.*] What is the net selling-price of red-pine in Dunedin?—At the present moment we are selling on the basis of Southland lists, which is about 11s. 2d. net.

117. And the net price of Oregon is 18s. 6d.?—That is so.

118. According to your experience with red-pine at 11s. 2d. and Oregon at 18s. 6d., there is no likelihood of it interfering with red-pine?—No, I do not think so, except in a few isolated instances.

119. Taking other parts of the colony where Oregon is landed at the same price, or where the red-pine is a percentage higher, do you think there is any likelihood of it competing in those districts?—To some extent, yes.

120. You say you know it is largely used up in the North Island, but not in these districts?—That is so.

121. What was used in the Auckland District for building purposes previous to the importation of Oregon during the last few years—for ordinary scantlings?—They worked off a lot of inferior kauri and red-pine.

122. But is it not a fact that some of the buildings in Auckland were built entirely of kauri?—Yes, that is so; they worked off the inferior kind for scantling.

123. So that, although it is used in Auckland for scantling, it is replacing kauri and not red-pine?—That is so.

124. You said you were in favour of reducing the duty on long lengths of Oregon, but increasing it on the small sizes?—Not the long lengths, but the large sizes.

125. The increased duty on Oregon would increase the Customs revenue?—Yes.

126. You objected just now to the rate because it was increasing the Railway revenue?—Yes, that particular revenue.

127. Why should there be a particular object in increasing the Customs revenue?—I recognise the country has to have revenue, but I do not think one section of the community should be penalised as against another. The country man has to pay the duty at the port, and also 50 per cent. railage, so that the country man is paying more on his Oregon than the town man. The local timber in that particular instance is about one-third dearer. The taxation on that timber should be equal to every user as near as possible.

128. You believe that for the purpose of encouraging this particular industry the town worker should be compelled to pay a high price for his timber, that Oregon should not be allowed to come in in competition, and that the country man should be protected—he should not be called upon to do the same thing?—No, I do not say that. All I say is that the taxation on Oregon should be the same with the town man (who pays the duty in any case) and the country man. Immediately you put on the 50 per cent. increase the country man has to pay the extra railage, and also the duty.

129. Does not the same thing apply in regard to the delivery of timber in the town—is not the town man nearer the source of supply?—Our railage to Dunedin is 2s. 9d., whereas the railage to Mosgiel is 3s. 3d., so that the country man is again paying more than the town man, because there is steamer competition against the railway, and the railway charges come down to meet the steamer competition.

130. You do not class Mosgiel as a country district, do you?—Certainly, as against Dunedin. I am only taking that as an instance.

131. With regard to the seasoning of the timber before it arrives in New Zealand, I understand that the timber that has been landed off this boat is deck cargo only?—That is so.

132. No dry cargo landed at all?—No, nothing out of the hold. Why do you say "dry cargo"?

133. Well, it is deck cargo that is landed?—Yes.

134. And that timber has been saturated with salt water during the voyage?—Yes, and all the better for it.

135. So that it is difficult to tell whether that timber is wet or dry, or whether it is the salt water that has given it the appearance of being wet?—I should say that a deck cargo of Oregon timber coming to New Zealand has a better chance, because it is all the time in the open air and seasoning.

136. You can see by the general marks on the timber that it has been saturated with salt water, so that the probability is that the wetness is not due to the original moisture, but to being impregnated with salt water?—Very probably, in a large measure, that is so. The captain told me he had a lot of rainy weather all the way down the coast. I asked him how the timber fared with regard to sun splits, and he told me I need not trouble because there was a lot of rain all the way down.

137. *Mr. Ell.*] I suppose one reason for selecting Oregon is that it can be got seasoned?—Yes, being heart stuff it is more nearly ready for use.

138. You do not carry heavy stocks of New Zealand timbers because of the cost?—We do carry fairly heavy stocks—in fact, too heavy at present; but, unfortunately, the position is that we cannot get anything extra for seasoning, although we can sell it more readily.

139. But you get no more for it?—Yes, that is so, except in a few isolated cases where it is required for cabinetmaking, &c.

140. And that is how it is that there is a difficulty here, and why there are complaints that seasoned timber cannot be obtained?—Simply because there is no inducement given to the merchant to season the timber.

141. I think you suggested in your evidence that houses would be more expensive if the architects were a little more strict with regard to demanding seasoned timber?—The people who build the houses would have to pay a little more, but it would be beneficial in the long-run.

142. What would you say would be a fair thing to charge for seasoned timber—1s. a hundred extra?—One shilling a hundred would not look at it. It would probably be 2s. to 2s. 6d.

143. An extra 2s. a hundred would make a difference in the cost of the ordinary cottage of £10?—Yes, about that.

144. But there would be better timber in the house?—Yes. In Christchurch they are more particular, and their timber is better seasoned.

145. *Mr. Field.*] I mentioned that the price of rough rimu in Wellington was 10s., and Mr. Clarke mentioned 14s. 6d. I was referring to the sawmilling price, while Mr. Clarke was referring to the timber-merchants' price?—I could not imagine it was selling at 10s. I said it was only assumption on your part, because I could not believe that it was selling at that price. What is going on in the sawmill is one thing, and in the trade another. Before I came into the box you were talking about kauri, and some one made the remark that we could get very little of it. The line you asked me to give detailed figures of is one of the worst lines we have to handle, hence our desire to get Oregon not only on account of the benefit to the consumer, but because it is better for us to handle.

HUNTER MCANDREW sworn and examined. (No. 36.)

1. *The Acting-Chairman (Mr. Arnold).*] What are you?—District Engineer of Railways, Dunedin Section.

2. Have you been requested to make any report to present to this Commission?—No. I have simply come to give evidence, as requested by the Commission.

3. Have you any statement you wish to make?—I have taken out a few notes, but I do not know whether they cover the ground that you wish.

4. What timbers do you use for your sleepers?—On this section the majority of our sleepers are hardwood—jarrah. We use silver-pine and a small quantity of ironbark, a small quantity of grey-gum, and creosoted native timbers and softwoods.

5. You do not creosote in this district at all?—No, not in Dunedin. It is all done at Kew.

6. Can you tell us how many sleepers you have down in the Dunedin Section?—Roughly speaking, I should say about one and a quarter million—perhaps rather under that.

7. And they run about 25 ft. to the sleeper?—Yes, about 23 ft.

8. How many sleepers are you putting down on an average per annum?—Well, for the last three years the average has been 41,000, but it has been increasing. In 1907 we put down 35,000, in 1908 40,000, and this year about 48,000. That is for renewals.

9. Now, are the local woods absolutely unsuitable unless creosoted?—I would not say they are absolutely unsuitable, but the creosoting prolongs their life.

10. What do you say is the life of a local sleeper without creosoting?—Well, I could give you my ideas of the different kinds of timber. What I referred to just now was the softwood sleepers—rimu and kahikatea. I was not referring to silver-pine or totara.

11. What I want to get is the extended life caused by the creosoting process?—In that case, then, it may be well to state this: that on this Dunedin Section, owing to its being largely composed of curves, and sharp curves at that, from 5 to 7½ chains radius, the softwood sleepers are not particularly suitable. The action to which the rails are subjected under the traffic causes them to spread, and the spreading forces out the dogs, which necessitates very frequent regauging. That means bringing the rails into their proper gauge on the curve. That necessitates boring fresh holes for the fastenings in the sleepers, and after two or three gaugings you have got two holes in each intersection—one on each side—so that in three or four regaugings you have eight holes. These holes receive the moisture, which sets up decay. That determines the life of the sleeper. A sleeper which is perfectly sound except in the rail-seat is to all intents and purposes unserviceable as a railway sleeper. There is another matter which may be considered: the pressure on the rails has a tendency to force them into the rail-seat—what we call cutting the sleeper—and that interferes with the surfacing of your track.

12. And you use creosoted sleepers on the sharp curves?—We do use them if we cannot get anything else, but very sparingly. We use them almost entirely on the straights, and use the hardwoods on the curves. The hardwood resists both the cutting that I referred to and the spreading of the gauge to a much greater degree than the softwoods.

13. Is it a fair thing to say that a softwood sleeper has a life of about six years if it is not creosoted, and twenty years if it has gone through that process?—I would not like to make a general statement like that. I should prefer to pick out the timbers, and I would put them in this way, leaving out puriri, of which I have not had much experience: the order of value for general railway purposes is, in my opinion, as follows: If you include puriri, I put that first, then silver-pine, and I say that silver-pine has a life of from fifteen to twenty years on the straights, on the curves something like twelve to fifteen. That is uncreosoted—we do not creosote silver-pine or totara. Totara, in my opinion, has a life of from fifteen to twenty years on the straights, and from five to ten years on sharp curves. The creosoted softwoods are rimu, matai, and kahikatea or white-pine, and in my opinion the creosoted softwoods have a life of from fifteen to eighteen years on the straights, and on sharp curves from five to ten. With regard to uncreosoted sleepers, as far as my experience goes, rimu has a life of six or seven years, birch four to five, kamahi three to four; but I have not had much experience of kamahi. Matai is most irregular as a sleeper, and it has not a long life—probably three to five years—I have known them taken out in three years, and I should say the same with regard to kahikatea—three to four years. We have tried rata in small quantities, but not with success. That completes the list so far as my knowledge of softwood timbers goes.

14. Do you know what class of trees are being planted by the Government on the reserves?—No, except from the knowledge I have acquired from a visit to Hanmer. Principally larch was planted there.

15. Do you know whether those trees will be suitable for sleepers?—I should think so.

16. Do you think it would be a wise thing for the Government to see that a large number of trees suitable for railway use is planted in the Dominion?—I think so.

17. Is there anything else you would like to add?—I do not think there is anything further. I said that we were using hardwoods in large numbers now—mostly jarrah. The price at which we get the jarrah renders it economical that we should do so. Of course, you pay more for them than for the softwoods, but they have a very much longer life.

18. *Mr. Hanan.*] Can you give us any information as to the timber used in the workshops here—for car-building?—Not any detailed information. I have not much to do with the workshops—they do not come under my jurisdiction. They use kauri pretty largely, and Australian woods.

19. Do you care to express an opinion as to the need of conserving our forests?—Well, I do not know that I should, unless it be taken as the opinion of a layman. Personally, I should like to see them conserved.

20. Do you think that the importation of foreign timbers tends to conserve our local timber-supply?—I think it undoubtedly must.

21. *Mr. Field.*] Do I understand you to say that, speaking from a railway point of view, you thought it better to use Australian sleepers than our own?—Yes, speaking from a railway point of view.

22. You think your estimates of the lives of creosoted and uncreosoted sleepers are fair?—I think they are very close.

23. You have had a good many years' experience?—Yes.

24. The reason I asked the question was because it was mentioned by Mr. McCredie in Invercargill that it would last longer?—Did he differentiate between the straight line and the curved track?

25. Perhaps his was on the straight?—I said that in the straight tracks it would last up to eighteen years, I thought.

26. He said twenty years?—Yes, that is on the straight, but not for the curves such as I have charge of.

27. Have you seen the creosoting process at work?—No, I have not actually seen it at work.

28. You are not prepared to say whether the creosote-works are up to date or satisfactory?—I am not prepared to say that, but I understand they are up to date.

29. *Mr. Leyland.*] Have you any experience as to the life of a puriri sleeper?—Not a great deal of personal experience.

30. How long would you say was the life of a puriri sleeper?—I have seen a good many taken out of the track, and from inquiries that I have made—I am not depending on my own observation, but on the observations of others—I find that the consensus of opinion is that they are good for twenty years.

31. Mr. McCredie told us that the expense of creosoting was largely dependent upon the quantity of creosote used—that is, with an ordinary 8 by 5 sleeper?—Yes.

32. There is on the table here a pamphlet and specimens of birch creosoted and uncreosoted by the new American process called the Rueping process, which extracts the creosote. Have you had an opportunity of giving any attention to that particular system?—No, I have not.

33. *Mr. Morris.*] In reply to a question put to you just now you said you were in favour of conserving our forests—what would be the effect on our railways?—Well, I do not quite know.

34. Does not a large percentage of our railway earnings accrue from the carriage of timber?—Yes, certainly. I did not mean by conserving our forests the shutting-up of every mill, or not using any native timbers at all. I thought the question rather referred to the waste that had gone on through the progress of settlement burning up the timber.

35. I thought you wanted to lock up the whole thing?—I did not have that in my mind.

36. *Mr. Barber.*] Is the timber traffic on railways very profitable?—I cannot say.

37. Have you used for sleepers any trees that have been planted in New Zealand but not natural to New Zealand, such as the blue-gum, for instance?—No, I have not myself, and I do not think any have been used.

38. Are there any trees growing in New Zealand, not natural to New Zealand, that would be suitable for railway sleepers?—I think some trees in Canterbury would be suitable for sleepers, provided they grew big enough.

39. Do you think it would be in the interest of the Dominion to encourage the planting of these trees for sleepers?—I think so.

40. *Mr. Ell.*] You say that on the average for replacing sleepers in the Otago District about 44,000 a year are required?—Forty-one thousand was the average for the last three years—viz., 35,000, 40,000, 48,000, averaging 41,000.

41. Have the Railway Department, to your knowledge, discussed the question as to the future supply of sleepers for the railway system of New Zealand, which is growing very rapidly?—I do not think that has been very seriously discussed.

42. Do you think that, in view of the fact that there are big demands made in Australia upon their hardwood, and the unsuitability of our timbers here, which are unsuitable in respect to the curves, it would be a wise thing on the part of the Department to take the matter into consideration?—That would depend upon what the supply is over in Australia. I understand the supply is unlimited, for the present at any rate. That will be a question for the future, no doubt.

43. Seeing that we have a big railway system, and that our requirements will be very great in the future, do you think it desirable that the Railway Department should consider it and make provision by planting special and suitable timbers for this work?—I should think so.

ROBERT CHISHOLM sworn and examined. (No. 37.)

1. *The Acting-Chairman (Mr. Arnold).*] What is your trade, Mr. Chisholm?—I am a furniture-manufacturer.

2. You will know something about various kinds of timbers, both local and imported?—Yes.

3. You are acquainted with the Catlin's district?—Yes.

4. Would you tell us to what extent local timbers are used in your business, and generally as to their suitability?—Some local timbers are admirably adapted for furniture-making. The rimu, birch, and kauri are all extensively used for that purpose, and found very suitable. The rimu in particular is specially suitable, although perhaps you cannot say it is more so than kauri, as they are very much about equal in demand.

5. Is there much birch used?—A considerable quantity of birch.

6. Is it very suitable?—Yes.

7. What imported timbers are used?—Imported timbers are used pretty extensively. There is the oak, walnut, clear-pine, but especially the two former—viz., oak and walnut.

8. Could local timbers be used in place of those named by you?—No, they could not be used in place of oak, which is used where it is required and asked for. The difficulty lies in the fact that there is so much furniture imported both from America, Canada, and Great Britain, and the bulk of it is made of oak, mahogany, or walnut. Some people demand that their furniture should really be made of these woods, and they will have it so made if they can possibly get it.

9. You do not use Oregon, of course?—No, not in the manufacture of furniture.

10. What duty is there on oak and other timbers?—I think it is 2s. per hundred all the way through.

11. Do you think that should be increased?—No, I do not. I have a very strong opinion that it is a mistake to have the raw material in connection with and essential to any industry taxed even to the extent that it is at present. I think while it is necessary for the purposes of revenue that there should be a certain duty on almost everything, at the same time, it seems to me that those articles that are used in the process of manufacture ought to have the duty just as low as possible.

12. That is, if it cannot be done without?—In each of these cases it cannot.

13. You would have to import them if the duty were doubled?—That is so.

14. Is there much manufactured furniture imported now?—Yes, a good deal.

15. Is it decreasing?—Yes, it is decreasing.

16. What is the cause of that?—The cause of it is that the duty that was placed some years ago upon imported furniture—viz., 25 per cent.—assisted the local manufacturers very considerably; many articles are now being made to compete successfully with the imported article.

17. The introduction of machinery, I presume, has enabled you to manufacture cheaper?—Yes, that is another and important factor enabling us to compete with the imported article. There is now about ten times as much machinery in use as there was ten years ago.

18. Your factory is up to date, then?—Yes.

19. The total cost is less all round now than it was years ago in consequence of improved methods?—I do not know that you can say that the total is less. I should say that it is more. The additional cost of labour and the additional cost of timber has increased the cost of production very considerably, even to a much greater extent than is made up by the introduction of machinery.

20. To what extent does the extra cost of timber affect your industry?—I should say it is affecting the price, probably from 10 to 15 per cent.

21. Do you think the price of timber to-day is too high?—Well, there is always a buyers-and-sellers standpoint from which the price is viewed. From what I have seen in the papers I should say that the timber-merchants are not making a fortune. I do not think, myself, when you compare the prices, that there is much to complain about. As time wears on, the sawmillers have got to go back farther, and consequently the cost of the production of the timber is increased. I do not think that the price that is charged at the present time for timber is unreasonable. Still, the very fact that we have to pay very much higher has raised the price of production.

22. I want to ask a question or two away from your own trade; have you had any timber from the Catlin's River district?—Yes.

23. What class?—Rimu and birch.

24. It is suggested that the timbers of that district are inferior to those of Southland?—I would have no hesitation in saying that the West Coast rimu is a superior class of timber to that of Catlin's River. It has many advantages over the latter. The tendency of most timber from Catlin's to twist is a good deal more, and it is not quite so suitable for cabinetmaking purposes as West Coast timber.

25. What about Southland?—In some parts of Southland there is bush where the timber resembles the West Coast timber a good deal, but, generally speaking—and I think one is perfectly safe in saying—the West Coast is superior to either Southland or Catlin's. In fact, three-fourths of the timber used by us comes from the West Coast, and has always done so.

26. *Mr. Field.*] You said you were against putting a duty on the raw material. Do you regard inch boards as raw material?—Yes, I do, because they are brought in here for the purpose of being manufactured. There is no single board but what is used in some article or another.

27. I am not speaking of Oregon boards put directly on to buildings as they are?—You never have oak or walnut put into buildings without being manufactured. My remarks did not apply to Oregon.

28. *Mr. Morris.*] You told us that the duty put on imported furniture assisted the local trade?—Yes.

29. You advocate duty on imported Oregon?—I never mentioned such a thing. If you had asked me the question I would have said, Certainly not. I never expressed the opinion as to whether there should be a duty on Oregon or not.

30. We are told that rimu is not suitable for joinery-work. What is your experience?—Rimu is admirably adapted for many articles in furniture-manufacture.

31. Then, it does not twist about?—It is all nonsense to say that it twists more than other timber. Red-pine is like every other timber in the matter of twisting. Care should be taken as to the season of the year in which it is cut. Given that, with proper seasoning, and provided the rimu is of fair quality, it really will not twist any more than the majority of the imported timbers. It is equally as good as the majority of imported timbers. We have tested it thoroughly.

32. Do you find that it stands as well as kauri?—It stands better than kauri in many ways. I do not think that a piece of rimu is so liable to twist as kauri. It is certainly not so liable to shrink. One objection to kauri is that it is so subject to climatic influence. If you put it into an article, no matter how dry it may be, if it is subject to damp it swells, and swells very much. It is far more subject to that than rimu. Rimu is as good a timber as you can get to stand, and is as free from warping, twisting, and all such objections as other timbers.

33. Thank you, Mr. Chisholm, I am glad to get a testimonial for our West Coast timber?—I was not aware that you were from the West Coast, and what I have said is the result of my own experience.

34. *Mr. Barber.*] Have you any difficulty in getting timber for the furniture trade?—Yes, we have experienced considerable difficulty in getting kauri and rimu, especially rimu, owing to the immense quantities that are being exported to Australia. I have had some orders on the West Coast that have not been completed for many months, and I have been put to a great deal of inconvenience through it.

35. Do you think, if Oregon was allowed to be imported to take the place of kauri beams, and seeing that it is necessary to use kauri for building purposes, that it would assist the furniture trade throughout the colony by making their supplies more easily available?—It is quite evident that the mills in Auckland have not, so far as our experience in Dunedin goes, been able to supply the local demands. Whether this is through the export trade being of such importance to them that they ignore the local trade, or whether they are not in a position to furnish the requisite supplies, I cannot say.

36. *Mr. Ell.*] With regard to the cost of oak and walnut used in the higher-class furniture, what does that run out at per foot—that is, landed here?—It varies considerably. For instance, from Canada you can get it much cheaper than from the States, and lately the markets have been slackening somewhat. Plain oak and quartered oak differs a great deal in price. You would be safe in saying, from about 8d. to 11d. per foot—that is, with the duty.

37. What is the cost of rimu, per foot, for cabinetmaking purposes?—Rimu for cabinetmaking purposes has to be special—that is, specially selected. Bear in mind it is not just ordinary building-timber, and consequently the prices ruling generally for good rimu for cabinetmaking purposes are a little more expensive; and the size determines the price. It would be about 9s. on the West Coast. Then, there is freight. It costs us about 13s. 6d. landed in our yard.

38. That is about 1½d. per foot?—Yes.

39. There is no possibility of oak and walnut interfering with the local timber?—Absolutely none.

40. Both these timbers are absolutely necessary to the maintenance of a big industry?—Yes. It means that you have either to import the article already made or manufacture it here from the material.

41. It would place the manufacturer to better advantage if the duty were removed?—Much better.

42. You use rimu, and beech, and kauri in the manufacture of furniture?—Yes.

43. In view of the fact that this industry is a standard industry in New Zealand in supplying furniture for the homes of the people—and they are increasing in number—do you think it would be wise on the part of the Government to make some timber reserves so as to provide for the future need of this and similar industries?—I do think so. Referring to the district which the Chairman has mentioned—that is, the Catlin's district—I think, if it could be done, reserves should be created there. I feel grieved at the enormous waste of wealth that is going on in the destruction of timber. Good timber, valuable for all purposes, is being burned simply to have the use of the ground for cultivation.

44. Do you consider that a most wasteful policy?—I do.

45. With regard to beech and rimu, you stated, I think, in your evidence that if these were cut at the proper time of year, when the sap was down, that it would make them more useful and more valuable for your purposes?—Yes, I think that is where an injustice has been done to our timbers. It is almost criminal the waste there is at present. As to beech, especially, it is a timber the value of which up till recently has not been understood. It is much more valuable than we formerly believed. In my judgment our beech will come to be a most useful timber and valuable asset to the Dominion, if cut in the proper season.

46. That is, particularly for furniture-making and for chairmaking?—Not only that, but for anything that requires texture. So far as we are able to test it, it is almost equal to American ash and beech. It is of a very tough nature, so that for various purposes in connection with agricultural implements, for instance, it will become a most useful timber. It will stand a strain almost equal to ash or beech.

47. Seeing that much of this beech grows on a country which is not very valuable for other purposes, would it not be a wise thing to set aside some beech forests?—Yes, I think it would be,

and we set the example. We purchased a bush section in Catlin's about twenty years ago, and we have not allowed a stick of it to be cut, because of the value we attach to it. We are holding it there in reserve.

48. I would like to ask you as a citizen, and one who has devoted a good deal of attention to this subject, would it not be a good thing to establish a school of forestry?—One of the most necessary things to do.

49. Can you say what is being done by the Forestry Department at present?—Not very much. They have showed some diligence during the past few years in planting areas down South here. I think that, in the face of the wanton destruction of so much native bush, and the wholesale way that it is going on in the Catlin's and other districts which I have seen, it seems almost anomalous to be spending so much money in planting timber.

50. Do you refer to destruction of timber in rough and broken country?—Yes, I have seen many places where the bush was being wantonly destroyed, and where the land could be of no earthly use for any other purpose, such as on very steep faces on hillsides.

51. *Mr. Field.*] I got a letter this morning from a gentleman at Riverton who complains of the loss they are put to in consequence of the duty now levied on beech in Australia. Do you think they are suffering from a substantial grievance in that respect?—I think that the Commonwealth Government are standing in their own light by putting on a duty for the purpose of preventing the importation of timber like our beech here. The Commonwealth imports very extensively from the United States, and I am perfectly satisfied that our beech will stand a strain equal to and possesses a texture as good as any of those timbers.

52. *Mr. Ell.*] I think you stated in your evidence that you had an order outstanding for some time on the West Coast, and that you were unable to get it executed?—No; I have not an order standing ot the present time. I do not think there is the same difficulty experienced in getting an order filled on the West Coast now that there was nine or twelve months ago. My remark did not apply to the present time.

53. *Mr. Morris.*] You obtain your supplies from the West Coast—practically from Mr. Malfroy?—Yes, he cut considerable quantities for the Exhibition. I know that a great deal of rimu has also been exported from New Zealand to the Commonwealth. There was an extreme difficulty in getting orders filled from nine to twelve months ago.

54. Are they large exporters to the Commonwealth?—Yes.

55. You say there was no rimu being exported to the Commonwealth until the last twelve months?—No rimu has been exported to the Commonwealth for years.

CHRISTCHURCH, TUESDAY, 6TH APRIL, 1909.

SAMUEL HURST SEAGER sworn and examined. (No. 38.)

1. *Hon. the Chairman.*] What are you?—An architect and Fellow of the Royal Institute of British Architects.

2. You are aware of the objects of this Commission, and we should like some information from you concerning the various paragraphs in the order of reference?—I do not know that I can give any information on those points, because I am an architect and do not know anything with regard to the cost of felling or the distribution of the timber, but as an architect I should like to bring some points before the Commission. My first note is on the relative value of Baltic and yellow deal as compared with New Zealand timbers for joinery. The New Zealand timbers suitable for joinery are kauri and rimu. The reason that imported timber is more often used is on account of the unreliable character of the New Zealand timbers. The different classes of timber are not sorted, so that it is impossible to tell what class of timber is being used. There is no better timber, I consider, for joinery than one variety of kauri, but this is mixed together with other varieties which are wholly unsuitable, so that no dependance can be placed upon it by architects. We have, therefore, to fall back upon the imported timbers, which are very carefully graded sometimes in Europe into as many as nine classes, the majority into four and five classes, all having distinct brands. In this way uniformity in any particular line is secured. The same remarks apply to rimu; plain, straight-grained wood is mixed with wood of irregular fibre, which, eminently suitable for decorative purposes, is quite unfit for any position of strength or for any position where freedom from casting and warping is essential. Kauri—the disrepute into which it falls from want of proper classification: Although there are four varieties of kauri timber, which could be easily classified, the timber is spoken of as a whole, in spite of the fact that these different varieties have very distinct and opposite qualities—for instance, one variety which has been distinguished as red kauri is very liable to cast, and twist, and shrink longitudinally as well as transversely. Another variety, which has been called the white kauri, does not warp, and does not shrink longitudinally if fairly seasoned. Another variety, called soft kauri, has the same qualities as the white kauri. Again, in respect to its weight-bearing qualities, the red kauri is very strong, and therefore suitable for beams and joists, as also is the white kauri, but the soft kauri will bear very much less transverse strain, and is wholly unsuitable for beams or heavy framing. In respect to durability, there is a variety called the black kauri, which, though unsuitable, on account of its being charged with resin, for joiners' work, is, on the contrary, the most durable of them all. Unless, therefore, these different varieties are distinguished by proper markings and sold separately, it is impossible to rely upon them for any particular purpose. These different varieties, it should be stated, can be found in one tree, the red being obtained from the central

portions and the white in the outer. Black kauri is heartwood excessively charged with resin, and the soft kauri is a local variety. Although these different kinds possess such very different characteristics, no distinction is made in the books of reference. It is all spoken of simply as kauri, and therefore one series of tests will be remarkably different from another, and the conclusion which has hitherto been drawn is that kauri is such an unreliable wood that it should not be used. In every series of tests not only should the exact variety be distinguished, but the position which the piece tested occupied in the tree should be stated. Timber taken from the butt end of the tree is stronger than that from other portions. Black-pine, its confusion with miro: The same difficulty from lack of classification exists in relation to the woods used for durability, for, while matai or black-pine is a timber of great durability, the timber miro, which resembles it in appearance very closely, is extremely undurable; and, again, although not durable if in contact with moisture, it is very much stronger than black-pine, and is of great value for beams if under cover, whereas black-pine is more brittle, and if used for beams in place of miro will result in failure. In rimu also there are misleading differences in the qualities of wood cut from various parts of the tree. For instance, heartwood from large trees is extremely durable, being impregnated with resin, while heartwood from small trees is much less durable, and could not, therefore, be used when in contact with the ground. A reliable handbook needed: The great difficulty architects have to contend with is that there is no good, reliable handbook on New Zealand timbers. Good work has been done in the past by engineers, but the results which they have published are so conflicting that it is impossible to know which to follow, and one serious defect is that one set of tests cannot be compared with another, because they worked under different conditions with different sizes of timber, and an exact description of the wood is not given. Mr. T. Kirk's book on Forest Flora of New Zealand is a very valuable one, but it is chiefly botanical, and Mr. Kirk points out the weakness in his record of "Strength of Timbers," and expresses the regret which all architects must share that a "series of experiments with the chief New Zealand woods had not been made in which these matters would have received proper attention, and to accompany the statement of results with drawings of the structure of each kind as shown under the microscope; but this has been frustrated for the present by the abolition of the Forestry Department." This was twenty years ago. I am not sure that this defect has been remedied. At any rate, no work of the kind is to be found in our Reference Library. The essential need, then, for architects in relation to the timber industry is that all the different varieties of building-wood should be very carefully tested on a uniform system, and small samples for reference supplied, together with full particulars of their qualities. In addition to this, all timbers should be sorted into their proper varieies at the mill and marked in accordance with a uniform system to be determined. The use of timber in contact with the ground: There is one essential point in respect of the preservation of timbers used in contact with the ground, as telegraph-poles, posts, gate-posts, &c., and that is, whether or not timber which is placed in the ground the reverse way from its growth lasts longer than that which is placed with the butt end down. Opinions at present are divided, and, as this is an extremely important question in a country where so much fencing is done and so much timber used for telegraph-poles and posts, it is one to which a series of careful tests on a scientific basis should be directed. I have shown there are four distinct kinds of kauri which have very distinct properties, and therefore it is wholly misleading and of no value at all if a piece of kauri is taken to an engineer unless he knows and distinguishes at once the exact class of kauri and the position in which it was grown. I have a small pamphlet here published by the Bureau of Forestry in America which I will hand in for the information of the Commission. It explains my idea of the kind of thing that should be published in reference to our own timbers.

3. *Mr. Ell.*] Have you been in business in Christchurch for a number of years?—Yes, since 1885.

4. Can you give the Commission any information with regard to the cost of building-timber now and, say, ten years ago? Has it advanced to any great extent?—I cannot remember that. It is much dearer than it was a good many years ago. I remember you could get good building-timber for 9s. 6d., and now it is 14s. 6d., but I am only speaking from memory. It is certainly very much dearer than it was some years ago, but as to the exact dates I cannot remember.

5. Now, in regard to the nature of the imported timbers in connection with the building industry, can you give us any information as to the kinds of timbers which you think are more suited than the native timbers for building purposes?—Yes, yellow-pine and Baltic. It is absolutely essential we should be able to get them because it is impossible to obtain the white soft kauri of which I have spoken. We cannot really depend upon getting it here, and the consequence is, we have to fall back and insist on Baltic and yellow deal from America.

6. With regard to the cost of those two imported timbers and kauri, is there any very great difference?—That I should not like to say from memory, but they are dearer than kauri as far as I remember. I have been away from Christchurch for some time, and perhaps they have varied since I left.

7. Then, they would not come into competition with kauri so far as the prices are concerned?—I do not think so.

8. Then, with regard to its being better for certain purposes?—It is essential to use it.

9. What other timbers do you think essential to the timber industry?—I think Oregon pine is not absolutely essential. I think we could get on very well without it. It is certainly a remarkably good wood, but good, first-class rimu in nearly every instance could take its place if available. I have always used the native rimu, and have not used the imported timbers unless specially asked for by the client. Good rimu, I think, is an excellent building-material, and if it could be obtained in good quality nothing better could be wished for. I do not think Oregon pine is as essential in New Zealand as Baltic pine and yellow deal.

10. With regard to the sizes, can you obtain in New Zealand timbers in the sizes required for building purposes in connection with large buildings?—Yes, I think so. You cannot, of course, obtain New Zealand timbers in the size or length that you can obtain Oregon pine, but now we use steel joists in the place of beams. Previously timber was used for the flooring, and it was essential then to get long, sound beams, but now we use steel girders in their place, and therefore it is not essential to be able to obtain straight beams of great length or growth. I do not think, with New Zealand timbers, that we should find it impossible to get all we required in that respect.

11. Now, with regard to the cost of building a five-roomed cottage ten or twelve years ago and now, has there been any great increase in the cost consequent upon the rise in the price of the timber?—It is certainly much dearer than it was.

12. How much do you think the advance in the cost has been?—I think somewhere about 15 per cent.

13. On the cost of the timber?—Yes.

14. *Mr. Field.*] Is that the total increased cost of the building?—Yes; say, the building is dearer by some 15 per cent., covering all things.

15. *Mr. Ell.*] I am confining my remarks to the timber only?—Without reference, I could not say.

16. But there has been a considerable increase?—Yes, there has been.

17. Do you think that has anything to do with the slackening of the building trade? There is a slackness at present, is there not?—I do not think so.

18. To what do you attribute the present slump in the building trade?—To the tightness of the money-market, and also to the fact that there has been such tremendous building activity in the last four or five years, and that such sufficient building has been done up to the present. That, together with the fact that it is not a favourable time for building, is the cause of the slackness in the building trade. I do not think the increased price of timber would influence the clients at all.

19. Have you had any difficulty in obtaining supplies of timber for building?—No.

20. Always a ready supply?—Yes.

21. Have you had any restrictions placed upon your securing supplies—have any millers refused to supply you or your clients?—No; it is always done through the timber-merchants and the builders. I have never heard of any objections at all.

22. If a builder is outside the association, have you ever heard of a miller refusing to supply him with timber?—No; but what I have heard is that if I dealt direct with the timber-merchant I should have to pay so much more than the builders who deal direct with them. They allow the builders so much in addition to their 2½ per cent. for cash. I understand they allow them a commission on all the timber they purchase—an allowance. If they are recognised builders or members of the Builders' Association they can obtain timber at a lesser rate than I can. When I say "I" I mean the rest of the public.

23. If a builder is not in the Builders' Association, would he get that discount?—I believe not—I have been told not.

24. Then, in regard to the uses to which kauri and rimu are specially adapted, you have had a good deal to do with such work. I want you to give the Commission your opinion with regard to the adaptability and the ornamental and utilitarian character of rimu for the inside work of houses?—I think I was one of the first architects here to realise the ornamental character of rimu, and I used it in the City Council offices here in 1884. It is an extremely beautiful wood, and I consider it compares very favourably for joinery-work with some of the best ornamental timbers to be found here, and I have used it continuously. I scarcely ever put up a house without using that timber, and have found it always extremely satisfactory, only with this qualification, that there has always been a difficulty in the fact that every line has been terribly mixed, and one has had to exercise the greatest care in examining every individual piece of timber that goes into the building to see whether or not it is the class of wood you want. That should not be. We, as architects, ought to be able to specify a particular class of timber, and we ought to know that that quality of timber is kept separate from all others, and that the timber-merchant would supply it. That is the great need for us as architects. It is not so now; it is all mixed together. There is some difference made if timber is particularly bad. For instance, if lying in the merchant's yard, a yardman throws on one side pieces obviously inferior as a separate line. My point is this: that it is not those which are obviously inferior that matter—everybody can see a bad stick for themselves, and it should not be used; but there are essential differences in the qualities of good timber depending on the part of the tree from which it is cut, and these ought to be separated and kept apart. Then, the difficulties in the use of it would be very much lessened, and we should be less tempted to use imported timbers. I might just mention in reference to rimu that I have used this largely for doors and joinery generally, but in several cases I have had, say, twenty doors made for a work, and perhaps eighteen of those doors will stand splendidly—not a twist or a warp—but the other two, simply by want of classification of timber will twist so much out of shape that they will have to be taken down and discarded. It is that unreliability in regard to the timber which makes us so anxious whenever we use New Zealand timbers.

25. *Mr. Ell.*] Take timbers properly classified and treated: do you know of any imported timber likely to replace rimu for these special works?—Oregon does.

26. Is it ornamental?—Extremely so; it works up to a beautiful finish, and the difference between the summer and winter growth is so marked that if cut on the slant you get a beautiful figure, taking a high polish, and very ornamental. It takes stain readily, and the stain sinking into the softer part of the wood gives a deeper stain, and consequently a fine variety of colour. It is really an excellent wood, and would be likely, if rimu was not available, to take the place of rimu very largely. It is now the same price as rimu.

27. You referred to winter and summer cutting: which is the best time of the year to cut New Zealand timbers?—Winter, undoubtedly.

28. If they are cut in summer-time, is that detrimental to the quality?—Undoubtedly, and it is for that very reason that the New Zealand timbers are so variable, the marketable lines of it: some being cut in summer, some in winter—some shrink enormously, and some stand remarkably well. We have no guarantee that it is cut in summer or winter; it should be so marked; and, indeed, none should be summer-cut—it should all be winter-cut.

29. Two other architects have given us the same opinion. Do you think it is desirable, in view of this fact that more authority should be exercised over the cutting of the trees by the Forestry Department?—Undoubtedly. I consider that a thing of the very highest importance, for the simple reason that the timber is of far greater commercial value if cut at the right time of the year.

30. With regard to the lasting qualities of a house built with seasoned and with unseasoned timber: can you say the difference?—One built with unseasoned timber would show signs of decay in perhaps ten years, and one built with seasoned timber might last up to fifty or sixty or even a hundred years. I have seen timber taken down from old houses which has been there thirty to forty years, as sound as the day it was put in. This was New Zealand timber. It must have been thoroughly good seasoned timber to stand that time. If you put in unseasoned timber you have within that timber the elements of incipient decay, which would be bound to develop, and in a very few years the whole would be of far less value.

31. Then, your experience leads you to the opinion that if houses in New Zealand were built with more seasoned timber they would have a longer life?—Yes, undoubtedly, and so be incalculably more valuable to the community. A house would commence to decay in ten to fifteen years in the one case, and in the other case it would live generations.

32. It would be a financial gain to the people of New Zealand if houses were required to be built of seasoned timber?—Undoubtedly.

33. Have you any difficulty in obtaining seasoned timber?—Very great; we cannot get it. I believe lately the timber-merchants are stacking timber and charging 2s. extra per hundred, but then we cannot always rely on getting that. My own experience is—perhaps now it might be different—hitherto it has been impossible to get seasoned timber. It has come generally straight from the mill to the timber-merchant's yard, and straight from there to the building—often straight from the mill to the building—so that it is impossible to get seasoned timber. The only way is to specify that the building should stand for a certain time, when the framing is up, to dry.

34. You say they charge 2s. extra for seasoning?—For stacking. That does not imply that the timber is seasoned, it only implies that it has been stacked; whether or not it is seasoned by that stacking we have no guarantee. It takes a considerable time, according to the size of the timber, for seasoning. Five or six months is the very least time for small scantlings; some timber ought to stand for years.

35. The difference in price in 1896 is 1s. between seasoned and unseasoned?—It is 2s. now.

36. With regard to the future needs of this country, for manufacturing and for building purposes, what do you think we should do for the future supplies of timber? Should we make certain reservations until such time as our planted trees have matured?—Yes, I have always thought that. It seemed to me to be almost criminal to burn down thousands of acres of splendid trees, as has been done in various parts of New Zealand. It seems to me that we have among our New Zealand timbers all that is required for all building purposes, if properly cut, sorted, tested, and marked. We could then rely on all the timbers we have, and there would be no need to import from elsewhere. I do not know how much of this soft kauri—silver-grained kauri—there is, but if the supply of that is very limited, then we should have to rely upon the imported yellow-pine or Baltic to take its place; but, assuming that variety of kauri to be available, then that is as good a material for joinery as could be obtained anywhere in the world.

37. In view of the fact that kauri is fast diminishing, and according to the Lands Department will be cut out in fifteen years, do you think it desirable to have an export duty upon it?—Yes, I should certainly think so.

38. You speak about people not having sufficient knowledge of our trees, and you have evidently read up something about the forestry laws of other parts of the world. Do you think it would be wise to establish a School of Forestry, as is done in Japan, Germany, America, and France, and other countries?—I certainly think it would be a very excellent idea.

39. To intelligently plant and care for our plantations?—Yes, certainly.

40. *Mr. Hanan.*] Is the building trade brisk in Christchurch now?—I have not known it so slack for very many years.

41. How do the buildings erected in the last five years compare with those erected ten years ago, as regards the class of timber, durability, and permanency of the building?—I do not think there is much difference, because we insist always in having good heart timber, and as long as we get that (we have to get it now with very great difficulty, and we should be able to get it easily) the house will have a good life, providing the timber is properly seasoned.

42. Are you putting in that seasoned timber?—Now it is impossible for us to get it oftentimes. We specify that it shall be seasoned, and we take care to get the timber as quickly as possible after the contract is let, to stack it, and to delay the building in order that the timber is as far seasoned as we can get it; but as to obtaining thoroughly seasoned timber from the timber-merchant here, that hitherto has been impossible. However, as I say, I think they are recognising the necessity of obtaining seasoned timber, and are taking more care than they did in the past. When the building trade was extremely brisk there was not time—the timber came straight from the mill to the work, and they could not accumulate stocks; now it is possible to

accumulate stocks which can stand for years, so that in future there should be no difficulty in obtaining seasoned timber if only they lay in good stocks.

43. Have you any difficulty in obtaining good heart of rimu?—Yes, it is all mixed with partly sap-wood. There are some excellent sticks among the lines, and these have been sorted out. It is impossible to get all heart; we have to take the heart with the outer wood. I have not noticed if there is a diminishing quantity of heart. Some timber I have obtained lately is quite good quality, but it all has to be sorted.

44. Where do the Christchurch people obtain their timber-supplies?—That I could not be sure of. Some of it comes from the south, and some timber from Pelorus Sound, and some from the West Coast. Still, I am not an authority on that; I cannot state exactly where they do obtain their timbers from. Different merchants have different mills in different parts.

45. In Dunedin they complained strongly about not being able to obtain good heart red-pine, and also in Invercargill?—Yes; I have not found any great difficulty, only that it has to be sorted—that is where the difficulty rests. You have to buy a large quantity to be able to pick out exactly what you want.

46. Have you much difficulty in obtaining kauri here?—The kind that is suitable for joinery-work you cannot get here; that is the reason why we fall back on yellow-pine and Baltic.

47. Is there much speculation in the building trade here—builders putting up houses as a speculation?—Yes, a great deal of that.

48. Has that fallen off lately?—Just now it has fallen off considerably, but a few years ago whole neighbourhoods were springing up—put up by builders as a speculation. Large districts sprang up like mushrooms, and perhaps the whole speculative.

49. You spoke of the preparation of a book dealing with New Zealand timbers: would you suggest by whom that book should be compiled?—No; I could scarcely suggest that, because it would be the work not of one man, but the researches of several working on a uniform line. For instance, all the testing would have to be done probably by Professor Scott, of Canterbury College; but if the book was to be valuable he must work in conjunction with others, so that all might be done on a uniform system. One man would have to go to the forest to see the particular tree, get it cut on a definite system, the different pieces marked as to locality and position in tree, and so on. It is valueless to take a piece of timber by chance and get it tested; a test is worthless unless we know from what portion of the tree the wood came, and we want to know whether the tree grew on swampy ground or high and dry ground. If the latter it would be much stronger and more solid. Therefore there should be a sort of committee working together to give us all this reliable information.

50. Do you favour an increase in the duty on Oregon pine?—No, I do not think I should, because we should not use it if we developed our own resources.

51. By allowing it to come in, you think it would conserve our timber-supply?—Yes, it is certainly useful in that way. It would tend to conserve rimu, because it is used in place of kauri and rimu now for joinery-work and ornamental purposes.

52. As to imported timbers, do you not think they have helped the building trade of this Dominion?—You mean that buildings have been put up which otherwise would not have been put up? I scarcely think that.

53. Do you think the price of timber has anything to do with diminishing the building trade?—No, I do not think so. If a person wants a house he will build it.

54. As to seasoning, have you got any scheme to suggest?—Natural seasoning is the only proper way—that is, to take care that the timber is cut at the right time of the year, that it is carefully stacked with fillets between, under a covered shed with open sides, so that the air can pass freely between every piece; that is the only good rational way. Any forced system of seasoning by hot-air chambers dries up the sap too rapidly and renders the timber brittle.

55. Would not that add to the price of the timber?—Yes, because the capital would have to be sunk in the timber, and would remain there perhaps for a year or more, and interest on that money would have to be added to the cost of the timber. That is perfectly natural, and we are quite willing to pay the extra money which the merchants ask for the seasoned timber.

56. Speaking of the working-classes—those of them having buildings erected—do you find that the price of timber is too high to be within their reach to build houses?—That I could not say. Architects usually do not have such people for their clients. These people generally deal direct with the builders, or else buy a house put up by a builder as a speculation.

57. Have the majority of houses been put up by architects?—Oh, no! the majority are the work of builders. For every house an architect does there might be perhaps ten put up by builders—that is, the small class of houses.

58. How does brick compare with wood for building?—Brick is dearer. It is extremely difficult to determine the exact difference in cost; it depends largely upon conditions as to finishing. It generally happens that when a brick building seems to be dearer a great deal of expense is in the proportionately more expensive finishing. A brick house is usually a better class of house than the timber house; therefore the extra cost is not wholly on account of the bricks used. The actual amount of walling done in brick is certainly above the cost of the same amount of walling in wood; how much more is merely a matter of calculation.

59. In the long-run the brick building would be the cheaper?—I do not think in the long-run it would be much cheaper, with this important condition: that the wooden building is built of thoroughly well-seasoned and proper heart timber. In a brick building the greater part is of wood; often only the outside walls are of brick; there are wooden roofs, floors, and joinery, and that has all to last in the brick house as in the wooden house; more than half a brick or stone house is wood. The floors always go first if the timber is unseasoned, and they will go as fast in the brick house as in the wooden house.

60. During the last three years is it not a fact that most of the timber going into the houses you are erecting here has been unseasoned timber?—Oh, yes! that is so, because it is impossible to get it properly seasoned.

61. And, of course, you do not give these houses as long a life in consequence?—No, they will be a source of expense to their owners by reason of repairs and depreciation.

62. Do you know if the white-pine borer is here?—Oh, yes! it is very strongly in evidence in Christchurch. I have seen houses practically riddled with it.

63. And that has helped to sell a number of houses in other places?—It may be. Generally people are glad to get rid of a house with borer in it. I have dealt with houses affected in this way, with sheep-dip; thoroughly saturated all parts attacked; that will check the ravages. I have used Little's sheep-dip, but any arsenical or non-arsenical preparation would do, I suppose. I always take the precaution, when making additions to an old house, to coat the whole of the new timber where it touches the old with a preparation.

64. In Dunedin and Invercargill they had not yet dropped on an effective preservative or destroyer, and you say you find sheep-dip effective?—Yes, it checks the borer wonderfully. I found that out by trying it on a house in which I was living myself. The borer otherwise gets into the soft woods, and the furniture, and into rimu, and even black-pine when adjacent to white-pine. If there is no white-pine the germs do not seem to develop, but white-pine seems to form an active nest, from which the borer attacks the other timbers; so that we have long since given up white-pine for good work.

65. *Mr. Field.*] Talking about the grading of our timber, do you think it can be done fairly inexpensively?—It would cost next to nothing. When it is at the mill the timber could be made into different heaps just as well as into one heap.

66. It would not require close examination of each piece of timber?—No, because at the mill they would know from which part of the tree it comes, and the qualities, as far as we can determine, are owing to that. All European timber is marked, every stick of it, with a special brand showing to which class it belongs; and, as I have said, sometimes as many as eight or nine different grades are classified with one timber.

67. As a rule, every grade can be obtained from the same tree?—In respect of kauri that is so—all except the soft or silver-grained kauri, which grows in a particular locality. That is why the grading should be done at the mill.

68. With regard to seasoning: I suppose anybody can get seasoned timber if he wants it?—He can season it himself, and we take that precaution, and always get the timber immediately. The builder is under penalty to have the timber on the ground immediately, and it remains for as long as necessary to season it; but with the greater number of houses put up for speculative purposes no such precaution is taken.

69. Do you think the practice of putting up unseasoned houses is so rife that there ought to be some legislative restriction put upon it?—Yes, I have always thought that. It is criminal to put into buildings unseasoned timbers, and people ought to be forced not to build with unseasoned timbers; in other words, it should be easier to obtain seasoned than unseasoned timber.

70. With regard to the 2s. extra for stacked timber: does that obtain in Christchurch?—Yes, that is on the lists of to-day—2s. extra for stacked timber.

71. You do not know the practice in other places, of course?—No.

72. Do you express an opinion as to whether the post or pole should be put with the butt or top down?—My own opinion is that it should be put with the top of the tree in the ground, and if put in such a way I think it will last longer than with the butt down; therefore timber which has to be used in such positions should be marked for the top and the butt. That opinion is held by many, but there is a difference among experts, and it is in the interests of the timber trade that it should be determined scientifically which theory is right. My theory is that if put in the way the timber grows, the moisture will more readily penetrate.

73. You have deservedly earned a very high reputation as an architect, and have given a good deal of thought to this timber question?—Oh, yes! I have given careful study to it. It is included among the subjects for examination for the A.R.I.B.A.

74. With regard to the increase in the price of timber, has there been any complaint on the part of persons building houses, builders or private persons?—There have been very many complaints about the price of building generally, but then the price of building is not dependant only on the price of timber, but also upon the high rate of wages, which makes building so dear, more even than the price of timber.

75. Bricks and other materials have gone up in price?—Oh, yes! everything has gone up from what it was a few years ago, and, of course, the high rates of wages are accountable for the high cost of building, very largely indeed.

76. Take an ordinary seven-roomed house, well-finished: what proportion does the timber bear to the cost?—Generally about one-half, I think—that is, for a well-finished cottage having a good deal of internal fittings, but without calculation I cannot give accurate information on this point.

77. You were rather hazy as to the increase in price of timber. The increase, according to our evidence, was 2s. to 1s. 6d. per hundred?—I remember getting rimu at 9s. 6d., and now it is 14s. 6d., from the timber-merchants in each case.

78. Was there any difference then and now between the discounts allowed?—It is only of late years—two or three years—that discount has been allowed to the members of the Builders' Association (when the builders' associations amalgamated) and not allowed to the private purchaser.

79. I understand that you are very much against the destruction of our valuable native timber?—Yes, I regard it as a calamity and a crime that thousands of acres of our valuable timber in the North Island should be destroyed as is done.

80. Have you heard anything from the North as to the statement that Oregon is competing largely with our rimu?—Not from the North, but I know it is here. It is getting a very ready sale. I went to the yards only yesterday, and saw a large stack had been removed within the last few days, all of Oregon timber.

81. For what purpose is it used?—For ordinary building purposes. It is taking the place of rimu in every respect, as far as I know.

82. For framing and flooring and outside work?—Not for flooring—it is not suitable for that—but for other purposes. The difference between the soft wood and the harder growth is too great, and so it would make an uneven floor. Baltic is not suitable for flooring for the same reason; it is apt to splinter. Oregon is used principally for framing, not for weatherboards. I have not seen it used for linings generally, but I have used it myself and have seen it used for decorative panels, for which it is very suitable.

83. It is used very largely for the purposes for which our rough sawn rimu is used?—Yes, it takes the place of that largely.

84. There is plenty of sale for figured rimu?—We cannot get enough of it. I have had great difficulty in getting it, and have had to pay £1 2s. for it sometimes.

85. It is readily understandable that where mills can sell the whole of their best rimu, they may have some difficulty in selling the rougher stuff if Oregon is replacing it?—Yes, that is most likely, but there would be no difficulty in getting rid of good rimu as long as it was available. I should always use it myself.

86. You are aware that a large amount of rimu is being discarded at the mills—near the bark—timber that would be fit for sheds, &c.?—Some of it is, but there is not enough thrown away. Too much sap-wood comes down.

87. Although the sap-timber could be cut into boards, you think it should be thrown away?—I think it is a waste of labour to use it even for shed purposes. It has a life of only a few years, and should never be used except for the merest temporary erections.

88. Have you any opinions on the fiscal question? Are you a Free-trader or a Protectionist?—That depends on the particular article.

89. Supposing that Oregon pine is unduly competing with our rimu, and mills have to be closed in consequence of milling becoming unprofitable, and therefore the timber has to be burnt: do you not think it would be far better to consider whether we should not put a duty on, so long as we sell the local timber at a fair price?—I think that the proper way to prevent this competition with Oregon is to take care that we sell a better, or as good an article. Hitherto no care has been taken with the article which is sold that it is absolutely reliable. As soon as we can rely on New Zealand timber, then we should not seek these outside sources at all. The remedy is within our own hands.

90. If the millers take all the steps you recommend, and still could not make their business profitable, do you think then that the country might consider the imposition of a duty?—They would not find that if they sold a good article; we should be only too willing to buy it.

91. At any rate, the timber should not be burnt?—Certainly not.

92. And if it is true that valuable timber is threatened by fire because the milling is unprofitable, then the matter of duty should receive attention?—Yes.

Hon. the Chairman: I do not think that has been shown anywhere.

93. *Mr. Field.* No, I am putting a suppositious case. Of course, the Commission has not arrived at the North, where we are feeling the difficulty. What have you to say to the statement that rimu is probably second to no timber in the world except English oak? Do you think that is a fair statement, or is it exaggeration?—No, but it wants qualifying. The heart of timber cut from a small tree is a very different thing from the heart cut from a large tree. The tree must be matured. If they cut down immature trees they get an inferior timber, and it is impossible for us to determine that in the yard; therefore that must be seen to in the mill-yards. If the statement was made that the heart of well-matured large trees of rimu was equal to oak, I should agree with that, but the heart of small immature trees is distinctly inferior to oak.

94. *Mr. Leyland.*] I think you are wrong in saying that we can get all the different qualities of timber out of one tree. I think it depends on the district, and whether the aspect is northerly or southerly; and there is also a special kind of soft white kauri which comes from a special district?—Yes, I said that. I said that the red and the white timber can be obtained from the same tree, but the soft or silver kauri is from a different district.

95. With reference to builders' discounts: builders have to spend a good deal of time running to the yard and attending to such matters, and therefore should have a special discount?—Oh, yes! I do not disagree with their getting the discount. I only stated it as a fact that they did get it.

96. If there is no discrimination shown between the builders in Christchurch there would be no fault to find?—Oh, no! that is their lookout.

97. Would you lay the same emphasis on winter cutting for New Zealand trees, for evergreen trees, as for deciduous trees?—Yes, undoubtedly, although the difference is not so marked as in deciduous trees; still there is a considerable difference between the growing period and the period of rest.

98. But the rest is very small. At the conference held in Wellington some years ago specimens were shown of trees as active apparently in winter as in summer. Professor Kirk states that the sap does not rise or fall, but undergoes a chemical change?—Probably all that would apply more forcibly to rimu grown in the tropical climate in the north. The sap does not disappear in evergreens, of course, as in deciduous trees, but it is nevertheless quiescent.

99. With regard to the 2s. extra for seasoning or stacking, you think that the timber should be selected?—Yes. I do not object to the charge of 2s. at all; I think it is perfectly fair, especially if the timber is really selected.

[Document from Californian and Oregon Universities *re* timber-tests submitted to Mr. Seager for his opinion, to be given Commission later on.]

100. Do you not think that engineers are glad to get long lengths of Oregon for work where steel girders would not do—for bridges, *e.g.*?—I do not think that bridge-builders would use Oregon. If there is any part which is confined, it will rot.

101. The steel girders are imported, are they not?—Oh, yes!

102. And the objection to Oregon is that money is going out of the country?—Yes.

103. The Oregon has to be manipulated, and gives a large amount of work?—Yes, and there is also a certain amount of manipulation needed for steel girders, too—cutting and drilling, and so on. They could not be put in as imported.

104. Do you not think it is better for us to import Oregon direct rather than get long lengths from Australia?—Yes, undoubtedly, if it is required.

105. You would not advocate any interference with the importation of Oregon if it is required?—No, certainly not; there are certain circumstances in which we wish to use it.

106. Seeing that there has, according to the British Commission's report, been a general rise in the price of timber, is it to be wondered at that our timber-prices have increased?—No, that is only natural; we should naturally expect timber to be higher now than it was years ago.

107. If Oregon cannot be sold under a certain price, do you think it interferes with the sale of the cheaper line of rimu?—The line of rimu is now the same price—the good line. Rimu must be, I should say, 2s. per hundred cheaper than Oregon to make up the same value to the builders. Oregon cuts so much more freely and quickly, and the sticks are straighter. I think he would be willing to give a difference of 2s. per hundred.

108. You think Oregon affects the local timber industry then?—I certainly think it interferes to some extent; but we cannot have the enormous output of timber we had when there were those tremendous building operations in swing. I say that Oregon, if imported and sold at the same price as now, must interfere with the local timber industry to some extent. But I certainly would not prohibit Oregon coming in. The merchants will be willing to import as much as is asked for, and if it is asked for, there evidently is need for the importation.

109. *Mr. Clarke.*] According to your experience, it is practically impossible to get well-seasoned timber?—Yes, qualifying that by stating that it may be more easy now than in the past, because the merchants are taking more care.

110. And for long lengths, you think we can substitute steel joists?—Yes.

111. Is it not necessary to have ready access to long lengths for roofs—*e.g.*, where steel could not very well be used, such as tie-beams?—Not now, to any great extent. Where we could not get timber readily we should make the roof an iron construction.

112. Would it be easy to get a piece of local timber 40 ft. by 12 in. by 6 in.?—You could not get that here except in kauri.

113. You could not get it in Christchurch?—No, you would have to wait until it came from the North.

114. And that means considerable delay?—Undoubtedly.

115. Then, would it not be better to encourage the use of timber that could be stacked readily by importing in larger quantities, which practice would also conserve the kauri for better purposes?—Oh, yes! I would not do anything to stop the importation of timber, because there are some circumstances in which it would be advisable to use imported timber.

116. You know that, according to the Lands Department's reports, our timber is practically limited to a little over one generation?—Yes, I know that.

117. Would it not then be advisable to secure permanent supplies by means of afforestation?—Yes, undoubtedly.

118. *Mr. Morris.*] In your opinion, you said all timbers should be sorted at the mill?—Yes.

119. Have you had any experience of milling-work at all?—I have seen them working, that is all.

120. And you told us it would cost next to nothing to do it?—I cannot conceive how it could cost very much, and the value of the sorting would be out of all proportion to the very slight cost incurred. It would increase the value of the timber enormously, and the cost must be infinitesimal to mark it to show the kind of timber it is.

121. Does not the merchant sort the timber?—Their practice is to throw on one side sticks which are obviously bad. That is, they would not stack a stick which was obviously bad, but they could certainly not discriminate between the different varieties and classes of timber as they ought to be discriminated, and placed in different classes at the mill, as heart, outside, or cut from the butt or from the top of the tree. The timber is so different in quality in those different parts, and could not be differentiated when the sticks are cut except by an expert in timber-sorting.

122. You told us that timbers were retailed here at 9s. 6d., and now were retailed at 14s. 6d.?—Yes.

123. That is less than the usual discount?—Yes.

124. Bringing it to 13s. 6d.?—Yes.

125. Do you think that this increased price has interfered with building operations?—No, I do not think it is the price of timber only; but the increase is the cost of timber, wages, and everything else, that is the determining factor.

126. Have you experienced any difficulty in getting long lengths of timber, say, rimu, from the West Coast?—I have never used any long lengths of rimu, only marked sizes which could be readily obtained; I have never wanted any rimu, say, 50 ft. in length.

127. The reason advanced, that Oregon should be imported because of its long lengths, does

not hold so far as you are concerned?—No; but still it might happen that I should be glad of being able to use a long stick sometimes. Hitherto I have not required it—other architects might have done so.

128. You say there is at least 15 per cent. increase in the cost of building now?—Yes, quite that, I should think; but, of course, it is difficult to determine, because we never have exactly the same work to reproduce. If we had to carry out the same design now and ten years ago, we could tell the difference exactly; but we do not have to do that.

129. Is not this increase due to the more luxurious class of buildings and fittings and conveniences as compared with ten or fifteen years ago?—There is, of course, a demand for a better class of dwelling than there was some years ago; but it does not necessarily follow that the better and more artistic house is the dearer house of the two. In many cases the inartistic house which was a commonplace of years ago, cost quite as much as the artistic home of to-day. It is not on account of the better designs that are produced that there is an increase of cost. It is on account of the rise in cost of material, &c.

130. You referred to builders not belonging to the association: cannot a builder obtain supplies from other sources besides the merchants belonging to the merchants' association?—I suppose he could; but I qualified my statement by saying that as far as I understood it was so. I have no definite knowledge. I have always understood that they must belong to the association to get the discount, but I suppose they could get their timber direct from the mill, unless there is some arrangement among the millers to prevent this. That I do not know.

131. You told us you thought an export duty should be put on rimu?—Yes, I think on New Zealand timbers generally. I am not in a position to state from personal knowledge whether there is a sufficient supply still in New Zealand, and whether that supply will recur and give us timber for all time; but if there is any likelihood of a shortage, unquestionably there should be an export duty.

132. With regard to seasoned timber: you said you had seen rimu taken out of buildings up for forty years as good as the day it was put there?—No, I did not say "rimu"; I said "New Zealand timber," not "rimu." It was black-pine and totara I referred to. In one case it was totara taken from a building where it had been used as floor-joists, and the space between the floor and the ground was unventilated—the worst possible position—and yet the timber was as good as when put in. In the other case, the timber was black-pine taken from the old mill in Christchurch, and there were some splendid blocks taken from there, which must have been in use forty years. The builder working for me cut these up into beautiful timbers.

133. You cannot say whether that timber was seasoned or not?—No, but I am sure it would not have lasted if it had not been seasoned, and I say this from a wide experience. [NOTE.—If green timber is placed in such a position in a building that it is freely exposed to the air it, of course, will season there as well as elsewhere.]

134. I think it is more than likely it was put in green. Now, with regard to heart rimu for joinery purposes: this is a difficulty that the builders have to contend with, you say you cannot obtain sufficient?—Often I cannot.

135. And the sawmiller cannot supply enough rough timber to be able to have the heart?—But I know that a great deal of choice and valuable rimu is all lumped together and used for ordinary purposes. Instead of using timber valued at 14s. 6d. they are using in its place timber valued at £1 2s. Figured rimu is used for ordinary building-stuff because it is not properly sorted, and consequently there is a loss of that difference in value. In many cases where timber has been brought on to the work, say, 12 by 2, I have looked over it and seen beautiful figured stuff, and have picked it out and used it for special purposes.

136. Have you any experience at all of the artificial seasoning of timber?—Not personally. I only know from study, and from intercourse with those who have had personal experience, that it does render the timber too brittle, therefore reduces its weight-bearing qualities if it is artificially seasoned; the only good form is the natural seasoning.

137. You told us that the cost of timber was half the cost of the building. Did you not make a mistake?—I have not worked it out accurately. I should imagine that the labour would generally be about half the cost of the material; that is merely approximate, it all depends on the amount of work put in.

138. Do you think it would be any drawback to building operations if the duty on Oregon was increased?—No, I do not think so. Supposing the rimu were not available, of course, it would increase the cost; we should have to fall back on the Oregon. If they are really burning and destroying timber because they cannot get a sale for it, then the sooner that is brought into the market the better. We should not buy Oregon, or I should not specify it, except under the necessity that we could not obtain New Zealand timber.

139. You, as an architect, never specify that Oregon shall be put in in preference to native timber?—No, not unless it is specially asked for by the client; then I have used it, and found it very satisfactory, but I consider our own rimu so good that I should always prefer to use it.

140. *Mr. Barber.*] The price of red-pine is 14s. 6d.: is that ordinary building-timber?—Yes, that is on the list of to-day—timber not sorted at all.

141. In order to get that timber dry you have to pay another 2s.?—Yes, that is 16s. 6d. a hundred for ordinary dry building-timber.

142. What is the price at which Oregon is sold in Christchurch—Fourteen shillings and sixpence, and that is dry, of course. It has been cut and stacked for a certain period, so that the Oregon is sold cheaper in Christchurch now than red-pine.

143. In this ordinary red-pine at 14s. 6d. there is a certain percentage which you said it is criminal to put into a house?—Yes. Oftentimes the builders get this and bring it down to the work, and I have to condemn it as unfit for use.

144. So that a policy which excluded Oregon and compelled the use of this inferior red-pine would be unfair and disastrous to the worker building a home for himself?—Yes; I should not like to see it made impossible for us to get this Oregon if we wished it.

145. A policy which excluded it would be unfair to the man who is trying to make a home for himself?—Yes, providing that we cannot get good New Zealand timber. I think it would be unfair to exclude Oregon under the present circumstances.

146. It would be unfair for a man to build a home for himself and find at the end of fifteen years that his capital was lost?—There is no necessity for him to do that if he exercises sufficient care in the selection of the timber, if he takes care to have it seasoned; but the difficulties of getting seasoned timber at present are very great, and they should be removed.

147. You say it is impossible to have the difficulties removed under present conditions?—Yes, that is so.

148. What is the price of kauri in this district?—Thirty-two shillings, I think.

149. Do you think it is fair if there is any other timber that can be had to take the place of kauri to compel the consumer to pay £1 12s. for material when one of equal value might be purchased at 14s. 6d.?—No, I think we should certainly be able to get Oregon.

150. With regard to the association that exists in this district, is that a combination of saw-millers and timber-merchants?—That I do not know; I do not know anything about it.

151. Supposing a contractor gave an order to a miller for a certain quantity of timber, would it be delivered unsorted?—Yes, unless the contractor gave special instructions for a special sort. It would come to him all mixed up, and it would require to be sorted by the contractor himself.

152. *Mr. Stallworthy.*] Is the outer portion of the heart of a large rimu-tree more valuable or durable than the heart of a smaller tree?—I do not know.

153. Do you know the district in which that soft kauri of which you spoke grows?—I forget the name—somewhere beyond Auckland. It comes from one special district.

154. With regard to the competition: when things were busy was there keen competition between the timber-merchants?—There were a good many of them in business, but I do not know that there was any special competition; I think at all times there was a ruling price; I do not remember ever being able to get timber cheaper at one place than at another. There was always plenty of competition among the builders.

155. *Mr. Mander.*] Do you find Oregon equal in quality?—As far as I have been able to judge it has always been well seasoned and of equal quality.

156. Did you ever know of a rimu house, built of ordinary rimu, rotting in ten years?—Yes, I have seen it beginning to rot before then. That would be on the ground and in any place where the water can collect. It used to be the fashion to scribe the stops over the end of the weather-boards, and so form a lot of pockets where the water could get in, and there it would rot under ten years.

157. Do you know of a rimu house lasting for generations?—We have not passed generations yet. I have seen rimu twenty years after as good as the day it was put in, and there seemed to be no reason why it should not last for generations.

158. A house built when I was a boy, fifty years ago, of sap-rimu for inside purposes is standing to-day?—I should regard that as an exceptional example. If it escaped by reason of avoiding ordinary decay it ought to have fallen a victim to the white-ant long ago.

159. You say it is absolute waste to put sap-wood into buildings?—Yes.

160. Are you aware that two-thirds of the timber you get from the West Coast and all other places is sap-timber?—That depends on what you define as sap-timber.

161. Sap as distinct from heart?—But there is an intermediate wood between the heart and the outer casing which is good wood. Sap-wood is sometimes defined as all wood which is not heart. There are really three varieties—outside sap-wood, intermediate, and heart. It is the first which, I say, it is criminal to put into buildings. Intermediate timber should not be regarded as sap-wood, and I do not refer to it as such. That will not last as long as heart, but longer than sap-wood.

162. Is it not a fact that when houses are built for speculative purposes invariably the cheapest kind of timber is put in?—I have not built any such houses, so I cannot say.

163. You spoke of an export duty being put on our timbers. Do you say that, having regard to the risk of fire among native timbers—by settlers clearing their land and so forth?—Yes, I think so. If there is that risk there is all the more reason to preserve as much as possible of our native bush.

164. Are you aware that it is very difficult to preserve it when the process of settling has to go on?—I understand that, of course. I understand that a great deal has been burned by accident—settlers perhaps setting fire to their own timber, and the fire spreading for miles.

165. And do you not think our own employees should be considered—that we should not import timber to come into competition with our own, and have our mills shut down and our employees thrown out of work?—Undoubtedly, and I have always worked on that principle. I have made it a practice to specify anything produced in New Zealand rather than elsewhere if I can do this with justice to my client. But if I cannot get good properly seasoned timber in New Zealand it would be a great injustice to my client not to use Oregon, and I should be sorry if I were prevented from getting Oregon under these circumstances.

166. If the timber-merchants made more profit out of Oregon it would force Oregon on the market?—It does not rest with the timber-merchant, but with the architects and the builders; they buy what they want.

167. Do not the timber-merchants have any influence over the architects?—No. Architects choose what they think best. The merchants, of course, send round their circulars, but the opinion of the architect is what counts.

168. If Oregon costs 14s. 6d. and seasoned rimu 17s., do you not think the Oregon competition would affect the rimu trade?—Yes, undoubtedly it would. Oregon is now finding a very ready sale here, and the builders prefer it because it works so freely and it is drier.

169. *Mr. Ell.*] Have you any experience of the use of native beech?—I used it once for a cottage which was near a beech forest, but it was very unsatisfactory; it casts and twists about in all directions. There are considerable areas of beech forest, and it is useful for rough work—posts and so on—but not for scantlings and boards. I had those cut from it, and they were very unsatisfactory; it was not seasoned before I cut it up, of course.

170. Do you think if it was properly seasoned it would be valuable?—The timber I used twisted up in the drying. I do not know if other examples would answer better. My experience in that instance led me to suppose it would buckle up in the drying.

171. If cut in the winter-time it would be less liable to twist and warp?—That might be so. I should think it would be a thousand pities to see the beech forests go up in smoke if it could be made into good timber for any purpose.

172. With regard to Oregon for finishing—panels and joinery: what is the price of that as compared with the finest description of rimu?—Fourteen shillings and sixpence for Oregon, as compared with £1 2s. 6d. for figured rimu. All Oregon is one class that comes here as far as price is concerned—14s. 6d. I do not say it is the highest class that comes here, but I say selected portions of it can be used for joinery.

173. *Mr. Field.*] You have not had occasion to use Oregon unless specified by clients?—I have not used it hitherto unless asked for by clients.

174. Are you forced to use rubbishy timber of our own in place of Oregon?—No, certainly not. With regard to the use of Oregon: when I used the Oregon it was, I think, 18s. 6d. or £1 per hundred. It is only quite lately that it has come down to 14s. 6d., and therefore forms a rival with rimu. At the time to which I refer rimu was so much the cheaper, and quite as good as Oregon, and therefore I should not have used Oregon except at the request of my clients. To-day, if I could not get first-class heart rimu, I should certainly use Oregon at the ruling price.

175. Can you not get good building-rimu?—Oh! I think so. The yards are not full of rubbish; you can get good timber, but you have to take special care in the selection of it.

176. *Mr. Barber.*] While you are particular to use only good heart rimu, supervised by you as architect, the same care might not be exercised with regard to the selection of timber for buildings run up for speculative purposes?—Well, the poor timber is used somewhere; it is not burned. Unquestionably the inferior timber goes into the construction of buildings, although manifestly bad pieces are put on one side in the yards and sold at a lower rate.

177. So that in the use of Oregon pine there would not be this risk of inferior timber getting into the buildings?—No, because it is all good class.

178. Is it a very large portion of New Zealand timber that is bad. We know that we throw away 30 per cent. of the timber; is a large proportion of this 70 per cent. bad?—No, the larger proportion of it is well fitted for building purposes, and I should say that only 20 per cent. of the 70 per cent. is not fit for building purposes, or rather less perhaps.

C. E. PAGE, sworn and examined. (No. 39.)

1. *Hon. the Chairman.*] Can you tell us anything with regard to the cost of felling and milling?—No, I am a timber-merchant, of the firm of Edmonds and Page, Christchurch, and I only know the price we pay for the timber. The price of red-pine is 6s. 9d. to buy from the miller, and scantlings and timber suitable for dressing, and 8s. 6d. for dressing sizes and sizes suitable for dressing. Of course, that is not the cost to the merchant. In addition we have freight, 3s., by water; railage and wharfage, 1s. 2½d.; marine insurance, 1d. or a fraction over; then, from the railway-truck the cost of handling and cartage to yard is 8d. to 9d. till it is sorted in the racks. The price of kauri is 18s. 6d. f.o.b. Kaipara. We only get one class of kauri here; there are three classes listed. The cost would be the same as above, with the exception of insurance, which would be greater. The price of kauri to the merchant in Christchurch is dearer than to the builder in Auckland—that is, it costs us more at the mill than it costs the builder in Auckland. The price at which kauri is sold varies. Red-pine—for instance, the ordinary building-material—is sold at 14s. 6d. *ex* yard, less 5 per cent. trade discount and 2½ per cent. cash; other lines are sold at higher rates; unseasoned timber selected for dressing is charged at 16s. 6d.—that is, the higher-grade timber. But, as a matter of fact, I think the price-list would speak for itself. [Present price-list of timbers in Christchurch put in.] A great deal has been said as to the difference in the cost of construction of houses owing to the increased price of material. From experience it is altogether wrong, in my opinion. The increase in the cost of material makes but slight difference in the cost of construction of building. I have made one or two notes—one of them taken from our books—the price of contract and timber supplied. This particular house was a single-storied eight-roomed house with all conveniences, and the contract price was £790 (this was within the last month or two), made up as follows: 450 ft. super. V.D.L., £4 17s. 3d.; 1,082 ft. super. red-pine, £9 0s. 7d.; 487 ft. kauri, £6 2s. 11d.; 264 ft. matai, £3 3s. 2d.; Oregon, 11,218 ft., £78 4s. 3d.; jarrah, 840 ft., £10 7s. 7d.; red-pine, dressed, 6,804 ft., £66 13s. 5d.; mouldings, 2,232 1 in. ft., £17 17s. 1d.: total, £196 6s. 1d. The discounts off this were 5 per cent. and 2½ per cent., making a net cost of £182 7s. 3d. I have estimated as near as possible (estimating moulding from 1 in. ft. to superficial feet) that the amount of timber was 22,333 ft. If the price of timber were to rise or fall 1s., after taking out discounts, it would make a difference of only £10 6s. 11d. on a £790 house. I have also got three plans in which there is a gross estimate of timber, which I can give the Commissioner. [Three plans handed in.] These are of houses, two of which contain 12,000 ft. super. and the third 15,000 ft. super. The quality of the timber is pretty much the same in the three houses, rimu or Oregon being about

the same price in Christchurch. Another point I wish to make is this: The general public have an idea that the timber-merchants charge an extraordinary amount of profit on the goods they sell. This is not the case. I happen to be the manager of a company, and have gone carefully through the figures. I do not wish to dish up the figures to the public, but I say that the gross profit on our turnover to the 1st October was 15·65 per cent. Out of that we have to allow for wages, salaries, depreciation, telephones, fire and accident insurance, interest on bank advances, license, rent, rates, and loss on cartage (about £1 per week on each dray), auditors' fees, bad debts (1½ per cent. would be lucky), stationery and stamps, loss on bad timber (which is a considerable item), and the hundred-and-one sundries which could not very well be enumerated. The whole of that has to come out of the 15·65 per cent. before there is anything for interest on the capital invested, and I contend therefore that the profit is very small indeed, and it is wonderful how the business manages to scrape along at all.

2. *Mr. Ell.*] You are a timber-merchant and a manufacturer?—Yes.

3. And a thoroughly experienced manufacturer, because you have worked at your trade, and have had some years' experience in business?—Yes, I have had practical all-round experience.

4. The evidence you have given with regard to the cost of these buildings, and with regard to the eight-roomed house is from your actual experience?—Yes, from the actual entries in our books, and we supplied the whole of the timber in this house—not an estimate, but an actual fact.

5. With regard to the plans which you have put in, the estimates are taken out with a full knowledge of the trade?—Yes. The estimate of so many thousand feet on the plans allows for the discounts.

6. You say that the ordinary rough building-timber costs 6s. 9d. f.o.b. on the West Coast?—Yes, or wherever we get it from. The landed cost in our yard is 11s. 8½d.

7. And for the selected timber for high-class work you pay 8s. 6d.?—Yes, with other charges added as before. We sell the 6s. 9d. timber at 14s. 6d., less 5 per cent. and 2½ per cent., and the 8s. 6d. timber at 16s. 6d., subject to the same discounts.

8. With regard to dressing: the complaint is made that the cost of dressed timber has gone up unduly?—Of course, people do not understand the waste and trouble there is with dressing, or they would not complain. You put timber in to strip; it costs extra for that; there are several handlings, and you have to cart to the mill, back from the mill, and keep it about for other people's convenience, and there is a certain amount lost through milling and the curling. When going into the mill, the yarder will reject a good number of pieces as unfit for dressing, although they have been bought and paid for as millable timber. All this accounts for the extra cost added on by the dressing.

9. You consider that the price of dressed timber only affords a narrow margin of profit?—Yes. It depends on how you gauge profit. I do not think anybody could gauge the profit on dressed timber exactly, because there is so much waste on different lines. In the auctioneers' rooms one may see plenty of dressed timber practically thrown away, sold at 6s. and 8s. per hundred.

10. With regard to kauri, you state that it costs the Christchurch merchant more in Auckland than it costs the Auckland builder?—The Kauri Timber Company will not allow the Christchurch merchant the same discount for timber out of their stacks in Auckland that they allow the Auckland builder.

11. That is, they allow the Auckland builder a trade discount?—They only allow the merchant 2½ per cent.

12. What do they allow the Auckland builder?—I believe it is 10 per cent., but I am not sure.

13. Have you any knowledge of kauri being imported from Australia into Christchurch?—No.

14. Now, with regard to the uses of New Zealand timbers, in your factory what kind of timbers do you use generally?—We use rimu, kauri, and a little beech.

15. Do you know of any imported timbers that are found valuable for this purpose, and can be had at the same price?—For manufacturing purposes, no, certainly not. The only thing that comes into competition with the local timbers is three-ply American timber. It is imported very largely for drawer-backs and for the backs of wardrobes.

16. It is the only imported timber that comes in here that can compete with our local timbers?—Of course, oak is used by people who care for it, and who can afford it—that is, people with money. From the price point of view there is nothing to equal beech. I am speaking of the manufactory we are carrying on ourselves. Some of the imported timbers do compete in other works. We manufacture cabinetwork generally.

17. Suppose we deplete our supply of New Zealand timbers by very rapid exportation, what would the effect be upon the cost of these manufactured articles to the public of New Zealand if we had to rely upon these imported timbers?—By the present rate which they are asking for American oak the prices would go up.

18. And the public of New Zealand would suffer?—They would have to pay more for the manufactured article.

19. A good deal more?—No. There is not so much timber in any one particular article. People have an erroneous idea that there is a terrible amount of timber in a thing, such as we are speaking of, but the labour is six or eight times more valuable than the timber.

20. In answer to the question that I put to Mr. Chisholm, he said that the cost of wood fit for cabinetmaking and furniture-making purposes was about ¾d. a foot, and that the cost of oak and walnut was about 8d. to 11d.?—There must be some mistake about that. Perhaps he said 3d.

21. Threepence, yes, that is it?—American oak does not cost 8d. to 11d. I know that it can be landed considerably less than the figures quoted by you. I have known it to have been landed here for 4½d. a foot.

22. Sixpence to 8d. per foot?—Yes, that is figured oak.

23. In view of the fact that our kauri is being rapidly cut out, and as we have only a limited supply of rimu, do you think it desirable that we should make some permanent reserves?—I can only speak of manufactories and timber-yards. I have not given the bush question much attention.

24. As a manufacturer, and in view of the fact that you might be entirely dependent upon imported timbers for your supply, do you not think it desirable that we should make some permanent reserves of our own forests?—No doubt it would be good if it could be done, but I do not know anything about the milling business.

25. They tell us that kauri will be cut out in about fifteen or twenty years at the outside?—They told us that when I was an apprentice.

26. We have had thorough surveys?—I have not made a study of that aspect of the question, so that any answer I might give would be of little value to you.

27. Have you experienced any difficulty with regard to seasoned timbers?—The position in Christchurch is this: that when a builder wants material he asks for matchlining or anything that has been thoroughly seasoned, and he will not take it unless it is thoroughly seasoned. The whole of the timber that is put through our local sawmills in respect to moulding lines, weatherboards, and suchlike is thoroughly dried timber before it is put into the hands of the builders, and they will not take it unless it is dry. The timber that goes out of our yards is practically dry. In the old days when a man took a contract he stacked the timber on the ground, and thereby dried it; but if you go about the City of Christchurch now you will not find these stacks, for the reason that the timber is now supplied thoroughly dry.

28. Do you sell seasoned timbers at those rates?—Yes, at the rates on our list.

29. Do you not make any difference in Christchurch between seasoned and unseasoned timbers?—Yes, a man will not buy unseasoned timber.

30. With regard to the price?—The people will not buy it. It is always dried before it is sold. The prices show one price for unseasoned—viz., 16s. 6d.—and for seasoned timber 18s. 6d.

31. That is 2s. per hundred difference?—Yes.

32. Assuming that it takes 10,000 ft. for a five-roomed house?—That is rather on the low side.

33. Say an ordinary five-roomed house, with 12 by 12 rooms, that would make a difference of £10 on the cost of the material of that house?—The position is this: Nobody ever buys seasoned scantlings or seasoned rough boards, because it is not necessary. If you refer to my figures you will see that there is only some six or seven thousand feet in that list that I have got down there that requires to be seasoned. It is totally unnecessary to season the remainder.

34. That makes about £6 difference then. Statements have been made that if seasoned timber was insisted upon people would not buy it because of the increased price?—That is not so here, and I am speaking of what I know.

Mr. Ell: That is entirely opposed to the statements made in Invercargill.

35. *Mr. Hanan.*] If it is a fair question, Mr. Page, from whence do you obtain your timber-supplies?—What timbers do you refer to? We get red-pine from Greymouth, and from Pelorus, but principally from Greymouth.

36. Do you draw anything from Otago and Southland?—No.

37. Have you ever done so?—No.

38. Have you any difficulty in getting supplies from the West Coast, and if so, what is the nature of the timber you have difficulty in procuring?—The West Coast only supplies us with red-pine, and we have no difficulty whatever in getting that from the West Coast.

39. Have they lowered their prices within the last twelve months, or have they increased them?—I cannot tell you. The price used to be 8s. all round, f.o.b., but now it is 6s. 9d. for the scantlings and rough stuff, and 8s. 6d. for the dressing lines.

Mr. Mander: That is less.

40. *Mr. Hanan.*] Has your trade or business increased during the last two or three years in imported timbers?—Very little in oak and cedar. Lately we have gone in for Oregon. Our sales of Oregon have increased, and that is an imported timber.

41. Would that be during the last twelve months?—Yes, during the last twelve months.

42. Your sales of Oregon timber are increasing, then?—Yes.

43. There has been a slump in the building trade?—Yes.

44. Did that slump take place before Oregon began to come in here in quantities?—It gradually came on. I do not think that Oregon had much effect upon the building trade one way or another.

45. The importation of Oregon does not affect you?—Yes, that is so. The tightness of money is the cause of the slackness of trade.

46. I suppose to-day the requirements, generally speaking, are met?—I think so. Of course, there is some little amount of building going on, but not much.

47. Do you manufacture furniture?—Not actually furniture. We employ cabinetmakers, but we confine ourselves mostly to fittings, mantelpieces, and that kind of thing.

48. For sashes, what do you find is the best kind of timber?—There are several timbers that are very good. Californian redwood is good timber for that purpose.

49. Is there much of that coming into New Zealand?—No, there is not a great amount.

50. Is it increasing?—I cannot tell you that.

51. What about Oregon for window-sashes?—I have not seen it used much here.

52. What do you use here principally?—American yellow-pine, Californian redwood, and Baltic.

53. Have you a high opinion of kauri?—I think there are not many finer woods than kauri

54. Is it not one of the most valuable timbers we have?—I should say it is the most valuable all-round timber in the world. It can be used for anything.

55. Do you favour an export duty being placed on kauri?—I have not considered the matter.

56. As to imported timbers, what is your opinion as to duties? Would you remove the duty or would you put it on?—It does not matter whether you put it on or take it off. It will be all the same whatever is done.

57. You say it has got to come?—The imported timber here cannot hold its own.

58. Supposing that you encourage Oregon, and it displaces some of our New Zealand timbers in the market, would that not mean a falling-off in our railway-earnings, seeing that the carriage of timber is a big item in the way of freight?—Naturally it would.

59. That would not be desirable, in your opinion?—I am only thinking of the timber trade. The duty here and the railway charges added is equivalent to 2s. 4d. per hundred feet. There is 4d. over and above red-pine. You cannot handle Oregon in this country now.

60. You think that as things are at present Oregon is sufficiently handicapped?—I think it is pretty well handicapped just now.

61. Would you say it means to prohibit Oregon timber?—I do not say that, but I say that it is handicapped. If you take Oregon from Christchurch to Culverden there is extra railage to pay on it, and if you add that to the duty there would be a handicap of 3s. 8d., or if you took it to Methven there would be a handicap of 3s. 6d.

62. Would you suggest taking the duty off Oregon?—It does not matter to us. I am in the capacity of a merchant.

63. Speaking as a citizen of New Zealand, and knowing what you do about the timber trade and the resources of the Dominion in that direction—although perhaps you may not know all about it—I say, speaking as a citizen, do you think it desirable that we should conserve our New Zealand timbers to meet the needs of the future?—I would certainly not take the duty of Oregon. I should leave the duty as it is.

64. *Mr. Field.*] You are a timber-merchant, Mr. Page?—Yes.

65. You regard your business as a necessary evil. Is it possible for the consumer in all cases to buy direct from the sawmiller?—If they bought direct from the sawmiller they would lose by it, because they would have so much handling and waste. It is necessary to have a distributing centre.

66. Even although you get a greater profit, it pays the consumer?—They buy now from the merchant because they find it more profitable.

67. As to the profits you make, we have had it in other evidence that the profit of a timber-merchant—the price he receives—should be, over and above what he pays for the timber, from 2s. to 3s. 3d. per hundred feet to cover all expenses. Is that too much?—It depends entirely on the cost of the thing in the first place.

68. Speaking generally?—If you are selling timber at 8s. or 9s. you would not expect the same profit in it as on timber you were selling for £1 10s.

69. I am speaking of the ordinary red-pine?—I am sure you want 2s. or more. With 3s. you could make a do of it, because there is a lot of waste and trouble about timber.

70. If you are buying timber which is costing you, say, 11s. you are not robbing the public very badly if you are charging 14s. for it?—No, we are not robbing the public at all. We are not here to rob the public. Competition regulates that.

71. We were told this morning that you timber-merchants charge 2s. 6d. per hundred feet for stock in seasoning?—That is wrong. We charge 2s. per hundred feet for stripped timber. I think that when money is invested for a length of time in timber for seasoning and drying purposes it is worth 2s. per hundred.

72. Two shillings, not 2s. 6d.?—Yes, 2s. Then there is the labour on it.

73. In regard to this question of seasoning, do you think that a man should be compelled to season timber whether he wants to or not? I just want your opinion in the matter?—It would be very foolish to try and do that.

74. Do you find people using unseasoned timber?—They see that it is properly seasoned in this part of the world.

75. As to the framing?—It is pretty well seasoned before it is covered in. It is usually thoroughly dried before it leaves the timber-yard.

76. You think it is unnecessary to have legislation?—I think the people in Christchurch can look after themselves. They are now well catered for.

77. I suppose you get no timber here from the North?—We get kauri, but very little ordinary building-timber. We did not find it satisfactory. A lot of it was dozy.

78. There is another element of cost in your operations, particularly in the case of our New Zealand timbers: Is it not a fact that while stacked in the yard they go off very much in quality?—You lose the top boards in every stack.

79. If your boards are stacked close together, what happens in three months?—You have to dig them out with a spade.

80. You cannot give us any opinion on this question of our timber-supply at all?—No, I know nothing about that.

81. About the quality of the timber that you get here, what proportion of the timber received into your yard is subsequently found to be absolutely unfit for building purposes?—When we get timber of that kind in our yard we send it away for pigsties.

82. What proportion is there of that timber?—Very small.

83. Is it not due to that fact that it is necessary to have Oregon timber?—No, certainly not.

84. You were speaking of yourself. Speaking generally, are there large sums of money made in the business here?—I do not know other people's business. The money has not come my way.

85. Would you be surprised to know that well-known firms of timber-merchants in the Dominion are in a state of liquidation at present?—I would not be surprised to hear that.

86. About this increase in price of O.B. rimu, we had in evidence this morning that the price had increased from 9s. 6d. to 14s. 6d. in ten years?—I think you will find that ten years ago it was 13s., and now it is 14s. 6d. One of our witnesses has the figures.

87. You are sure that from 9s. 6d. to 14s. 6d. is not correct?—It is incorrect.

88. What is your opinion regarding the likelihood of an increase in the importation of Oregon?—I do not think much more will come.

89. Do you think it will cease?—No, not quite. I think that the price of Oregon is likely to affect the amount that will be imported. In many cases it is desirable for beams, and it will be brought here for such purposes, but I do not think it will be imported for general use.

90. You have heard that in the North Island the millers are alarmed and are closing down?—Yes, I have heard that.

91. In the house which you gave us an illustration of—that is, the house containing 280 pounds' worth of timber—I notice, of rough red-pine there is only 9 pounds' worth, whereas of Oregon there is 78 pounds' worth. What is the Oregon used for in that house?—All the framing.

92. For no other purpose?—Possibly the rough boards.

93. You do not use Oregon here for flooring or weatherboarding?—I would not recommend it.

94. What was used in the case of this house you speak of?—Dressed red-pine.

95. You said the importation of Oregon would have no effect on the building trade here. Have you any opinion as to what effect it would have on the millers?—It stands to reason that if there is less red-pine used there will be less asked for from the millers, and that is the only conclusion I can come to. If there are so many millions of Oregon imported there will be much less red-pine to be cut.

96. You spoke of Oregon being handicapped in the matter of railway freights: that, of course, does not exist at the ports where there is no railage?—No. It only exists from here to the port at Lyttelton.

97. In the case of the main towns of the colony there is little or no railage. There is none at Auckland, Wellington, or Dunedin?—It is a matter of 4d. here.

98. It is not seriously handicapped in the big towns of the colony?—That is so. You cannot send it to the country.

99. *Mr. Leyland.*] You stated in your evidence that, taking the actual figures, that was a gross profit of 15·65 per cent.?—Yes.

100. Out of that you had to take wages, rent, fire and accident insurance, &c.?—Everything except labour that produces value.

101. If a statement were made that timber-merchants would get the gross profits, would that be an absolute reply?—Our books are kept as a company's books should be kept, and that would be the gross profit.

102. Do you not think that a man who embarks in enterprise of that kind takes a big risk?—It means a big risk—that you must have a very big turnover before you can meet your expenses. What I want to convey is that there is a 2½ per cent. cash discount, but the builder gets a trade discount which we do not get.

103. With reference to trade in Auckland, a builder gets 10 per cent.?—In that case the merchant is paid 18s. 6d. f.o.b. Kaipara, and the merchant does not have to pay cartage. In that case you have got 2d. advantage.

104. The timber-merchant carts the timber to the consumer, and you pay no wharfage?—I am making no reference to the price we pay at Kaipara, and every time you handle timber you have a loss.

105. But he gets discount and does not pay cartage?—He gets it, according to our reckoning, at 2d. of a higher rate. But timber you sell at 18s. 8d. costs more than ours at 18s. 6d.

106. *Mr. Mander.*] They have got to cart to the vessel for you, you know?—They sell very cheap.

107. Are you not selling at a very little profit, if any margin at all?—At a very low profit.

108. Not a payable margin?—I question whether it meets expenses.

109. Are quotations from American agents increasing?—Certainly.

110. Can you offer to quote for an Oregon pine?—You would lose money if you did.

111. Are there orders going forth for Oregon?—I think very few.

112. It is very evident that with the increased cost there would be less Oregon imported?—Yes.

113. The question is that the price would rise to a prohibitive rate?—Yes.

114. The prices have risen to a prohibitive rate?—Yes.

115. The reason Oregon was not imported was because it was too dear?—Yes.

116. Seeing that importations are likely to leave a diminishing quantity, is it not likely that the amount imported will not keep pace with the consumption? Our consumption of timber has doubled for ten years. Is the import likely to increase? If it is not there will be a bad effect on the millers?—According to the way you put the question, you take it that there is an increased demand now being made.

117. But we want to take the average consumption of the colony?—I cannot answer a question of that sort, because you are putting a fact which I do not approve of altogether.

118. You have said that it is the custom here for the timber-merchants to supply seasoned timber for matched lining and dadoes?—Yes.

119. We have had it in evidence that in Southland that is not the custom—that the people buy all the timber green. We have also had it in evidence that the timber-merchants in Invercargill were starved out, and there is no merchant between them and the mills. Is not the in-

ference this, that owing to the merchants having been starved out there is no seasoned timber to be got?—If the merchants have any chance of making money they will remain, and will supply the article that is required, and if the thing is cut to such a fine degree that must be the natural consequence.

120. If people want seasoned timber they must support the timber-merchants?—Yes. If the timber-merchants were not supported the very same thing would prevail in Christchurch.

121. *Mr. Clarke.*] With regard to kauri, do you think it would be advisable to increase the export duty on kauri so that it covered all classes and all sizes in view of the great advance in the price of kauri within the last ten years?—I think it is working its own cure as far as Christchurch is concerned; but with regard to the export duty, I have not gone into the thing carefully. With regard to the price, if you refer to the figures I quoted this morning you will find there was a small amount of kauri used in very fine houses. You will find it is 480 ft. if you refer to the figures.

122. If kauri is as superior a wood as you have stated, would it not be to the advantage of this Dominion that that valuable timber should be retained, even although we imposed an export duty on it?—One naturally likes to have the best for ourselves, but at the same time it is getting a pretty broad question as to whether we should protect the industry for the sake of the few people who use kauri here. I have not gone into that matter at all.

123. I have here a price-list which shows that in 1898 12 in. kauri here was 16s., and in 1909 it is £1 9s. 6d. Do you not consider that increase out of proportion to the increase in the cost of production?—I do not know what the cost of production is.

124. Now, it is alleged there is in existence a timber ring to control the price: is there any such ring or combination existing?—We have an association here. I should like a definition of a "ring." We have an association here, and we work together for our own good. We arrange prices, and according to the statements I have given you and the privileges we receive, it is not a high price or a high rate of profit. There are other matters with reference to the association whereby we save, and are thereby enabled to sell at a lesser rate than if we had not the association. For instance, our railway down here is a bit of a pandemonium sometimes, and a little while ago before this association was in vogue every merchant had to go down to the railway or send somebody down to get his own timber. We now employ a man who is recognised by the Railway Department, to whom we pay £10 each, and it is work which used to cost us a long way more than that. We also help one another in many matters. There are matters of policy we talk over amongst ourselves the same any any body of men will. With regard to prices, we have the association price-list. That is a thing we are not at all ashamed of, and we do not consider our association, or, as some people call it, a ring, has ever taken advantage of the combination to fleece the public. If you refer to the figures you will see that the percentage on our sales is a very small one.

125. Now, can a builder or any one of the general public obtain supplies from anywhere at less than the prices quoted in the price-list?—Yes, by taking 10,000 ft. of red-pine. He can get ordinary building-material at 12s. 6d. at the Christchurch station, and dressed lines at 14s. 3d.

126. *Mr. Field.*] Any buyer?—Yes, any buyer.

127. *Mr. Clarke.*] If any buyer or any builder places an all-round order for a moderate amount for the requirements of one particular contract he might have, would he have any chance of getting it at other than the list prices for a smaller quantity?—What quantities do you refer to?

128. Supposing an ordinary building order without any 10,000 ft.?—If you take an ordinary building order, say, a five-roomed cottage, you would get 10,000 ft. to start with.

129. Assuming you only wanted to build one room to-day, could a man obtain the necessary amount of timber at less than the list price?—We have merchants in Christchurch outside our association, and they use our price-lists, but how they treat the discounts, of course, is a very moot question. They may give a greater discount or they may not. If you ask them they will tell you they do not.

130. Then, in fact, your association really does control the retail price?—We have no control of anybody who is not in our association. If they choose to sell at a given rate it is a matter for them to say themselves whether they can sell at that price.

131. Would there be any difficulty put in the way of a builder or any one of the public in obtaining further supplies if he dealt with one of those men?—No. There is absolutely no power to prevent a man getting his timber where he likes, and if any one went to such a man as the one in question for the rough timber and came to us for the dressing-stuff we would supply him.

132. A given class of timber is sold at a good rate from whatever source it may come. We had a case at Riverton where it was sold on the truck for 6s. 6d. and 8s. 6d. Do you still sell it at the same price in Christchurch? It has been said in evidence that it was landed by some millers at 6s. 6d. and by others at 8s. 6d.?—We do not have any time for Southland timber, which is no good to us. We buy at 6s. 9d. and 8s. 6d. at Greymouth and Pelorus Sound, and we charge the ordinary building rate.

133. From Greymouth or Pelorus Sound, is it all the same price?—It is one price from Pelorus Sound or Greymouth.

134. So that this stuff you sell retail, plus machinery work on it, at £1 2s. and £1 7s. 6d. costs the same as sawn timber?—No, one is 14s. 6d., and that is a lower-grade timber. Dressing lines cost us 8s. 6d., f.o.b.

135. So that 8s. 6d. is the maximum price at the port of sale from your wholesale men?—I am speaking of ordinary timber when I say 8s. 6d.—that is, ordinary dressing-timber. Of course, some timbers cost more if they are wider or longer.

136. Is it not the same cost to you whether 6s. 6d. or 8s. 6d.?—If you go for longer lengths, which cause the sawmiller a lot of trouble, he has, of course, to be paid for it.

137. *Mr. Morris.*] The figures which you quoted in your evidence prove that the cost of the timber in a building is less than 25 per cent. of its total cost?—Those figures prove that conclusively. Of course, I should like it to be made clear on this point that I have not included doors—they are in a separate heading—but the amount of timber in the doors is not a great deal. I am speaking of the timber which a merchant supplies as timber.

138. The excessive cost of the timber at the present time has not, in your opinion, brought about the present slump in the building trade?—In the first case there is no excessive price.

139. But the man who buys it says there is?—Well, he should know. The slump in the trade is due to the tightness of money, I think; there is no other cause for it.

140. In your evidence you mentioned what you considered a fair price for stripping and seasoning timber: did you take into consideration the loss incurred in seasoning the timber—the depreciation while it was stacked?—I said a lot of it was lost when taking it to the mill.

141. That is, split ends?—Yes, there is no end of trouble in that way.

142. What would the loss amount to?—I could not tell you that without reckoning it up.

143. Would it run to 10 per cent.?—No, not 10 per cent.

144. Would it be 5 per cent.?—I should not like to say until I reckon it up.

145. There is a large consignment of Oregon pine landed in the colony at the present time. Have you any knowledge what percentage of that is coming to Christchurch?—I have no idea. The only things I hear are from the man in the street.

146. I understand a very good portion of that cargo is going to Lyttelton?—I know there is none coming to us.

147. It is thought by some people that the whole of the timber that grows in a timber district is fit for building purposes, but, of course, you know it is not?—Yes, I know it is not.

148. Do you think it will tend to reduce the cost of rimu for dressing if there is no use made of the rough stuff which is now being replaced by Oregon?—It will increase the cost of the dressing line.

149. Do you think that will be the case?—I am absolutely certain. You cannot throw stuff away—you must get rid of the log.

150. That means that a miller cannot place his rough second-grade timber, but has to supply the first-class stuff for which there is a large demand. We were told this morning that you cannot get enough of it, so what is he going to do with it—will he burn it or what?—I should say if he could not get rid of the product of the log he had better close down.

151. Then, you certainly consider it would not tend to improve matters by introducing Oregon to take the place of our timber?—Oregon is a very good timber, but I do not think it will do any good. I trade in Oregon as a merchant—I am grinding my own axe when I get a chance.

152. As a New-Zealander you think it would be in the interests of the country that we should use our own timber, employ our own people, and keep the cash in the country?—There is no doubt that the amount of money that has gone out of the country has had something to do with the depression, but I cannot say how much of it has gone in Oregon pine.

153. In regard to the matter that Mr. Clarke questioned you upon, is it not a fact that the builders prefer to deal with the merchants instead of the millers because they cannot get supplied with all their reqiurements from the millers direct?—If a builder wants to deal with the millers direct he has to become a merchant himself to supply his own wants.

154. That is, he has got to stock it and trade in it?—Yes, and he cannot do so for his own particular jobs only.

155. I take it the association was formed to prevent cut-throat tactics and that sort of thing between business men?—Some people think that all they have to do is to start in the timber business and make a fortune by cutting prices, and we want to avoid that if possible. We do not ask for big prices, and we have other objects in our association. We have also a big lift with the railway, and we are recognised by the Union Steamship Company; but as individuals we could not get that protection. If anything goes wrong over milling matters you are not dealing with the representative of one firm, but the representatives of the timber-merchants, and therefore we all save money by having the association.

156. You do not think it is a crime for the merchants to pull together and to try and conserve each other's interests in this way?—If we did not pull together we should fall to pieces. We have the labour unions against us, and that is the only possible way to become united. We are up against combinations of all descriptions, and some people ask us to stand alone, but we should be very foolish if we did.

157. *Mr. Barber.*] With regard to the association, you say that if a builder wanted to purchase his own supplies from the mill he would have to become a member of the association?—I did not say anything of the kind.

158. You said he would have to stock the timber?—I said he would have to become a merchant.

159. Why would he have to become a merchant?—Well, you cannot send to the West Coast an order for so many lengths of 3 by 2 and 4 by 2, and so many mouldings, because they cannot supply it in that way. A man has to have 10,000 pounds' worth of timber before he can supply builders anything like decently.

160. Why cannot a timber-merchant on the West Coast supply an order of that kind—can't he, or won't he?—You could not expect the West Coast people to do it unless they were merchants The sawmiller cannot supply mouldings and that sort of thing.

161. I am not talking about mouldings at all—I am talking about ordinary building-timber and flooring, and such timber as is turned out from the mills?—The flooring and weather

boarding is finished in the mills in Christchurch. As a matter of fact, if you get the weather boards from the mills you have to dry them after. You have got to dry the stuff first and then mill.

162. Otherwise the buildings are not satisfactory?—I do not quite say that. If it is dry you produce a better article.

163. Why does that system prevail in Southland?—I do not know anything about Southland.

164. The builder almost invariably orders his supplies straight from the mill, and from Catlin's, and the freight is charged as from Riverton?—I have had many years' experience in this city.

165. Supposing a resident of this district was willing to give an order for, say, 50,000 ft., or even a scow-load of timber, from one of the West Coast mills, would they supply it?—Through a merchant.

166. They would not supply him, then?—I dare say. I do not know.

167. That would look as if there was collusion between the timber-merchants and the timber-millers?—We arrange to buy it all if they will sell it to us.

168. With regard to the retail selling-price of red-pine, you say it is 14s. 6d., less discount, which brings it to 13s. 5d.: is that the price of ordinary building-timber?—Yes.

169. If it is stacked and dried it is 2s. additional?—We do not stack and dry scantlings. It goes straight from the ship to the yard and from the yard to the building after it is all sorted.

170. What percentage of 16s. 6d. timber is there in a building then?—I would again refer you to my list. That will give you the proportion.

171. Unfortunately the example you give provided for a building that was erected almost entirely of Oregon or imported timbers?—It would have been the same if it had been erected of red-pine. All the Oregon that was used in that building had not one stick of it dressed. It was only replacing red-pine in that respect.

172. It would make no difference to the cost of the building?—No, none at all in either timber.

173. First of all you told us you could not tell us exactly what the cost of timber was some years ago?—I should say it was about 13s. ten years ago. We have witnesses here who can give you that.

174. Timber has always been dearer here than in Wellington?—Yes, it should be.

175. How is it that 13s. was the lowest ten years ago if timber was 10s. in Wellington ten years ago?—I think they were a lot of fools in Wellington, because they could not do it for the money.

176. They were doing it, and that was before the combination existed?—They could not do it.

177. Even with the increase in wages and the difficulty there is in milling timber at present, we have evidence that timber is being sold in Wellington to-day at 9s. 6d.?—I have sold timber at 8s., and was glad to get quit of it.

178. This is good timber that is sold for 9s. 6d.?—I should say there is some more madness going on.

179. Now, with regard to the increase in the price of timber, you say that it has not been very much in this district, whilst I wanted to show that while you gave an example that 1s. rise in timber would not add very much to the cost of the erection of this eight-roomed house, if the timber had been going up periodically and had risen 6s. in nine years it would have added considerably to the cost of the erection of this house?—Yes, that is apparent. It is about £10 for every 1s. rise per hundred feet of timber. It is easily reckoned out. I have not known the conditions to prevail that you speak of.

180. It will be proved by documentary evidence directly. While the cost of rough building-timber has increased, do you think that the cost of furnishings and fittings for a house has increased—for instance, register grates and similar fittings—have they increased in price, and are they dearer now than ten years ago?—I can tell you with regard to the iron-market only. During this last six months there has been a very steady decrease in the price of any goods manufactured from iron. The lists were quoted at list prices, less 50 per cent., plus 10 per cent., and in many cases now—just this last month or two since the depression—it is quoted at less 50 per cent., less 10 per cent., less 5 per cent.; and that is what it used to be in the old days. The price six months ago in grates was considerably higher than a few years ago.

181. That evidence is different to the evidence of an architect in Dunedin, who said they had been reduced in price?—I have documentary evidence in my office.

182. *Mr. Stallworthy.*] What discount do you allow to builders?—Five per cent. and 2½ per cent. for cash.

183. How long has that been the practice?—Ever since I have been in the timber trade as a merchant seven or eight years ago.

184. Has there been no corresponding increase of price because of the builders' discount?—You will not give something for nothing. Nobody else but builders buy our stuff. Our sales are almost entirely through builders.

185. Where a builder gets a discount of 12½ per cent., does it affect the price to the public?—We have to provide for our profit.

186. Are we to understand that if a builder gets 12½ per cent. trade discount the price of timber must be advanced to meet that?—I should like to say that the builders do not get 12½ per cent. I am speaking of our own case. We protect the men who earn their living by the use of timber to the tune of 5 per cent.

187. Do you think that 5 per cent. is a reasonable amount to allow builders?—That is our reason for putting it at 5 per cent.

188. If they are allowed 12½ per cent. in some places do you not think that a bit high, seeing that you have settled 5 per cent. as fair?—Builders and others in other places are purchasers of timber. The matter of discount does not matter very much here because nobody else buys timber.

189. Can you give us any idea of the amount of kauri you purchase and that passes through your hands in twelve months?—I do not know that I should say if I knew. I think I should refrain from answering that question.

190. You told us that the cost of your timber was increased because of some inferior pieces in the 8s. 6d. lot; now, is it not a fact that sometimes you find some superior pieces in the lower-price timber and place them in the higher grade?—When they come to the mill after drying if they are curled we then do not send them to the mill for dressing purposes, as it would be a waste to do so. We put timber of that kind with the rough timber.

191. Is there not a certain degree of regrading by placing timber for which you paid 6s. 9d. at the mill in a higher grade?—There is no danger of the mill making that mistake. It is the reverse way.

192. Then, the grading at the mill itself is always against you?—We sort the timber, and the agent for the miller sees to it. We get them to make any needful alteration.

193. You buy timber at 8s. 6d.?—Yes.

194. Sometimes you have to throw out pieces because they are not fit?—Yes, that is so.

195. Is it not a fact that there are some superior pieces in the lower grades which you can lift up?—Very few indeed.

196. There are some?—I have not run across them. There may be some. When you come to work out a cargo you generally find that the miller is not a liberal grader: he works more to the higher grades.

197. Do you class your timber as it arrives, or do you take the mill classing?—We class it when it arrives. If the classification is not correct, there is a reclass.

198. Do you obtain all your West Coast timber from the one man?—No.

199. It is possible, then, to obtain timber from the West Coast from more than one agency?—There are four sources. There is an association, and there are people supplying timber outside of the association.

200. Are you interested in sawmills?—No.

201. *Mr. Mander.*] Have you heard of timber being imported from Australia to Christchurch and sold at less money than it can be purchased for at the mills in Kaipara?—I have heard a lot of funny talk, but I do not take any notice of the man in the street.

202. Considering there is 3s. freight to Australia and 3s. back again do you think it possible for such a thing to take place?—Utterly impossible. You could not do it.

203. Do you find any difficulty in getting your orders supplied from the Kaipara?—I have had no difficulty.

204. You heard Mr. Seager say that Oregon was coming into competition with rimu in Christchurch. Do you believe that to be the case to any great extent?—There is a limited amount of business doing in Christchurch at the present time, and Oregon has got a big slice out of it, but I do not think there will be much brought in.

205. You think that unseasoned scantlings put into a building in Christchurch would rot in ten or twelve years?—I am sure it would not.

206. Do you think if it were seasoned that it would last fifty or sixty years?—I have not lived long enough.

207. Do you think there would be that difference?—It is nonsense to talk like that.

208. Suppose you frame a house with red-pine?—It gets thoroughly weathered before the building is finished. It will be thoroughly dried by the time the building is covered in.

209. You are aware that kauri has gone up in price during the last few years?—Yes.

210. You were asked if you believed in an export duty. You are aware that there is already an export duty on kauri timber logs of 5s. and 3s. on flitches?—I do not know anything about the kauri trade, and I do not feel inclined, therefore, to wade into deep water.

211. Considering the royalties on kauri timber have gone up during the last twelve or fourteen years from 6d. to 3s. 6d., do you not think that would account to some extent for the increased prices of the timber at the present time?—Of course, it must do so.

212. You are aware that there is a great risk of fire in the bush, there is also the loss of sap, and many other contingencies in connection with the trade?—I am not surprised.

213. Are you aware that benchmen's wages have gone up from £1 10s. to £2 10s.?—I know that all wages have gone up.

214. Do you find that the cost of handling timber in your yard has very much increased?—Everything that has to do with labour at all has very much increased.

215. Do you have to employ any more hands now to handle the same quantity of timber that you handled ten or twenty years ago?—I cannot well answer that question because our stacking is done by contract. The contractor having to pay extra wages the contract price has had to go up.

216. In purchasing rimu have you ever discriminated between inside sap and outside sap in the rimu log?—My experience of red-pine is that you sometimes get what some people call heart quite away out from the bark, and again you get timber that is only just missing the bark that is a good, sound timber.

217. In such cases I suppose you have a difficulty in discriminating between inside and outside sap?—From the side view you could not tell the difference.

218. In regard to a miller supplying a builder in Christchurch with timber, if he had to select long lengths and keep a retail yard do you suppose he would charge a very much higher price than the merchant, or could he do it at the same price he is now selling it to you for?—He would have to charge an extra price.

219. *Mr. Field.*] We heard this morning that there were three classes of timber in rimu—viz., the heart, the timber which was neither heart nor sap, and also sap close under the bark. You have told us that there is good timber to be got right close out to and near the bark. Would you

regard it almost as criminal to put that timber in a building?—You get a good timber in rimu right close out on to the bark. I should not hesitate to put it into a house of my own.

220. We have heard a good deal said about this alleged timber combination. Do you think that combinations are confined to the timber trade between buyer and seller—that is, in other trades have you not heard of so-called combinations?—I have heard of combinations in other trades; we all have, right up to the newspapers which we read in the morning.

221. *Mr. Clarke.*] Now, with regard to the question of discounts, it was stated by Mr. Seager that the members of the Builders' Association have preferential discounts. Is that so?—Our way of doing business is that we give a trade discount to any man who makes his living by the use of timber, whether cabinetmaker or manufacturer.

222. *Mr. Ell.*] With regard to the last shipment of Oregon, can you tell us what price was charged for it, c.i.f.?—You are opening up a pretty big question, and I cannot give an answer to that in a straight-out way, because certain classes of Oregon are sold at certain prices—that is, when you get into different sizes you pay different prices.

223. I am speaking of No. 1 merchantable?—That is the only class that is coming here. If you get lengths up to 16 ft. and 24 ft., that is one price; up to 40 ft. is another price. I can give you the market quotations to-day. The flat rate for Oregon to-day would be about £4 5s. per thousand, c.i.f.—that is the last quotation, or rather it is three of four weeks since I received it; and since then I have not looked the quotations up. There is, however, an upward tendency in the price of Oregon.

224. You do not think there is any immediate danger of Oregon displacing the rougher building rimu timber, such as is cut at our sawmills?—No, unless there is a slump in the American timber-market again, and then the danger would recur.

225. At present you cannot afford to sell Oregon at a lesser price than you receive for ordinary building-timber—viz., 14s. 6d.?—When we bought that Oregon timber we were on a good wicket. The ordinary rate then was 7s. 6d. per hundred, and it has gone up over 1s. already. Of course, if you get long timber you pay more, and you cannot get long timber for that price.

226. For what would you be able to sell a 30 ft. length red-pine?—I cannot tell you unless I go and look it up There is 6d. per hundred feet extra for every additional foot. I think 30 ft. would be about 4s. extra.

227. What would you sell a 30 ft. Oregon at?—Oregon costs 16s. and rimu 19s. 6d.

228. So that it is in the greater lengths that Oregon scores?—Yes.

229. That is due to the fact, is it not, that sawmillers have difficulty in getting long lengths out of New Zealand timbers?—I am not going into the sawmilling trade.

230. You cannot get it at the price from the sawmiller?—There are other factors to be taken into consideration. For instance, the freights charged by the railway and also by the Union Company are greater in proportion on long lengths than on short lengths. There is so much extra per hundred for carrying the long lengths. Then, there is only a certain amount of overhanging allowed, and if you start to bolster timber you have to pay for that. Therefore the difficulty in transit is one of the main factors.

231. These long lengths are occasionally required for building operations?—Yes.

232. In view of that fact, do you not think it would be necessary to our building industry to allow Oregon to come in at a reduced rate, at least in the larger sizes?—I have already stated that if you left it alone it would be all right. I do not say it should be increased.

233. *Hon. the Chairman.*] Are you aware that there is a shipment of Oregon in Dunedin at the present time?—I hear so.

234. Do you know if there is any of that for Christchurch?—I have none coming to my yard.

CHARLES TAYLOR sworn and examined. (No. 40.)

1. *Hon. the Chairman.*] What are you?—A member of the firm of Taylor Bros., builders, Tuam Street, Christchurch. During the evidence this morning I gathered that the Commission desired some definite information with regard to the amount of timber contained in a given house. I have a plan here of a contract we carried out, of six rooms and conveniences, also a detailed statement of the cost. Approximately there are 15,500 ft. of timber in the building. [Statement put in.] The rooms are 15 ft. by 12 ft., 14 ft. 6 in. by 14 ft., 11 ft. by 5 ft. 6 in., 12 ft. 6 in. by 14 ft., and 10 ft. by 10 ft.; pantry, 7 ft. 6 in. by 5 ft.; bathroom, the same; wash-house, 7 ft. by 8 ft.; and scullery, 7 ft. by 8 ft. There is also a verandah in between.

2. And what is about the cost of that-sized house?—The contract price for that house was £495.

3. How long ago was that?—That was in 1906—July—and the whole of the rough timber came from the Coast. It was a direct order, and was supplied at 12s. 9d.

4. Did it come direct from the mill?—Direct from the mill to the station through a Christchurch merchant. It was put on to the job, but I am not quite sure whether the 12s. 9d. was at the station or on the job.

5. Can you say what that-sized house would cost at the present time?—No, because the price of timber has considerably advanced.

6. How much?—There is a considerable increase in almost every line.

7. But can you specify any amount which you think it would cost, showing the increase during that time?—I could not tell exactly. I should say there has been about a 10-per-cent increase since then.

8. That would be 1s. per hundred feet?—Yes.

9. *Mr. Ell.*] In regard to the house you mentioned costing £495, have you any idea what the house would cost now according to existing prices?—I should say about £550. As a matter of fact, that house was too cheap at the time. There is an advance generally all round.

10. *Mr. Field.*] It is not quite a fair example?—That is the minimum. If you examined the sheet you would see how it worked out.

11. *Mr. Ell.*] In that £500 how much would be represented by the advance in the price of the timber?—It is difficult to say, but I think it is plain enough. There is about 15,500 ft. of timber, and at 1s. it would be from about £7 to £10.

12. Now, in regard to dressed timber, I understand there was a rise in dressed timber recently, and a reduction in the price of the rough timber—is that so?—Yes, I believe that is the case.

13. How much has dressed timber advanced by?—I really could not tell you. We very seldom buy any timber for dressing. We usually get a cargo for ourselves, and dry it, and do all our own milling

14. And all the rough timber is reduced 1s. per hundred feet?—Yes.

15. Do you know what that reduction was due to?—The reason, I think, was that it was difficult to get the dressing-sorts. It has become more difficult to procure timber suitable for dressing.

16. With regard to building-timber, what kinds of timber does a builder require in a house of the sort you mentioned?—In this particular house the plates were V.D.L., and the whole of the other timber was red-pine. The sashes were redwood, kauri doors, and redwood or Baltic front doors.

17. What kind of timber is used now in the building of an ordinary house?—It entirely depends on what is specified—sometimes it is Oregon and sometimes red-pine. It is usually red-pine for all roof-framing, and sometimes kauri for window-frames; redwood or Baltic for sashes, but generally houses of the description I mentioned are of red-pine.

18. Now, for rough building-timber, the price of rimu and Oregon is about the same?—Yes.

19. So that it is just a question of choice—there is nothing to gain by buying Oregon instead of rimu?—The only gain is that it is easily worked and costs less for labour, and is a better job. It is more suitable for framing than red-pine, because it is more reliable. It is lighter and stronger, and you can depend upon it, and that is more than can be said for red-pine.

20. Is that not owing to its seasoned condition?—No, I think it is the nature of it. Red-pine is a good timber, but Oregon is better for the particular purposes for which it is used.

21. Can you tell the Commission your experience as to the difference in the value of seasoned timber as compared with that out of the forest green?—Do you refer to red-pine?

22. Yes?—Well, with regard to red-pine, that is usually used for framing purposes. To start with, I do not know of any other timber that seasons so quickly as red-pine does. Three or four weeks' drying will be quite sufficient, especially if it has had a good rain since leaving the mill. If it gets a good soaking of rain it will take the sap out much quicker than dry weather, and the timber will be better for it. With regard to the timber usually used for framing, my contention is that if the timber leaves the mill straight for the job before the place is covered in, the timber is practically dry enough for all purposes. That is for a wooden building, because in a wooden building there is a certain amount of circulation of air through the weatherboards that does not take place in a brick building, and the timber is improving all the time. Notwithstanding that, I maintain that Oregon pine is better for the job.

23. So, then, it is on account of its greater suitability that it is selected?—That is so.

24. Have you experienced any difficulty in obtaining long lengths and large sizes in New Zealand timbers?—Yes, it is very difficult to secure the sizes you require. In fact, usually in jobs of any considerable size a special order has to be sent away as soon as the job is secured, and then there is usually a delay before the timber is on the ground, and then it is not suitable. There is no doubt that with large timber such as 12 by 3 and 12 by 4 coming direct out of the bush, it is not conducive to a good job, nor to the reputation of the man handling it. Moreover, it costs anything from 50 to 100 per cent. more to handle it on account of its great weight.

25. Now, supposing the specifications require that to be cased in, what is the effect if you put a green stringer into a building?—I do not think that would have any material effect on the wet timber, because there is usually sufficient air circulating round any casing so long as the ends are not sealed. If the end of the timber is painted or tarred, or in any way sealed up, then decay must take place on account of the sealing-up of the pores.

26. Now, with regard to the price, do you find Oregon pine cheaper in greater lengths than New Zealand timbers?—It is—we have used it considerably.

27. According to the last witness it was a difference of 4s. 6d. in a 30 ft. length?—We have used a considerable quantity. We had lengths of 36 ft., and they were charged at 16s. per hundred, and if it had been red-pine it would have been 2s. more.

28. Seeing that Oregon pine can be obtained in long lengths, which is necessary for the building industry, do you think in view of that fact it is desirable to impose a heavier duty?—No, I do not think so. I think Oregon pine should come in free of duty simply because it is not going to replace our red-pine. There is sufficient room for both timbers. The class of Oregon pine that is coming in will never compete with red-pine for the purposes for which red-pine is suitable. It is a very rough, inferior class of Oregon pine that is coming into the colony; it is the lowest grade. There is no question about that, and the highest grades of that pine are expensive.

29. For studs and rough work it is well adapted?—Yes, well adapted. You could never work that class of timber into joiners' work.

30. It would never come into competition with rimu suitable for joinery work?—No.

31. Such as inside work?—Yes, that is so, and it is not suitable in exposed places, because it will not stand the weather.

32. So that you do not think the sawmillers have anything to fear from the importation of Oregon pine?—I do not know anything about that. I am not prepared to say what the effect will be on the sawmillers, but I think there is room for both timbers, and one is more suitable for the class of work it has to be used for.

33. And it is required by the public?—Yes, I think it undoubtedly is.

34. Seeing that rimu is used and so well adapted for finishing, cabinetmaking, and joinery work, and that kauri is also suited not only for joinery-work and for carriage-building and railway-car building, do you think it is desirable the country should retain by some means those timbers for the use of our own people?—I do. I think there should not be another bit of kauri allowed to go out of the Dominion, because I do not know of any other timber which can be used for so many purposes. I do not know of any other timber that would replace kauri.

35. You indorse the statement of the last witness that it is one of the best timbers in the world?—I do without any hesitation.

36. Now, with regard to rimu, seeing that we shall require it for our various industries which employ a large amount of labour, do you think it desirable we should make certain reservations to preserve the supply, and also prevent its exportation?—That is a big question, but I think, where large tracts of forest are destroyed simply for the purpose of settling the land, that it would be better to allow those tracts to remain until such time as the timber could be profitably placed on the market.

37. When I tell you that the operations of the Forestry Department of this country have only succeeded in planting 9,400 acres of land, and that the nearest time we can expect to draw on those forests is forty years from now, do you not think it desirable to retain possession of some of our rimu forests so as to preserve them till the planted trees are sufficiently matured?—Yes, I think it is desirable.

38. *Mr. Hanan.*] You have a Builders' Association here?—Yes.

39. What is the membership?—I could not say. I believe the president of the association will be giving evidence, and he will give all that information.

40. Is there much cutting in the building trade?—Yes, it is very keenly competed for.

41. Have the number of builders increased during the last three years in Christchurch?—I could not say. There are a great number of builders here.

42. And you find a falling-off?—Yes, there is not the amount of work that there was.

43. Have you ever tested the quality of wood underground so far as the preservation is concerned?—I have seen wood removed—kauri, totara, and black-pine.

44. What opinion have you formed in that connection?—I have seen kauri after being in the ground for between twenty-five and thirty years as good as it went in. It depends entirely on the class and quality of the timber. Of course, there are various grades in both totara and black-pine, and also kauri, but if you get the best of each they are, I think, equally durable.

45. Now, as to the effect of the water, have you had any experience in regard to rivers and streams in connection with protective works and bridge-making?—No, I have seen it used, but I have not had sufficient experience to be able to pass an opinion upon it.

46. Does it pay to build a house to let in Christchurch?—I do not know. I have not built any for letting purposes.

47. Have you much difficulty in obtaining kauri in Christchurch?—Yes, it is rather difficult. We have had several orders cancelled or delayed for a time. It is very difficult in Christchurch to get kauri from the mill.

48. What about the price?—It seems an excessive price.

49. You believe that we should let the timber from other countries come in here free?—The one particular timber, Oregon pine, in bulk, but I would not admit it in the small sizes.

50. Why?—Simply because by bringing it in in bulk we shall insure, I think, a better quality of timber, and it will make labour in New Zealand in cutting it up to the sizes required. If we brought it in in large pieces not less than 12 by 2 or 12 by 3 it would have the effect of not coming into direct competition with red-pine, because red-pine would be there in the specific sizes required. The Oregon pine would have to be cut into the different sizes, and, rather than go to the trouble of having the Oregon cut, they would use the red-pine.

51. Have you had any difficulty in obtaining good red-pine here?—There is not the same amount of good figured rimu in mixed lots that there was some years ago, but my opinion is that with all red-pine there is very little of it bad. There is the figured class of red-pine and also the milder dead colour that often passes as such, and if you examine it you will find the heart there just as you find it in the figured timber.

52. How does building in wood compare with building in brick in Christchurch?—I should say about 10 per cent. extra for brickwork.

53. Has building in brick increased in Christchurch?—Not to any appreciable extent.

54. You think it is just as profitable, from a permanent standpoint, to build in wood as in brick?—I do not know. I think the majority of people prefer wood. I think the feeling is that they think it is a better house and more wholesome.

55. But from the standpoint of repairs, depreciation, and the difficulty of getting good seasoned timber, is it not more profitable to build in brick?—I think you could get the timber all right—there is no difficulty about that.

56. You get all the timber from the timber-merchants here, do you?—No, a considerable amount of it comes through the timber-merchants from the bush, but they are direct orders obtained through the timber-merchants.

57. Would it not pay you to get it yourself direct without the middleman?—I do not know whether it would.

58. Have you ever tried it?—No.

59. Have you ever obtained timber from the South?—No, we have from the Coast and from Havelock.

60. Is there a big market here for timber from the Coast?—I am not in a position to answer that.

61. Do you think the recent reductions in connection with the railway freights on timber has helped the building trade?—I do not think it has had any effect one way or the other.

62. Do you suggest any alterations in regard to the railway freights on timber?—No, I have not considered the matter.

63. *Mr. Field.*] Are you a speculative builder?—No, I have never built any houses for speculative purposes.

64. You say that Oregon pine is better than our rimu for framing purposes?—Yes, it is more reliable.

65. Do you say it is not competing with our rimu?—To some extent it may be.

66. Well, take the house you built in 1906, all the framing there was red-pine?—Yes.

67. That was before you could get Oregon pine?—Yes.

68. If you built that house to-day the framing would be of Oregon?—Not necessarily; the client may not wish it.

69. You say the Oregon is better?—Yes, I certainly prefer it myself, but I would not use any undue influence over any client.

70. If you were putting up a house for your own use?—Then I would use Oregon pine.

71. And probably the customers would be guided by your advice in the matter?—I do not know. We have just completed a house for a client, and he had his own way, after forty-three years' experience of the New Zealand bush, and he had a house built of Oregon pine. He eleminated red-pine entirely from the job, and would not have it under any consideration.

72. Well, taking your own case, assuming you were building a house for yourself, you would certainly have built that house in 1906 of red-pine, and to-day of Oregon?—That might apply to myself, but not to any one requiring a house, simply because they would be deterred by the Oregon coming in in certain sizes.

73. It could be used for framing?—Yes.

74. Can it be said it does not compete with red-pine?—It does in a way, but not as much as it would if it was coming in in different sizes, such as 3 by 2 and 4 by 2.

75. But it is coming in in small sizes?—Not to my knowledge.

76. Have you not seen any inch boards?—Yes, but they have been cut here.

77. For what purposes do you consider red-pine better than Oregon?—We use it for all kinds of furnishing and finishing, for mantelpieces, wardrobes, &c.

78. In that case what are you going to do with the rough rimu?—I maintain that it would be used in preference to Oregon for certain work.

79. If Oregon was not here this rough rimu would be invaluable?—No doubt.

80. We were told this morning that timber adjacent to the bark in red-pine logs was so bad that it was practically criminal to put it in a building?—I think that red-pine is different from all other timbers so far as its sap is concerned. I have seen very little sappy red-pine. There is no comparison between the sap of red-pine and the sap of totara or kauri. In the case of rimu the sap is practically all good inside the bark.

81. Fit for building purposes?—Yes, all fit.

82. We had it on evidence also this morning, I think from Mr. Seager, that Oregon was very good for joinery work if properly treated and cut. Do you know anything about that branch of the subject?—In all my experience I have not seen it used for joinery work, with one exception, and that was for fine work, and then it was a failure. You cannot dress it beyond the chisel or the plane, because immediately you use a scraper or glass-paper you bring it out in holes and lumps all over, owing to its softness in certain parts as compared with other parts in the same piece of timber.

83. Then there is no danger of it coming into competition with red-pine?—That is so.

84. I did not think so, myself, and I was rather astonished at that evidence. You say the Oregon that comes in here is of a rough quality?—It is not so fine as some of the pines.

85. Do you think that the best Oregon—that is, heart—is kept in the country in which it grows?—I do not know what becomes of it.

86. It does not come here?—I have seen a considerable quantity of Oregon in Melbourne, and the Oregon we get here is similar to that, and all it ever was used for was for rough purposes.

87. Something was said about the strength of Oregon as comparing favourably with that of rimu. Have you ever seen any tests, or the results of any tests?—I am of opinion that the one is as strong as the other, but the Oregon is very much lighter.

8. A test was made in Wellington, at a foundry there, in the presence of fifty well-known business men, when it was found that the Oregon broke at a certain strain of so many tons, whilst the machinery they had was not equal to break the rimu?—All that I can say is that they had a very rotten bit of Oregon and a bit of very tough red-pine.

89. They were careful men?—I have worked amongst Oregon for ten years, and I have worked amongst red-pine since I was sixteen years of age, and I am now nearly fifty, and I am satisfied that in a fair test between Oregon and red-pine Oregon would beat it every time.

90. You have never made a test?—No, only in a rough-and-ready sort of way.

91. You said you thought that tracts of timber should be preserved?—What I said was that at the present time I understood that a great amount of bush was being sacrificed in the interest of settlement simply because it is far away from the market. I think that that hilly country should be left as it is for the present, allowing development to proceed, and thereby bringing the market in time to the timber.

92. What would you suggest, Mr. Taylor, with regard to timber lands in the hands of private individuals? Whilst I quite agree with you regarding the timber on Crown lands, I would like to have your opinion as to what you would do in the case of privately owned lands?—As to privately owned timber lands we have no recourse.

93. You can see for yourself that you cannot expect private individuals to keep it?—That is so.

94. You could not do it, and I could not do it?—I quite agree with you.

95. You said, and quite correctly, that there should be discrimination between small sizes of Oregon and large sizes as far as the duty was concerned; now, do you not think that if the duty were taken off the large sizes the buyers here would import only large sizes and resaw it here?—I would remove the duty from Oregon altogether, because it is required and there is room for it. I would not admit any under a certain size.

96. When times are bad in the colony, and only a certain amount of timber is being used, you will readily understand that where Oregon is competing with red-pine the tendency must be towards the closing-up of our own mills; in such a case is it not a fair thing to protect our own industry?—Yes, that is so, provided you at the same time study the interests of the greater number.

97. Assuming the price charged for our local timber is reasonable?—Yes.

98. Assuming that, do you not think that the industry deserves protection?—Yes, but the public also requires protection. I think you would have all the protection you require if you limit the importation to certain sizes—that is, allow no Oregon to come in under certain sizes, say, 12 by 3 or 12 by 2.

99. You have heard that Oregon is competing with our timber?—The statement has been made, but I do not know whether there is any truth in it. I know myself there is a slump here at present. The timber is not being used, but that has nothing to do with the importation of Oregon.

100. You say it is being used very generally for purposes for which our rimu would be used?—Not in comparison to rimu.

101. At any rate, if it were so that our bush was being burned and destroyed through the advance of settlers, if our railway freights were being reduced, our railwaymen thrown out of employment, our mills unused, and our money going out of the country, would not these considerations influence you to protect our industry in hard times?—Yes.

102. *Mr. Leyland.*] Do you think, Mr. Taylor, that any large areas of native timbers are being burned owing to the importation of Oregon?—I do not know. I say if such is the case it is a mistake and waste.

103. You are aware that in the past very large areas were burned, and at that time no Oregon was imported at all?—Yes.

104. With reference to competition, is it not a fact that Oregon is exceptionally cheap?—Yes.

105. Then, if it were increased in price that competition would practically cease?—That is so.

106. You say that it is lighter, stronger, more reliable, and more reasonably worked?—Yes.

107. You said that the lowest grades only are being imported?—Yes.

108. Then, if the better grades were imported it would be better?—Yes, it would be better in every way, because it would be more expensive, and it would not enter into competition with the red-pine.

109. We inspected a cargo at Dunedin, and we found it was not of a low grade. We found that it was all heart and no sap?—I am only speaking of what I have seen.

110. You do not know how Oregon is graded?—No.

111. I can tell you, as a matter of fact, that two of the lowest grades of Oregon are not sent here at all. They are exported to China. The sap of the timber turns black after it passes through the tropics, so it is kept in a temperate zone and sent to China. You were emphatic in stating that there should be an export duty placed on kauri?—Yes.

112. We have evidence to show that Oregon is largely used in place of kauri?—No. I do not know any purposes for which Oregon would do where kauri is used at the present time.

113. Is it not used now for long lengths, and where they do not want any sap timber they take Oregon?—I do not know.

114. Do you require Australian hardwoods here?—Yes, they are being used.

115. We know that jarrah is necessary, and the same thing applies to some extent to blue-gum and ironbark?—Yes, it is difficult to get black-pine or totara now.

116. If we impose a duty on kauri and Australia reciprocates, what will be the result?—There is no reason why black-pine and totara should not be reproduced.

117. You would have to live a long while?—Yes.

118. *Mr. Clarke.*] You stated that you have experienced difficulty in getting supplies; say you wanted to give a good large order, especially with a reasonable amount of long lengths, if there is difficulty now in getting supplies, will that difficulty not increase, seeing that the bush portions of the Dominion are rapidly receding from the towns and cities?—No, if Oregon is allowed to come in here it will take the place of those special sizes that had to be specially ordered.

119. With reference to the procuring of our local timbers, will it not be much more difficult to get these same timbers years hence, when the supplies are very much farther back, and therefore it will be desirable to replace these timber?—Yes, that is the position.

120. Now, with regard to plastering, if you were about to erect a building with a considerable amount of plastered partitions would you not use Oregon in preference to red-pine for the plasterwork of the house?—Yes.

121. It is much more suitable for that work?—Yes.

122. The question was raised as to a man using Oregon when he could obtain rimu: now, would you consider that a man would be within his rights, even if he chose timber that came from

abroad, in such a case—I mean there would be nothing outrageous in it?—Certainly he would be within his rights.

123. With regard to the burning of timber on private lands—lands independent of State forests—do you think there are any settlers in this Dominion so foolish as to burn good red-pine nowadays?—I do not know, I am sure.

124. As to the facilities for obtaining supplies here, supposing you wished to get your supplies from any one outside the Sawmillers' Association or the Timber-merchants' Association, would you expect any difficulty in getting a good reliable supply of stuff?—I never tried it.

125. Is that because from your own common-sense knowledge of the trade you would be courting trouble if you did try?—We have reason to believe that we should be better treated by the merchants than if we went to the miller.

126. *Mr. Morris.*] You told us, Mr. Taylor, that there was sufficient room for both timbers in this market?—Yes.

127. You consider rimu for finishing-work preferable to anything else?—Preferable to Oregon, but not to anything else. Oregon is no use for finishing.

128. With regard to rimu, there is only about 25 to 30 per cent. fit for the finer work, and I want to know what you are going to do with the remainder if you use Oregon—that is, for purposes that this rougher class of rimu is specially suited for?—The great percentage of rimu is suitable. Even the dull-coloured unfigured stuff is suitable for anything.

129. The rough heart of the tree, as long as it is sound timber, is quite suitable for framing-work?—Yes.

130. And strong enough for all practical purposes?—Yes, but it is not as good as Oregon.

131. Not as good as Oregon?—No.

132. I think that must be your opinion?—I am giving you my opinion.

133. With regard to the tests spoken of by Mr. Field as between rimu and Oregon, in which the rimu stood over 3,000 lb. more than Oregon under an hydraulic jack, and did not break, whilst the Oregon gave way at 3,000 lb. less, do you know whether the architects specify for an increased number of joists when erecting buildings of Oregon instead of rimu?—No, it is the other way. They generally consider that Oregon is stronger than rimu, notwithstanding the test that has been cited.

134. Would it surprise you to learn that they place alternately Oregon and rimu, because they say the rimu is the strongest?—I am not surprised at anything a man may do. Men have their fancies.

135. I suppose your fancy is not due to this being foreign lumber?—No. I have had long experience in connection with Oregon.

136. Have you ever experienced any serious trouble in obtaining a 12 by 2 or a 12 by 3?—They are not stocked in Christchurch. They are difficult to get. On almost every occasion the order has to go direct to the bush, and generally you have to wait a fortnight or three weeks before you are supplied. When it comes to hand it is not difficult to imagine what this green stuff is like. It is hard to handle.

137. Speaking of the colony as a whole, do you think it advisable to import Oregon here?—Yes.

138. Rimu is not so difficult to drive nails in as Oregon?—I think, from a contractor's standpoint, Oregon is a superior timber to work.

139. There are a great number of people employed in the timber industry?—Yes, but you must remember that the public are also a considerable number. Further, there would be a considerable amount of wages paid away for the manipulation and handling of this Oregon if it came in in bulk.

140. I believe myself that if Oregon was restricted to large sizes and long lengths I do not think the millers in general would very much object?—That is a matter of opinion. The percentage used would not be very large.

141. *Mr. Barber.*] Regarding the opinion which you have expressed as to the importation of Oregon, do you know whether this opinion is held by others following the same occupation in this district?—I cannot speak for any one else: it is my individual opinion.

142. We read that builders generally throughout the Dominion have passed resolutions emphasizing the wisdom of importing Oregon duty-free?—I have not taken particular notice of that.

143. *Mr. Mander.*] Have you ever regarded Oregon as a particularly beautiful and ornamental timber?—No.

144. You would not think of using it for panels or furniture?—I have never seen it used as an artistic timber at all.

145. You said if you had your own way you would prevent any more kauri going out of the country?—Yes.

146. In face of the fact that large areas of kauri timber are held by private individuals, which they have purchased at very high prices, say, 3s. per hundred royalty, would you prevent these people from exporting and compel them to hold on for an indefinite period, and at the same time run the risk of fire, which you must know is very considerable?—I am not prepared to state the nature of the machinery that would have to be brought into operation in order to retain this timber for the colony. I do say that it is very difficult now to obtain kauri from the North, and I think that is not fair, when we know that there are thousands upon thousands of feet exported every year.

147. The Australian market at the present time is the best market for kauri?—I know that. I was there, and we could buy cheaper there than in Auckland. That is sixteen years ago.

148. We get much better prices for the timber in Australia than in New Zealand. Considering we get such very much higher prices for our kauri timber in Australia than we can buy Oregon for, do you not think it is a very good exchange?—We are not importing Oregon from Australia. I do

not know. I do not think it is a fair exchange, because we are sending away something that we are absolutely in need of, and that we cannot get any other timber to replace.

149. We have had evidence in other parts of the Dominion that Oregon will answer all purposes for which kauri is used, or very nearly all?—I have never heard of wash-tubs being made of Oregon, neither do I think it suitable for vats. There are a hundred and one things for which it cannot well be used. Oregon would not do for the outside linings of window-frames. It will rot in a very short time.

150. You are aware, in regard to our New Zealand forests, and especially kauri, that there are very great risks in regard to fire?—Of course, there is a risk in regard to fire—that exists all the time. Nearly all the timber that the Government have tried to conserve has been destroyed by fire.

152. *Mr. Ell.*] With regard to the use of kauri, Mr. Taylor, you are speaking with a knowledge of twenty or twenty-five years' experience?—That is so.

153. You say, with a knowledge of both timbers, that Oregon cannot be used for the same purposes to which kauri can be put?—No.

154. Do you consider it wise to put huge beams of kauri into a building, when the kauri is exceedingly valuable for cabinetmaking and for the finer descriptions of work?—I think it is absolute waste. The same remark applies to figured red-pine. Oregon could take the place of these timbers for beams, &c.

155. Have you used beech?—No, I have no experience of beech.

156. *Mr. Jennings.*] Would you give preference to local timbers, under fair conditions, if you had a chance?—Yes, if all things were equal. If I was satisfied that red-pine was as suitable for a job as Oregon I would use red-pine.

157. Have you had any opportunity of using totara from the Waimarina forests?—No. I have used totara, but I do not know where it came from.

158. I judge that you are in favour of the importation of timber for the general good of the public?—That is so.

159. If you followed that out, would you not destroy the principle that was initiated—viz., the protection of our own industries?—Well, that opens up another question altogether. What I did state was that I am favourable to importing timber where we have no timber equally suitable for certain purposes. In my opinion there is no native timber so suitable for certain purposes as Oregon is.

160. You are a member of the Builders' Association?—Yes.

161. Is that a local asociation or a colonial one?—Local.

162. Does it exist for the purpose of keeping up prices?—I do not know what it exists for, but I suppose there is acertain amount of mutual benefit.

W. Goss, Timber-merchant, of Christchurch, sworn and examined. (No. 41.)

1. *Hon. the Chairman.*] Will you kindly tell us what you know of all or any of the subjects within our order of reference?—Gentlemen, I am a timber-merchant in Christchurch, and as such I am appearing before you. We are prepared to show that the profits we are making in Christchurch are not only not excessive, but we consider that they are really not enough considering the amount of financial liabilities that we have. The position of the trade in Christchurch is very different from any of the other large centres. We are a long way away from the source of supply, and we are handicapped in that we are a long way from our harbour. Owing to that the timber-merchants have to hold extremely large stocks to be able to do their business, and, in addition to that being so, of course, our expenses are very much greater than those of the southern merchants that have been referred to by the Commission to-day, and I think in dealing with the Christchurch trade that is a matter which should certainly not be overlooked. To explain the system that obtains, I might say that, as has been pointed out to-day, we draw the main quantity of our supplies from the West Coast. That is principally due to the fact that they were the only people from whom we could be sure of getting a sufficient supply. Some few years ago the position of the trade in Christchurch was bad. Then we had the Exhibition mooted, and that was the cause of what I was going to call a boom, but it meant a tremendous increase in the building being done. The Exhibition building consumed an immense amount of timber. We found there was at that time some difficulty in getting our supplies, and, owing to the fact that the West Coast millers were then doing their best to encourage sawmilling there, and enlarging their output, we drifted to them for our supplies. Before that we had been getting our supplies from various parts of the colony. We had had supplies from the South, and in the early days a good deal of timber came from our own peninsula here, and we were also drawing some of our supplies from Little River. We have also had supplies from the North Island and from Pelorus Sound, but we found those people were not able to supply, and therefore we drifted to our present source of supply. There was a considerable amount of timber being used at the time of the Exhibition, and owing to the Exhibition, trade increased very largely and very rapidly in Christchurch. Owing to that the output of the mills increased, the stocks held by the Christchurch merchants increased, and the industry became a very large thing. Things went on well until, of course, the financial stringency pulled us up, and now we find that we are not only not able to keep ourselves fully employed, but in many instances we find it extremely difficult to keep going at all. I might say we have never, even during the immense increased business, increased our profits beyond what any one would call a reasonable amount. I am satisfied that were any body of competent men to go into this question of what the timber-merchants in Christchurch have been charging for their commodities, it would be proved conclusively that we have been only reasonable in our demands, taking into consideration the amount of expenses we are put to. We get our timber

from Greymouth, and pay 3s. per hundred feet freight, and f.o.b. price is 6s. 9d. for ordinary building-timber, and 8s. 6d. for the better class of rimu. With regard to rimu, that is the main timber we use in Christchurch, and leaving Oregon pine out of the question, the amount of other timber that has been used in Christchurch during the last number of years is infinitesimal. We have to pay the Union Company 3s. a hundred for freight, and our charges from Lyttelton to Christchurch are 3½d. for wharfage, 3d. for loading into the truck, and 8d. railage, making a total charge of 1s. 2½d. Now, in regard to the figures that have been gone into by Mr. Page, I might say I entirely agree with them. I made out some figures myself, and they almost agree with Mr. Page's. I am situated somewhat differently from Mr. Page. I receive the timber at my siding, it is then tallied up and carted to my particular yard, and the timber that is for dressing purposes has to be sorted. It remains on the stacks for an average of perhaps six months, it is then taken down from the stacks, and, as Mr. Page has said, what is not fit for dressing has to be thrown on one side. The rest is put away for the market and is then dressed. This method of doing the business is a source of considerable expense. It is necessary in Christchurch to have a considerable amount of room, and that means a large area of land. In Christchurch, as you know, we are rated on unimproved values, and thus, unfortunately for the timber-merchants, their rates are very heavy in proportion to their business and the amount of capital invested. I consider I am right in saying that we pay more in rates and taxes than any other class of the community. All those things should be taken into consideration in dealing with the cost of the timber. I might say I am not discussing the question of right or wrong of unimproved values—I am rather in favour of the unimproved values, which has been the means probably of increasing building, and what we have lost hitherto in one way we have probably gained in another; but, still, when taking into consideration the cost of the timber, we must not overlook the fact that this is one factor in connection with our expenses. There is a big item in insurance, as we run a big risk from fire, and not only that, we must of necessity put up with the average clause so that we may be paying a premium on a very large amount, and we only get a certain amount if a fire takes place. Another question is that of depreciation. We have depreciation all along the line; timber cannot be handled without being depreciated. The longer the time it is kept in stock if it is exposed to the weather the more it will depreciate. We have depreciation from all sorts of causes; we have depreciation through the north-westers that we have in Christchurch, and we will sometimes probably find that we will have it wet one day and the timber will get very wet, and the next day we will have a howling north-wester, and the consequence is that the timber will pull asunder through the rapidly increased temperature. Then there has been some talk to-day in regard to the question as to whether the sawmillers can supply the builder. Well, I consider that one reason why the sawmillers do not supply the builders is that they very much prefer that they should have a go-between as far as the risk of bad debts is concerned. They are quite satisfied that the merchants should take that upon their own shoulders, and that has been a very large item—in fact, too much of it in the past. In a season of this sort, when there is a slump in the industry we feel that more than we do at any other time. That is a thing that always affects the timber-merchant far more heavily than if the conditions are better and good times ruling. Then, of course, we have the accident insurance, which has been increasing, and is still increasing. Rates are going up, and we are liable now for more than we ever were before, and consequently our rates are increasing, so that I consider in some items we are selling we are really not making any profit whatever. I have some extracts here from a balance-sheet of a firm which balanced at the end of February this year, and Mr. Page has told us that the gross profit on his business for last year was 15·65 per cent. The trade expenses of the firm I am referring to now were 19·09 per cent. of the turnover, and I am prepared to allow any recognised accountant to verify these figures for the Commission. So that, should 15·65 per cent. be the amount of gross profit that can be made by timber-merchants at the present time, and I maintain under existing conditions it is not possible to get more than that, then it will be readily seen that with trade expenses amounting to 19·09 per cent. of the turnover, it would be impossible to make a net profit at all, and that is the position of the firm I am referring to—that is, that they have no profit at all to show for their last year's working.

2. *Mr. Jennings.*] Is that business still in existence?—Yes, unfortunately it is. Another point has been made, and has been somewhat elaborated. That is with regard to the difficulty of getting the larger red-pine. I want to say here that we had excellent testimony from Mr. Seager along certain lines, but I also want to state that he has been away from the colony for some two years or more, and his last experience of the timber industry in Christchurch was at the time we were extremely busy, when the Exhibition building was going on, and, as I have stated, there was a tremendously large amount of business being done at that time, and it may have been a little difficult to get certain sizes of red-pine; but I will defy any one to prove that it is impossible to get the ordinary requirements for building purposes in red-pine from the yards in Christchurch now. A point has also been made with regard to rough timber—what we call ordinary building-timber. Now, our rule is not to dry the ordinary building-timber, but to send it out of the yard just as it comes in. It has also been pointed out that it is only used for framing, and in consequence of that it is exposed to the air for some considerable time before it is covered in. As a result of that, in building weatherboard houses in Christchurch there is a considerable amount of draught and seasoning going on till the studs are dry. I have not known of any serious results in consequence of putting unseasoned framing into a house. I might say that, owing to the badness of trade, merchants in Christchurch have had to fillet their ordinary timber, and that is a loss to the merchant. They cannot get any more for it, for the reason that timber when dry is liable to twist. When wet is is generally straighter than when dry, and of course any one with any knowledge of house-building knows it is essential that the studs should be straight when put in a building, otherwise they have a tendency to pull the whole wall crooked. With regard to the price we are paying

now for kauri, I have had a good deal of experience in kauri, and I want to say this for those who are supplying kauri, that I do not consider there is very much in it if you take the difference we have to pay for it here and what the Auckland merchant has to pay. I consider that the grading that is required to supply our market must of necessity carry an increased price. We have only one purpose for which we can use kauri, and that is for joinery-work, and therefore it is essential that the kauri kept in stock by the merchants here should be nothing but the very best grade. No merchant will take inferior kauri from the mills—we will only take the best. Mr. Seager has pointed out that there are differences in what is called the best kauri, and we strive to get the white kauri if it can be got, and we are careful that we get nothing but clean kauri. The sawmillers are always trying to get the merchants to buy an inferior grade of kauri so that they can produce it at a lesser cost, but, seeing that we will not do it, they have to charge the increased cost in order to supply the article we must have. Then, a point has been made with regard to Oregon pine being dry. The Oregon pine we get into our yards is not dry. It may have dried partially from the time it has been cut in the bush, but there has never been any system of drying with the Oregon. If one would take the trouble to cut up some of this stuff when it comes in you would find it was very wet. It certainly cannot be called dry, taking the stuff right through. We shall probably be asked in Christchurch here if anything can be done to better the existing state of the trade. Well, gentlemen, speaking from a purely parochial point of view, I consider the only thing that is going to make Christchurch a busy centre is our canal. I do not want to preach canal here, but if we had the canal, and we could get our timber right alongside our yards, we should be making a great saving in expense. I have often envied the merchants in other centres on account of the ease with which they can get their timber into their yards. Could we do away with the handling at the railway I consider there would be great saving in the cost of handling the timber. Consider for a moment that if we were able to get down to the seaport we should have a harbour, and the timber would be landed on the wharf and carted to our yards, and in that way it would save a tremendous amount of handling. Without that we cannot possibly expect to be able to sell timber at the same price as they do in the other large centres. I have here the ruling prices of timber running back as far as October, 1900, and I might say that, as far as the alteration in the pricing of red-pine by the millers is concerned, that has only come into vogue since October, 1908. Before that we only had one price from the miller for his product, and I understand we must take what is called the product of the log. Well, it is true that there is a large amount of timber thrown out at the mill which is not a merchantable commodity, and the rest of the timber we have to take, whatever it is like, and that has always been the difficulty with us. I do not say that we cannot get a better class of rimu, because we can, and we get all we want, but in getting all we want of the better class of timber we have to take such a large quantity of the poorer class. As a merchant it matters little to me whether I sell Oregon pine or red-pine, providing the profit is as large on the one as on the other. The merchant is here to supply the demand, but the difficulty I see is that if Oregon is coming into the place we must deal in it and we must have it. Then, gentlemen, what are we going to do with the inferior quality of red-pine? If that question can be satisfactorily answered to me I will then say I do not fear Oregon pine. As Mr. Taylor has pointed out, Oregon is suitable for long joists and beams, but for studs and for the smaller sizes I consider that red-pine is quite equal to Oregon, but as merchants it matters little whether we deal in Oregon or not, providing we know what to do with the other, and that seems to me to be the difficulty. There is one other point I should like to emphasize, and that is with regard to what Mr. Taylor has told us, that in 1906 it cost less to build a house. I do not propose to deal with the cost of the house, but with the cost of the timber. I have price-lists here for 1906. In September, 1906, the price of sawn timber up to 12 in. wide was 15s. for red-pine retail; to-day the scantling size costs 14s. 6d., but the timber fit for dressing is 16s. 6d. That is the increase between then and now. It is not 1s. 6d. increase, because there is a rebate of 6d. on the O.B. sawn timber, while it is only the timber selected for dressing purposes that is up 1s. 6d., so that is not a 10-per-cent. rise, taken all round.

3. *Mr. Barber.*] Do you mean to say that you did not pick the timber in 1906—that it was all 15s., heart and ordinary building-timber?—The position, so far as the Christchurch merchant is concerned, is that they have always picked the timber. They have always been asked for the two classes of timber. We take the product of the log from the sawmiller, and up to the latter part of last year they charged one price at the mill, and it was left to us to do the best we could with the lot.

4. With regard to the price of 15s., I want to know whether that was the universal price that the merchant charged for all-round timber?—At that time. The date of the price-list I have in my hand is 2nd July, 1906. The price of sawn timber at that time was 15s., and then we had an extra shilling, all unseasoned timber selected for dressing was 1s. per hundred feet above that price. That is equivalent to what we are selling to-day at 16s. 6d., and it was then 16s. What we are selling to-day at 14s. 6d. was then 15s. Mr. Taylor said there has been a rise in price of 10 per cent., but I submit it is no rise at all, and my figures will bear me out. Those are the absolute figures which we were charging in those days, the discount being exactly the same. There is one thing probably that might be of interest to the Commission, and that is this, that the Christchurch merchants have been apparently under a cloud for some considerable time. There has been a feeling abroad that the Christchurch merchants have been robbing the public. We have been already tried and condemned by one of the newspapers here. The Commission undoubtedly is not responsible for that, but we want to clear up the position, and we are prepared to prove anything that may need proving. We want to clear up all doubts, and to show that we are doing a legitimate business here, and also that we are indispensable to the public; and for that purpose I should very much like the members of the Commission to take a turn round the yards and see how we are doing our business, and if the Commission would take the trouble to go round and see the yards I should be very glad to show them my yard and show them the expenses we are put to. Some little time ago the Minister of Labour made some statements with regard to the price we charged for

kauri in Christchurch, and we thought we should have been examined on that point by some one in authority, but instead of that those statements appeared in the papers, and were absolutely erroneous.

5. *Mr. Arnold.*] The present Minister of Labour?—No, this was in 1907. I should like to read a letter which was written and sent to the Minister of Labour, and it explains the position of the merchants in Christchurch. The letter is dated July, 1907, and was written by me as president of the association. It reads, "To the Minister of Labour, Wellington.—Sir,—I have the honour, by direction of the members of the above association, to write you on the matter of the prices ruling for kauri timber in this district. The matter has attracted considerable attention in the daily papers, and the members of this association have not been afforded any opportunity of being heard on the subject. It has been deemed proper that I should place before you the true facts of the case, and it is believed that, after due consideration has been given to them, you will have reason to modify the views which we fear you have hitherto held with regard to this very important matter. Briefly stated, the position is as follows:—

	£	s.	d.
Cost f.o.b. at shipping port	0	17	0
Schooner-freight to Lyttelton	0	2	9
Insurance	0	0	2½
Railway charges from Lyttelton to Christchurch	0	1	2½
Discharging and cartage from railway to yard	0	0	4
Stripping and stacking in yard	0	0	6
Total cost	1	2	6
Selling-price	1	7	0
Less 5 per cent. trade discount and 2½ per cent. cash discount ...	0	2	0
Net price received by merchants	1	5	0

The foregoing leaves a margin of gross profit of 3s., but from this has to be deducted the cost of giving delivery. This is a considerable item owing to the fact that kauri is only used here for special purposes, and as a good deal is consequently sold in very small quantities, 6d. per hundred feet would be about the average cost of doing so. As indicated, the timber is always stripped for drying, and we cannot, therefore, reckon less than twelve months as the average time kauri is kept in stock in Christchurch. This being so, 5 per cent. must be added to the cost to allow for this—that is another 1s. 1d. off the gross profit. We now have a bare 1s. 5d. left of our gross profit, and out of this all expenses incidental to running a timber-yard have to come, and it also has to provide for all risks, many of which are very considerable in a timber trade, such as fire, split boards, and other damage done to the stock through exposure to the weather, besides unavoidable damage in handling, and, in addition, the ever-present risk of bad debts. In the matter of fire, we would point out that in insuring against this we are heavily handicapped, for not only are the premiums high (higher, too, than in most other large centres owing to the absence of a high-pressure water-supply), but we cannot effect an insurance on a timber-stock without the general average clause being inserted. We must also point out that timber-merchants in Christchurch are very heavily taxed in the matter of rates through the rating being on unimproved values, a timber-yard requiring such a large area of land in proportion to other businesses." The selling-price at that time was £1 7s., and we deducted a discount which left our net price at £1 5s. That states the case, and, as I have said before, the merchants are quite prepared to answer any questions that might be put to them, and they hope to give to the Commission any information it may require, and if not in their possession they will try to procure it.

6. *Mr. Ell.*] Referring to the matter of prices and cost, what are you charging here for scantling and for rough timber up to 8 by 1?—Up to 12 in. we are charging 14s. 6d.

7. Flooring, tongued and grooved, 4 by 1, what are you charging at the present time?—£1 0s. 6d. All the prices that I am quoting are subject to the trade discount and 2½ per cent. for cash.

8. The price in Dunedin is 1s. less on the building-timber?—Yes, but they do not have the same quality. We maintain that ours is a better quality.

9. Better seasoned?—No. Their timber is from the south and ours is from the West Coast, and we hold that our stock is better than theirs. I would not have Southland timber in my yard if I could get the other.

10. There is a difference in the price of tongued and grooved of 2s. 6d. For an 18s. timber they charge £1 0s. 6d. here?—I think that their price is a better price than ours. I have explained the expense that we are put to with regard to that. It is impossible to make the same job in working wet timber as in working dry. The architects of Christchurch are very particular, and the timber must be worked dry. Some years ago we worked it wet, but now it must be seasoned first and worked after.

11. What is your price for rusticated weatherboards?—£1 0s. 6d., the same as the other.

12. There is 4s. difference between the Dunedin price and the Christchurch price. It is 16s. 6d. in Dunedin?—What discount?

13. Two and a half per cent. for cash?—They are very much nearer the sources of supply.

14. You admit there is a great difference?—Just about the difference in the railage from Dunedin to Christchurch.

15. They pay railage from Riverton?—Their railage would not cost as much as we have to pay for sea carriage here. Their railage from Riverton to Dunedin is 2s. 10d., whilst our sea carriage is 3s. to Lyttelton.

16. With regard to lining 6 in. by ½ in., what is your price here?—Fourteen shillings and ninepence. I had better put this price-list in. [Price-list handed in.]

17. *Mr. Barber.*] I think it would be as well if the witness put in the price-list of previous years?—I do not know if I can trace them back to 1900. They are hard now to get, and I want to keep these copies of previous lists.

Hon. the Chairman: We can have a copy made, and you can have it back again. [Agreed to.]

18. *Mr. Ell.*] You say that your rates have been going up a great deal?—Yes.

19. You know that the general rate was 3 1/16d., and this year it is only 2½d.?—I meant the general rates right through. I did not say this year from last year, because our prices have not gone up.

20. The rates are down in that respect?—They are up in other respects.

21. The other rates have not been altered. With regard to the rates which you pay, are you not gaining some advantage in this way, I mean in the large increases that have taken place in land-values in the city—is that not some compensation to you?—Am I to understand that you ascribe the increase to land-values rating?

22. No. I only say that your business sites are gaining in value?—I cannot say.

23. I know of one yard that was valued at £4,500, and it was sold for £8,400?—We pay increased rates on those values.

24. I admit that?—We may reap a benefit ultimately. Of course, we hope to get more when we sell out.

25. You are a timber-merchant, and you have had, as I know, a lifelong experience in business: now, what special sizes are you asking for in Oregon?—We are not asking for special sizes at present. If a job is Oregon it is Oregon right through, but we are not asking for any special sizes at present. I say that Oregon would be preferable to rimu only in a few sizes—that is, in long lengths and for large joists. I may say here that I was under the impression that Oregon was of a higher breaking-strain than rimu, and I think that this is one of the things that the Commission should inquire into and make public. My experience has been confined to Christchurch. I have not had a very great deal of experience in respect to Oregon, and my opinion has been formed from expressions of opinion from others.

26. You charge, as Mr. Page has told us, 6d. per foot for every foot over a certain length?—Yes, in rimu.

27. So that in a long length, say, 30 ft., it would make a difference in the cost of that?—Yes; but there is this to be thought of: in the house that has been before the Commission to-day there is not a 30 ft. in the whole lot of it. It is only in very few instances that these are required. Sometimes they use steel girders.

28. There is a good deal of Oregon used in a building I know of now?—That is a store.

29. Yes. Have you experienced the same difficulty as other merchants in getting long lengths?—No. We have had no difficulty in getting long lengths in native timbers, but the cost is more. The reason that the cost is more is this: I know a little about milling. I am interested in a mill. The reason that the cost is more proportionately for long lengths is because the demand is small. The case is different in America, because they would rather cut long lengths than short lengths. Their plants are more up to date than ours, and that is chiefly owing to the fact that they are able to take up larger areas than we do. Eight hundred acres is all that is given here, and it does not pay to put up a big plant, and that being so our mills are at a disadvantage in cutting long lengths. We should have no difficulty if we could get the Railway authorities and the Union Company to carry these exceptional lengths at no greater charge.

30. As a timber-merchant, knowing the demand there is for large sizes in big buildings, would you think it a wise thing to increase the duty upon Oregon in large sizes?—I do not know that there is a demand. If you could prove to me that there is a demand and that the demand cannot be filled in any other way, it would be a different matter. I do not see what we are going to do with the rough grade of rimu if Oregon should replace it. I have now a large supply of scantlings that I do not know what to do with. You have only to leave red-pine together for a certain time when it will become a fungus, a pulp, and rot away. I have to strip that stuff to keep it from becoming bad. Now, if Oregon is allowed to come in it will displace that class of rimu. If Oregon takes the place of that we shall have to say to the sawmiller that we cannot take lower than a certain grade of red-pine. He would reply that owing to the fact that he was unable to dispose of the rougher class, he would be compelled to charge a higher price for the finer qualities. It would simply mean that that grade of red-pine would have to be increased proportionately, as much as 30 or 40 per cent. The bringing-in of Oregon will not help the building trade whatever, and that appears to me to be the only logical conclusion in regard to the matter. We shall have to throw back on the miller a certain percentage of his product which will be valueless for commercial purposes, and so he must increase the value of the rest correspondingly. That being so, we had better pay the increased duty on the Oregon than have that occur in New Zealand.

31. You are aware that in the finishings of buildings it is not all heart and figured rimu that is used?—I have listened to what Mr. Seager said this morning. In many instances we sell timber that has absolutely no heart in it at all for finishings. If it is clean sap it will go. There is no other timber that I know of where sap can be used to such advantage as rimu. It takes the stain well, and finishes well. It is infinitely better than Oregon for outside work.

32. As to furniture-making, I understand the cheaper stuff is used—that is, there is a large quantity of sap?—All sap practically. We have now great difficulty to get figured rimu in New Zealand. The public now want it because they have discovered its value. A taste has been created for it, and there is a demand for good clean figured red-pine. The merchants have great difficulty in getting it, and, to my mind, it is really the finest timber any one could use in the internal finishings of a house. When I said it was all sap for cabinetmaking purposes, I might

explain that when the workman comes across a board half sap and half heart, it would pay him better to cut off that 6 in. and thereby get another board and so preserve that 6 in. of heart, and it is done in order to get the quantity required.

33. They use all sap for cabinetmaking purposes thoroughly dry?—Yes, thoroughly seasoned.

34. Even if your market was partly shut out for rough timbers, there is a market—I do not say to what extent—for inside finishings to houses?—I think you misunderstood the position. The demand is for that sap. We talk about rough timber. I do not call that O.B. It is too good for rough work. The heart often has a streak of resin in it; that is what we call "gummy heart," and that is not good for decorating purposes. We have trouble in getting rid of that.

Mr. Hanan: Will you bring your balance-sheet to-morrow?

Hon. the Chairman: There must be no more questions, as the witness wants to get away to meet an engagement.

Witness: The balance-sheet can be inspected by a competent auditor.

35. *Mr. Hanan.*] Have you any objection to let the members of the Commission have it?—I have no authority, and I cannot get at the other man.

36. Would you try to obtain it?—I am quite prepared to have my figures substantiated by a public auditor.

Hon. the Chairman: I think it is fair if you appoint an auditor.

CHRISTCHURCH, WEDNESDAY, 7TH APRIL, 1909.

W. GOSS, examination continued from previous day. (No. 42.)

Witness: Mr. Chairman, I have typewritten out a copy of the balance-sheet of that particular firm that I was talking about yesterday, and am putting it in before the Commission. As I stated, it can be verified by anybody whom the Commission likes to appoint. I would ask that it be treated confidentially. I have also prepared another statement. Of course, I did not know exactly on what lines the Commission had been going; if I had I should have been better prepared with information; but last night I went back through the books for thirty-five years to see the prices of various timbers. Our price-list, which I am leaving with the Commission, goes back to the latter part of 1900. I have gone back every six months to June, 1896, and then I have taken December, 1895, and gone back each five years to 1874, and I find that the selling-price of red-pine in 1874 was 17s. and 18s. At that time we were getting red-pine from Banks Peninsula, principally. It was being brought over the Sumner bar, and of course there were not the expenses then that we have now in many ways. I thought this information might be interesting to the Commission. [Documents handed in.]

1. *Mr. Hanan.*] Have you any objection to producing the balance-sheet previous to the one that you now submit of that company, or is it obtainable?—I will show it to anybody you like to appoint, and the auditor can make any comments he likes about it.

2. Will you show it to the Commission in private?—I have no authority to do that from the company concerned.

3. When you give us a list of the expenses, is it not fair to give us the other side of the ledger also?—If there is one.

4. If you give the expenses of the firms you have mentioned, in order to allow the Commission to arrive at a true knowledge of the position so far as the building trade is concerned, do you not think it but fair that we should also have from you the other side of the ledger?—If there is one.

5. What is your answer to that?—I will undertake that the Commission shall be supplied with the same information for the previous year.

6. You will give the other side of the ledger?—I will give the same information for the previous year.

7. But only as to expenses?—I do not quite see the drift of your remarks. We are giving you all the trading expenses in connection with this business on the turnover. Now, I say here that "The above percentages are on the turnover for the year. The cost-price in truck at Christchurch being 11s. 1d. for O.B. timber and 12s. 10d. for timber suitable for dressing purposes, while the prices to the consumer are list prices less 5 per cent. trade discount.

8. That does not enable one to get at the true position?—It gives you all the information that should be required for the purposes of this Commission, I take it. You can take our trade prices, and you will be able to draw your own conclusions from them.

9. To boil it down, you are not willing to let us see the previous balance-sheet to the one you submitted in respect to the business of the firm that you refer to?—I will make the same statement with regard to that balance-sheet that I have made with regard to this one. You have got the selling-prices of timber, and you know the difference between the selling-prices and the purchasing-prices.

10. Has your income-tax, so far as relates to your own business, increased or decreased during the last two years?—It has decreased very largely.

11. During the last three years?—Yes, it is a diminishing quantity. The best term was at the time of the Exhibition. Then there was practically a boom in Christchurch.

12. And it has steadily decreased since then?—Yes.

13. As to the sawmilling business, how has that come out on the West Coast?—That I do not know.

14. You have had no balance-sheet?—Yes, I have seen balance-sheets of some businesses.

15. Are you interested in more than one sawmilling business on the West Coast?—Yes, I have one of my own, and am also interested in others.

16. How has the sawmilling business paid, taking the last five years?—I cannot tell you exactly, because I have not seen a balance-sheet of the sawmill business only. The two businesses are mixed up together in my case.

17. Did I understand you to say that the amount of Oregon that came here was infinitesimal?—No. I referred to the other timbers that Mr. Seager mentioned, such as yellow-pine, Baltic pine, Californian redwood, and such timbers. I said that I was leaving out Oregon pine for the moment.

18. At about what time did the slump take place in the sawmilling trade in Christchurch?—I do not think any one could put his finger on any particular date and say that was the time when the slump started. It has been a gradual decrease.

19. Is that in consequence of Oregon timber coming in?—No, but Oregon timber I consider has been a small factor in the case.

20. Can you give us any information as to the quantities of Oregon that have come in during the last three to five years?—Prior to 1908 only one cargo of Oregon came into Lyttelton for a great number of years—over a period of perhaps twenty or thirty years. I suppose the Commission will be able to get the exact figures from the Customs.

21. The slump had taken place in the sawmilling business before 1908?—No. It probably was approaching, but it had not really taken place.

22. Seeing that only one cargo came in during the time you have mentioned, would you say that the importation of Oregon was a factor worthy of consideration so far as the slump was concerned?—Certainly, to a sawmiller.

23. But how much Oregon came in?—I will tell you the bearing it had on the matter, to my mind. There was a fear that Oregon pine was going to flood the market, and, that being so, merchants would not order red-pine from the sawmillers, and since then—since the beginning of 1908—the demand for building purposes for which red-pine or Oregon is suitable has been so small that, although the amount of Oregon that has come into the place has been proportionately small compared with the quantity of red-pine that had been coming in in previous years, it has been sufficient to act very detrimentally to the millers.

24. But the timber had to be obtained somewhere?—Timber was not required. I am not talking of any particular class of timber, but timber generally.

25. As a matter of fact, Oregon has not to any extent displaced New Zealand timber in the local market?—In the local market Oregon has displaced red-pine foot for foot for every foot that has come in.

26. You base that statement on how many cargoes of timber?—On the whole of the timber that came in in 1908.

27. Do you know what quantity that amounted to?—No. It would be only guesswork on my part.

28. Prior to 1908 the market here was not troubled much with importations of Oregon?—No, although probably a good deal was ordered before 1908.

29. As a matter of fact, there were no importations?—No, but if it is ordered people know it is coming.

30. Do I understand you to say that the timber-merchants here are making no profits at all?—I did not make that statement.

31. I ask you if that is so?—I am not speaking for the others. I am not making the profit I ought to make. I am not making the profit that should be made on the amount of money invested in a business of the size of mine.

32. How many years have you been in business?—The business I am in was established in 1859. It was my father's business before mine.

33. And it has gradually grown?—It has grown with the place.

34. And up to twelve months ago it was a successful, flourishing concern?—Yes. I do not say that it is not a successful concern now, but I say it is not so successful as a business should be with the amount of capital that is invested in it. I say it would probably be better if the capital were invested in something else.

35. That is based on the trade of the last twelve months?—Yes.

36. Have you made out your balance-sheet for the last twelve months?—Not yet. It is being made out.

37. *Mr. Jennings.*] Are there any timber lands in Canterbury within reasonable distance of Christchurch—on the Peninsula, or such places?—No, none that I know of at all. There is supposed to be a little timber at Kaikoura. I sent a practical sawmiller up there to report on the district, and he brought back word that timber was not there in sufficiently large quantities to make sawmilling payable.

38. Then you are dependent altogether on outside sources for supplies of timber?—Absolutely, at present. There was originally some timber in the Oxford district, but it was principally birch, and it has practically been burnt out or cut out.

39. Are there any other factors that have determined what is thought to be the high price of timber beside the disadvantage that you labour under in having to get it from outside? It has been aserted in other places, for instance, that the men do not work so well, and that wages have gone up?—That is undoubtedly so. Wages have gone up all round, and everything that we use in connection with our industry is costing us more.

40. What is the increase so far as wages are concerned, comparing to-day with ten years ago?—That I do not know without looking up. I do not remember exactly what the wages were, but they have undoubtedly risen.

41. Do the men work as well now?—No, I do not think they do. I do not think there is the same output of work that there used to be.

42. Can you assign any reason for that?—No.

43. Has our race deteriorated?—I should not like to say so.

44. In America and Australia I have found that the New-Zealander has always held pride of place for work. Why should he go back here?—I do not think New-Zealanders have gone back. If there were the same necessity for work probably they would work just as well.

45. With regard to the seasoning of timber, do you put an extra price on timber that is seasoned?—Yes, our price-list provides for that. There is an extra 2s. a hundred to cover the cost of seasoning.

46. That is owing to the length of time that you keep it in stack?—Yes, and the cost of stacking and the depreciation through waste.

47. Are you familiar with modern appliances for seasoning timber, such as Powellising?—No. I have had the Powellising process explained to me, and have been told it is a good process, but I have had no personal experience.

48. If you were satisfied that it lessens the cost, would you adopt it? Take timber that is put through that process in the North Island. It seasons the timber almost within a fortnight or so?—I think the merchants would be glad of anything that would save them from the necessity of keeping such large stocks.

49. Can any person outside of the Builders' Association purchase timber from you?—Yes.

50. There is no combination to prevent it?—No.

51. *Mr. Field.*] You probably heard Mr. Seager say that many foreign timbers were sorted and graded into as many as nine grades?—Yes.

52. And it was argued that the same thing should be done with our rimu, and that sawmillers could do it inexpensively. Have you anything to say on that subject?—From my own experience I do not think it at all practicable to do it at the sawmill, without a tremendous increase of expense.

53. Do you say it is necessary, or do you say that what sorting is required could be done better at the yards?—We should still have to sort at the yards, because the timber would get damaged in transit, and, seeing that we should still have to stack, I think we might as well do it here as there. I do not think there would be any saving in expense by having the timber sorted at the bush mill.

54. Can you tell me how the importation of Oregon has increased as compared with the output of our own New Zealand timber—that is to say, when it commenced to come in in large quantities?—We have very little to go upon in Christchurch. Oregon has only come in last year with any degree of certainty. Business was bad when it commenced to come in, and there would not have been anything like the same demand for red-pine as there had been, even if Oregon had not come in; but Oregon coming in of course decreased what little demand there was for red-pine.

55. Of course, we have had a slump, as you describe. Supposing we had not had the Oregon coming in, do you think the millers could have pulled through better than they have?—They would have had so-much more cutting.

56. Do you know anything of the durability of Oregon timber?—Not of my own personal knowledge; but, of course, I have discussed Oregon very largely with those who have had experience of it, and I am told that Oregon is not durable unless it is kept well away from the damp.

57. Can you tell me whether this is correct: I am told that recently in Christchurch some large pieces of Oregon had to be taken out of a building after it had been erected only a few years—I think about four years—because they were beginning to go. It is only fair to say that they were in contact with brick?—I heard that the beams had to be taken out, but I did not hear that they were Oregon beams.

58. Do you know what was substituted?—No.

59. Do you know anything about the durability of timber in contact with brick—that some timbers stand better than others?—I consider that timber that is going to be in contact with brickwork should be very dry when put there, and should be kept dry, and then, I think, there are plenty of timbers that would stand; but I think that being dry and having ventilation and air-space at the same time are the two essentials.

60. You are quite satisfied that the evidence we had yesterday with regard to the price of rimu increasing from 9s. 6d. to 14s. 6d. is incorrect?—Nine shillings and sixpence was not supposed to be the recognised price of timber at any time in Christchurch; 10s. was supposed to be the recognised price. Some merchants did cut the price down to 9s. 6d., but that was about 1895 or 1896—fourteen years ago. In 1897 my father had a contract with a sawmiller on the Coast to supply him with red-pine timber at 5s., f.o.b., Greymouth, and the freight then was 2s. 6d., instead of 3s. Timber has gone up 2s. and freight 6d., and we are paying a halfpenny more for wharfage. That is 3s. 6d. more we are paying now for timber than we paid them, and besides that we have our extra expenses.

61. It is not correct to make the bald statement that timber has gone up from 9s. to 9s. 6d. in a few years?—I should not make that statement, because if you go back to 1884 timber was 13s., in 1879 it was 16s., and in 1874 it was 17s.

62. We were told the timber-merchants charge 2s. for stacking, do you do that or guarantee seasoned timber?—I said yesterday that I considered the timber-merchants in Christchurch were able to supply ordinary requirements for building purposes dry, and we undertake to do so. For that we charge 2s. per hundred, and I consider 2s. is, if anything, too little, owing to the immense expense we are put to in producing the timber.

63. Do you hold any opinion in regard to the conservation of our timber?—I do not know that I do. I think it is a very large question to discuss. I have the cutting-rights of bush on the Coast, and I have a great dread that unless I have that timber cut out very soon it will not be there for me to cut out. Greymouth is usually a wet place, but if they have a dry season they have all sorts of dangers to contend with. They have had several fires there already, and also a fire very near my boundary, and unless the timber is cut out very soon it may not be there to

cut out, but will be burned out. There is another big question, but which I do not feel competent to deal with, and that is whether the land which it is proposed to conserve for bush areas would not give a better return to the country if opened for settlement. That seems to be the greatest question as to which would pay the country best, whether to have the land settled upon and so producing every year probably more than it does at present, or to keep that land tied up for the purpose of the timber on it.

64. Do I understand that you would be in favour of using our timber as we want it?—Certainly. As far as I can see, that seems to me to be the safer plan.

65. I suppose you would not object to the Government reserving a fair area of timbered land so long as they do it with care and without the risk of fire?—No, I would not have any objection to that. As I say, I think it is a question that requires a lot of consideration, and careful consideration at that, to see whether this land would not produce more if it was cleared and settled upon. The lands in Taranaki, I consider, are bringing in more from settlement now than if left in virgin forest. The unearned increment would not give us so much as if the lands were settled upon, and the only way to get settlement is to cut the timber off, otherwise it may be burned.

66. You agree with regard to timber lands held for milling purposes, that there is only one course open to them?—Yes, that is the only one way to get settlement—to cut it.

67. The main trouble you say in regard to Oregon pine is that it displaces our rough timber?—I said yesterday that I held very strongly to that opinion. If we are going to use Oregon pine in any large quantities, it will mean that it will only displace the red-pine that we are at present most anxious to use. If the sawmiller has no outlet for that rough class of red-pine, and we only use the clean timber, then he must of necessity charge us more for that clean timber, and although the public may be reaping the benefit through getting Oregon in at a lower rate than rough rimu, they would have to pay more for the dressed lines of rimu which Oregon is not suitable for.

68. I think you gave expression to the opinion that in the average rimu log there is a certain quantity of timber in the vicinity of the bark that it would be almost criminal to put into buildings?—Well, that, of course, never comes here—that part that is of no use is left at the sawmill and burned.

69. From your knowledge of the rimu logs, is there a large proportion of it which is unfit for building?—Yes, there is a lot of it in the log which never leaves the mill. It is left there in heaps, and in most places it is burned.

70. But is there not so-much timber that it is necessary to cut off with the bark?—Yes.

71. Where they can cut a square junk of timber they cut it?—Yes, if they can cut it clear.

72. Well, the timber they can cut in that form, is it good timber?—Yes. The timber that comes here, with few exceptions, is all right for building purposes. I have used any amount of it in buildings, and I should not like to be called a criminal.

73. *Mr. Leyland.*] I understood you to say just now that you owned a sawmill yourself?—Yes.

74. And that you are financially interested in some other sawmill?—Yes.

75. *Mr. Clarke.*] With regard to the extent of the sales in this district and in your particular business, do you sell most from your own sawmill?—Yes, mostly from my own sawmill.

76. Do you apportion the balance from sawmills in which you are interested financially?—No, not necessarily so. The other sawmills I am interested in send their timber here through an agent, and the agent sends the orders there, and they are executed by the sawmills. As a matter of fact, I order very little outside what I get from my own mill.

77. Then, in the case of your own mill you get two profits, the sawmiller's and the timber-merchant's?—Yes, and I run two risks.

78. With regard to the use of Oregon pine, you know, of course, that our annual consumption of timber is on the increase—our statistics show that?—I do not think the last twelve months will show that.

79. If it is an established fact—and I think we can easily find out—that all over the world the consumption of timber is increasing all the time, would there be any reason to suppose that this country is using less timber than any others?—No, I should think not.

80. Would it not be a fair inference that we should be increasing our timber-output?—Yes, if normal things obtain once again.

81. Is it not a fact that going a little beyond the normal in busy times there has been some difficulty in keeping the building trade going and supplying the timber?—None whatever here If we have had a reasonable time to execute an order we have generally been able to do so.

82. Would not that depend on what might be called a "reasonable time"?—No, I do not think so.

83. Assuming that evidence has been adduced before this Commission in other places that difficulties of that kind have been experienced, then it would be fair to say that there have been difficulties in some parts of the Dominion in obtaining sufficient supplies?—That I have nothing to do with. I can only speak from a Christchurch point of view, and I consider that Christchurch has never had any difficulty in getting supplies, not within the last few years.

84. Look a little beyond the immediate surroundings, and from the point of view of a citizen of this Dominion: If the increasing demand for timber is likely to grow, would it not establish this fact, that the importation of the Oregon that is being carried on now would be barely sufficient to cope with the increasing demand?—I have not the figures to prove that, and it has never been proved to me that that is so, and I do not consider I am in a position to discuss it.

85. I think you said it would be advisable to clear the bush for the purpose of obtaining a better return from the land: do you apply that to all bush or only some bush?—I stated that it was a question that required very grave consideration—I did not give it as an opinion.

86. With regard to clearing the bush, have you any idea what would happen from a climatic point of view if we cleared all the bush?—No, but I have had considerable discussion with people as to climatic influences. What do you mean by "climatic" changes?

87. Is it not a fact that where forests have been largely denuded of the bush the effect of the rainfall has been disastrous instead of beneficial?—I have heard it stated very positively but I do not give it as my opinion, that the bush has nothing whatever to do with the rain, but that the rain zone has a great deal to do with the forest area. It was said we had no bush worth talking about on the Canterbury Plains, and it was said very positively that the bush existed on the West Coast because it was in the rain area; not that the rain area was there on account of the bush, but the reverse.

88. Is it not a question as to whether or not the bush causes the rain, but whether or not it conserves the rain, and whether the gradual absorption of the water is not a benefit to the farmer and producer? Would it not be much better if the bush and undergrowth was allowed to remain, and be conserved for the special object of benefiting the farming people?—I think that is a very deep scientific subject that it would be very unwise for me as a layman to express any definite opinion upon until I had much more data at my disposal to deal with it.

89. So far as the experience of other countries is concerned, would you be prepared to accept and recommend this Commission to accept the opinion of men, or specialists who have been appointed by the Government, to report on these matters, and especially where they have reported in the direction I have indicated?—I should want to see both sides of the ledger first. I have in my mind just now countries where there is no very great rainfall, and they produce some of the best cereals. South Australia has a very low rainfall, and there they have very good products. Still, I do not consider that that is a question that I am at all competent to express an opinion upon.

90. *Mr. Morris.*] You are concerned in the importation of Oregon pine into this market?—Yes.

91. And your experience is that a great deal of it is not dry?—I do not think any of it is really dry.

92. We have been told the timber is dry and that is the reason it is used in preference to our native timbers?—That is not according to my experience—my experience is that it is not dry.

93. In connection with the depression in the sawmilling and building trade, I think if you told the Commission what is the average amount of your purchases from the West Coast mills for the last twelve months, compared with the two years previous, it may be of interest to us?—I have not got the figures for February yet, but I think they are not getting more than 25 per cent. from the West Coast mills now of what they were getting, say, eighteen months ago.

94. Can you also tell us what is the percentage of red-pine fit for dressing and manufacturing purposes obtained from your own mills?—Of course, my mills are an exception.

95. You think your mills are better than any one else's?—Yes, certainly. I should say about fifty per cent. is the most, under favourable circumstances, that you can expect to get. I would also say that, with all bush that is worked that I know of, the timber varies throughout the bush: you may get a very good run of bush and a very poor run. It has all to go to the market, and I should say fifty per cent. is the maximum amount of good clean timber you can get out of red-pine logs.

96. Then, in the event of this foreign timber being admitted into this country free, what are we going to do with the balance of our timber—would it not tend to increase the price of the dressing-material?—I answered that question yesterday. If that timber is not going to be used I really do not see what we are going to do with it, and it must of necessity increase the cost of clean timber very considerably.

97. You told us that you consider it is equal to Oregon in every way for framing purposes and building?—Yes. The only thing I excluded yesterday was long beams and big joists. It is probably lighter to handle, but the tendency in all good buildings in Christchurch is to make them fireproof as far as possible, and therefore they are using steel joists, and hence Oregon is not very much required in Christchurch.

98. In regard to the profits, do you consider, as a sawmiller, that the prices of timber now charged by the West Coast mills are too high?—I do not. I do not think they are enough.

99. Then, of course, as a citizen of New Zealand, you consider it is in our own interests to keep our money in the country and employ our own people?—Yes, I do. I look at it in this way, that if it could be proved to me that the country was going to be benefited by getting other timber to take the place of ours and conserve our forests, then I would be prepared to consider the position, but I do not think that has been proved.

100. You know that on the West Coast there is a tremendous amount of land which, after the present crop of timber has been removed, could be reserved for future timber-supplies?—Yes.

101. *Mr. Barber.*] You are interested in timber-milling?—Yes.

102. You are also looking out for further timber interests?—No, I am not at present.

103. You said you sent a man to Kaikoura to advise you in regard to some timber areas as to whether they were worth going in for?—Yes, but that happened three years ago.

104. But you would not pay a man to report in such a way unless you were looking out for some further interests?—You said "at present."

105. Now, you have been endeavouring to show that thirty-five years ago timber was very high in price, and that it would not be fair to say that timber has gone down?—No, I did not say that. I said it was as fair to say that as to say that there had been an unnatural increase in the price of timber, say, since twelve years ago.

106. Are you aware that twenty years ago timber was being placed on the railway-trucks in Southland at 4s. a hundred feet?—Well, twenty years ago we were not concerned with any timber that was placed in trucks, because our timber was always brought by sea.

107. Do you think it would cost more to place it in a schooner than on a railway-truck?—It depends upon how close the schooner can be got to the mill.

108. Taking into consideration the conditions twenty years ago and now, do you think there would be any difference in the cost in placing the timber on a schooner as compared with a truck?

—I do not know of any place, except on the peninsula here, where the vessels could get very close to the mills, and, that being so, there would be railway freight to the port. I do not think the peninsula timber was ever supplied at that price. The prices I referred to are the selling-prices of the timber.

109. You admit you were buying timber at 5s. f.o.b.?—Yes, twelve years ago.

110. What were the facilities for milling timber thirty-five years ago?—I do not know.

111. Can you tell me whether the mills were better equipped thirty-five years ago?—I had not seen a mill thirty-five years ago. My experience of bush sawmilling goes back to ten years ago.

112. In regard to the importation of Oregon pine, you say Oregon has replaced foot for foot the red-pine?—That is so. You must bear in mind that I did not say, in New Zealand, but in Christchurch.

113. You disagree with the evidence that has been given in Christchurch that Oregon has been used to replace kauri more than red-pine?—I am giving you my own opinion to-day.

114. And that is that none of it has replaced kauri?—Not that I know of. We do not use kauri in long lengths here in Christchurch.

115. Now, with regard to the 2s. extra for stacked or seasoned timber: I presume if you had a quantity of timber stacked and a builder came to you and said he wanted timber out of a stack he would have to pay 2s. extra if it had only been stacked for a fortnight?—That is true, but I do not know of any builder who would do such a thing.

116. It comes back to the question that if it is once stacked that timber is 2s. extra?—We undertake to supply dry timber, and for that we charge 2s., and if the builder pays 2s. a hundred he gets dry timber.

117. You say that Oregon pine does not come to this country dry?—That is so.

118. In what part of the ship does the Oregon come that you handle?—I do not know.

119. Has it been deck cargo?—No, not deck cargo, but I do not know what part of the ship it comes in.

120. We saw a cargo landed in Dunedin which was all wet: it was not sap, but was sodden with salt water, and that may account for your experience that Oregon pine was landed in Christchurch wet?—I do not think so.

121. You made a statement that you are not importing more than 25 per cent. of the timber from the West Coast that you did eighteen months ago?—Yes.

122. Have you been importing timber from anywhere else?—No, I am talking about the timber coming into Christchurch. The red-pine that Mr. Morris was referring to comes from the Sounds and Collingwood district, and from Greymouth.

123. It is all reduced in the same proportion?—Yes.

124. You stated you were prepared to submit a balance-sheet to an accountant: will you also submit invoices giving exact figures?—Yes, I will show the cost.

125. You say that you are not importing more than 25 per cent. of the timber that you were eighteen months ago?—I say that Christchurch is not importing, and that was the question Mr. Morris asked me.

126. How are you in a position to say that?—Because I saw the returns.

127. You cannot submit the invoices?—That is so. I have not got them. I think you could get the whole of these returns from the Customs.

Hon. the Chairman: I think we shall have to curtail these questions. Many of these questions have a tendency to confuse a witness who is at all nervous.

Mr. Barber: I do not feel inclined to let certain statements go without cross-examination.

Hon. the Chairman: I am sorry I did not curtail the statement made previously.

128. *Mr. Arnold.*] If a duty is placed upon Oregon pine, or if it is increased, is there not a likelihood of the local or native timbers rising in price in proportion to the duty?—I do not think so, unless the demand largely increased.

129. You think the internal competition will be sufficient to keep the price of the local timbers down?—Yes, for some years to come.

130. Is the supply of local timbers—rimu, totara, &c.—sufficient to cause that?—I think so.

131. Now, you have a very heavy stock in your timber-yard, which we were very interested to see this morning, of well-seasoned timbers, and I want to ask if you are prepared to take an order from anybody for timber?—Yes, I am prepared to take an order from anybody. I do not care who it is. The only condition that I stipulate for is that he will pay for it.

132. You have a combination amongst the merchants?—We have an association.

133. Can you tell me when that association was first formed?—The association was in existence in an informal way I should say nine or ten years ago, and it was formed as the Christchurch Timber Merchants' Association some seven years ago, and then a year or so later it was formed into the North Canterbury Timber Association. It has been in existence now for six years.

134. What are the objects of the association as it now exists?—The mutual protection of its members, the betterment of the timber trade, and the arrangement of all matters in connection with the business.

135. You have price-lists?—We have a price-list accepted by all members of the association.

136. You are united with regard to arbitration matters and things of that sort?—We have discussed the advisability of being registered under the Act.

137. What is your relationship with the Builders' Association?—We have none whatever.

138. No relationship?—None.

139. If you received a communication from the Builders' Association requesting you not to serve a certain builder who was outside of their association and who refused to join, what would you do?—In the first place, I do not think that the Christchurch Builders' Association is at all likely to send such a request; and, in the next place, I do not think that we should consider the letter.

140. You have never had such a letter?—No, not a suggestion of such a thing. It could not possibly come from the Builders' Association without my knowing it.

141. Do you purchase from the mills outside of those you are interested in yourself?—Yes, but not latterly, because there is not the demand for timber.

142. Do you know whether the members of your association are ever influenced as to purchasing from those mills because they are outside the Millers' Association?—I do not know of any mills that are outside the Millers' Association. They are either in one association or in another association.

143. There are outside mills?—I do not know of them.

144. You said just now, or at least I took it from what you said, that your men are working under an arbitration award?—Yes.

145. Do members of your association pay exactly according to that award, or in some cases do they pay higher wages than that specified in the award?—I have known of a few instances where men have been paid higher than the award. I do not know what the others do.

146. So that there is no real complaint so far as the timber-merchants are concerned as to the high rate of wages?—No. I consider that wages here are reasonable in our trade—that is, taken as a whole—although there might be certain instances that I would not consider right.

147. It is not suggested that an alteration should be made in wages so as to reduce the cost of timber?—Personally I should be sorry to see it done.

148. I understand that you are favourable to the bush land being used up for our requirements?—Yes.

149. You appreciate the fact that the time may come when there will be a scarcity of timber?—Yes. That is a point, however, that requires more consideration, because there are large tracts of the world where timber can be readily grown, and we have some of this land in New Zealand. The question arises whether it would not be better to get our timber from there in times to come.

150. Do you know sufficient of the bush country in the Dominion to give an opinion as to whether it would be wise after the big timber suitable for sawmilling had been cleared, to leave the remainder as a timber reserve for future use—that is, with the view of allowing the younger timber to grow up?—I should say not, unless there were special conditions attached to the land. Of course, the land might not be fit for anything else, and in that case it might be left, although I may say that the young bush gets terribly knocked about when felling the big timber. As a matter of fact, the small timber is generally damaged.

151. Is it a fact that the undergrowth is likely to come up and choke the young growth of timber left after the large trees are cut out?—I do not know that.

152. Have you an opinion on the subject of afforestation?—No, nothing more than I have already said.

153. If it can be shown that we have large tracts of land in New Zealand that are not so far used for ordinary cultivation—not even for grassing purposes—and that they are suitable for imported trees which might be planted and grown successfully, do you not think it wise that this Dominion should go in for such a scheme?—Most decidedly. It would be a great boon, and the country would be beneficially affected by it.

154. *Mr. Stallworthy.*] Have you generally been present at the meetings of your association at which rates have been fixed?—Yes.

155. On these occasions were there members present who thought the prices agreed upon too high?—No, I do not remember any member who thought the prices agreed upon too high, but I certainly remember many occasions where many members thought they were fixed too low.

156. There has been a difference of opinion then?—I do not think our association would be composed of humans if it were otherwise.

157. What timber area do you hold for the mill you yourself own?—I think it is 2,469 acres.

158. From the Crown?—No; freehold. I have cutting-rights over that freehold, none of which is Crown land. I think I have a lease of a very small bit of Crown land of about 200 acres, I should say, in addition to the other. It is an educational reserve.

159. You take, I believe, the outputs of mills which you are interested in?—My principal sources of supply are from my own mill, and apart from that I can get timber from any mill on the Coast. I do not contract to take any output of any mill, and I have no arrangements with any mills.

160. *Mr. Mander.*] Will sap rimu stand inside a building as long as heart rimu will stand outside?—Yes, I think so. It only wants to be kept away from the damp.

161. You have never discriminated between the inner circle and the outer circle of sap?—I do not know what the terms mean.

162. You consider all sap equal outside the heart?—I think there is more variation in the heart than in the sap.

163. In your experience, do you not think that there is sufficient hilly country in New Zealand on which to conserve timber without conserving valuable timbers for climatic purposes?—I do not know much about the areas of land that are hilly or otherwise.

164. Are you not aware that there are very large areas of hilly country containing timber that is not valuable for milling purposes?—I have no figures.

165. Do you not think it would be wise to take into consideration the advisability of conserving the hilly country for climatic purposes rather than some of the more valuable low lands?—I should certainly say so if it is not valuable land.

166. Would you be in favour of conserving our timber areas as much as possible, consistent with the requirements of the people of this Dominion?—You mean, provided the people of the country needed sufficient land for settlement.

167. Yes, and consistent with the requirements of the country for timber purposes, as well as for other purposes?—I do not know. As already stated, I cannot speak about the conservation of the bush until I see more definite statistics than those we at present have.

168. Do you consider it perfectly legitimate to lock up further timber areas to provide for our future supply?—I think that if a timber-merchant did not do that he would be very foolish.

169. If you purchased an area of timber lands, which might otherwise be destroyed, and held it for twenty years, would you not by so doing conserve the timber-rights of this country?—Yes; but I do not think it is possible to do that unless you could buy the freehold, and you cannot get the freehold from the Crown.

170. That is so, but you could buy from private individuals?—There is not much freehold bush land left now. The position obtaining on the West Coast is different from the position obtaining in the kauri districts.

171. When importing timber from other countries—say, Oregon—do you consider it would come out drier in the hold than on the deck: which would you prefer if you were importing?—I should very much prefer to have my timber below, because on the deck it stands a chance of getting washed about and saturated with salt water.

172. Do you not think that timber in the hold of a vessel sweats considerably?—The Oregon that I have had here all came in vessels—steamers that were not long in coming—and I have not noticed any deterioration from that point of view.

173. In regard to conserving the smaller trees in a bush that has been leased for sawmilling purposes, do you not think that the dead tops, &c., of the larger trees which would be strewn about would be very liable to catch on fire, and so the whole scheme might go up in smoke?—There is more danger in that respect than in the virgin forests. There is very little doubt but that what you state would take place sooner or later. There is always a lot of wood left about where timber has been worked out of a forest.

174. *Mr. Field.*] Were you in Wellington last year when that large deputation from the Timber-millers' Association waited on the Government?—Yes.

175. Do you remember any offer made to the Premier at that time with regard to milling at a certain price?—They said the Government could fix the price, and several made a statement to the effect that they would hand over their books to the Government. I think they are still prepared to do that.

176. *Mr. Ell.*] You said that the Timber-merchants' Association was prepared to supply anybody: are you prepared to allow anybody the same discount?—Anybody who earns his living from the use of timber.

177. Do you not discriminate against the two men?—We do not discriminate at all in the matter of discount.

178. With regard to buying, is it possible for any miller outside the association on the West Coast to sell to any one of the timber-merchants in Christchurch?—I do not think they would buy from them, because we have been so messed up in our supplies that we have arranged with the West Coast sawmillers that if they will lay themselves out to supply the Christchurch market we will get our supplies from them so far as they are able to supply.

179. With regard to leaving the young timber, are you aware that the timber regulations in America, in any considerable forest, require them to take the bigger trees out with great care, and thus leave the younger trees to develop?—No, I did not know that that was being done. It would require much supervision in the felling. I have also heard that in several districts in America the timber is nothing like so inflammable: for instance, the redwood is almost uninflammable, and will not burn.

180. *Mr. Barber.*] With regard to the association, are there any printed rules belonging to it?—No. We have rules just in the ordinary way, and each member is supplied with a copy of the rules.

181. Could you supply the Commission with a copy of the rules?—Yes.

182. *Mr. Morris.*] Mr. Ell asked you if you were aware about certain timber regulations under which they only took the heavy timber and left the young trees standing. Do you think it is practical to do that on the West Coast?—No, I should not say so. I think the sooner it is cleared the better, once the big timber is removed. It would be very liable to be burned. The timber that is left is of little use.

183. *Mr. Mander.*] Do you think that the Government regulations in some measure compel the destruction of timber by compelling the lessee to cut it out in a certain period?—Of course, there is only a certain area, and it has to be worked out in a certain time, and you must keep on working.

184. And work it out in a certain time?

185. *Hon. the Chairman.*] You are wrong, Mr. Mander. Have you not had an extension?—Yes.

186. Did you ever know any one that was refused?—No, I do not think I have.

187. I would like you to quote the price of flooring from the Southland mills?—The price is: Tongued-and-grooved flooring and lining—4 by ½ T. and G. per 100 ft., 12s. 6d.; 4 by ⅝ T. and G. per 100 ft., 13s. 6d.; 4½ by ¾ T. and G. per 100 ft., 14s.; 4½ by 1 T. and G. per 100 ft., 15s.; 6½ by ½ T. and G. per 100 ft., 11s. 6d.; 6½ by ⅝ T. and G. per 100 ft., 13s.; 6½ by 1 T. and G. per 100 ft., 14s.; rough T. and G. per 100 ft., 1s. 6d. less than above: ½ in. extra in width added for tongue.

188. That is the price in Dunedin in the yard?—Was it seasoned?

189. It does not say?—I have been making inquiries, and I find the practice in Dunedin is not to season their timber, and that wants to be taken into consideration when comparing the prices with ours. The price that we quote is for seasoned lines.

190. *Mr. Ell.*] There was a difference of 4s. per hundred feet?—We only make 2s.

191. Here is the price-list of John Murdoch and Co., of Dunedin. Their price for tongued and grooved, 4 by 1, is 18s.?—Ours is only £1 0s. 6d.

192. Yes, but that is the price there?—Then you quoted rusticated.

193. That was 16s. 6d.?—Ours is £1 0s. 6d., and I may say that it is very seldom used here.

194. Allowing for the 2s. difference for seasoned timber?—It is an anomaly, because it costs us as much to purchase the one as the other. Our lengths are up to 22 ft., whilst theirs are only up to 20 ft. Moreover, it does not say there whether it is dry or not.

195. *Mr. Morris.*] It would seem from what we have heard that the practice in Southland is to dress the timber green after being sawn at the mill?—Yes.

196. How would you get on if that was adopted in Christchurch?—I do not think the Christchurch trade would take that, because it would not be good enough for the trade. Timber that is dressed green is nothing like so good as timber that is dressed dry. A few years ago we always dressed it green, but we found it did not give satisfaction. We now dry the timber first and put it through the mill, and we find it makes a good job, but that costs more money. We could supply timber at about 16s. 9d. if it came straight from the mill. If we supplied it green we should get it straight from the mill on the other side, and we could supply it at something like the Dunedin price-list, and our price would be in that case 16s. 9d.

EDWIN HENSHALL, Timber-merchant, Papanui, sworn and examined. (No. 43.)

1. *Hon. the Chairman.*] I understand you are a timber-merchant at Papanui, about three miles from Christchurch?—Yes.

2. I shall be glad if you can assist us in the subject of our inquiry?—I do not know that I can say very much, as the subject seems to have been thoroughly threshed out from a merchant's point of view by the previous gentlemen who gave evidence before you. We are in business at Papanui, and we keep stocks there. I cannot say anything about the cost of felling. Nor can I speak of the cost of cutting at the mill. We are not interested in any mill. We get our supplies from the West Coast.

3. Will you state to the Commission how you get your supplies?—We get our supplies from the mills through the agent here.

4. Are there many agents in Christchurch attending to the West Coast millers?—I only know of two.

5. There may be more?—I could not say. I only know of two.

6. Will you name those two agents?—The West Coast Trading Company have an office in Christchurch, and there is also a Mr. Budd who handles timber here.

7. Those are the two agencies that you deal with?—I think Mr. Reese handles timber also. He was in partnership with Mr. Budd at one time, but they have dissolved partnership.

8. That makes three?—Yes.

9. Do you do much business direct with the millers through them?—The order goes direct to the miller through them. They forward the order on. We understand that it is to the convenience of the millers to have one representative, so that all orders can go forward in order and be executed.

10. How is the trade of Christchurch now compared with what it was two years ago?—It is very much less. Our experience is that there is much less trade being done at the present moment.

11. Less building trade?—Yes, less sales of timber.

12. That accounts for less building, I take it?—Yes.

13. Do you take any contracts for building, yourself?—If any one comes to us and wants a house built, we do it.

14. So that you are a builder as well as a timber-merchant?—Yes.

15. *Mr. Hanan.*] You are not interested in any sawmills?—No.

16. How do the timber-merchants in Christchurch who have no mills compete with those who have mills?—I do not know. You see there is one price set by the West Coast sawmillers. It really matters little whom you get the timber from; it is one price, I understand. Perhaps the man with a mill would have an advantage; he would be entitled to that to compensate him for his capital invested.

17. How long have you been in business here?—As a seller of timber, about six years.

18. Has your business increased during that time?—Yes, it increased rather rapidly up till a couple of years ago, but there has been no increase since then.

19. Does your last balance-sheet show a falling-off?—Yes.

20. What is the date of it?—The 31st March twelvemonths was our last. We have not completed our present one. We are working at it.

21. As regards expenses, comparing your balance-sheet with the previous balance-sheet, how do you stand with regard to increased expenses?—Do you mean the yard costs and so forth?

22. The expenses of carrying on your business?—They have been less during this last year.

23. *Hon. the Chairman.*] Does that mean that you have fewer hands?—Yes, and we have also had to economize. We have had to do a little paring on account of the state of the trade.

24. *Mr. Hanan.*] It is only within the last two years that you have found a falling-off in your business?—Yes, the last twelve months, strictly speaking. It has been more pronounced then.

25. Business has been fairly good with you, and there was really nothing to complain of up to the last twelve months?—No, nothing much to complain of.

26. Can you say that that remark applies to the timber-merchants so far as your knowledge goes?—I can only speak for ourselves.

27. Have you been importing any Oregon?—Yes. We have taken Oregon, with others. Cargoes come here, and we have taken some.

28. Have you taken a share of a shipment?—Yes.

29. When did the last shipment arrive?—We have not had any for six months.

30. You are aware that there are complaints from the West Coast in respect to the importation of Oregon affecting the sawmilling industry?—I know nothing of the matter with the exception of what I read in the newspaper.

31. Speaking from the standpoint of the local market, would you say that if there be a falling-off in the sawmilling trade on the West Coast it is due to any extent to the importation of Oregon?—In my opinion, it is not all due to the Oregon. Oregon must take a share, of course. The proportion of Oregon that has come into the place probably would have been replaced by rimu had there been no Oregon; but it is owing to the state of the money-market, I take it, that the falling-off has occurred. In our business, contracts have been held up owing to the money-market. We consider that a lot of our business has gone off owing to the state of the money-market.

32. Is not the quantity of Oregon compared with the quantity of West Coast timber used in Christchurch very small indeed?—I do not know. There seems to be a lot of Oregon about the place.

33. Since when has there been?—During the past twelve months.

34. And all you know of is one shipment that has come in during the last twelve months?—I have read of others. We have only had one, but I understand there have been other shipments come in.

35. What quantity did that ship bring, do you remember?—No. I believe it was about 800,000 ft., but I am not stating that authoritatively.

36. Do you know anything as regards the class of Oregon to which it belonged?—It seemed fair Oregon, as far as I know Oregon. Of course, we have always handled it more or less in small quantities.

37. Do you send much Oregon to country stations? Does it pay to do so?—No. We do not look upon Oregon as a very profitable timber. It is right down on bed-rock.

38. Then, what does find its way into the local market is utilised locally and does not go out into the country?—I understand that that is so. It is mostly large stuff, and therefore, I take it, it goes into big buildings for beams and so forth.

39. Now, as to duty: do you think that Oregon is at present handicapped sufficiently?—I am only giving my own opinion, but I think the duty is all right as it is. I do not think it would be wise to take it off or to increase it. I should say, leave things as they are.

40. Is there any agreement between the timber-merchants with regard to the price of jarrah?—Not that I know of.

41. There has been no alteration made in the price of jarrah in the local market within the last twelve months?—I understand there has been a slight rise.

42. When did that rise take place?—Probably about eight months ago.

43. Are you all charging the same price for jarrah?—Yes, I understand so.

44. Then, this rise was in consequence of an agreement come to between the timber-merchants?—I could not say that at all.

45. How did you come to increase your price for jarrah? Was it in consequence of any agreement or understanding or suggestion on the part of any other person in the trade?—It was mutually arranged by the timber-merchants that the price should be a certain figure, and it is not a bit too much. There is nothing much in it.

46. What was the reason for the increase taking place?—That I could not say.

47. Before you agree to an increase do you not know the reason why such increase should be made?—I was not at the meeting that regulated that matter.

48. Whatever the others do you fall in with—is that so?—Certainly, if it is reasonable.

49. But in this case can you say whether the increase in the price was reasonable?—I should say it was.

50. What were you selling jarrah at before this increase was made in the price?—£1 2s. a hundred.

51. What are you selling at now?—Twenty-three shillings.

52. As regards kauri, do you favour an export duty on kauri to keep it in the country?—I could hardly say; it is a matter I have never gone far into. I should think that is more a matter for the Government to decide. But there is no doubt kauri is a very good timber. It can scarcely be done without.

53. You are a member of the association. Can you tell us how many are in the association?—No.

54. Is there any fee payable to join the association?—Yes.

55. Do you know the amount of it?—Five guineas, I think.

56. Are all the timber-merchants in Christchurch in it?—I think there are some outside of it.

57. Do you know the reason why they will not join?—I have not the least idea.

58. Do they sell cheaper than you people?—I do not think so.

59. You are all the same?—I understand so. I have been told so. I have seen no price-list, so I could not state authoritatively.

60. With regard to jarrah, do you combine together for the importation of jarrah, or how is it brought in here?—It is taken in much the same way as Oregon, I think. If a man wants it he takes a portion of the cargo.

61. Can you tell us what quantity of Oregon you have sold in the last twelve months?—I should have to go into the books to state definitely, but, judging by the stack of timber as we got it and as it is at the present moment, I should think about 12,000 ft. to 14,000 ft.

62. Could you say what amount you sold for the twelve months previous to that?—None. Well, there might have been two or three hundred feet.

63. Have you any objection to giving the Commission the quantity of timber all round that you sold twelve months ago?—No, I do not know that I have; but to give figures like that I should require to go to the office.

64. Would you mind getting that information for us? I want the amount shown as sold in the last balance-sheet, as compared with that in the previous balance-sheet—the figures for all timbers, rimu and Oregon pine being particularised?—Yes.

65. *Mr. Field.*] Have you had any complaint here as to the price of timber?—No, I have heard nothing about the prices.

66. Do the timber-merchants complain of the price charged by millers? Do you think it is a reasonable price?—I think so. I should say so.

67. Have any builders complained of the price charged by timber-merchants?—I have heard none. Of course, you will always get men when buying a thing wanting to get it for less.

68. Have you ever heard of any timber-merchant, or builder, or private consumer of timber being, in your opinion, oppressively treated by reason of the understanding said to exist between the sawmillers and you timber-merchants and the people who work in timber?—No, I have heard no complaints at all.

69. There is really no difficulty in Christchurch so far as you know?—No. As far as I know, every one is satisfied. The builders do not complain. I have not heard any serious complaints.

70. You say that Oregon has been largely used in Christchurch for the past year or so?—I should say that it must have been, because there appears to have been a fair quantity come in, so some one must be using it.

71. A good many ships have come to Lyttelton, have they not, with Oregon?—I think so.

72. *Mr. Leyland.*] With reference to the fixing of the price of jarrah, I have here the association price-list, and I find that with regard to jarrah, yellow-pine, and Baltic there are no prices fixed by the association?—They would appear on the Jarrah Company's list. The Jarrah Company post the list out.

73. Then your association does not fix the price of jarrah?—No. It has practically nothing to do with fixing the price.

74. You told us just now that the association fixed the price of jarrah. You were not thinking, I suppose?—I was going by the list. There is a list issued by the Jarrah Company, and we are charged accordingly.

75. Then the jarrah people fix the price of jarrah?—Just so.

76. I suppose the timber-merchant is allowed a special discount?—He gets a buying discount.

77. Now, with reference to the quantity of Oregon used: do you know that the amount of Oregon timber imported last year was equal to one month's importations of rimu?—That I could not say. I do not know how much rimu came into the port or how much Oregon.

78. Are you in favour of prohibiting the importation of Oregon?—I think that Oregon for beams is a good timber. For long lengths it is a very good timber.

79. I have a letter in my pocket which states that certain jobs in Auckland are hung up till long lengths can be got. Under such circumstances, do you think that any hindrance should be placed in the way of the importation of Oregon?—That is a very large question. I do not know that I am capable of answering that. It is a matter of policy. If Auckland people are waiting for long beams, I should have thought they could get some kauri.

80. We cannot get half as many long kauri beams as are required?—That goes to prove that Oregon is useful and necessary in that instance.

81. *Mr. Clarke.*] With regard to fixing prices, you said that the prices were mutually arranged. In the event of competition being prevented by foreign timbers being barred, would there be anything to prevent the prices being mutually arranged for local timber, to the detriment of the public?—That would not occur, because any one can start in the trade. If too high a price were being charged for an article some one else would immediately start. It would rectify itself, I think.

82. You think that if the price of timber went up 1s. a hundred feet, that would be sufficient inducement for any one to set up in the timber business in opposition to your association here, for instance, or its members?—I do not say that 1s. a hundred would make a very great difference. If you take a house—for instance, an ordinary five- or six-roomed house—it takes from 10,000 ft. to 12,000 ft. of timber. That is only an increase of £5 or £6.

83. Assuming we multiplied that house by a very large number, and the quantity of timber by very many hundreds, would that not amount to a considerable tax on the community, that 1s. a hundred all round?—If wages rose and everything along the line rose, the timber would have to go up. I could not say whether it would be detrimental or not to the public. It is a thing that is not likely to be done, anyhow.

84. What is to prevent its being done by the association?—They would not raise the price above what a yard can be handled at. The present price of scantling does not give you a sufficient profit to handle it.

85. Am I to take that as an indication that the sawmillers would be very likely to increase the price if there were no competition?—I do not know that they would. It would be a matter of local conditions. If wages and other things rose, I suppose they would increase it then.

86. In view of the possibility of prices going up, and in view of the increased demands of the Dominion, would it not be better to use a certain proportion of foreign timber and save a certain proportion of our own as long as we can do so to advantage?—I could scarcely say. I do not know whether it would be wise to save our own forests or not. I should think it a matter of what the land will produce: whether it will produce more from the growing of timber or from other uses—agriculture or whatever it may be.

87. *Mr. Morris.*] With regard to Oregon, do you not think that if this timber is admitted into this country on the same basis as at present, its importation will increase a great deal, and so "cut out" our native timber?—I think it will decrease unless the trade alters a lot. I do not think there will be many orders going forward for it, because there are pretty large stocks on hand now.

88. Can you give us any idea why Oregon is sold in this market at 14s. 6d. when they are charging 19s. for it in Dunedin—21s., less 12½ per cent.?—No, I could not give you any idea why that is so. It only shows that they charge a very low price for timber here.

89. It is not done with the object of bringing it into competition with our native timber?—No, I do not think so.

90. *Mr. Barber.*] I understand you to say that you are opposed to a reduction on the duty on imported timber?—It is a matter I have never gone into, therefore I cannot really say whether I am opposed to it or not. It appears to me that the present duty is sufficient. I should say it is about a fair thing.

91. Your opinion is that that should be retained?—Yes. I do not think there will be very much more Oregon come forward. I do not know authoritatively, but I hear that the price of it is rising, and if it rises at the source of supply Oregon will not come into this market. It cannot be sold any cheaper than it is sold now, and if the price rises at the source of supply that will block it from being profitable to handle.

92. You said that you are a member of the association?—Yes.

93. Do you know whether the association has, as an association, decided to oppose the removal of the duty on imported timber?—No, I have heard no discussion on the matter whatever at any of the meetings.

94. Why do you, as a timber-merchant and builder, advocate the retention of the duty which imposes an additional 2s. on the price of timber to all the people who purchase it, and consequently makes the cost of building dearer, and therefore rents higher? What is your reason for advocating a policy such as that?—I have not gone into the matter, and therefore I do not strongly advocate it one way or the other; but I suppose our local men will require protecting. We do not know under what conditions the Oregon is cut. It may be cut by cheap labour, or under other conditions which give it an advantage. That is a matter I do not know much about.

95. Do you consider timber a manufactured article or a raw material?—I suppose it is partly manufactured when it has had a saw through it.

96. In that case, would you class wool, after it has been clipped off the sheep's back, as a manufactured article?—I could not say. I have seen a few sheep in the paddocks—that is all.

97. Do you believe that the 2s. duty on timber is responsible in many ways for the high rents which prevail throughout New Zealand at present? It helps to increase the cost of building, and consequently increases the rent to the working-man?—No, I do not think that has much to do with it. For instance, the scantling in an ordinary cottage would not amount to very much. In an ordinary six-roomed cottage there would not be more than 5,000 ft. of scantling all told, and it would not all be Oregon.

98. But it is not used only for scantling, but for flooring, sarking, lining?—Oregon is only useful for scantling; it is not a bit of good dressed. It would not be used for flooring or lining.

99. It would not be used for the lining of a house?—No, it is never used here except in framework.

100. *Mr. Arnold.*] If Oregon and other imported timbers are only used for scantling in connection with a house, then their importation could not do very much harm if they came in free?—They would compete to a certain extent.

101. Only to the extent of the scantlings?—Yes.

102. It is a mere bagatelle?—The scantlings would represent about 50 per cent.

103. In an ordinary five-roomed house the increase in the price of the timber would represent something like £18 to £20?—No, it would not.

104. You say that that evidence is wrong?—There is about from 10,000 ft. to 12,000 ft. of timber in an ordinary five-roomed house, and 10,000 ft. at 1s. increase is £5. If the whole of the house was built of Oregon an increase of 2s. in the duty would only amount to £10.

105. If the whole of the duty were removed it would make very little difference so far as the building was concerned?—It would be a very small item.

106. Have you any idea how many men are employed in the sawmills in New Zealand?—No.

107. Then, you have not the slightest idea how many men would be displaced by the importation of Oregon pine?—No, I could not say. I do not know how many men there are working in connection with the sawmilling industry.

108. Then, you have no idea which is the better for the Dominion—to displace the small number of men employed in the bush mills or to tax the whole of the community by an increase in the duty on Oregon?—No.

109. So that your evidence is quite valueless so far as that question is concerned?—Yes.

110. *Mr. Stallworthy.*] In regard to the business of a timber-merchant, am I right in presuming that the man in a large way of business has an advantage over the man in a small way of business?—Well, naturally his output would be larger. He would be able to effect economies in the handling of it, I should say.

111. And he could sell his timber at a cheaper rate than the small man?—I do not know. He would have to get a bigger plant; he would have to allow for interest on his larger stocks and plant, and that would perhaps counterbalance it.

112. But it is not natural that a man in a large way would be able to sell at a larger profit than the man in a small way?—Perhaps so in some instances, but there are higher wages paid in large firms sometimes than is the case with a man in a small way of business, and therefore it brings the selling-price of the article to about the same.

113. Who fixes the price in the association—the larger or the smaller man?—It is a mutual arrangement.

114. But the influence of the men in a large way of business is greater than that of the men in a small way?—No, I think it is equalised. I should not say that the big merchant has much to do in the matter of regulating the prices any more than any one else.

115. You buy your timber from the West Coast through the agent here?—Yes.

116. Is it a uniform price?—Yes.

117. It covers the whole of the timber you buy?—No, there are two prices.

118. What are they?—6s. 9d. and 8s. 6d.

119. *Mr. Mander.*] You say that within the last year or two you have increased the price of jarrah 1s.?—I think it has gone up 1s. The Jarrah Company has raised it 1s. We simply go by their list.

120. And they put the price up on you first?—Yes, certainly. We simply charge their list price. We have practically nothing to do with it.

121. You had to pay 1s. extra for the jarrah, and consequently charged that extra?—Yes. If we are charged 1s. extra we have to charge that amount in addition.

122. Would a reduction of 2s. in the duty on jarrah reduce the price of rimu, do you think?—I could not say.

123. Would a builder get the whole of that 2s. if the duty were taken off jarrah?—There is not a great deal of jarrah used. It is only about 4 per cent. of the timber in a building.

124. But supposing the duty were taken off Oregon pine, do you think that would reduce the price of the building to that extent on all the timber used for building in Christchurch?—I could hardly say what effect it would have.

125. If it did reduce the price by 2s. on the market, would it also reduce the price of rimu to that extent?—Well, rimu could not be sold at that price.

126. Could the rimu-producers compete with Oregon if the duty was taken off and it was sold at 2s. less in Christchurch?—It could not compete. There would have to be a cheaper way of producing it than at present.

127. Do you not think that, if a merchant in Christchurch made a larger profit out of Oregon than out of rimu, he would force Oregon on the market?—I suppose it would be natural that he would sell the best-paying line.

128. *Mr. Ell.*] Are you interested in sawmilling at all?—No.

129. You are purely a timber-merchant?—Yes. We have no interest whatever in any mill—we deal entirely through the agent.

130. You told us with regard to Oregon that it was mostly imported in large sizes and used for big buildings?—I should say so. It is very useful for big work.

131. And necessary?—Yes.

132. That being so you would not advocate any higher duty to exclude it from the market?—No, I do not think I would advocate a higher duty on it.

133. Now, with regard to jarrah, was there not an Australian company in operation here two years ago?—Yes.

134. Was the timber that was then being sold at the price competing with some of our local timbers—black-pine or any other timber?—Yes, it was certainly competing with black-pine.

135. Is it a fact that the Australian company was bought out by a local syndicate of merchants?—I could not say.

136. Is the present company a Christchurch company?—I do not know who it consists of. It is called by the same name—the Jarrah Timber Company.

137. You never heard there was a change of ownership of the yard in Moorhouse Avenue?—I heard there was an alteration taking place in the business. The manager here went north.

138. Who is the manager there now?—Mr. West.

139. A Christchurch man?—That is more than I can say.

140. Is it not a fact that after the change in management the price advanced?—I think it advanced.

141. You say the price went up 1s.?—I think it was something like that. I could not say unless I had the list here.

142. I understood you to say that jarrah had gone up 1s. within the last twelve months?—Yes, it went up, I think. We only get a buying discount.

143. That is since the change in the management has taken place?—I think that is so, but I could not say for certain.

144. *Mr. Field.*] Is Oregon being used for framing in the small buildings and cottages in Christchurch?—I think there is some of it being used.

145. Is it not a fact that rimu would be used if Oregon were not here?—Yes, I think rimu would come in.

146. Then Oregon is to that extent displacing red-pine?—To that extent, and also for scantlings.

147. Mr. Arnold asked you a question in which he apparently suggested that as a result of the sawmills being closed a number of men would be thrown out of employment. Would not other results take place besides? Would not the capital of the sawmiller be lost?—Certainly, if the mill were closed. It would depreciate very considerably if the mill were shut up.

148. He could not get anything for his trams?—That is a thing I do not know. The thing must be worth something.

149. But if milling is bad all over the colony it is no good trying to sell sawmilling machinery?—I suppose it would be on a falling market.

150. What about the timber on the ground? Would not that be burned and the land used for farming?—That is a thing I could not say. I really do not know which pays the best.

151. It would be a pity to see our valuable timber go up in smoke?—I understand a lot of it is burned, and if they could make money out of it by milling it you would think they would do so.

152. Then, you do not think it would be better to have the money spent in the colony instead of sending it to America?—Yes, I think we can do with all the money we can get here.

153. There is also the railway freight which would be lost. Would not that have a bad effect also?—Yes, it would lessen the revenue of the country.

154. *Mr. Arnold.*] Do you say that, if it was necessary to discharge one-fourth of the hands in any particular mill, the capital would be lost?—I understood Mr. Field to suggest the shutting-up of the mill altogether.

155. That was not the question I asked you. I asked you the question as to a certain number of men being thrown out of work. Mr. Field is trying to minimise the reply I got from you. If the whole mill is shut down, do you say then the whole of the capital will be lost?—Not entirely. There must be some value attached to it.

156. What do you mean by "capital"?—Money expended on the plant and land.

157. Is that all the capital expended in a sawmilling business?—As I have said, I know nothing about the sawmilling business. I do not know the amount of capital required. We buy our timber from the mills, and are not interested in any mill in any shape or form, but if you discharge your hands there would be a loss of wages in the district.

158. Now, if you have a capital of £2,000, and you close your business, would you not use that capital for some other purpose?—You might not get £2,000 for your mill.

159. Again, with regard to the railway, do you suggest that if a certain portion of the milling labour that is done now ceased to be done, that the railway is going to suffer? Would there be a less consumption of timber in the Dominion?—Well, I should think that the railway in the district would suffer to the extent of the loss of freight on the timber it previously carried.

160. But, then, the Dominion is the proprietor of the railways?—But America's timber comes into our ports, and there is not much railway freight on it.

161. You know there is an extra railway freight on the imported timber?—Yes.

162. And therefore if there was the same consumption there would be a gain and not a loss?—It cannot be a gain if the Oregon comes into a port and is not carried on the railway. I take it that nearly all the Oregon that comes to this country goes to the four large centres, and there would not be much railage on the stuff that goes to three of them. I do not think there is much Oregon used in the country districts.

163. But the suggestion is that if the duty were taken off it would be used, and if it were used would not the railway suffer in consequence?—I think the railway would suffer the same because, as I pointed out, the Oregon comes into the ports, and there must be a greater percentage of Oregon used in the cities than in the country.

164. Why not in the country?—In the first place, there is not so much work done in the country as in the cities.

165. At the present time there is a certain revenue derived from the local scantling, and the suggestion is that if the imported scantling is to be used instead, would it not have to go into the whole of the buildings wherever they were?—Certainly, if we do not use our own article we shall have to use the other.

166. Therefore the argument that the railway is to lose the revenue is a bogus argument?—Well, I should say the railway must get a good deal of revenue from the bush sawmills, because there are millions of feet of timber carried from the bush sawmills to the port of shipment. The mills are getting further back, and there must be railage paid on that timber from the sawmill to the boat, and, seeing that such a large proportion of the timber comes from the coast to this market, I should take it that the Westland railways would suffer considerably if they lost all their timber trade.

167. But would they lose it all? You do not suggest that, do you?—I am not suggesting anything. When you go into statistics and what might happen I have nothing to say, because I am not an authority on it.

168. You admit that Oregon pays a heavier freight on the railway than the local timber?—Yes, they pay a little more on it, but I am not certain.

169. *Mr. Stallworthy.*] What is the relative proportion of the West Coast timber you buy at 9s. 6d. as compared with the 8s. 6d.?—About 50 per cent.—about half of each.

170. *Mr. Field.*] When I asked you about the sawmiller's capital being lost, you assumed the capital actually invested in the business; you did not think I meant his outside capital?—I took it that you meant the money spent in his mill and bush.

171. *Mr. Mander.*] Supposing Oregon timber displaced the rimu timber in the principal towns of New Zealand, would that not prevent the country millers from sending their timber into those principal towns?—If the duty on Oregon pine was reduced by 2s, I do not see how rimu could compete in the cities.

172. But rimu could compete in the country in consequence of the extra freight put on Oregon pine?—Yes, I should think so.

173. *Mr. Morris.*] As a builder and timber-merchant, can you say what percentage of the timber you get from the mills is fit for dressing and manufacturing purposes?—About fifty per cent., roughly speaking.

174. *Mr. Barber.*] With regard to the question of railway freight, have you any idea whether or not there is any profit made out of carrying timber on the railways?—That is not for me to say. I do not know whether they get a profit out of it or not.

175. Do you say the Dominion is going to have a very heavy loss through not having this timber to carry?—I do not think it would be a very heavy loss. I should say it is reasonable to assume that it must lose something if there is no rimu carried on the railways.

176. And when the Government, for the purpose of helping the industry, carry it at a very low rate, you do not know whether they are carrying it at a loss?—I do not think they would carry it at a loss.

177. *Mr. Hanan.*] Can you tell us if the timber-merchants in Christchurch have increased in number during the last twenty-five years?—I think there are one or two more in the town.

ERIC CHARLES GOLD SMITH, Commissioner of Crown Lands, Christchurch, sworn and examined. (No. 44.)

1. *Hon. the Chairman.*] You are Commissioner of Crown Lands for Canterbury?—Yes.

2. It is not expected that you are in a position to deal with the whole of the subjects relating to our inquiry, and a number of them you are not expected to trouble about?—I do not know anything about the first four on your order of reference.

3. We want to know specially from you with regard to the timbers of Canterbury—their quantity, how they are disposed of, and what the position is for the future?—We have given all that in one of our returns.

4. Have you the return here?—Yes. [Return produced and deposited.] The total amount available is 31,545,000 ft. In stating a quantity like that it is quite a guess, because it is impossible to estimate the quantity of timber in a forest for milling purposes unless a proper survey is made.

5. Then, no survey has been made?—No. An experienced miller might go through the forest and estimate the quantity of milling-timber, but you cannot do it accurately. A more accurate and perhaps the only way of estimating the quantity of timber in a given area would be to select an acre here and there of fair average bush, survey these acres carefully as to quantity, average them, and from that arrive at an estimate of the total timber in the whole quantity.

6. Then, you are only able to give an opinion on that small piece that you measure?—You take that as an approximation. If you were careful it would generally run the same. You take an acre here and there, and then you get a proper estimate.

7. Have you a statement to show where this timber is situated?—Yes, there is a map here.

8. Can you tell the Commission how many mills are operating on this timber at present?—Not from memory, unless it is in one of these returns.

9. *Mr. Mander.*] That does not include the West Coast?—No, only the Canterbury Land District.

10. *Hon. the Chairman.*] Will this map not help you to give the information as to the number of mills?—I only came back last night from the south, and I have not had time to look at this. As a rule, these estimates of milling-timber are very wide. I can furnish the Commission with a return of the mills that are working in the district, and you may have it this afternoon.

11. Do you know the number of leases that were issued to millers?—Yes. They are all in these schedules.

12. Could you tell us the principal number and where situated, how long they have been in operation, together with the quantity of timber still left unoperated-on?—Near Waihau there is a bush, but it is only 270 acres; there is another bush in the same neighbourhood containing 5,500 acres; in Mount Thomas, 2,500 acres; and Kawai, 900 acres.

13. *Mr. Ell.*] What kind of timber?—Forest Bush, 350 acres; Peel Forest, 1,000 acres; White Rock, 1,400 acres: making a total of 2,750 acres leased at the present time.

14. What are the conditions of your leases in Canterbury? How much do you let to one mill?—We have no big milling leases.

15. Are there any of them extending over 800 acres—they are generally in 200-acre lots, I understand?—These leases are for milling purposes. I did not think you would want me until to-morrow morning, and I have not taken the information out.

Mr. Ell: I think we had better leave it until you get it out.

JAMES ROWE sworn and examined. (No. 45.)

1. *Hon the Chairman.*] You are the president of the Builders' Association?—Yes.

2. You know the points the Commission wish to get information on?—Yes.

3. Can you throw some light on them—the matters set out in this order of reference?—Of course, my experience is only as a builder. I am here to answer any questions you may ask me. I cannot say that I have any knowledge of the actual timber industry, so far as the sawmilling and felling of timber is concerned.

4. Can you tell us something about the builders and how they get their stocks?—The timber is mostly purchased locally by the builders from the different merchants.

5. Where do the merchants generally get it from? Can you tell us?—I understand that most of the merchants purchase from the sawmillers in the different parts of the Dominion. Some of them are sawmillers themselves, and are owners of sawmills.

6. You know there is an association among the builders?—Yes, there is.

7. Can you tell us anything about that?—As far as the association amongst the builders is concerned, it is merely what you might call a mutual association—not for any combination for the raising of the price of building in any way. It is for the mutual benefit of the trade in general. The Builders' Association in Christchurch was started in this way: Some years ago there was always trouble with the architects with regard to conditions of contract. Every architect had separate rules and sets of conditions, and if a dispute arose the architect was the sole arbitrator; the builder had no redress. Often a case went to the Court, and the first thing the Judge would ask the contractor was whether he signed those conditions, and he would answer, "Yes." Well, then, he was simply thrown out of Court through having signed conditions that he should not have signed.

8. Did the association get that altered in any way?—Yes. After forming an association they met the architects, and at the present time we are working under a set of conditions that has been accepted by the architects throughout the Dominion—by the Architects' Association and the different builders' associations.

9. They understand one another now?—Yes.

10. This association does not interfere with tendering for work?—Not in the least.

11. Each member is a free agent?—He is a free agent when tendering for a job.

12. *Mr. Field.*] Have you any complaint to make about the price you pay for timber?—Personally I have no cause to complain, as far as that goes. It is a recognised fact, I think, amongst builders that if they have to pay a high rate for their timber and are working on a certain basis on the cost of the building, they lose nothing by it.

13. Knowing what you do about the matter, do you personally think the timber-merchants are getting too much?—Of course, you might say it may be purchased cheaper.

14. Some lines cheaper and some lines dearer?—Yes.

15. Taking it all through, is it a fair price?—On the average there is nothing to complain of. The timber-merchant has always to keep a certain amount of stock on hand to supply the demand.

16. Could you give the Commission any idea as to how much timber has gone up in price in the last ten years? Have you been here ten years?—Yes, fifteen years.

17. Take the last ten years. You know that timber has gone up all over the world, of course?—Yes. I think, taking it right through, it would average 15 per cent. That is, over ten years.

18. What is Oregon pine used chiefly for here?—Principally for joists, beams, and truss-work, and all like that—big timbers. Latterly it has also been used for lathing for plaster-work. It is far preferable to kauri in that respect.

19. Have you seen it used for framing?—Yes.

20. The framing of an ordinary building?—Yes. I had eleven years' experience in Victoria, and the same thing applies there. You might say they have their ordinary building-timber, which is used similarly to our red-pine here for the common class of cottage-work, but principally Oregon is used for the better class of buildings—for framework and so on.

21. If Oregon were not here, rimu would be used for that purpose?—Yes. The greatest trouble we have as regards the rimu is that we cannot get sufficient stocks in hand for the supply of what you might call thoroughly seasoned timber. I heard Mr. Goss and several of the timber-merchants on this point. The builders' idea of seasoned timber and the merchants' idea are two different things.

22. What is it, precisely, that you have to complain of, then?—That you cannot get it seasoned as you would like it seasoned. The timber does not stand a sufficient time to season. If the Commission took the trouble to walk round the different yards in Christchurch they would find that most of the timber is stacked out, exposed to the hot wind and sun. Necessarily that involves a great deal of waste.

23. That is the loss of the timber-merchant?—Yes.

24. While so stacked, of course, it is seasoning?—Yes, to a certain extent.

25. When the merchants charge you—as I understand some of them do charge—2s. a hundred feet extra for seasoned timber, do they not give you seasoned timber?—It is not always what you would call seasoned timber. It might have been in stack three, four, or five months—sometimes less if there has been a run on particular lines.

26. Is not that sufficient for ordinary framing and ordinary boards if properly stacked?—No, I do not think so. I consider that with most of the New Zealand timbers it requires from eight to nine months. The best time of the year for seasoning timber is the winter, when it gets the frost. The frost draws the sap out better than the north-westers.

27. Do you mean to say that if you take any New Zealand timber, in small pieces, that has been stacked for four months, you cannot rely on that?—No, you cannot. I had an experience some nine years ago with black-pine. It was taken out of a building that had been up here for forty years. It was some heavy beams—12 in. beams. It was taken out, and I cut it up for joiners' work—for panelling—and after that had been put through the mill again and left to stand and was glued up, it shrank even then. That was the old Lane's mill. That is one of the greatest drawbacks with New Zealand timber—we can never rely on it.

28. Is there a serious result arising from using timber that has been stacked four months?—If the sap is not thoroughly out of it and it is placed in a position where the air does not get at it, it rots quicker.

29. It is not that it opens at the joints?—No. Often enough it will twist and warp, especially if it is for plaster-work. For instance, if it is for the first floor of a building where the ceiling underneath is plastered, if the joists are not thoroughly dry, directly the atmosphere makes itself felt the timber begins to shrink and the plaster to crack. Of course, it is put down to the unseasoned timber that is used.

30. If timber has been stacked for nine months, what would be a fair additional price to pay for it? It is rather an expensive matter, I suppose?—Yes, most decidedly. There is another thing. Most of the timber is felled at the wrong time of the year. Timber is felled all the year round.

31. You say that it ought to be felled in the winter-time?—Yes. From the reports we have, if it is felled then and is left lying before it is cut, the sap gets out of it quicker. For special-order stuff we have to send the order away, and get the timber and use it straight away. We can never rely on going to any yard in Christchurch and ordering a sufficient quantity of joists and putting them into the job next week.

32. Do you think it makes as much difference in the case of our evergreen trees as in the case of the trees in the Old Land that shed their leaves in the autumn? Do you not think there is more sap going up in the spring, when the trees are budding, than is the case with the evergreens?—I do not think so.

33. Has Oregon been coming in in large quantities here during the last year?—In fairly large quantities, I think, this last twelve months. Of course, there is a slump in the American market, and the price of Oregon went down; and the freights, I think, were reduced on Oregon coming here.

34. Does the importation show any sign of easing off?—I think it is easing off, because there is no market either for Oregon or red-pine at the present time. The building trade has dropped off.

35. Do you think the building trade in Christchurch has been in any way affected by the increased price of timber: you say it has increased 15 per cent. in ten years?—I do not think the increased price of timber has affected the trade in any way.

36. It is the dull time?—Yes.

37. Do you think that, economically, it would be a good thing to-day for the sawmillers to sort their timber and grade it at the mills before it comes here?—Yes, to a certain extent it would.

38. Do you think it would pay to do so? Would you be prepared to pay the additional cost of the grading?—As far as I am concerned, it is not I that would pay for it.

39. Would the consumer be prepared to pay, do you think?—I think that in the majority of cases he would. As regards red-pine, the great trouble is that there is a lot of theory as regards sap and heart; what one man will call sap another will say is heart. If we were to condemn all that some people say is sap we should condemn fully three-fourths of the red-pine in New Zealand.

40. What is ordinarily termed sap is, as a matter of fact, very fair building-timber, is it not?—Yes. In fact, I have brought along to the Commission a sample to exemplify what I mean. [Samples produced and explained.]

41. With regard to this question of Oregon, you say that Oregon is used for the framing of buildings, and that to some extent it displaces our red-pine?—To a certain extent—not to such a great extent. It is used more for large sizes.

42. Still, it is used for framing?—In the better class of dwellings; but in, for instance, a four-roomed cottage, for the match-lining or anything of that sort I do not think there is much preference as regards Oregon and red-pine. Every one has the idea now that Oregon is the better timber, and people will use it in preference.

43. There is always a prejudice against the local article, is there not?—Yes.

44. And it is sold quite as cheaply here, I understand, as red-pine?—At the present time it is. That is only since these few shipments have come in, but in a few months I do not think it will be so cheap.

45. Of course, we are told, where Oregon is dearer than red-pine, that red-pine has nothing to fear; but where it is cheaper than red-pine we are asked, "Why put a duty on Oregon and prevent people building as cheaply as possible?" What do you say about that, and the effect it might have on our timber-mills and our milling-country? Do you know anything of the conditions which prevail in the North Island?—No. My experience has been in the South Island.

46. Have you given much thought to that question?—No, I cannot say that I have given any thought to it.

47. Do you yourself think it would be wise to provide for the compulsory seasoning of timber, or do you think the people have the remedy in their own hands at the present time?—I think the people have the remedy in their own hands.

48. *Mr. Leyland.*] With reference to the architects' conditions, you have managed, as the result of your association, to get conditions that apply equally all over the Dominion?—Yes.

49. Do those conditions apply to Government contracts?—Not as far as the Public Works Department are concerned; but several local bodies have adopted them.

50. Not Government Departments?—No.

51. Do you not think it desirable that they should?—Yes. We have approached the Government on the matter.

52. A friend of mine—a builder—tendered for the erection of the Post-office in Auckland, after giving a fortnight's work. He was the lowest tenderer, but no tender was accepted. Do you not think he should have had some remuneration for all that trouble?—Most decidedly. A builder is entitled to payment for his work as well as anybody else.

53. Do you think it desirable that the importation of Oregon should be restricted?—I do not think it would be desirable to prohibit it altogether.

54. Do you think the present duty is quite sufficient?—Yes.

55. Do you not think the present duty should be taken off the long lengths—the lengths that are so difficult to get in New Zealand timbers?—The association went into that matter some few months ago, and a recommendation went before the Federal Council, and it was recommended that the duty should be taken off altogether; but since then we have rather modified our views. I have the resolution here, "That this association is of opinion that any reduction in the duty on Oregon would not improve the building trade, as the price of dressing-lines in red-pine has already been and would be increased if millers could not find a market for the rough timber."

56. *Mr. Field.*] That is, the rough red-pine?—Yes.

57. *Mr. Leyland.*] With reference to those beams that you mentioned having had cut, were they heart or sap?—All heart.

58. Do you think, for the purposes of beams and for joists, that heart of Oregon is superior to sap rimu?—Yes, most decidedly.

59. Then, if a builder or proprietor wished to build a brick building, do you not think it would be folly to put in sap rimu if he could get Oregon at a slightly increased price?—Yes.

60. Then, if it would be better for the building, do you think it would be better to restrict the importation of Oregon?—Yes, that is what we think, as far as the builders are concerned; but we do not want to restrict the using of it.

61. The reason for asking you that is because there is a difficulty in getting large beams in rimu, especially in long lengths?—Yes; in fact, I have found myself that in ordering a large quantity of 12 by 2 or 12 by 3 you might order a dozen or so extra so as to get some heart, but it is very little heart you get.

62. But supposing you wanted a hundred 12 by 4 in heart of rimu, could you get them in Christchurch?—No.

63. Do you think you could get them more quickly in heart from the mills?—In perhaps six or eight weeks' time.

64. And in the meantime operations would be stopped?—Yes, if you wanted them immediately.

65. If stocks of Oregon were held there would be no difficulty in getting an order like that?—No.

66. Do you not think that is an advantage to the trade and also to the colony?—Yes. I had that experience this time last year. A warehouse was burnt, but the walls were perfectly sound, and a new roof had to go on. It was six weeks after signing the contract before I had a stock landed on the ground. An order had to be sent away specially to get the tie-beams for the roof. After that Oregon came in.

67. Do you think there would have been anything said about Oregon if it had not been for this depression? Would not the builders have rejoiced if they could have got Oregon?—I do not think there would have been anything said myself as far as my experience goes, and I do not think the merchants are losing anything on the Oregon. In fact, I think they are making more on Oregon than on red-pine at the present time.

68. *Mr. Clarke.*] With regard to the retail price, the commonly accepted retail price of sawn timber here is—what?—Fourteen shillings and sixpence, less a discount.

69. But does not that represent the price of only a portion of the timber; for instance, is there not an increased price for timber over a certain width?—Yes.

70. How much a hundred feet for the first?—I have not a price-list with me, but as far as I recollect now it has increased in price up to 19 in. in width.

71. And does the price go on increasing as the width increases?—Yes.

72. And there is a further increase over a given length?—Yes. Over 22 ft. it is 6d. a hundred feet extra per foot in length.

73. Further than that, over and above your rough-timber price, you have a price for timber suitable for dressing-lines—how much is that?—I think it is 2s. a hundred extra for dressing.

74. Is not a large quantity of that used in building operations?—Yes, for ordinary building you might say there is more than one-half of it dressed timber.

75. Then, in addition, there is a further price for timber that is filleted?—Yes, that is another shilling, I think.

76. Is it not 2s. for what they call seasoned timber?—All stripped timbers selected for dressing up to 12 in. is 18s.

77. So that quoting 14s. 6d. per hundred as the market price of timber conveys a very poor idea of the actual cost of the timber used in that case?—That is quite so.

78. In regard to the necessity of having foreign timbers, assuming you had an urgent order for a building for temporary purposes requiring a large number of not long lengths, but moderately long lengths, could you procure them at short notice?—I should say that from my experience it would have to go through as a special order. None of the merchants care to stock those large sizes of ordinary building red-pine for that particular purpose.

79. Then, you do not agree with the statement which would imply that any builder can get anything he wants in the building trade in Christchurch at short notice?—Certainly not.

80. *Mr. Morris.*] This question of seasoned timber seems to be a very serious one in Christchurch?—Yes.

81. Have you any experience of artificially seasoned timber?—No, I cannot say I have. There is no such process in Christchurch as far as I know. I have seen artificially seasoned timber in Melbourne, but have not had any experience in using it.

82. How does it stand after being put through the process?—I could not say.

83. We were told yesterday that the artificial process generally deteriorated the material?—I have seen the process, and I should say it would have that tendency. It is principally steamed.

84. Do you consider the samples of wood you have shown us here a good class of wood for finishing-work in buildings?—For ordinary housebuilding purposes I consider it is the average class we always get.

85. In regard to the question of big joists and beams, is it not usual for a builder when he gets a job to order those things right off the reel: he does not wait till he wants to use them?—No, the orders have to be sent straight away.

86. And in most cases they get them on the ground before they are required?—Yes.

87. But not sufficiently long to season?—No.

88. There is really not much in regard to the question of having to wait long for big joists?—There is this in it: the timber when you get it is not seasoned. Very often we get it on the jobs in such a condition that men have remarked that they have heard the birds singing in it.

89. We have heard that Oregon is not seasoned, too?—That is a mistake. I have had a good deal of experience in Oregon.

90. How long do you think it would take to season an Oregon beam, say, 14 in. square?—Probably it might take two years.

91. And do you think the timber that comes here should be kept in the stack for two years?—The sap is virtually out of the log days before it is milled.

92. I understood that the timber in many cases goes straight off the saw on to the ship?—That is different to what I have heard. When being brought down from the mill it is generally done by water carriage, and that has a tendency, even if the timber is long in the water, to take the sap out of it. The water will gradually draw the sap out of the timber. The experience we have is that if you have unseasoned timber, especially colonial timber, it will very soon show itself.

93. Did you not make a mistake when you said you paid more for 9 in. timber. Does not the difference in price commence at 12 in. in width?—Yes, that is right.

94. And over 22 ft. in length?—Yes. I think the last price-list stated 9 in., but there was a former price-list.

95. *Mr. Barber.*] You said you were a member of the Builders' Association?—Yes.

96. How many members are there in the association?—I could not say from memory, but I think 130.

97. And do they comprise the largest contractors in Christchurch?—Yes.

98. Mostly those who tender for large jobs?—Yes. You might say the whole of the large contractors are members of the association.

99. How many builders are there outside the association?—I have heard various statements. In fact, I have heard it said that at one time there were double the number outside; but I believe there is another association started, and its membership has dwindled down to something like half a dozen.

100. What was the other association formed for?—It was more for the small builders.

101. What is the fee for joining your association?—Two guineas for membership, and the other is only one guinea.

102. The builders outside of your association must have been dissatisfied with the conditions?—No, they were not. There are a lot even outside of the association who look at paying two guineas—it is too much of a tax on them. Speaking of our own association and the majority of the members, it is not for the individual benefits that are to be derived or for the receiving of discounts from the timber-merchants; but we recognise that if we can only uphold our present conditions instead of reverting back to the conditions which existed two years ago, it is worth two guineas for us to combine into an association.

103. You claim that the members of your association are the most experienced builders in Christchurch?—Yes.

104. What reasons can you give for a body of men who are experienced in the building trade reversing a decision they came to previously with regard to the importation of Oregon pine?—I think it was more in sympathy with the local product that, if they were to advocate the duty being taken off the Oregon pine altogether, it would affect the local timber.

105. Was it the outcome of a threat from the timber-merchants that they would increase the price to you of all timber you wanted for dressing purposes?—No, we have had no intimation from the timber-merchants.

106. Are you aware that the alteration of that resolution is in direct conflict with a similar organization in New Zealand? Take Dunedin, the resolution passed by the association there was very strongly in favour of the removal of the duty on Oregon pine. Are you aware that your association is acting counter to the wishes of the trade in other parts of the colony?—No. Of course, I think, so far as our association is concerned, they would have no objection to the duty being taken off Oregon pine in the large sizes, so that if anything required to be cut up into the smaller sizes it would then give work to the millers here.

107. You do not object to Oregon being imported duty-free in the large sizes?—No, not in the large sizes. The reason why the resolution was altered in that respect was that we thought that if the duty was taken off altogether on the large sizes, we should not object to it being put on the small sizes, so that if it was brought in it would give a certain amount of work to the saw-millers here in cutting it up; and that also would increase the price of it, so that it would counteract against ordinary red-pine for building purposes.

108. With regard to seasoned timber, would it be possible for any one to tell, when a shipment of Oregon pine arrived, whether it had been seasoned and had become sodden with salt water?—Yes, I think we could distinguish the difference by cutting it.

109. You say that seasoned timber has a great advantage over unseasoned timber?—Yes.

110. And you say it takes nine months to properly season timber?—Yes.

111. If you had a large contract in which you wanted long lengths, you say you would have to order them after you got the job?—Yes.

112. And the job would be proceeding while you were waiting for them?—Yes.

113. And those beams would be put in without being seasoned?—Yes.

114. Is it possible under any conditions to get those long beams in all heart?—Not in all heart, as some theorists ask us to believe it should be.

115. And it would be put into a building in a condition of heart and sap in unseasoned timber?—Yes.

116. And that would be covered up almost soon after it is put in?—Yes.

117. And that would be a natural weakness to the building?—Yes.

118. *Mr. Arnold.*] In regard to removing the duty on the large sizes of Oregon only, have you considered whether it is not a fact that the better class of timber comes in in smaller sizes?—I have never heard that the better class of timber came in in the small sizes.

119. For instance, if you were having 4 by 3 brought in, would it not be necessary for them to send a better class of timber than they do in the large block?—I do not think so. I have understood as regards Oregon that there are about four or five different grades, and the extra first grade is a very fine grade of Oregon. That is used in America for joinery-work, I believe, but I am certain it could not compete with red-pine, because I happen to be acquainted with one of the officers on the boat that came here, and he told me that the sister boat in the company he was in left with the same quantity of Oregon pine on board, but it was valued at double the price of the Oregon that was brought here.

120. You think, then, that even at the present moment we are getting an inferior class of Oregon pine—that they do not send their best timbers here?—It is not the very best Oregon pine.

121. You say their timber is felled and then brought down by water?—Yes.

122. Do you know that as a fact or by reading?—It is only from what I heard those acquainted with it saying. The officer of this boat told me it is floated down to the boat in millions of feet bound together.

123. Are you aware that they tap their timber, and that the trees which are tapped produce very inferior timber, and that it is that timber which is sent to New Zealand?—I have not heard that. I should think it is hardly likely. I do not think they would go tapping the timber-trees purposely.

124. But is not that their system for the purpose of getting a large product?—It is quite possible it may be.

125. Do you not think that, as the demand for Oregon increases, as it is increasing in the different markets of the world, there is a greater likelihood of our getting unseasoned timber here?—I do not think so. As far as my experience is concerned in regard to Oregon both here and in Melbourne, it always seems to come here in the same state. It has never come in green. It always seems to have been cut a considerable time before.

126. You have had experience in the factory with Oregon pine?—Yes, fifteen years ago. My experience here covers twenty-five years.

127. You say that the timber you receive here now is as well seasoned as that which you received twenty-five years ago?—Yes.

128. *Mr. Stallworthy.*] Do you think 5 per cent. is a sufficient builders' discount?—No, I do not.

129. You think the merchants should allow you more than that?—Yes.

130. Would you consider 10 and 12½ per cent. too high for a trade discount?—I think 10 per cent. would be a fair discount.

131. Are the list prices the actual prices, or do you know of any special discounts allowed any individuals?—I do not know of any special discounts except from hearsay. As far as the list produced is concerned, there are some merchants who allow a further discount, and I think that is done to gain trade.

132. There is cutting into the prices even below the list prices?—Yes. I know one firm which gives 7½ per cent. besides the 2½. In fact, I bought a small line myself and received that discount.

133. In tendering for building-work, is it the practice for builders to give the customer the benefit of the builders' discount?—No, it is not.

134. The effect of the competition does not tend to make builders do that?—Not as far as my experience goes. I think the builder is as justified in having his perquisites as a draper is in receiving his profit on the material when making a suit of clothes.

135. What does the builder do for his customer for that discount — what service does he render for it?—He has an office staff to keep up and an establishment.

136. But he charges for all that?—And he has a certain amount of wear-and-tear on his plant, and losses, to make good.

137. Has the importation of Oregon lessened the cost of buildings?—No, I do not think so. It has made no reduction.

138. I suppose your association discusses matters affecting the building trade?—Principally.

139. Has the association anything to suggest in the way of developing the building industry?—I cannot say that we have, because I think it is financial. When finance is easy and money plentiful there is generally more building going on.

140. There is no other cause?—I do not think so.

141. You told us that a merchant said there were more builders outside your association than in it. When the merchant made that statement was your association asking for any special concession, and so caused him to say that?—I forget the circumstances under which that was said.

142. Has your association ever asked for any special concession?—No. I think when that statement was made it was with regard to this discount business. There were a great number, we found out, outside the association who were receiving discount, and this merchant made the statement then that there were as many outside the association as in it, and that he would be very glad to have them on his books. He would like the whole of their trade without the 5 per cent.

143. *Mr. Mander.*] You said you had to pay extra prices for wide timber, and for timber over a certain length?—Yes, sir.

144. Do you know whether the merchants have not also to pay a higher price for that class of timber to the timber-merchant?—I could not say.

145. Do you not think it is likely?—As regards the Oregon that has been imported here, it has been landed at Lyttelton all at the same price, but nevertheless the price has gone up for lengths over 24 ft.

146. Considering the merchant would make a very small profit on the ordinary timber, would it not be legitimate to charge a small profit for the special lengths and sizes to make up for that?—Probably.

147. If the duty were taken off Oregon timber doubtless all rough timber would be used for building purposes?—I do not think so.

148. If it was put in cheaper than rimu?—Provided it was imported in larger sizes and had to be cut up into smaller sizes.

149. If the duty were taken off it altogether and the small sizes were introduced into this country?—It would cut a good deal of it out of the market.

150. If that happened you would have to pay very much higher for rimu for better-class work. Do you not think, under such circumstances, it would be reasonable for that result to take place?—Yes, the association recognises that probably that would occur.

151. If the merchants allowed you 10 per cent. instead of 5 per cent., do you not suppose they would have to put up the price of timber to meet that?—Yes.

152. Then, it would be very little benefit in that case. Do you think it honest, when a combination takes place in the timber business, or in any other business, and it is arranged to allow a certain discount to builders, for one or two members of that association to allow a higher discount in order to get the trade?—You ask me in reference to the timber-merchants?

153. Yes. They allow now 5½ per cent. discount: in order to secure trade from other members of the association do you think it would be fair for some to allow 7½ per cent. discount?—No, it would not be honest to do that. They should be true to their association.

154. *Mr. Ell.*] You do not agree with the statement of the timber-merchants that there is an abundance of seasoned timber always to be obtained in Christchurch?—No, I do not agree with it at all.

155. I may say that this scarcity of seasoned timber was also complained of in both Invercargill and Dunedin. Now, from your experience as a builder, is a house built of seasoned timber of more value to the person having it erected than if it were built of unseasoned timber?—Certainly, and the amount of difference in the cost would be trifling—not more than £10 on a five-roomed cottage. It would be 2s. per hundred feet extra, and that would only mean on the dressing-lines, as the ordinary rough stuff would only be 1s. extra.

156. It would be less than £10 extra?—Yes—about £7 10s. The public would be gainers, because houses so built would last much longer. There would be a distinct gain from a national standpoint.

157. Do you think that the matter of not being able to obtain seasoned timber is due to the trees being cut at the wrong season of the year?—I think so.

158. If a sawmiller in the Riverton district told me, as he did, that beech cut in the winter-time was not so liable to warp and shrink or split as beech cut in the summer-time, would he be saying what was correct?—I think so.

159. You have already told us that you do not approve of a heavier duty being put on Oregon?—I would allow the duty to remain as it is. It would not hurt if it were taken off the larger sizes.

160. If any alteration was made, it should be taken off the larger sizes?—That is my opinion. It would be a greater benefit to the consumer to take the duty off the larger sizes and lengths.

161. With regard to prices, have they advanced materially lately on dressed lines?—There has been a slight increase lately in these last price lists on dressed lines and a small reduction on the rough lines.

162. According to the Christchurch price list, rusticated red-pine boards have been sold here for £1 0s. 6d.?—That is so.

163. In Dunedin, 16s. 6d., being a difference of 4s.?—Yes.

164. Do you consider that the difference in the price of timber justifies a difference of 4s. per hundred feet?—As far as Christchurch is concerned, and as far as the timber-merchants are concerned, they do more as regards having dried timber, such as rusticated and flooring, than the other centres do.

165. It is only fair for me to say that the 16s. 6d. priced timber is not seasoned?—That is so far as Dunedin is concerned.

166. There is still a difference of 2s.?—Yes.

167. Are there any different conditions? The labour is about the same. Can you explain why there should be such a difference?—There is extra handling in connection with dried timber. After it is run through the mill it has to be stacked again and put away. There is a certain amount of extra handling.

168. With regard to jarrah, has it advanced a little in price?—Yes, I think it has.

169. You were able to obtain it twelve months ago at less than black-pine?—Yes, a little under black-pine.

170. Are you aware of any change having taken place in the management or ownership of the Jarrah Supply Company in Christchurch?—Yes. I believe the present company is a local company which bought out that Western Australian Millers' Company.

171. With that the price advanced?—I cannot say for why.

172. The price was advanced?—Yes.

173. You do not know whether it was due to the rise of the price of jarrah in Australia?—I could not say.

174. With regard to the supply of timber, will the millers on the Coast or down south supply any builder in Christchurch with a line of timber should he want it?—Yes, I think so.

175. Without going through a merchant?—There are some mills that you can get a supply from.

176. Now, with regard to the supply of timber generally, you have had a lot of experience as a builder, and you know the needs of the country: are imported timbers essential to the building operations of this town—that is, where New Zealand timbers cannot well take the place of them?—There are no timbers required as essential if we had a sufficient supply of our own. We have plenty of timber here. For myself, I consider we have timber equal to Baltic in the kauri, or even in totara, for certain classes of joiners' work outside. We pay £2 2s. for Baltic, and those timbers if properly grown and selected are quite equal to any of the imported timbers.

177. That is, kauri and totara are quite equal to any of the imported timbers if properly sorted and seasoned?—Yes, that is so. Because they are not properly sorted and seasoned you cannot rely on them. They would command a better position in the market if they were properly treated before they passed into the hands of the builder.

178. In view of the fact that kauri is one of the best timbers in the world for general purposes, and is needed by the people of New Zealand, do you think it desirable that we should place an export duty on it with the object of preserving it for our own needs?—Well, it is an open question.

Of course, it is this way: if we cannot get anything to replace it it would be better to do so. For instance, some four or five years ago I had a building in which kauri was provided for in 40 ft. lengths. I ascertained that the lowest quotation I could get for kauri delivered in Christchurch was £1 9s. at that time. I asked the architect whether he would object to Oregon being substituted for kauri in respect to the rough work, and he agreed. I landed the Oregon from Melbourne in Christchurch, after paying the duty, at £1 2s.

179. That is 7s. less?—Yes.

180. You consider that using kauri for such purposes as that is a waste of extremely valuable timber?—Yes, if we can get more suitable and cheaper timber.

181. You consider that, when beams of kauri are put into a building, and when kauri can be used for joinery-work and for coach-building, as well as for various descriptions of furniture, to put it into beams would be a great waste, as much so as if mahogany were used for some purpose when a rougher timber would serve the purpose as well?—Yes.

182. We are told by the Lands Department that the kauri-milling industry at the present rate of output will not last more than fifteen years, although it is not suggested that there may not be some kauri-mills here and there twenty-five years from now; still the industry, as we see, has only about a fifteen-years life. In view of that fact, and of the fact that we cannot obtain any imported timber so suitable for our various purposes, I want to ask you as a builder and a citizen whether you do not consider it desirable to place some duty on the exportation of kauri?—I think most decidedly we should have the benefit of the timber.

183. With regard to the use by the Telegraph Department of totara, I saw a totara pole at Dunedin the other day 16 in. square used as a telegraph-pole, whilst an ironbark timber one-half the size would have served the purpose as well. Seeing the value of totara for cabinet-work, do you not think it was waste on the part of the Government to use it for such a purpose?—Yes, decidedly. They could get jarrah for less.

184. The reason for the large size was because of the brittleness of totara as compared with hardwood timbers?—Yes, that is so.

185. It also took up a considerable portion of the footpath. Now, with regard to making some reservations—I do not suggest making reservations on rich agricultural lands, but reservations of forests upon broken and extremely steep and hilly country, reservations, say, of rimu for the future needs of the country. I may point out here that we have planted up to the present only about 9,400 acres of land for our future needs, and the Department tells us that the nearest date at which any of that timber will mature is forty years hence. In view of that fact and of the increasing requirements of an increasing population, do you not think that it would be a wise thing for the Government to make some permanent reserves?—Yes, I think so. I think our association has sent in a requisition to the Government.

186. *Mr. Hanan.*] Do you know of any timber-merchants that have closed down during the last three years in Christchurch?—No, I cannot say that I know of any that have closed down.

187. They are still continuing their business?—I know of a good few builders.

188. Who have gone to the wall?—Yes.

189. The result of extreme cutting in the trade?—More than 5 per cent.

190. Can you give us any information regarding the durability of timber—I mean New Zealand timber—when placed in the ground?—It all depends upon the nature of the timber in the first place and the nature of the ground it is put into.

191. What have you found yourself?—We always recommend totara as the best timber for standing in the ground. I may say that I have seen kauri taken out of the ground that had been in for thirty years, and it was found to be as sound as the day it was put in.

192. How does rimu stand?—There is only a certain class of rimu that would stand any length of time—that is, the very rough heart, with a resiniferous texture. I think some of that will stand as long as other timbers.

193. Have you seen anything of imported timbers in the ground: can you speak of their durability?—I have seen a good deal of jarrah and ironbark. They are good timbers, but Oregon does not stand in the ground—in fact, Oregon will not stand exposed in any way for any length of time.

194. Have you any experience of timber under water, say, as piles?—I have had no experience of timber under water.

195. Have you used Southland timber, and if so, how does it compare with the West Coast timbers?—Well, it is a much harder and coarser-grained timber than the Coast timber. In fact, very few architects in Christchurch will allow Southland timber to be used. There is one firm of architects here who provide in their specifications that no timber grown south of Christchurch shall be used on the job.

196. What is the name of the firm?—I do not care to mention the name.

197. Is there any reason why it should be kept secret?—I do not think there is any particular reason.

198. Do you know if the firm has any connection with the West Coast millers?—That I could not say.

199. Is that the only firm you know of?—I think there is another one of the same kind.

200. Is there a member of that firm giving evidence to-day?—That I could not say. I do not know if his name is on the list.

201. *Mr. Leyland.*] I want to try and clear up a doubt about the difference in the cost of tongued and grooved here and in Dunedin. First, here it is dry and there it is green, and we have evidence to show that there is a difference of 2s. in favour of Dunedin, and that the dry timber is worth the difference?—Yes.

202. And 8d. railage, with extra handling costing 3d.; then there is the discount on the extra 4s., which is equal to 4d., so that they are really putting 4s. 6d. on the cost, and the timber-

merchants here are giving you the timber at 6d. less than entitled to when it is worked out?—That is so.

203. *Mr. Morris.*] You told us you believed that some merchants were giving preferential discounts?—That is so.

204. Have you any personal knowledge of this matter, or is it only hearsay?—I have knowledge myself of it personally.

205. You know it to be a fact, then?—Yes.

WILLIAM ALLEN JEWELL, Joinery-works, Christchurch, sworn and examined. (No. 46.)

1. *Hon. the Chairman.*] We wish to get some evidence from you to assist the Commission in the questions enumerated here?—I am conversant with some of them. I am a joiner and cabinet-worker.

2. You are a builder?—No.

3. Then you are concerned most with the finer timbers?—Yes.

4. Will you tell the Commission of any special features in respect to timbers used by you which might be of value to them in the inquiry, together with any particulars as to your business generally, the employment of labour, the position of the retailer, manufacturer, &c.?—There has always been trouble with regard to the seasoning of timber, such as kauri and red-pine. Sometimes we have been able to get seasoned timber, whilst at other times there has been great difficulty in getting it. With regard to prices, freight, railage, &c., I have not gone into that fully, but I have seen several statements about it. In furniture we use kauri chiefly, and most furniture is now stained to imitate walnut. We invariably use kauri unless it is in the cheapest lines. A great deal of furniture manufactured now is made of red-pine, or rimu, but this is generally put into the auction-rooms. I consider these woods very unsuitable for furniture. They do not stand well. My experience of red-pine is that you may have had it for years, and then it will go.

5. You mean it will twist?—Yes, twist. The same thing applies to my little knowledge of building. It is all right whilst wet, but rimu twists very much in drying; and when used on a plastered wall the walls very often go to pieces, probably twelve months after the work is completed. We have one trouble with regard to kauri. We are supposed to get in New Zealand first, second, and third classes, but we only get one quality in Christchurch at the present time.

6. Do you know which of the qualities you do get?—No, I do not.

7. It would be the third quality you get?—Sometimes.

8. But you said just now that you only get the one quality here?—Yes.

9. My question was whether you knew which of the three qualities you did get?—Lately we have been getting a very good quality, but some months ago it was a hard matter to get a good quality.

10. *Mr. Ell.*] What you mean is that it is all called first-class?—Yes; it is paid for as first-class. At the same time we have circulars sent from Melbourne quoting us for first, second, and third quality of kauri. Of course, I have not had ocular demonstration with regard to that; I only know from the price-lists, and from firms in Melbourne and Sydney supplying first, second, and third qualities of New Zealand kauri. Of course, the kauri at the present time is very high, and according to those who are, as we say, "in the know," it will only be a few years when we shall not be able to get any kauri at all. Then I should like to know what we are going to use in New Zealand to take its place, because rimu is not suitable.

11. You say that kauri is the most valuable timber that you have for cabinetmaking purposes?—Of the colonial timbers.

12. How does that compare in price with the cheapest imported timbers that are equally suitable?—Favourably.

13. The price is favourable to kauri?—The price is favourable to kauri—that is, if you got imported timber suitable for furniture you would have to pay in many cases more. I have got oak in. Good kauri you cannot reckon less than, roughly, 4d. a superficial foot. I got oak here, kiln-dried, from America last week, and it did not run me into more than 6d.

14. About 50 per cent. increase if you could not obtain kauri?—Yes. Oak would not suit for stained work, but there are other woods used in America and England that are very cheap there, but they would cost as much as kauri to land here, probably more.

15. So that the effect on the general public would be, if the kauri-supply were depleted entirely, to advance the cost of furniture?—Under the present tariff?

16. Taking existing conditions?—Yes.

17. That being the case, and with the knowledge you have that a large number of people are employed in the trade in this country at good wages, and that you are able to supply cheap and good furniture to the people—furniture that will last—do you not think it would be an extremely wise thing on the part of the Government if certain provision was made for the future needs of these woodworking industries to preserve our supply of kauri for such purposes?—Yes, I have thought so for many years.

18. You think it would be the duty of the Government to make some provision for the future needs of these woodworking industries?—I think, myself, in view of the Kauri Syndicate and what Australia is able to get from New Zealand, that we ought to be protected in that way.

19. Seeing that we are not growing in our forests any timbers that are equally suitable for this work, and in view of the fact that those trees will not mature for forty years at the very earliest, what are we going to do in the meantime if we do not make some provision for the supply of native timbers for our industries?—I really do not know.

20. As regards beech, or birch as it is called here, have you used that at all?—We use a quantity of it.

21. Do you find it suitable?—Not for manufacturing furniture.
22. For what purposes do you use it?—For drawers' sides and the bottoms of drawers, and also for dowels.
23. Have you had experience of it with regard to chairmaking?—Yes, it is very good for chairmaking.
24. Does its tough character recommend it?—Yes.
25. Does it take the stain well?—Yes, but it is not suitable for doing up into joinery in wide boards, such as table-tops.
26. Do you find any trouble in getting it in seasoned condition?—We always have to season it ourselves.
27. Do you find it shrinks at all, or to any great extent, if it is properly seasoned?—No, if it is well seasoned, and especially if it was cut at the proper time of the year. That is what I consider the trouble with the timber. I think that if our colonial woods were cut at the proper time of the year they would compare favourably with any other timber.
28. So you agree with the Southland sawmiller who told us that the beech cut in the winter-time was not so liable to warp and shrink?—That is so.
29. Seeing that we have very large areas of beech forest, which is regarded generally by builders as a useless timber, do you think it would be a good thing if the Forestry Department took the question in hand and tried to show that under proper treatment beech could be turned into a good marketable timber?—Yes, I do.
30. That would be far better than the timber being burnt on the ground?—Certainly.
31. *Mr. Hanan.*] Do you favour an export duty on kauri?—Yes.
32. Do you think it desirable that the duties should be removed from imported timber?—Not altogether
33. Off what would you remove the duty—Oregon?—I would not remove the duty altogether. I certainly believe in a duty being placed on it—a certain duty. I also contend that if we require a timber for building purposes here, and it is of better quality for building than any colonial timber, we ought to allow it to come in here favourably.
34. What timber would you suggest should come in here favourably?—Oregon.
35. You would have a duty on Oregon, would you?—Not a prohibitive duty.
36. What would you suggest—that it should come in free in balk or in small sizes?—Of course, I am not conversant with that. That has more to do with the builder than myself. Builders always use certain sizes, and they would know. If the timber seasons well in the cut lengths without twisting I say it would be better to come in in that way.
37. Would you increase the duty on Oregon, or allow matters to remain as they are?—I should leave them as they are.
38. As to furniture made of New Zealand timber, have the prices gone up in the last five years?—Yes.
39. How much per cent. would you say?—About 10 per cent.
40. The cost of furniture has gone up about 10 per cent.?—The cost of furniture has gone up more than that (cost of production).
41. How much would you say in the last five years, speaking generally?—At the present time you can get furniture much cheaper in Christchurch than you could five years ago.
42. Of an inferior class, is it?—Yes.
43. But taking a certain class of furniture—a good class of furniture—what would you say the increase has been?—Now I think of it, I do not believe there has been any increase at all in the price of furniture (selling price).
44. That is, first-class furniture?—Middle-class or first-class.
45. Has the price of labour gone up in the last five years in your business?—No, labour has not gone up in the cabinetmaking business.
46. Is there any more machinery employed?—Yes.
47. That has not tended to bring down the price of furniture?—Yes, it has. It would, naturally.
48. That is, on the cheaper class of furniture?—It is essential now to use machinery for all classes of furniture. It is different from when I learnt my trade, and took everything out in the rough and trimmed it up.
49. Those doors that you spoke of, did you make them or your father?—My father made them. Although I am supposed to turn out a fair quality of work now, I do not think my father would have cared to turn out anything of the kind.
50. That applies to other things as well?—Generally speaking, in our line the youths have to go to the Technical Schools now to learn their trade.
51. That is due, I suppose, to the desire for cheapness—everything cheap?—Partly so. You do come across some people who want good furniture. I have private orders now for furniture that probably would be taken out of an English design-book.
52. You find, then, that the class of furniture being sold now is, generally speaking, much inferior to the class sold ten years ago?—Oh, yes! Mind you, there are men here capable of turning out work as good as the first class in England; but, generally speaking, it is not so.
53. There is more demand for inferior, cheap furniture?—Yes.
54. Can you tell us anything about the importation of furniture? Is it increasing in Christchurch? Is more coming in?—I do not know definitely. I have been told that it is. I have been told that the colonial workmanship is down very low in some people's estimation, and that they are buying imported furniture.
55. You do not know whether the imports are increasing or not?—No.
56. Is the industry in a good position, generally speaking?—Yes. Of course, for the last two months it has been down very much, but two or three months ago it was impossible to get cabinetmakers.

57. *Mr. Jennings.*] What is your opinion so far as labour is concerned? Do the apprentices and the journeymen show the same desire to turn out good work that they did ten or twelve years ago?—That is hardly going back far enough, to my mind.

58. Say, twenty-five years ago?—No. The trouble is that in those days the master took great pride in saying that a lad served his time with him, while now it is immaterial; he does not care for the journeyman to waste his time showing the lad how to cut a dovetail or make a joint, and he cannot afford the time himself. The consequence is that the lads go to the Technical School, where they are supposed to learn their trade, instead of the bosses teaching them, as it used to be.

59. I take it you are a New-Zealander?—I have been forty-seven years here, and am pretty well a New-Zealander.

60. Do you think that the deterioration or want of interest in the work is due more to machinery than to the individual?—That has been a great cause.

61. Would you prefer to use the local timbers that are suitable for your own particular industry rather than foreign timbers, at a fair rate?—No, I would not say that.

62. *Mr. Field.*] You are a joiner, are you not?—A cabinetmaker. I make shop and office fittings and cabinet-work.

63. You do not profess to know as much about the respective merits of building-timber as the ordinary builder, I suppose?—No.

64. Do you know anything about Oregon pine and rimu?—Yes, I know something about that.

65. You say that Oregon pine is more suited for big timbers, mainly because it is cheaper and lighter?—I reckon it is better as studding in a house, also, than rimu.

66. You think it is better for framing a house?—Yes.

67. Why?—Because it does not warp or twist so much as rimu.

68. Have you had very much trouble with rimu warping or twisting?—Yes, a great deal.

69. In the framework of houses?—Yes, such as window-frames and so forth.

70. You would not use rimu for window-frames, would you?—It has been used.

71. But it is not usual?—No.

72. I am talking about the framing. Have you heard of any difficulty about the twisting of rimu?—I have seen it.

73. Often?—Yes, often.

74. What is it due to—the timber not having been seasoned?—Yes; it is put in when it is wet.

75. Do you think there is much building in unseasoned timber in Christchurch?—I do not mean to say that the timber is absolutely wet, but it is not seasoned in a great many cases.

76. Do you mean to tell us that all the Oregon pine that comes here is seasoned?—No.

77. I suppose that most of the rimu you buy is first-class stuff?—The first-class rimu—what we call figured rimu—it is a hard matter to get dry. We have to stack it ourselves. That is, in certain thicknesses—larger sizes. With regard to the other rimu, that is used in furniture, and if it is well seasoned it will stand all right—that is, if it is straight-grained. There are different kinds of red-pine; some of it has a very straight grain and is clear-looking, and another sort is what we call heart.

78. Do you buy a good deal of rimu?—Yes.

79. What you buy is not the rough rimu, but what is fit for furniture-making?—Mostly so, unless it is a shop-fitting job. We buy rimu for that. It is not necessary for it to stand so well in ordinary shelving.

80. Still, you do not buy rough timber for shelving?—No.

81. And what about the resinous stuff and so forth?—We would not buy it if we had the other.

82. But there is a good deal of that in the rimu-tree?—Yes.

83. Is it not a fact that it is that class of material which the Oregon is shutting out—that is to say, it is that timber stuff which is used for framing in a building?—I do not think the builders would care to execute orders for that.

84. What is to happen to it?—I do not know. They are talking about felling and burning some of the timber which cannot be used, and clearing the land for settlement.

85. What is to happen to some of this rough, resinous rimu?—Are you alluding to post-and-rail work?

86. No, to heart rimu. It is rough, because of the resin in it?—That is different from the figured rimu.

87. Yes, but you do not buy the resinous timber I refer to?—No.

88. You have seen plenty of it in the framework of buildings?—Yes. I mean ordinary rimu, not resinous.

89. That is what it is well fitted for, is it not?—I should not like to say it is. I should not like to condemn the building that had it in. It is durable.

90. Oregon pine is used for the framework of buildings, is it not?—Yes.

91. And our rough and resinous timber is also used for that?—Yes.

92. Now, if Oregon pine is taking the place of rimu for this purpose, and you admit it is, do you not?—I have never known that any builder would buy a line of resinous rimu to put in a building if he had a contract.

93. But plenty of it goes into his trade?—Probably without his knowledge.

94. What is to happen to it? Is it to be thrown away? If Oregon pine takes its place what are we to do with it?—Will it not do for posts and rails?

95. Rimu does not do for posts and rails?—It is used a lot, not for posts in the ground, but for rails, and it would stand in the ground if it were resinous.

96. What I want to get at is, what is to become of our rough rimu if the Oregon takes its place for the purpose we have been using it for?—You mean the ordinary rimu used in the construction of the framework of a house?

97. Any rough rimu that is used for framework?—Yes.

98. Until last year that was used always?—Yes.

99. Now you say you prefer the Oregon?—I said I preferred Oregon, but I would not take the duty off the Oregon. I also said that if the rimu were seasoned it would be all right, but the trouble is that it is not seasoned when it is put into the houses.

100. How long do you say it takes to season an ordinary 3 by 2 or 4 by 2?—It ought to go through a good summer and winter, at any rate—nine months.

101. Before it is actually covered over with boards?—Yes, to be thoroughly seasoned.

102. What about the Oregon? It is cut green in the forests and is brought over here in a week or two?—Oregon is totally different. It would not twist in drying or warp like rimu.

103. Would you prefer to put that in green, rather than rimu?—Yes.

104. Coming back to the main question: we have used rimu all these years, and now it is being displaced by Oregon. What are we to do about it?—It could still be used, without having a prohibitive duty.

105. You think the duty might be adjusted?—Yes.

106. I suppose you are aware that the Americans put a big duty on our wool, which prevents our inferior wools being used by them at all?—Yes. I believe in protection every time.

107. If you were satisfied that this Oregon pine was shutting up our mills, and our timber was going to be burnt as a consequence, and the money invested in milling machinery and tramways and so forth was going to be lost, would you not think it would be fair to take into consideration the question of protecting our industry?—Certainly. I was asked a direct question with regard to my knowledge of Oregon and red-pine for building purposes, and I have given my answer conscientiously. When it comes to the protection of the sawmilling industry in this country, that is a different matter altogether.

108. You are aware that Oregon can be sold as cheaply as rimu? That is so, is it not?—Yes.

109. Are you aware that in Dunedin it is very much dearer?—Not being in the building trade I am not conversant with that.

110. In Dunedin, where it is dearer, those who want to help the timber industry are told that we have nothing to fear, because the Oregon is so much dearer. Here, where it is not any dearer, or is cheaper, we are told, "Why should you put a duty on Oregon when the people want to build as cheaply as they can"? What do you say to that? Do you think all these matters should be taken into consideration and a fair thing done in the adjustment of the duty?—Yes.

111. *Mr. Leyland.*] With regard to your kauri requirements, you like to get the soft, white kauri or the soft, yellow kauri that does not warp?—That is right.

112. One of the reasons why you are unable to get it is this: for building and construction purposes we have so many orders for specified lengths that when we get a nice, soft log suitable for your purposes we are compelled to take it in order to get the specified lengths for constructive purposes. If Oregon is admitted and is a good substitute for these specified lengths, do you not think it a good thing, for cabinetmakers could get the supply they require of that soft and white and yellow kauri?—Certainly I do. I understand, however, that you can get these in Melbourne. Is that not so?

113. No; that is a fairy story. Would not that modify your opinions in regard to imposing a duty on exported timbers if you found we could replace the loss by importing Oregon?—No, I do not believe in kauri being exported at all.

114. Do we not require large quantities of Australian timbers such as jarrah and other hardwoods?—Yes.

115. If we impose a duty on kauri, do you not think it likely they will impose a duty on the timbers we require from them?—I do not think so.

116. This desire to get timber is becoming keener in all countries?—But I am speaking of the matter of kauri, but not on account of reciprocity, and in a few years you must admit that our kauri will be very low.

117. I ask you if you do not think it fair that we should weigh this consideration?—No, not in this case.

118. In view of the fact that if the timber is not milled it will be burned—would you prefer to see it burned?—No, certainly not.

119. There is a report here which shows there are 2,138 sawmillers in the Auckland District, or men employed in the industry, as against less than nine hundred in Westland and Canterbury combined. Would you throw those 2,138 sawmillers out of employment by placing a duty on kauri and burning it?—By agreeing to an export duty on kauri you mean you would be throwing so many men out of employment?

120. Yes?—If the kauri gets wiped out of the country altogether, where are they going to get employment then?

121. But it will still be gradually milled?—I should still be in favour of an export duty.

122. The sawmillers in the Auckland District have invested thousands of pounds under the present existing conditions, and if you alter those conditions would it be fair to put on a duty and stop that milling unless you are prepared to compensate them?—Well, it would be impossible that that kauri could be used for a number of other purposes for which it is not used at the present time without a reduction in price.

123. Though you will admit Oregon pine?—Not free.

124. If you prohibit it you are increasing the difficulty. If you make it easy of admission you find a substitute for the kauri and relieve your own trouble indirectly?—Not a substitute for the kauri, but perhaps a substitute for rimu.

125. It is being chiefly substituted for kauri?—You would not use Oregon in place of kauri.

156. But use kauri in place of Oregon?—You might do that.

127. *Mr. Clarke.*] With reference to the local supplies, you say you find it impossible to get dry timber. Do you have to season it even after you have paid the 2s. additional per hundred for timber that has been filleted?—I have had to send it back many times.

128. That means that it is not what it is supposed to be?—Yes.

129. Then, the 2s. a hundred imposed on the general public is a wrong imposition?—Not always. I have sometimes bought a few feet of kauri, and it has been beautifully dry, and when the Exhibition was on here I wanted 9 or 12 by 1 which had been stripped, but it was not dry, and I suppose I was paying more for that than I ought to have done.

130. Then, the guarantee is no guarantee for dry timber?—Not always, but lately we have been able to get it better.

131. *Mr. Morris.*] You have heard of Mr. Chisholm, of Scoullar and Co., furniture-manufacturers?—Yes.

132. Do you consider him an authority on our timber for manufacturing work?—I do not think he is a practical man. I cannot say definitely, but only from what I have heard.

133. What do you think of his opinion when he says that rimu is the best manufacturing-timber for furniture and the best in New Zealand for the purpose?—I may have asked the late A. J. White the same question, and he would not know. It does not necessarily follow that a man in the furniture business is an expert.

134. Would you not take it that a man who has put a lifelong work into it understands it?—But he is only the proprietor.

135. But does he not get to know all those things?—Only from hearsay.

136. Can you say, if our timber was cut at the proper time it would be better for your work?—That is well recognised.

137. Have you had any experience at all in felling timber?—No.

138. You have had a good deal of experience in manufacturing?—Yes.

139. Can you tell whether the timber is felled at the proper time?—No.

140. Are you able to tell the difference between summer- and winter-felled timber?—No, I am not. We all admit that it is very essential that all timber should be cut when the sap is out of the tree. That was always recognised in England when hewing the oak.

141. Can you account for the fact of their felling all oaks after the sap has gone up in England?—No, I cannot. It has always been recognised that when sap was in the tree it would warp quicker when drying than if the tree was cut when the sap was down.

142. Can you say whether the duty that was imposed on imported furniture has assisted your trade at all?—No, I could not say.

143. Mr. Chisholm said it had increased their business considerably?—Yes, I would believe that. If a person wished to buy English-made furniture he is prepared to pay more for it, and in that case it is different. Generally speaking, it would naturally make the furniture trade much better by having a duty on the imported furniture. Of course, the trouble with the furniture that is imported into the colony is that it is mostly made in the East End. It does not come from the leading firms in London, and in most cases it is inferior workmanship.

144. You told us that the price of furniture has not increased during the last five years?—Yes, and in the last two months it has gone down. There are three people in the furniture trade who have given up within the last month in Christchurch.

145. I suppose you say that the trade in inferior furniture has increased?—Yes. It is owing to the small manufacturers who are not in business in retail shops, but supply auction-rooms and other firms, and the timber that is put in in many cases is wet and the work comes to pieces, and that is really the cause of the talk about the colonial-made furniture.

146. Have you had any experience of artificially dried timbers in your business?—Well, I just got 1,000 ft. of oak from America a week ago really dry. We have not worked it up, but apparently it is in very good condition. Whether the grain will come out owing to the process I do not know; but in order to make it antique it is put in a fumigator to give it the appearance of aged oak. This is the first lot of oak artificially dried we have landed.

147. You are not able to say whether through being artificially dried its value is depreciated in any way?—No, I should not say it has. We have to pay extra to get it artificially dried, because the oak takes such a time to season, and if you get it from Melbourne as a rule it is not seasoned.

148. In America, I understand, at a great many sawmills they dry their timber in about three days?—Yes, it is very quickly done.

149. According to your evidence you are antagonistic to the use of rimu for ordinary house-building and studs and joists. Have you had any serious trouble over this timber?—I said that when rimu was placed in buildings as it was in Christchurch a number of years back it was not dry when used for framing, but if it was dry and seasoned then I say it would be all right. I also said that I would sooner put in wet Oregon than wet rimu on account of standing the air and not warping.

150. This question of the twisting or warping is a new one to me. You must have had some trouble with it?—Yes, I have had some trouble with it. It accounts for the plaster cracking all over the rooms.

151. Do you not think it would be much better for this country to employ our own people in pushing our own industry along and keeping the money here instead of sending it out of the country and employing the people in some foreign country?—Yes, I always thought that.

152. That is a sentimental reason?—No, I think it is a proper reason.

153. *Mr. Stallworthy.*] Have you an association of cabinetmakers?—No.

154. What quantity of kauri do you consume?—I can hardly tell you that; we use some thousands of feet.

155. A hundred thousand feet a year?—Yes, I suppose all that—perhaps more.

156. You mentioned some Melbourne price-list: can you compare the prices of kauri at Melbourne and Auckland?—No, not in Auckland, I could not do that.

157. Have you imported kauri from Melbourne?—No.

158. Do the timber-merchants allow you a discount on the timbers purchased the same as the builder?—Yes.

159. What export duty would you place upon kauri?—I am not in a position to say that. I think that would be for a man more conversant with it than I am.

160. Would you think 5s. a hundred would be a fair duty?—Yes. I am not conversant with what it is. I understand that when you ask me the question, that this 5s. would be an extra duty to what it is at present. Is there an export duty now?

161. There is a 5s. duty now?—On what condition?

162. On kauri going out of the colony in any large size?—Well, put more on.

163. Supposing you were living in a district where there are about seven settlements built up on the kauri-timber industry, with almost every home dependent on that industry, with hundreds of men directly employed and having wives and families dependent upon them, would you still prohibit the export of kauri?—Yes. You are speaking from a sentimental point of view, and I am looking to the interests of the colony.

164. Just now you said you would put a duty on it to protect the industry?—Yes. I would not put a duty on it if we could not grow it here.

165. You believe in the protection of our industries?—Yes. I am looking at it from a sentimental point of view. According to those who are supposed to know, it will be only a few years before you will not be able to employ the hands you employ now, you will not have any country to take it from you, and we shall be without that timber that we ought to have for manufacturing our furniture.

166. You do not mind placing our kith and kin in other colonies in the position of being without kauri, but you would not place ourselves in that position?—Placing ourselves in a position to get the kauri, and place them in a position that if they did want it they would have to pay the duty on it. I have seen Moore's list, and the prices at which they are offering to sell it in Melbourne. I have seen the late price-list for the first, second, and third qualities, and I can land it here, paying everything, as cheap as I can buy it is Christchurch at the present time.

167. *Mr. Leyland.*] I have here Mr. Moore's price-list, and in the 1909 list there is no kauri quotation, and in the 1908 list kauri is £1 7s. for 12 by 1?—I may have an old list.

168. *Mr. Stallworthy.*] Do you approve of a 25-per-cent. duty being placed upon imported furniture?—Yes, certainly.

169. Would you increase it?—Yes, I would.

170. And yet you object to 5s. a hundred on kauri?—I hold the opinion with regard to imported furniture that it can be made in the colony just as well.

171. *Mr. Mander.*] Do you consider that resinous rimu will last as long as Oregon or longer in any position you like to place it?—Yes, I think it would.

172. Why do you object to using it in buildings in preference to Oregon?—I have never seen any building erected with it. No builder will buy a line of that stuff if he can get out of it. A man would take too long to drive a nail in.

173. That is the principal reason?—No. I do not object to rimu at all, but I object to rimu being placed in buildings wet.

174. But you specially objected to resinous timber: you said you would not use it?—Certainly I would not use it.

175. But is the main reason that you find it difficult to drive the nails in?—I am not a builder.

176. If it lasts longer than Oregon in any position you like to place it, why do you object to use it?—I do not say I would object to use it. I said that I did not consider any builder would buy a line of resinous rimu with which to erect a house. I say he would sooner give 5s. a hundred more for the other than put that in.

177. Simply because it is more difficult to drive nails in?—Yes, but I did not say it was not as durable.

178. Do you not consider that, if it is necessary to conserve kauri at all, it is necessary for the State to take that matter in hand?—I would not say that the State should take that in hand. Do you mean take over the kauri bushes?

179. Take over the matter of conserving the kauri forests?—I think they should take that in hand, but not take it away from those in possession of the forests at the present time.

180. Would you compel private individuals to hold that timber for definite periods for the benefit of the State and run the risk of fires?—No.

181. Then, why do you say you would impose an extra duty on kauri?—Because I should like to see kauri being used in New Zealand in twenty years' time.

182. Would not that compel the private individuals to hold it for that time?—Not necessarily. If the private individual held it for twenty years, and thought he could get 5s. more for it he would do so. I do not think the merchants would do it, but the Government might do it.

183. By imposing an extra duty on kauri you prevent those people from sending this timber out of the country, for which purpose they produce it, and you would simply ruin them?—I do not think so. I think the price of kauri is altogether too high. Why is kauri so much dearer than red-pine? And if the kauri were brought here at a cheaper rate, should we not use it?

184. You can buy first-class kauri in Auckland as low as 18s. 6d. and 19s.?—Probably so, but we do not see it here.

185. I can supply you with kauri from my mill at 6s. a hundred upwards?—If I gave an order for 8,000 ft. at 6s. would you supply it?

186. Yes?—What kind?

187. Shaky heart?—No, thank you.

188. When calculating the price of kauri, have you not to calculate the price of the whole log?—But I never buy anything but the best class.

189. We have to charge a special price in order to compensate for the prices at which we sell the lower timber at?—Yes.

EDMUND GEE, Venetian-blind Maker, Christchurch, sworn and examined. (No. 47.)

1. *Hon. the Chairman.*] What is the principal timber used in your industry of venetian-blind manufacturing?—Californian redwood. That is used for the thin laths, and for top and bottom laths, pulley-pieces, we use kauri.

2. Are these the only two classes of timber used by you?—We used New Zealand timbers many years ago—probably ten or fifteen years ago—and we found them very unsuitable.

3. What is the cost of American redwood landed here in Christchurch?—Twenty-three shillings—that is, the thousand running feet. We get it milled.

4. Do you get it in small splits packed?—Yes, packed together in 5,000 ft. bundles.

5. It costs you how much?—It costs us £1 3s. per thousand running feet. That is at the present moment; recently it has been £1 5s. It really costs us landed here about £1 5s. now, and £1 7s. a little while ago.

6. Then you are not much interested in the question of the importation of Oregon timber?—Very little. In fact, we have only used it occasionally.

7. Do you find any trouble with regard to the redwood?—Very seldom. It is thoroughly seasoned when we get it Sometimes it may be a little water-wet, but it is fresh-water wet. It comes across in the logs in timber-ships, and they cut it in Sydney. We find we can land it here already milled very much cheaper than we can mill it ourselves.

8. The industry is not large enough to put up a plant to do it cheaply?—My father used to run a plant here, but it was greatly to his disadvantage.

9. Then you are not interested in the kauri and Oregon question much?—No, very little.

10. *Mr. Ell.*] You only use kauri in the top pieces?—That is all. We have used American white-pine and clear-pine, but those timbers are not so good as kauri—at least, so we think—because the kauri has a certain natural lubricant in it, and as the pulleys wear against the sides it forms a glassy surface. The other timbers are inclined to wear away in the pulley-holes, whilst the kauri does not wear away, and the pulleys run very smoothly against the sides. Still, we have to pick the kauri.

RALPH DAVISON, Manager for Messrs. Strange and Co., of Christchurch, sworn and examined. (No. 48.)

1. *Mr. Ell.*] I would like you to make a statement as to the timbers you require in your business, both imported and colonial. First, with regard to New Zealand timbers, what kind do you use?—Kauri, rimu, white-pine, and beech.

2. Roughly speaking, about what quantity of kauri do you put through in a year?—I do not buy any small lots, as I season in large quantities. We get through about 75,000 ft. to 100,000 ft. a year of kauri.

3. How much of rimu?—That all depends upon the quanity of beech we use. We use a lot of beech. About 75,000 ft. of rimu.

4. In regard to beech?—About 30,000 ft.

5. Do you intend to use more beech in the future?—Yes. It is specially suited for furniture, and especially in connection with the larger make of couches.

6. With regard to rimu, what special use is it put to?—Desks, sideboards, and different articles of furniture, also wash-hand-stands, chests of drawers, tables, &c.

7. What do you use kauri for?—Extension tables generally, and chairmakers' work. For the best class of furniture we use kauri stained as walnut.

8. Do you find that the workers in the factory appreciate the value of kauri and rimu for furniture-making?—I do not know anything about them. I am the outside man. I have to give them the dry article inside and keep up the stock.

9. You require roughly about 250,000 ft. a year?—Over that. Large quantities come in from New York.

10. Now, with regard to imported timbers, what do you require in that way?—Walnut; mahogany; cedar; oak, figured and plain; and a little blackwood.

11. Now, I suppose you are familiar with the cost of kauri, rimu, and beech. How does the cost of these imported timbers compare? Are they very much greater?—Oh, yes!

12. It is obvious, then, that if the furniture for the people of this country were made out of imported timbers it would cost much more?—I do not know how you could import it for cheap furniture. Decidedly the furniture would cost more. I have timber now that costs £5 10s. for 100 ft.

13. What kind of timber is that?—Walnut, figured oak, and mahogany range at the same price.

14. Roughly speaking, what does the rimu cost you?—We buy a high class. It costs 13s. 6d. at the railway.

15. As compared with £5 10s. for imported timber?—Yes.

16. That is the best quality rimu?—It is of best quality.

17. In the evidence you are giving us you are speaking as the result of many years' experience in the trade?—Since 1862.

18. So we have a right to assume that you have some knowledge of what you are telling us now in respect to these timbers?—Yes.

19. What does kauri cost you?—Kauri costs us £1 5s. at the Gasworks Company's works railway siding. No discount.

20. There is a very considerable difference in the cost of timber imported for furniture and the cost of the native timbers?—Decidedly so.

21. *Mr. Morris.*] Where do you obtain your rimu from?—For five years I have got it from George Erickson, of the West Coast.

22. Where does he live?—He does not belong to the association. I went over there and arranged with him. We also get a lot from Havelock, as one man's timber is not good enough for us.

23. Do you get better timber from Mr. Erickson than from other places?—It is not all rimu that comes to Christchurch. There are heaps of miro.

24. You do not mean to tell me that Mr. Erickson would send that to you?—All millers will pass it in if they get the show, but I happen to know miro when I see it.

25. You told us that this gentleman does not belong to the association?—Mr. Erickson—no. Not at Christmas time, although he might have joined it since.

26. Do you not consider that he might have used you just as well if he belonged to the association?—When other people do not know the difference in the two woods I pass it on. It will shrink little more than rimu, and it is a durable timber.

27. I have heard Mr. Erickson state himself that you have paid him more money for his timber because it was better than anybody else's?—He sends along the best quality. He always had a higher price than any one else, but I did not tell him that.

CHRISTCHURCH, THURSDAY, 8TH APRIL, 1909.

ALFRED ELLIOTT, Collector of Customs, sworn and examined. (No. 49.)

1. *Hon. the Chairman.*] I understand that you appear here to give the Commission the quantity of imported kauri, and Oregon, and other timbers of that class?—I can only deal with the imported timbers—not kauri. We have no record at all of the timber brought here coastwise. Do you wish me to read the statement which I have here?

2. If you put it in we can see it?—It is a return for the years ended 30th June, 1907, and 30th June, 1908. Fortunately, this return had been asked for by the Government, or I should not have been able to supply it now. It took a long time to compile. It shows the imports of the different kinds of timber, and the countries from which imported.

3. *Mr. Ell.*] Is there any kauri shown there—any kauri imported from Australia?—No.

4. You have no record of any kauri having come in?—No. [Return handed in.]

5. *Mr. Field.*] Would it be difficult to prepare a return of the amount of Oregon imported up to, say, the end of last month—that is, another nine months?—I could not let you have it to-day, and I understand the Commission rises to-day.

6. Could you send it after us?—Yes, I could do that.

7. *Hon. the Chairman.*] Will you kindly send it to Greymouth, then?—Yes.

8. *Mr. Field.*] What I should like would be the importations up to the 31st March—all the imported timber?—Yes.

WILLIAM JACQUES sworn and examined. (No. 50.)

1. *Hon. the Chairman.*] You are the secretary of the Builders' Association, Mr. Jacques?—Yes.

2. Can you give the Commission any information on the matters set out in the order of reference—questions 1, 2, and 3?—I have nothing to say on Nos. 1 and 2, and scarcely anything on No. 3. The only information I can give with regard to the price of timber is what it is sold at in Christchurch from the yards.

3. What are the prices of timber in Christchurch?—The price in 1901 for the ordinary material up to 8 in. was 13s. 3d. a hundred.

4. What difference was there between dressed and undressed?—The same as now—2s. a hundred. Last year we had two lists presented to us. In January the ordinary timber was 16s. In November it dropped down to 14s. 6d. But that does not represent the actual decrease in price, because the list was somewhat altered. In January of last year we had sawn timber at 16s., and 14 in. joists at 17s. 3d.; 9 by 1 and 12 by 1½ was 16s. 6d., and after that there is a gradual increase in price. In the list that was recently issued the only mention is of sawn timber, not suitable for dressing, under 12 in., 14s. 6d. There is no other mention of rough timber, but all unseasoned timber selected for dressing, up to 12 in., was 16s. 6d. So that the quoted price of 14s. 6d. might mean ordinary rough stuff up to 12 in., or it might not. They struck out the price of 8 in.—it was always quoted up to 8 in.—and then from 9 in. to 10 in. there was generally a rise

of 6d. I am speaking of rough stuff. In 1908 the position was this: Sawn timber up to 8in. was 16s.; 9 in. to 10 in., 17s. 3d.; 12 in., 17s. 6d.; 14 in., 18s.; 16 in., 19s. 6d.; 18 in., £1 1s. 6d. That last was the top price. The prices of 14 in. to 18 in. timbers were raised in November last. As I say, the list does not actually show the position. The other material for dressing has all risen in proportion. Kauri, of course, has risen considerably since 1901. The increase in the price of kauri in Christchurch from 1901 up to the present time has been 9s.—that is, for the ordinary sawn timber. The cost of joinery has also increased considerably.

5. *Mr. Ell.*] You say that the price of ordinary sawn kauri has risen in eight years 9s. a hundred?—That is the ordinary sawn timber; 12 in. has risen 9s., and 24 in. 11s.

6. I think if you put that table in it would be very instructive to us?—I will give you a copy of it.

7. Rough building-timber, so I understand, was reduced by 1s. a hundred a few months ago: is that so?—One shilling and sixpence a hundred.

8. In January, 1908, the price was 16s., and in November of last year it dropped to 14s. 6d., at which price it still remains?—Yes.

9. That is, a drop of 1s. 6d. a hundred?—Yes.

10. That was done, of course, by the timber-merchants of Christchurch in common agreement?—Yes.

11. And is it not a fact that at the same time the dressed timber was increased in price?—Yes.

12. By what amount?—Sixpence a hundred all round.

13. That makes a difference of 2s. a hundred?—Yes.

14. I have a price-list here for 1894, issued by a large firm of timber-merchants in town here, and they charged for seasoned timber a difference of 6d. a hundred?—Yes.

15. Now they charge for seasoned timber a difference of 2s.?—Yes.

16. The price at that time for 6 by 1 red-pine weather-boards, bevelled, back-dressed, unseasoned, was 11s. 9d., and for seasoned 12s. 3d.?—Yes, that would be about the price at that time.

17. Making a difference of 6d. a hundred for seasoned timber?—Yes. Ordinary timber was down to 9s. 6d. then.

18. Do you think the cost of yarding has gone up to such an extent as to justify an increase of 1s. 6d. a hundred as between the cost of seasoned and unseasoned?—Of course, wages have gone up, and there has been an increase in the value of land. Timber takes up a lot of ground for stacking.

19. Notwithstanding that wages have gone up, and that the value of land has gine up and rates in consequence, do you think that is sufficient to justify such a big increase?—Everything was very low then.

20. Everything was cut very fine at that time?—Yes.

21. There have been no recent failures among timber-merchants in Christchurch, or timber-merchants gone out of business recently that you are aware of?—I do not think so. One firm went out of business not long ago—Wallace and Co.

22. That is the only one you know of?—Yes.

23. It was not due to financial failure, so far as you know?—No.

24. The other businesses appear to be thriving all right?—Fairly well.

25. Notwithstanding the fact that they have reduced the price of rough building-timber 1s. 6d. a hundred?—As far as I know, that is so.

26. Can you give us any information with regard to the increase in price that has taken place in jarrah? When did that take place?—There was a rise of 2s., I think, when the company changed hands. It is only fair to say, however, that the price was increased a little before that again. I have not dealt largely in jarrah.

27. But there has been a rise since the local company took the Australian company over?—Yes.

28. Up to that time was jarrah competing with black-pine?—Very largely.

29. Jarrah was being used in preference to black-pine for fencing purposes?—Oh, yes! for building purposes as well.

30. You do not know whether the rise was due to an increase of price in Australia or not?—No.

31. About how long ago is it that the local company took the Australian company over—eighteen months?—About that, I suppose.

32. Now, with regard to the use of Oregon: what sizes are really necessary to the building industry?—They mostly come in, I think, for joists in the first place—about 10 in. or 12 in. The smaller stuff is not used much here.

33. And it comes in in long lengths?—Yes.

34. It is used largely in long lengths and larger sizes for special purposes?—Yes.

35. Have you experienced any difficulty in obtaining New Zealand timbers in these unusual sizes for special work?—Personally I have not, but I know from others that there is a difficulty in getting them.

36. And that would cause a certain amount of delay from time to time in building operations?—Sometimes when they get the joists the architect will not allow the builder to put them in for a time.

37. Because they come in such a green state?—Yes.

38. Do you think it desirable that, in the interests of the building industry of New Zealand and the public generally, there should be an increased duty put upon Oregon?—No, I do not think so at all.

39. Do you think there ought to be a reduction on the larger sizes?—That is my personal opinion. The large sizes should come in free.

40. And if there is any import duty it should be put on the smaller stuff?—Yes.

41. Is kauri used to any considerable extent in building a house?—Yes, a good deal for the internal work.

42. In the event of this class of kauri being cut out absolutely, do you think it would be detrimental to the people of New Zealand if we had to depend upon some imported timber to take its place?—I think it better to keep the best material as long as you can.

43. You think that in the interests of the people of New Zealand it would be best to keep the kauri as far as we possibly can?—Certainly. I think there should be an export duty on kauri—a large one at that.

44. To your knowledge, it is not only required for building, but is used by coachbuilders in the construction of vehicles?—Yes.

45. And by furniture-makers?—Yes. In fact, I think it is our principal timber.

46. Do you know of your own knowledge—you are not a native of New Zealand, I take it—of any imported timber that is equal in quality to it for the many uses to which kauri can be put?—No.

47. You consider it one of the best timbers in the world?—Yes. In the Old Country American pine is principally used.

48. And the prices for these timbers are advancing in the Old Country?—Yes.

49. So that, if we were dependent upon imported timbers for our various building and other woodworking industries, it would mean a serious tax upon the people of New Zealand?—Yes. I think you are allowing a very valuable asset to leave the country. When that is gone you will have to pay a larger price for an article that will be inferior.

50. And that will be a serious tax upon our people?—No doubt.

51. With regard to rimu, I want to ask you whether, in view of the various purposes to which rimu can be put, and is put, you think it would be a wise thing on the part of the Government to conserve large forest areas in rough and broken country where much rimu grows and which country is not specially adapted for settlement, to supply the future needs of our woodworking and building industries?—Yes; I agree with the idea of reafforestation, but I do not agree with the manner in which they are looking after the present.

52. I am talking now of our native forests—making reservations of forest areas in rough, broken country for future needs. You think that would be a desirable policy for the Government?—I do not think they should destroy any of the timber on such land.

53. Now, with regard to our forestry operations, I know you have taken a very deep interest in these for years past. Do you think the operations of the Forestry Department are as vigorous as they ought to be, considering that this country requires a constant supply of timber?—I do not think so.

54. You do not think that the Forestry Department, its operations having covered only 9,500 acres of land, is doing what it ought to be doing as a Department for the future needs of the country?—No, I do not think so at all. I do not think they are doing enough. They ought to plant quicker.

55. With regard to our sand-dunes and waste sand-lands, running into tens of thousands of acres, do you think some special effort ought to be made in the way of planting, to make those great areas of waste country profitable?—I think so. I think that is an object which the Government should always have in hand.

56. You are aware, of course, that France planted a great stretch of waste land along some part of her coasts, and that it is now valuable forest?—Yes, I have read of that.

57. *Mr. Hanan.*] You have studied the question of forest-conservation?—I have read a good deal about it. I take an interest in it.

58. Have you any suggestions to make as to where plantations should be established?—No. I think it is a matter for observation as to the best position for different kinds of trees.

59. Can you offer any suggestions as to what class of trees we should plant?—I think that possibly oak, ash, and elm are three kinds that should be planted largely. Those are timbers which will always be of commercial value, and they grow fairly quickly in this country, provided they are attended to.

60. What opinion have you formed of the prisons plantations?—I have only seen the one at Hanmer, and that was just as it was started, so I could not give an opinion on that point.

61. *Mr. Jennings.*] Has the increase in the price of timber retarded building operations to any extent, in your opinion?—I do not know that it has to any extent. I think there is a general depression all over the country.

62. And that has come within the last twelve months or so?—Yes.

63. You told Mr. Ell that you are in favour of allowing Oregon timber to come in in long lengths. Would you apply the same principle to the farming machinery of the Harvester Company of America? Should it not come in without a prohibitive duty also?—It is a question of whether you want it.

64. The farmers want machinery. The same principle applies, does it not?—Not always. We cannot produce Oregon. We cannot produce a timber that is so easily handled and worked in the rough.

65. But you stated that some of our timbers are superior, especially kauri?—For special work. It would be totally wrong to use kauri for beams and joists in the way it has been used.

66. Have you any knowledge of the totara that is in the Waimarina Forest?—No.

67. Do you know that it is used freely by builders and also by the Public Works Department for very heavy work, and that there is, in my opinion, an almost unlimited supply—at any rate, for the next fifty years? If you could get that timber at a fair rate and it would stand the tension

that builders would apply so far as structures are concerned, would you give that timber preference over foreign timber, at fair rates?—Yes, but then we know that it will not stand the strain, as compared with Oregon. That is the report I have.

68. We have evidence to the contrary?—I am only saying what I am told.

69. The decrease in the trade is owing to the depression, you say?—I dare say that has something to do with it.

70. *Mr. Field.*] Have you anything to say in complaint of the price of timber that is being charged or has been charged in the past?—No. I have not studied the question of merchants and millers.

71. Has there, to your knowledge, been any serious complaint about the price of timber in Christchurch?—No; general talk, that is all.

72. I suppose some people always complain?—Yes. The public always like to get the cheapest.

73. About this understanding, or, as it has been called, combination, between builders and timber-merchants and between timber-merchants and millers: do you think that has been in any way harmful to the timber-consuming public?—I do not know.

74. Do you think it has been anything but a fair understanding?—I do not think so at all.

75. You said that timber-merchants were keeping their businesses—that only one had gone out of business. I suppose you are aware that it is not a simple matter to give up a business of the character of a sawmiller's? I mean to say that if you were a timber-merchant, although you might be losing money or making nothing, you would probably hang on hoping for better times; in any case, you would probably find some difficulty in selling out at a fair price?—You might.

76. You cannot walk out of such a business in the same way as you could walk out of, say, a fruiterer's?—No. The business would have to be wound up.

77. Even though a merchant might not be making any profit and might desire to get out, difficulties would present themselves. There might not be anybody to buy at a fair price. You can see the difficulty of getting out of business and can understand a man keeping on, hoping for better times?—Yes. All of us are hoping for better times.

78. *Mr. Leyland.*] In reply to Mr. Ell you stated that kauri timber had risen 8s. a hundred in eight or nine years, I think it was?—Nine shillings a hundred.

79. That is about 30 per cent.?—Yes.

80. As that might convey the impression that the increase had been unduly large, would you be surprised to know that the royalties alone had risen 250 per cent.?—I knew that they had risen, but I did not know by what percentage.

81. With reference to the rise in the price of jarrah, is it not a fact that the world's timber-supplies are rapidly diminishing?—Yes.

82. All over the world the prices of timber are rising, so it is only to be expected that jarrah should rise?—Just so. I only quoted the price-list.

83. *Mr. Clarke.*] I have before me a price-list for kauri, printed in this city and dated 1899. The price marked on it for sawn kauri, 12 in., is 16s. That was ten years ago. Opposite that is a statement in writing that the price is now £1 9s. 6d. Is not that more than an 8s. rise?—I was quoting figures for 1901. The price was £1 0s. 6d. then.

84. I am speaking of the difference between now and ten years ago. Is this list correct which shows that ten years ago the price was 16s. and now it is £1 9s. 6d.?—I have not that list; I have only the figures for 1901.

85. Now, with regard to preserving kauri as much as possible for our future use. It is recognised that it is one of the best timbers in the world, is it not?—Yes.

86. Would it not be desirable to do all we can to preserve our timber for our own use? And I may say that the best boats that Lieutenant Shackleton says his party ever used were made of kauri. Should we not preserve our own timbers for our own use as much as possible?—I think we should.

87. With reference to our future supplies, if you will look at the latter part of our order of reference you will see that we are asked by implication to consider the future, are we not?—Yes.

88. We are now working on, practically, a limited supply in this country, are we not? There is not any being grown?—That is so.

89. Is it not good business that a man should not attempt to work on his capital only? You would not like to be working on your capital only, and not getting some return?—I said before that I think the Government should make some provision for future supplies.

90. With reference to a duty on Oregon, you were asked a question about letting machinery in duty-free. I suppose you recognise there is a difference between machinery and timber. Machinery is already manufactured when it comes here, whereas timber needs a large amount of labour bestowing on it when it gets here. Is not that a fact to be taken into account?—Yes, I think so.

91. We heard a good deal about keeping the money in the country. Assuming that we can land Oregon here at about 9s. without any duty, we get a product for 9s. that is sold, in some places, at any rate, for 16s. Where is the remaining value? It remains in the country, does it not?—Yes.

92. With regard to long lengths and the special uses of this timber: suppose you are putting up a building with a good deal of plastered work in it, would you not rather use Oregon than red-pine?—Yes.

93. For partitions and joists where they are to be plastered?—Yes.

94. You think it a decided advantage to have the opportunity of buying Oregon for those special purposes, and that therefore any extra duty on it would be a further tax on people who wish to build in that way?—Just so.

95. *Mr. Morris.*] With regard to Oregon, if our native timbers were used in all the building going on here, would not the same amount of labour be employed?—It makes very little difference with regard to labour.

96. So that there is practically no advantage from the labour standpoint in bringing Oregon into the country?—No, only we get a better material for the same money.

97. Do you think the general public derive any benefit from the importation of Oregon into this market at all?—I should say that if a person gets a better article for the same money he does derive a benefit.

98. Are you prepared to tell us now, as a practical man, that Oregon is a better article?—Yes, for some purposes it is better than rimu.

99. Have you ever had any serious trouble as a builder with our rimu when used in buildings?—Yes, it does not always stand in its position as it ought to.

100. It does not stand so well as Oregon?—No.

101. But before you got Oregon here you always got along very well with rimu?—Yes. A man does with an ordinary suit of clothes before be can buy a good one.

102. What I want to get at is this: You have never experienced any difficulty with your architect, for instance, in getting a job passed in which you used rimu when you had no other timber to work with—I mean, on account of it twisting or warping?—Oh, yes! I have had to take some out.

103. Have you had any experience at all in the milling of timber?—No.

104. Then you cannot tell us whether the miller is getting more than he should get for his timber at the present time?—No.

105. But you put in a price-list for 1894—I suppose with the object of showing that timber was much cheaper at that time than it is to-day?—I did not put in a price-list for 1894.

106. Then, you quoted figures from it?—It was 1901 I quoted the figures for.

107. If I told you that at that period the millers were trying their best to cut each other's throats, so to speak, and that none could pay their way, would you be surprised?—It was the general thing all over the country then. It was the same with builders, I think.

108. Do you consider that a desirable state of business?—Certainly not.

109. You will admit that the class of rimu you have generally had in this market has been good?—We get all kinds, I think—good, bad, and indifferent.

110. Take Oregon, for instance, and compare it: Do you not think it is cheap enough at the present price?—It is much the same price as the other. I see no reason why we should not get it cheaper if we can.

111. If you are buying Oregon to-day, as I understand you are, at 14s. 6d., less 7½ per cent. discount—that is, with the present duty on it—I think the public are being fairly treated, do you not think so?—No, I think the large sizes of Oregon should come in duty-free.

112. Have you ever experienced any difficulty in getting long lengths of rimu over here when carrying on your business?—Yes, we do at times.

113. I suppose if you ordered them in time you could get them?—People generally want their job done in a hurry.

114. If you get a contract placed in your hands for execution you generally have sufficient time to obtain these big sizes of timber long before you require them?—Not always.

115. Do you think that if the merchants here stacked them it would help matters?—It might help a bit.

116. It would mean that a considerable extra charge would have to be made for them if the merchant had to hold large stocks?—Yes.

117. *Mr. Barber.*] It has been stated that the importation of red-pine into this district has been reduced by 75 per cent. as compared with eighteen months ago—that is, there is only 25 per cent. of the red-pine being imported now that there was eighteen months ago. Do you think that is a true statement?—Of course, business is not so brisk.

118. Do you think it has fallen that much?—It must have fallen considerably, I should think.

119. What do you attribute that to?—There is not the demand.

120. Why is there not the demand?—There is no building going on. There is a general depression.

121. A good deal has been attempted to be made of the fact that sawmillers and timber-merchants have not done well. I think you said that only one of them here has ceased to carry on business?—That is all, I think. I spoke of timber-merchants, not sawmillers.

122. With regard to the general depression that has prevailed, do you think the timber-merchants have felt the depression any worse than those engaged in other industries, such as the boot industry, or even the woollen industry?—I suppose all businesses have felt the depression. There is not much difference.

123. You are secretary of the Builders' Association?—Yes.

124. It was stated in evidence yesterday that a resolution was passed some time ago in favour of the free importation of Oregon pine, but that resolution was afterwards rescinded, and the association as an association altered their opinion on that question. Do you know anything of that?—The resolution was not rescinded. The two resolutions will read very well together.

125. Can you submit the two resolutions to the Commission?—I can give you copies of them.

126. *Mr. Mander.*] You said that some time ago 6d. a hundred was charged extra for seasoning timber in the yard?—One shilling for stripping and 2s. for seasoning.

127. That is at the present time?—Yes.

128. But I mean some years ago?—Yes, it was done at 6d.

129. Do you consider 6d. a reasonable price for timber-merchants to charge for holding timber in the yard from six to twelve months?—No, I do not.

130. Then, they were doing it at less than cost-price?—I do not think it paid them at 6d.

131. Do you not think it legitimate that, when business people find they are doing business at less than cost-price, they should raise their prices?—Yes, but that is a matter for their business.

132. Do you think it wrong to raise the price of any commodity in proportion to the cost of the production?—No.

133. If you were satisfied that the cost of production has gone up so very largely on kauri timber, would you be satisfied that it was legitimate to charge the present price?—Yes, I am not complaining of the present price, only the difference in the cost.

134. When kauri timber was selling so cheaply some years ago—at about 8s. a hundred—are you aware that at that time there was very keen competition, and the people were losing very heavily over the business?—I am not.

135. If you were told that was a fact, you would not be surprised at that change which has taken place?—There is always cutting when business is low.

136. And that is not good business for the individual or the community?—No.

137. *Mr. Ell.*] Have you used beech at all for building purposes?—No. Twenty-five years ago I used a little in the country.

138. Have you any knowledge of it at all?—It is not a good timber for building, generally speaking.

139. I think you stated in evidence that you considered that to use kauri in large lengths and great beams was a waste of timber, because it is more valuable to the country for other purposes?—Yes, there is no doubt about it.

140. With regard to the Telegraph Department putting in huge poles 16 in. square, can you tell the Commission whether you do not think totara is more valuable for other purposes?—Yes, I think that most of the best totara should be limited to certain purposes.

141. Have you had any experience of it with regard to window-sashes?—Yes, it stands very well, but it is very short in the grain and liable to break.

142. But it stands the weather well?—Yes, there is no doubt about that.

143. As a builder, for what purposes do you think totara is specially adapted?—Ground plates or posts, or anything that is required to stand in the ground or where there is likely to be dampness.

144. But with regard to house-work, finishing, or panelling?—I do not care for it myself in joinery-work.

145. *Mr. Morris.*] Do you not find that the building trade feels the pinch or tightness of the money-market before other trades?—No.

146. For instance, a man can do without a new house or a new building when he cannot do without clothes?—I think our boot-factories feel it first.

147. But it is a fact that a man can do without a new house when he cannot do without clothing?—Yes.

ROBERT ELLISON sworn and examined. (No. 51.)

1. *Hon. the Chairman.*] What are you?—Secretary of the Central Dairy Company.

2. Can you give the Commission some information in regard to the timber you use in your factory?—All I wish to say, Mr. Chairman, is that the price of white-pine appears to have gradually increased. Some years ago we found that the cost of our butter-boxes had somewhat increased, and at that time we could not make a contract in Christchurch for a finished box under 1s. 6d., and we had to arrange for our supplies from the North Island. We found that by getting the boxes down in shooks and fitting them up here we were able to get our finished article for about 1s. 2½d., as against 1s. 6d.

3. So you are gaining 3½d. by the change?—Yes. I am speaking of three years ago.

4. And has that continued down to this time?—That is the position at the present time.

5. What price would that run into per hundred superficial feet at the price that it is at the present time?—It takes, roughly, about 8 ft. to make a box.

6. So that it is less than 1d. a foot?—Yes. Some considerable time ago the question as to whether something should not be done by the Government to preserve the white-pine forest was brought before the notice of our National Dairy Association, and at different times resolutions have been passed asking that an export duty be imposed on the white-pine. Whether that would be altogether desirable or not I am not prepared to say.

7. Have you any knowledge of the amount of white-pine that is exported for the Australian trade?—No, I could not say what is exported.

8. But for the benefit of the dairy industry you think that the white-pine should be conserved?—Yes, that some endeavour should be made to conserve it as far as possible. I understand that the Egmont Butter-factory of Taranaki, who supply largely the requirements of Taranaki and Wellington Districts, have a large quantity of country reserved to last them for the next twenty years.

9. Are there any white-pine forests suitable for butter-boxes in Canterbury?—No.

10. Where did you get your supply from previous to getting it from the North Island?—We always had the finished box supplied to us.

11. From where?—From the contractors. The timber, I believe, in some instances, came from Southland.

12. Not from the West Coast?—I have heard that a certain amount of it came from the West Coast as well.

13. *Mr. Ell.*] You say you believe that a large dairy company in Taranaki has secured an area of white-pine forest so as to provide for the future needs of the industry?—Yes, I understand that.

14. It is a matter of national importance that one of our largest industries should be helped in every way?—Yes.

15. Do you think it would be rather a matter for the State to bear the cost of preserving the supply and holding an area of white-pine forest, rather than that the different companies should do so?—Well, I think it would be quite within the province of the Government to provide for the future. It is only natural that as the supply becomes depleted the price must of necessity advance.

16. So that this company you mentioned evidently see there is a possibility that the price may be raised, and they are taking it by the forelock and trying to protect the interests of their business?—That is so.

17. Do you not think it would be a good thing for the Government, looking to the future needs of the industry, that certain reservations should be made so as to preserve a supply of pine timber for this purpose?—Yes, I do, certainly.

18. Do you know, where the Forestry Department are planting trees, whether they will be suitable for your purpose or not?—I understand they are planting, but I do not know whether any of the trees that are being planted will be suitable for our business.

19. In view of the fact that our natural forests are bound to disappear in course of time, the Forestry Department should make some special plantations, seeing that this is one of the great industries of the Dominion?—Yes, I feel that way very strongly. The only thing is that there may be the possibility of some substitute being found to take the place of wooden butter-boxes. There are already certain substitutes being offered, but they will only come into use if the price of white-pine very much advances.

20. Those boxes you are now speaking of are dearer than the boxes made of white-pine?—Well, they are as dear.

21. Can you give us any idea as to the quantity required by your company annually for this purpose?—Well, we want, roughly, from 20,000 to 30,000 boxes a year.

22. That is your company alone?—Yes.

23. And, of course, you are only sending out a small portion of the butter shipped from this country?—That is so.

24. So that that would have to be increased many times to cover the needs of the various companies in New Zealand?—That is so.

25. *Mr. Hanan.*] What was your last export for this season?—We usually ship for the London market from 250 to 300 tons of butter in a good season.

26. Have any changes taken place so far as your company is concerned in regard to the supply of white-pine during the last three years?—We never buy or handle the timber itself. We always buy the finished box.

27. You found you could bring the boxes all the way from the North Island cheaper than you could get them in Christchurch?—Yes.

28. Do you find the white-pine borer affecting your boxes? No, they do not have time.

29. *Mr. Leyland.*] I understand the boxes from the North come in shooks?—Yes.

30. And the price you paid for the local box was a box made up?—We had them made up.

31. And now you have to make them up?—Our finished box at present is costing us 1s. 2½d. We pay 1d. a box to have them put together, and we supply the nails.

32. Are you aware that the export of white-pine as returned from the Customs Department for last year was 57,330,565 ft., of a declared value of £222,914, and in view of that fact would you advocate an export duty on white-pine seeing the number of men who might be thrown out of employment?—I think the proper position to take up is to ascertain what quantity of white-pine there is in the colony, and base your decision on that.

33. In this case we are not only keeping the money in the colony, but taking the other fellow's money. It is said here that we ought not to allow Oregon to come in because it is sending money out of the colony. Do you not think the other fellows might say they ought not to allow the white-pine to come in because it is sending their money out of their countries?—We cannot be accountable for what they will do.

34. In other words, our imports for 1907 were £17,000,000, and our exports were £20,000,000. Do you not think it is a bit cool of the New-Zealander to talk about keeping the money in the colony when he wants to prohibit his timber going away and when he takes three million more?—I do not know whether my opinion is worth anything on that question.

35. *Mr. Morris.*] I suppose you feel justified in getting the best price for your butter?—We always try to do that.

36. Do you think it would be fair if the Government put an export duty on butter to prevent people paying 1s. 6d. a pound, as they did last year?—I do not think that affects the position. The price of butter is ruled by the outside market, and not by local conditions.

37. Do you not think it applies to timber too?—Yes, it does to a certain extent.

38. If there is no demand timber is cheaper?—That is right.

39. Instead of looking to our timbers for the future generation, which may not require it at all, do you not think it will be more likely in this progressive age that some substance cheaper than wood will be discovered which will be more suitable than white-pine for boxes?—It is quite possible that might take place, but it is only on account of an advanced price in the timber that will bring that about. At present there is nothing superior to white-pine.

40. *Mr. Stallworthy.*] You said it would be wise for the Government to inquire into the amount of white-pine in the colony. How many years' supply would you reserve? Supposing we have enough for the next fifty years, would you still advocate an export duty on white-pine?—You mean sufficient to supply the whole of the industry?

41. Sufficient white-pine for fifty years for the whole industry?—I do not know that it would be necessary to take any immediate steps under those conditions.

42. *Mr. Mander.*] If you held a bush of kahikatea for fifty years at 6d. per hundred, have you any idea what the value of that at 5 per cent. would be in fifty years hence?—No, I have not.

43. It would be a very large increase?—Yes.

44. Do you not think that it is legitimate that an increase should take place in the price of timber if it is held for any special purpose?—Well, it would have to. I do not see anything else for it.

45. If we could get rid of our timber now legitimately at a reasonable price, is it not probable that we may be able to put our money to as good a use as if we held the timber for fifty years?—Yes.

46. You spoke about a dairy company in New Plymouth buying a timber holding for the purpose of their business. Do you suppose the company will use the timber as they go along?—Yes, I think they will. The company I referred to is largely composed of butter and cheese factories.

47. Do you not think it legitimate that the large holdings of timber at the present time should not also be used for legitimate uses as they go along?—For legitimate uses, certainly, but at the same time I think that provision should be made so that our forests are not depleted. There is nothing to take its place.

48. I suppose you are aware there is great danger in holding timber, in consequence of fires?—Yes.

49. Do you not think it would be better to open up your country and settle it legitimately and dispose of that timber?—Well, I am not very much interested in that standpoint of the question. Of course, we are looking to our own side of the question principally.

50. *Mr. Ell.*] Looking to the needs of your industry?—Yes.

CYRIL HOLM BISS sworn and examined. (No. 52.)

1. *Hon. the Chairman.*] What are you?—District Railway Engineer.

2. Can you give the Commission any information with regard to the timbers you use?—Yes. The timber which has been used in the Maintenance Branch of the Railway Department on the Christchurch Section of the railways has been, during the year 1908—red-pine, rough, 322,000 ft., average price 13s. 6d.; red-pine, dressed, 243,000 ft., average price 16s. 6d.; kauri timber, not specified whether rough or dressed, 35,000 ft., average price £1 6s.; totara, not specified, 27,000 ft., at £1 3s. 6d.; matai, 1,100 ft., at £1 1s. We have made a rough estimate of what we shall require for the year 1909—namely, red-pine (rough), 300,000 ft.; and red-pine, dressed, 300,000 ft.; kauri, 25,000 ft.; totara, 20,000 ft.; matai, 4,000 ft.: and we anticipate a slightly higher price than that charged for 1908.

3. How much of Australian hardwood have you imported?—During the past six or seven years the quantity of Australian hardwood used for bridges has been approximately a quarter of a million superficial feet per year, the average cost of which has been £1 2s. 6d. per hundred superficial feet. Our 1909 contract, of course not yet delivered, is for 156,000 ft., at £1 4s. per hundred for hewn and £1 10s. for sawn, and 2,200 lin. ft. piles, at 2s. 6d. a foot. We also use a large quantity of hardwood sleepers on the Canterbury Section. This is all for maintenance and new works. The sleepers are not included in the 156,000 ft. The 7 ft. sleepers which we used in the year ending 31st March last were 85,345 jarrah sleepers, and the price quoted by our Stores Branch, delivered at Lyttelton, is 3s. 9d. We had a few ironbark sleepers—namely, 1,024—which were quoted at 6s. at Lyttelton, and we have used 1,720 silver-pine sleepers during the year.

4. Were those imported?—The silver-pine sleepers were brought from the West Coast. They did not arrive during this year, but had been on hand for some little time, and the price at Lyttelton was 4s. 1d. That makes the total quantity of sleepers used on this section during the year ended 31st March last 88,000. That is for the Canterbury Section, which goes as far south as the Waitaki River. The average annual consumption on that section could be put down at 70,000 sleepers. The extra quantity used during the last year was due to the fact that we had extra works, such as the duplication from Addington to Rolleston. In addition to that we imported during the year ended 31st March last 150,550 superficial feet of sawn ironbark sleepers. The cost of those was £1 2s. 9d. per hundred superficial feet. That is about all the information I am able to give you.

5. Those silver-pine sleepers from the Coast, have you used many of them?—In former years a good many were used.

6. But you have not been using so many latterly?—We have used none latterly. We have not had any during the last twelve months.

7. Did you ask for any?—No. The head of the Department settles the classes of sleepers that will be used. The district officers are not asked to make a requisition for different classes of sleepers. We say that we want so-many sleepers, but the head of the Department decides what timbers will be used.

8. So that, as far as you know, no orders have gone for West Coast sleepers?—I do not know of any that are coming from the West Coast at the present moment. Our Stores Branch would be able to answer that question.

9. Have you a creosoting plant for dealing with them here from the West Coast?—No, we do not do creosoting on this division. The creosoting is only done at Woodend, in Southland, and at Woodville, in the North Island.

10. *Mr. Ell.*] I think you told us that the jarrah sleepers cost 3s. 9d.?—That is so.

11. Have you any knowledge as to whether there has been an increase in the cost of jarrah sleepers in recent years, or not?—I cannot quote the prices from memory. I have not had a great deal to do with jarrah sleepers until the last year or two, so I could not go back any length of time.

12. With regard to any of the hardwoods that are necessary in any of the works of the Railway Department, have the prices hardened?—Yes; there has been an increase in the cost of ironbark.

13. To any extent?—I do not know that I have got the exact figures. Twenty-four shillings is the present price, and I think we have had ironbark at about £1 or 19s. 6d. within the last ten years. But that is only an impression from memory.

14. You say that you require about 70,000 sleepers a year for this section?—Yes.

15. And I think they told us in Dunedin they require about 48,000 a year. Do you know whether the Railway Department, or the officers occupying the position which you occupy, are making any provision at all with regard to the future supply of sleepers for the railway system of New Zealand?—In what way?

16. By planting or——?—No, the Railway Department are making no provision by planting, so far as I know.

17. You do not know of any special provision?—No.

18. So that at present they are entirely dependent upon importation?—Upon importation, or local timber to some extent, or possibly they depend on what the Forestry Department are doing. The Railway Department did plant years ago, but on the formation of the Forestry Department the Railway Department turned over the business to them. We have not paid any attention to the raising of timber since the formation of the Forestry Department.

19. Do you consider that sufficient provision is being made when I tell you that only 9,400 acres have been planted since the Forestry Department started operations?—Are you asking for my private opinion, or my opinion as an officer of the Railway Department?

20. Your opinion as an officer of the Department?—It is really a question for the Forestry Department. I could not hazard a guess even as to what amount of timber is expected to be got from an acre. At a rough hazard I should say it is not sufficient.

21. You are aware, I suppose, that the policy of the great American systems of railway, conducted by companies there, is to plant considerably?—Yes.

22. Notwithstanding the fact that they have vast areas of forest there even now untouched?—In certain parts of the country; but America is a very vast country compared with New Zealand. What is good provision in one part of that country might be no provision at all for another part.

23. Notwithstanding the fact that they have vast areas of forest there, they still consider it necessary to provide for plantations?—Yes, I know they are doing it.

24. Now, the railway system of Australia, of course, is growing rapidly?—Yes.

25. And there the demand for sleepers would increase year by year?—I should say so.

26. That being so, we are drawing from a supply which they will want for their own system. Do you think it is at all possible that the time may come when the price will harden further, with the constant demand?—I think that will be the tendency—for the price of hardwood to increase.

27. Do you think it would be a wise thing on the part of the Government to set to work and make provision by planting for the large demand that will be made for sleepers for our railway system in New Zealand?—I am not prepared to give a definite opinion on that subject. I think it is a little outside the province of a Government officer in my position to give an opinion on such a large question as that.

28. *Mr. Jennings.*] You have had experience of the North Island as well as the South with regard to timbers for the Department?—Yes.

29. What has your experience been of North Island sleepers that have been creosoted, as compared with jarrah and other woods?—The creosoted native timber is inferior to jarrah as a railway sleeper.

30. What is the difference in life—have you any knowledge?—We have hardly had sufficient experience for me to say. The creosoted native timber might possibly last as long as the jarrah, but it gets cut and damaged by the spikes and other fastenings very much faster than the jarrah sleeper; consequently with heavy traffic it tends to cut out very soon.

31. Have you any knowledge of what is called the Powellising process?—No. I know just a little of what they are doing in New Zealand in the way of creosoting.

32. The works have started?—I have seen the works. That is all I know about it.

33. You express the opinion that the creosoting of our New Zealand timbers does not render them equal to jarrah?—In my opinion it does not produce a sleeper equal to jarrah, considering the present price of both.

34. *Mr. Field.*] Why do you not use creosoted sleepers here?—I think it is chiefly on account of the distance we are away from the creosoting-works. All that they can put through are absorbed nearer to the works.

35. Do you know the difference between the cost here of a jarrah sleeper and the cost of a creosoted white-pine sleeper?—Not having used any creosoted sleepers for a long time, I do not know what our Stores Branch are quoting them at at present. I should say they are slightly higher in price, from what I remember, than the jarrah sleepers at their present price.

36. What is the difference in life between a hardwood sleeper and a creosoted New Zealand sleeper, putting aside wear and tear altogether—I mean, considering only climatic and other such conditions?—I should say that we have not had sufficient experience of either yet to tell you that. I think the probability is that the life of jarrah might be reckoned at thirty years on an average—that depending, of course, on the density of the traffic over the line.

37. You would not hazard an opinion as to the life of a creosoted sleeper?—No.

38. If the cost of creosoting were very much reduced, you might express a different opinion from that which you expressed just now?—Certainly. My opinion is formed taking into account the comparative price of each at present.

39. Have you heard of any new creosoting process?—The creosoting process is being modified, and experiments are being made, especially in parts of America. I have read of them, but have no personal knowledge.

40. Have you heard that under the new process the creosoting can be done with about half the quantity of creosote?—I know that processes are being modified, but I have not read the details.

41. *Mr. Leyland.*] Will you give us your opinion as to the comparative life of a puriri sleeper?—I should like to see the sleeper first—I have seen puriri and puriri.

42. What would be its length of life as compared with jarrah?—In my opinion a first-class puriri sleeper—a sleeper which I think it would be extremely difficult to get now—from what I remember would outlast jarrah in wearing qualities.

43. There is a large puriri bush open now in the North?—Puriri was scarce when I had experience of it.

44. *Mr. Morris.*] How do you think our birch timber at about 2s. a sleeper would compare with jarrah at 3s. 9d.?—My experience of birch timber for sleepers has been insufficient for me to form an opinion. We have not used any birch sleepers for a long time. I have only been in Canterbury for a year.

45. You do not know whether there is any birch now in use on the Canterbury lines?—None is being put in now. I have no doubt there are some birch sleepers left in the lines here, but I cannot give you an estimate of the number that are still left, or where they are.

46. *Mr. Jennings.*] What did you say was the life of a jarrah sleeper?—I think probably we might expect the average life of jarrah to be thirty years, except where the traffic is exceptionally heavy.

47. An architect has reported to the West Australian Government that the average life of an American oak sleeper in the States is from six to seven years, and creosoting makes it much longer, while the life of such a sleeper as ironbark is from fifteen to twenty years?—I still think that jarrah sleepers will last thirty years where the traffic is light.

HAROLD LIGHTBAND sworn and examined. (No. 53.)

1. *Hon. the Chairman.*] You can give us some information with regard to creosoting, I understand?—Yes. I have information with regard to the Rueping process, which is at present being used very largely by the railway companies in America for creosoting their sleepers and also their constructional timbers.

2. Will you tell the Commission shortly about the process and improvements?—The advantage of the Rueping process lies chiefly in the lesser consumption of creosote and a more thorough impregnation of the timber treated. Thus, by the old method an ordinary railroad-sleeper, 7 ft. by 8 in. by 5 in., equalling nearly 2 cub. ft., absorbs about 2½ gallons of creosote, while by the Rueping process a more thorough penetration would be obtained, with naturally more efficient preservation of the timber treated, and only 1 gallon of creosote would be finally retained in the sleeper, showing a saving of 60 per cent. in the quantity of creosote absorbed. Based on the consumption of creosoted sleepers by the New Zealand Government in 1905, stated as being 120,000 annually, absorbing 2½ gallons of creosote each, equal to 300,000 gallons, by the old method, a saving of 180,000 gallons per annum would be effected by using the Rueping process, equal to £5,625 per annum in cost of creosote alone. Then there is another feature that comes into the question, and that is the cost of creosote of approved quality. I am advised from America, where nearly the whole output of creosote for the world is handled, that creosote is quoted in Europe at the present time at 2¾d. to 3d. per gallon net, the estimated outside cost landed in New Zealand in bulk or barrels being 5d. per gallon. At this price for creosote, based on practical experience of treating by this process in America, the cost per sleeper would be approximately as follows: One gallon of cresote, 5d.; mechanical part of impregnation, wages, &c., at most 2d.: making a total of 7d. per sleeper for material and labour. There is another feature which I can illustrate by samples of New Zealand timbers and a small section of American timber, and these are very much in favour of this process as against the old processes. As already stated, 2½ gallons are absorbed by about 2 cub. ft. of timber, and none of that is taken out—that is absorbed by the timber. The consequence is that the timber is in a very stodgy and dirty condition for handling. By this process the creosote is extracted from the timber again—that is, all the creosote that is not necessary for thoroughly impregnating the cells of the timber is forced out of the timber again, leaving only just as much as is required for thoroughly preserving the timber. The consequence is that you get a timber in the condition of this sample. [Sample produced.] That is American pine. It is a section of a cross-arm of a telegraph-pole.

3. *Mr. Jennings.*] How long is it since that was treated?—I should say about six months. Here are some sections of New Zealand timbers, which I sent to my principals in New York for the purpose of having them treated in order to test the effect of creosoting on the principal timbers used here. I have here a piece of rimu and a piece of white-pine. These are the untreated sections which I retained. [Samples produced.] This will serve to show the thoroughness of the impregnation and the desirable condition of the timber after it has been treated. Here is a piece of honeysuckle [produced] which has been thoroughly impregnated, and it takes a polish very readily. From the condition of the timber after it has been treated by the Rueping process the field of use is very much widened as against the old method of saturating the timber with creosote, which was not only expensive, but was very much less desirable, inasmuch as the timber could only be used for very rough work or work that was half buried. It was impossible to use it for any exposed work that would be likely to be come into contact with by persons or other agents. Now it can be used not only for railway sleepers, but for bridge-work, culverts, telegraph poles and cross-arms,

marine piling and wharfing, mining purposes, fencing, street-paving, and all classes of rough buildings such as goods-sheds, grain-stores, stables, factories; and the framing of dwelling-houses. It is already known to the Commission, I suppose, that creosoting renders timber not only impervious to rot, but also to the attacks of any wood-destroying insects, such as the white-pine borer. To show the effect of the introduction of this process in America, probably one of the greatest railroad countries in the world, I might mention that during the last four or five years this business grew to such an extent that last year there were over 10,000,000 sleepers creosoted and put into use by the railway companies there. During the examination of the last witness the question arose as to the length of life of a creosoted sleeper. There is one small paragraph in this report which I hold in my hand in which they give the result of a test in France, and they say that after twenty-one years of use of creosoted timbers, only 6 per cent. of them required to be taken up, the balance being still in good condition. So that even then it was not fully proved what time they would last. They simply say, "We will mention in addition the fact that on certain railways, within a space of twenty-one years, only 6 per cent. out of all beech-wood railway ties which had been impregnated with tar-oil had to be exchanged. This should be the best testimony for the superiority of the tar-oil impregnation." That timber was not treated by this process, but by the old processes at a very much greater expense.

4. Were those softwood sleepers that are referred to in that quotation?—It was beech wood, which is a soft wood. In America they are using all softwood, such as short-leaf pine.

5. *Mr. Mander.*] Do you find that the softwood sleepers wear out by the dogs cutting in?—No. The American companies could get hardwood, but have adopted the creosoted softwoods on the score of economy generally. They, by their adoption of it, I think, have undoubtedly put the stamp of commercial utility on the thing. I have a good deal of other information in reference to this matter, but it would take too much time to give it to you. I have all the departmental reports from the United States Government Forest Service, and they go into the matter thoroughly of railway ties and the effects of the spikes and the wear generally; but that is too long a matter for you gentlemen to listen to now.

6. *Mr. Field.*] Could you leave those pamphlets with us?—Yes, I will do so with pleasure. Of course, this matter could be thoroughly tested by sending to America, where there are a number of plants at work, and getting our own timbers creosoted there; that I can get done easily, and there is little doubt of the rot-proofness of it. Creosoted ties have already been tested in France for twenty-one years, and in some countries even longer than that.

7. *Hon. the Chairman.*] You have not alluded to the life of creosoted timber in America. I take it that the principal information you can give us to-day is derived from America?—Yes.

8. You have not given us the life of any creosoted timber in America?—That has not been proved because it has not been in vogue a sufficient length of time to test it. It has been longer in vogue in France than in America, and also on the German railways.

9. Do you represent any syndicate?—I am the representative of Messrs. Lembcke and Co., of New York, who own the Australasian rights for this process.

GEORGE EDWARD RICHARDSON, Manager, Railway Workshops, Addington, sworn and examined.
(No. 54.)

1. *Hon. the Chairman.*] You are manager at the railway workshops at Addington?—Yes.

2. Can you give us any evidence concerning matters coming within the scope of this inquiry?—I can give evidence concerning the amount of timber we use, the class of timber, and the price we pay for it. We use kauri, rimu, and totara.

3. What are the quantities?—Of kauri and rimu for repair-work for the year our consumption is about 20,000 ft. for carriages and wagons.

4. What proportion will rimu bear to the amount of kauri you use?—Roughly speaking, about seventy-five per cent. of it is kauri.

5. For new carriage-work what was the average consumption for the last five years?—A hundred thousand feet, of which 75,000 ft. was kauri and 25,000 ft. rimu.

6. Has it increased or decreased during that time?—Last year we used very little. It all depends upon our orders. We have had practically no orders for new carriages recently.

7. Then, you have been making no new carriages?—No, there has been very little carriage-work this year. The timbers I have mentioned are our principal timbers. We also use totara and teak.

8. What do you use totara for?—For beading windows, for carriages, and for the flooring of sheep-trucks. Teak we use for window-sashes, and we use jarrah for wagons. In some classes of wagons lately we build them of jarrah right through.

9. Would not rimu be good enough for the boxing of the wagons—that is, the top boxing?—Oh, yes!

10. What proportion does the price of rimu bear to the price of jarrah?—Our price for rimu is 13s. 8d., and the price for jarrah is from 19s. to £1.

11. Can you tell the Commission anything in regard to the life of rimu as against jarrah?—We have used about 360,000 ft. of jarrah. We have only used it for the last eighteen months. As to the difference of life between jarrah and rimu I am not in a position to state. We have not used jarrah long enough.

12. *Mr. Ell.*] You say you pay 13s. 8d. for rimu per hundred feet?—Yes.

13. Is that ordinary building-timber, or is it of higher quality?—It is rough timber.

14. What quality?—Best quality.

15. We had a witness here who told us yesterday that he bought his timber for 13s. 6d.?—Our specification states all heart, but I am not quite clear on that point, because I do not buy the timber. It is certainly not all heart that we get.

16. It is not all heart, and yet you are paying top price?—No, it is not top price.

17. You require about 100,000 ft. a year?—Yes.

18. Are all the carriages built here?—I am only speaking of the Addington Workshops. We sometimes prepare the timber for other sections.

19. The timber required for the various workshops would be very considerable?—Yes. Petone built about sixty carriages during the last few years, whilst we only averaged about ten in the same time.

20. I want to ask you respecting our future needs for timber for various purposes. Would it not be wise on the part of the Government to make some provision by more extensive planting; and until such time as these trees mature would it not be desirable to have certain reservations secured for our needs in the meantime?—I think that some provision should be made.

21. You do not know of any special provision just now?—No.

22. *Mr. Hanan.*] Would it not be desirable for the Government to have timber reserves, and cut timber for their Departments?—I cannot answer that question, as I regard it as a matter of policy. I should not care to commit myself to that, and I would rather not answer it.

23. *Mr. Leyland.*] Have you any difficulty in getting your orders executed for your kauri-supply?—Yes, long lengths and short lengths as well.

24. Are you aware that the Railway Storekeeper has had to cancel orders for some millions in Auckland?—Yes. I experienced trouble at Newmarket.

25. Considering that Oregon is very largely taking the place of kauri for rough purposes in Auckland and elsewhere in the Dominion, although for some purposes kauri is best suited, do you not think it is desirable that the importation should be encouraged?—The form in which Mr. Leyland has now put the question enables me to answer it. Yes, because it would enable one to get kauri-supplies easier, and if that would be the case I should be in favour of the importation of Oregon.

26. *Mr. Morris.*] Is there any other of our native timbers that could take the place of kauri?—Not for carriage-building.

27. You consider that Oregon is a good substitute for it?—Yes. For framework it is very good. We have found no other native timber to take the place of kauri.

28. *Mr. Arnold.*] Do you know from what part of the Dominion your timbers come?—It is only by chance that we do know. I think a good deal of our rimu comes from the West Coast.

29. Do you get any from Southland?—I could not say.

30. Do you know anything about New Zealand bush country?—Not to speak authoritatively.

31. What do you mean exactly when you say that you think it desirable that the Government should reserve certain bush areas?—To provide timber for the future.

32. Do you mean, in bush where there are large trees now suitable for felling, that that bush should be reserved?—No, I do not mean that.

33. Do you mean that, if there are areas of bush where there is not suitable timber, that should be reserved?—No, I do not.

34. What are we to understand exactly?—Mr. Ell asked me whether I thought the Government should plant; and I said "Yes; and reserve the native timber until such time as they had matured."

35. You have no idea as to whether it is likely that there are areas of bush land at the present moment where the whole of the trees are not matured?—I expect there are large areas of trees that are not matured.

36. You do not know of any?—Yes, between the Waimangaroa River and the Mokihinui River.

37. Is there a large area there?—I did not say a large area of native bush, but trees that to my mind are not matured.

38. With regard to planting, what trees do you suggest should be planted?—I have no opinion to offer in that direction.

39. *Mr. Stallworthy.*] Do you use much Oregon in the workshops?—Very little.

40. You do not use it regularly?—That is so.

41. *Mr. Mander.*] Is it not a fact that the Government when buying kauri timber always specify for the best quality?—I believe so.

42. If you were a miller and you found it very difficult to get rid of your inferior qualities, would you not hesitate in selling the better qualities to the Government?—From a miller's point of view I think that would be a reasonable position to take up.

43. Do you not suppose that that accounts for the difficulty in the Government getting first-class timber?—I think it has got a deal to do with it.

ERNEST WEBSTER WALLER sworn and examined. (No. 55.)

1. *Hon. the Chairman.*] You are in business here, Mr. Waller?—Yes. I am a member of the firm of John Waller and Sons (Limited), timber-merchants, Christchurch.

2. How long have you been in business?—Thirty years.

3. Are you a member of the Timber-merchants' Association?—Yes.

4. I understand that you offered to make a statement to the Commission. Will you please do so in your own way?—Yes. I will make a short statement, and shall then be prepared to answer any questions. As I have stated, I am a member of the Timber-merchants' Association, and have been a member since it started. There have been a large number of attacks made on the Christchurch timber-merchants by certain newspapers, and in letters in the newspapers. Our association have not replied to these attacks, with the exception of writing to the paper, pointing out that we were willing to appear before the Commission in Christchurch, and anything the Commission wished to

know we would let them know. I take it that as timber-merchants we are not expected to go through the Court periodically, as has been suggested, but are supposed to have a fair return for the capital invested in the business. Whatever the finding of this Commission may be, the fact will remain that if we could not get a fair return for our capital we should have to leave the business. We as timber-merchants are prepared to show the Commission that we are getting nothing more than a fair return. Our prices show that. With regard to the price-list, there are one or two things I should like to speak about. In the first place, concerning kauri. Some time back we sent a letter to the paper, showing the exact cost of kauri to us as timber-merchants, and the price we were selling it at. That letter applies exactly to the present position, with the following exceptions: The cost of kauri when we wrote the letter was 17s. a hundred; it is now 18s. 6d and 19s. The next item that has been altered is freight. It was then 2s. 9d.; it is now 3s. The cost of carting was 4d; it is now slightly more than that. And, of course, our selling-price has gone up correspondingly. We have heard a good deal about the cutting of kauri in winter or summer. I do not profess to know anything about that; but it is essential that we should get as large a supply as possible into our yards in the winter months. For my part, I would prefer to lose the interest on the money than not to get the kauri in in the winter, because the interest on the money invested in the kauri is not such a large item as the waste that is occasioned through getting the kauri in in the summer. If we got a cargo of kauri into our yards when the north-westers were blowing, we might lose more in a week than possibly we should make out of the timber. For this reason the firm I represent gave an order the other day for 80,000 ft. or 90,000 ft., in order to get it in in the winter months. With regard to red-pine, the other timber-merchants who have been before you have told you the exact cost to us, and we defy anybody to show it is not that. And the same with our selling-price. As to the 2s. a hundred that we charge extra for seasoned timber, after thirty years' experience I can safely say that never in the history of the timber trade in Christchurch has the standard of timber required by the builders and private people been so high as it is at present. It is very high. After we timber-merchants get our timber seasoned we have to pick out a big proportion of it, which we have to sell as a lower quality of timber. If you gentlemen will come down to our yard I will prove this statement up to the hilt. A gentleman who gave evidence yesterday was asked whether he always got dry timber from the merchants, and he said "No." He was asked, "What do you do, then?" and he said, "I send it back." That is about the position. Competition is so keen that if a merchant cannot supply a man's orders he loses the custom. That is the position. With regard to expenses, our experience is that the whole of our expenses are continually creeping up—labour and everything else. I am saying nothing about the work of the men, but the requirements of the trade are such now that more men are required to keep the yards going. The labour is greater. This I am prepared to prove.

5. *Mr. Ell.*] With regard to kauri, you say that you lose a good deal if you do your seasoning in summer-time?—Yes. I wish to explain that, in this way: if we get the timber in the winter-time it seasons so much slower, consequently we do not lose so much in waste, though, of course, the interest is running on the whole time. If we can get the kauri in in the winter-time we prefer to do so.

6. With regard to this Jarrah Timber Company—I want to tell you what I have heard, and you can tell me whether it is true or not. I am told that the Jarrah Timber Company imports all the jarrah into this town, and also the Oregon, and that the different timber-merchants interested in the company draw their supplies from the Jarrah Timber Company's yard, and that the members of the Timber-merchants' Association are members of the Jarrah Timber Company. Is that so, or not?—I will tell you the exact position. The Jarrah Timber Company is a private firm. There are three or four timber-merchants in Christchurch who are members of that company; but, as far as the company is concerned, it has absolutely nothing to do with the Timber-merchants' Association. With regard to Oregon, the Jarrah Timber Company are not the only importers of Oregon.

7. Can you tell me whether it is true, as reported, with regard to the Jarrah Timber Company, that jarrah could be obtained much cheaper—1s. or 1s. 6d. a hundred cheaper—before the local company took the business over than it could be obtained directly the company had taken it over and made an alteration in price?—The only increase that has been made since the company took the business over is about 1s. a hundred. I am speaking now as a member of the company. The price charged for jarrah is, I maintain, absolutely fair. It is impossible to sell it for any less.

8. *Mr. Hanan.*] Do you anticipate an increase in the prices of timber, or a drop?—I cannot say that I anticipate either. I think timber will remain about the same as it is at present.

9. *Mr. Field.*] You said that the timber-merchants' prices were reasonable and did not give more than a fair margin of profit. Do you know anything about the millers' prices—whether the same can be said of them?—The company I represent is interested in a mill on the Coast; we have a half-share in it. Our experience of sawmilling during the last few years has been very bad. I do not think timber can be cut for a lower rate than at present obtains to make it pay.

10. Speaking generally, what profit are you getting per hundred feet, over and above the cost of production—what are the millers getting?—Speaking from our experience of the last two years, we have made nothing from the sawmill.

11. Absolutely nothing?—Absolutely nothing. I do not say it is impossible to make anything at the price, of course, or we should stop; but I maintain that timber cannot be cut for less money. I may add that I am a timber-merchant, not a sawmiller, and do not speak as a great expert on sawmilling.

12. We have heard that there is some sort of combination between the merchants and the builders, and between the millers and the merchants. Can you tell us anything about that?—With regard to the Timber-merchants' Association and the builders, there is no arrangement or

combination of any sort. The practice of the association now is to allow 5 per cent. discount to any man making his living by the use of timber; then we allow 2½ per cent. as a cash discount to any one, either builder or public, off our prices. There are no other rebates or anything of the kind connected with the building trade.

13. Is there not some understanding between the timber-merchants and the West Coast millers that the Christchurch merchants shall take their timber?—The Christchurch Timber-merchants' Association get their supplies from the West Coast Sawmillers' Association, and also from outside mills. A timber-merchant doing a large business must have an absolutely certain way of getting his timber, and be able to rely on getting all his orders executed in good time, so that there may be no trouble. There has been a good deal said about the difficulty in getting timber. As far as I am concerned, I have not experienced it. I think that any orders we have had on our books we have executed promptly. Of course, we have put ourselves in the position of being able to do so.

14. Do you mean to say positively that in this so-called combination or understanding there is nothing at all harmful to the consuming public—the people who use timber?—Certainly there is not—nothing whatever.

15. So far as the timber-merchants are concerned, are they a necessary evil, or would it be possible for the builder or the consumer to get his timber direct from the mill? Would he lose or gain by so doing?—Our experience through many years of trade since we have had a fixed price-list is that we have held our business together. I think you will find that the builders in Christchurch, or the larger proportion of them, will tell you that it is better for them to stick to a responsible timber-merchant. We have placed ourselves in this position: we are timber-merchants; whatever a man likes to order we will supply; we will take the risk of supplying it. If we have not got it ourselves, we purchase it.

16. By that means the builder, I suppose, is saved from keeping stocks, whereas you have to keep large stocks?—That is so. I should like to point out to the members of the Commission that we quote for special truck orders. In our list we quote for red-pine, 10,000 ft. or upwards, sawn timber not suitable for dressing, 12s. 6d.; and timber suitable for dressing, 14s. 3d.

17. *Mr. Barber.*] Is that net?—There is 2½ per cent. discount for cash—no 5 per cent. discount. To any builder or other person who wishes to stock 10,000 ft., that is the price.

18. *Mr. Field.*] In selling ordinary smaller lines, what, roughly speaking, must you get in order to allow yourself a profit? What do you get per hundred feet over and above what it costs to buy?—A statement of the actual cost was put in yesterday.

19. I thought you would have the amount in your mind?—I could work it out.

20. It has been estimated that the timber-merchant wants to get from 2s. 2d. to 2s. 3d.?—If I could get that profit and sell the timber as it came in, I should be prepared to close the yard.

21. Things being as they are, and a merchant having to keep large stocks, and pay rates, and rents, and wages, and so forth, what ought you to get in order to give you a fair profit?—I could not say roughly like that. It would depend altogether on different items. On some lines a good deal more profit must be made than on others. Take, for instance, skirting. Directly you get a split in a 12 in. skirting-board it is a dead loss.

22. But, taking all these things into consideration, what ought you to get?—I will say this, that the gross profit of the firm I represent was last year between 15 and 16 per cent. Out of that we have to pay all rents, taxes, rates, labour, office expenses, bad debts, and everything connected with the business. I can assure you one has to be pretty careful to make a profit.

23. We have heard that of all the timber-merchants in this city only one man has gone out of business—in recent times, I presume that is. Does that indicate that all the rest are making large profits?—With regard to that particular business, I may say that the stock was sold to anybody who liked to buy it, and the land also was sold. I do not think there was any question of trying to sell the business as a going concern at all. They simply retired from business. If it had been a good business, I take it the owners would have been able to dispose of it.

24. Was the firm in the position of having to waste a lot of machinery?—It was a timber-business pure and simple.

25. As long as they got rid of the stock they could easily get rid of the premises?—Yes.

26. There was not a large sum invested in machinery?—No.

27. Where you have a large sum of money invested in machinery, that makes it all the more difficult to get out of business, I suppose?—Yes. There is one thing I should like to say with regard to the question of red-pine or Oregon. I am speaking now as a timber-merchant. My firm sell Oregon or red-pine, and, as far as we are concerned, provided we get our profit, we do not care whether we sell Oregon or red-pine. We have a half-share in a sawmill, but it is a small thing compared with our business. But the position is with regard to red-pine, that we have to purchase the whole output of marketable timber; and when we bring this timber into our yards it may be 50 per cent. dressing-lines, and the remainder ordinary building-timber. Under old circumstances—before the Oregon came in—we were in the position of being able to deal with this timber—to sell it all. Now the Oregon has come into the market, it has taken the place of the ordinary building red-pine, and we are now called on to supply the better class only of red-pine in greater proportion than ordinary building. Consequently our yards are becoming stacked up with the ordinary building-rimu. We have got, I suppose, a couple of hundred thousand feet of ordinary scantlings in our yard which we have to stack. Of course, it is partly on account of the dullness of trade. As to the quantity of Oregon that has come into the market, we have a large stock of Oregon. I admit that the quantity coming in is not very large, but I think it is a growing business. The Oregon is becoming fashionable. A lot of witnesses have told you that they consider Oregon better for ordinary building purposes than red-pine. At the present time we are supplying, I think, five jobs with Oregon scantling, and the better class of red-pine for the finishing-timber.

28. Does this apply, in a greater or lesser degree, to other merchants also?—I think it must.

29. Assuming this state of affairs is as widespread as you indicate, what are you going to say presently to the millers?—I suppose that if we cannot sell the other timber, the millers will have to find some way of giving us just what we want.

30. And you told us just now that the millers cannot mill at a lower price than they are charging now?—I was trying to persuade one of our customers to use red-pine instead of Oregon, and he said, "Your trade is something like a butcher's: he buys a sheep, and if every one wants only legs and hind quarters he must either charge a great deal more for them or get rid of the other parts in some way." It must necessarily make the price high. I have nothing at all against the importation of Oregon, provided we could get the better red-pine without the inferior.

31. That is the difficulty—you can get rid of the finer class of rimu, but the rough stuff is stacking up in your yard?—That is so.

32. Heart of rimu with the resin in it, and our rough rimu generally, is not bad stuff for framing, is it?—I am not a builder; I am a timber-merchant.

33. But if a builder is careful in the selection of his timber, need it warp or twist to any extent?—The builders have managed to get along with it all right so far. As far as I personally am concerned, within the last ten years I have had two houses built for myself, and I can see nothing wrong with those. I listened with very great pleasure to Mr. Seager's evidence the other day. He said that the lifetime of a house built of unseasoned red-pine was ten years; but, unfortunately for us, these houses are not falling down at the end of ten years.

34. Tell us something about seasoning. Would you be frightened to put up a house with timber that was not absolutely and completely seasoned, and rely on its seasoning with the air that got round it while the house was being built?—With ordinary red-pine, for the rough studding and joists, and that sort of thing, the majority of builders like to get it nice and fresh, because it is straighter; and I think that all the seasoning that is necessary it gets before the house is properly covered in.

35. We have heard that it takes nine months to season timber—that it ought to be stacked for nine months?—Our experience as timber-merchants is that if we have scantling in the yard that has been stacked and stuff that is wet, the majority of people take the wet for preference. I should like to say, with regard to the seasoning of timber, that at present we practically supply the dressed lines—that is, weatherboards, match lining, flooring, architraves, &c.—ready for the builder to put into the job; and if it comes to a question as to whether or not we send the material out before it is seasoned—why, the competition in Christchurch is quite keen enough now to make a timber-merchant careful he does send seasoned timber.

36. You say that anybody building a house can get the timber seasoned if he wants it: is that so?—With anything in the way of an ordinary dwellinghouse, if a man wants seasoned timber he can get it out of the Christchurch yards. If it were a large warehouse, some of the stuff would require to be ordered, probably.

37. We were told by one witness that timber has gone up in about ten years from 9s. 6d. to 14s. 6d. a hundred?—I have the prices here. In 1899—ten years ago—ordinary building red-pine was 11s. 6d. in Christchurch, and that carried discounts of 5 per cent. and 2½ per cent. Now it is 14s. 6d.

38. It has gone up 3s. in ten years?—That is so.

39. Each of these prices is subject to discount?—I think so. My list with the discount mentioned on it only goes back to 1900. At any rate, in 1900—nine years ago—the price was 12s. 6d., and that was subject to the 2½ per cent. and 5 per cent. discounts.

40. You say you are supplying timber for four or five jobs now. Is all the framing of those jobs Oregon?—I do not think quite all, but it is mostly Oregon. We have one order for, I think, a Government institution, for 20,000 ft. of Oregon, which we are getting direct.

41. Has there been any serious complaint in this city about the price you charge for timber?—No. About all the complaints I have heard have been through the newspapers. There have been letters in the newspapers.

42. Can you assure the Commission that there has been no combination between millers and timber-merchants or between merchants and builders that has been at all harmful to the users of timber in Christchurch?—Certainly there has not.

43. If there is anything you have forgotten to tell us, you might mention it now?—There has been absolutely nothing between the builders and the sawmillers and the Merchants' Association that has been injurious to the public of Christchurch.

44. *Mr. Leyland.*] Have you any investments outside of your own business?—I am trustee for my father's estate, which has investments that I have to look after.

45. Have you any objection to telling the Commission whether those investments are less or more profitable than the investment of your money in your own business?—They are more profitable at present—investments in trading concerns.

46. With reference to Oregon, I understand that the timber-merchants here are selling Oregon at a very small margin of profit indeed; is that so?—Yes. It is too low, in my opinion.

47. The amount of Oregon that has been imported into Christchurch—does that include the quantity held in stocks as well as that which has gone into consumption?—It must.

48. The point is this, that it does not follow that the quantity imported has gone into consumption?—No; but the Oregon, in my opinion, is at present the fashionable timber, and the demand for it is growing at the expense of red-pine.

49. Can you tell me if Oregon is increasing in price? If you wish to buy Oregon to-day, have you to pay more when the shipments come to hand?—I believe it is increasing in price.

50. If that is so, will it not, very shortly, be unlikely to compete with red-pine for use in framing, owing to the cost? You will have to raise the price of Oregon if you pay more for it?—The price will have to be raised, certainly.

51. As a matter of fact, is it not true that very few orders are going forward now for Oregon?—That I cannot say. I do not know.

52. Did you see a letter in the *Lyttelton Times* this morning from the captain of the "Den of Ruthven," a timber-ship that comes here with Oregon? He says that he will have only about 500,000 ft. of timber to load, that the Canadian mills are getting more orders than they can possibly supply, and that the New Zealand market is pretty well filled up at present?—He states that, and he also states that the boat is trying to get a further subsidy. They are bringing Oregon over here in subsidised boats. The position is this: Oregon will, in my opinion, require to be 2s. a hundred feet more than red-pine.

53. *Mr. Clarke.*] With regard to seasoning, you say that you have no difficulty in filling orders for seasoned timber. Has that been so during the past three or four years, when things were busy? Were you at that time able to fill all orders for seasoned timber fully and properly and without trouble?—Yes, I can safely say that for more than the last three or four years any orders that have been intrusted to us I would guarantee to supply.

54. And they have been supplied in properly seasoned timber?—Yes, to satisfy our customers.

55. With reference to price, you said it had gone up 3s. in ten years. Do you say that that represents the whole increase in the price of timber over the last ten years? Were those extra prices for extra widths and extra lengths charged at that time?—The extra prices for lengths and widths have always been charged.

56. Were they charged the same ten years ago as now?—I could not say without looking it up.

57. Then, you could not say whether timber has gone up 3s. a hundred?—The basis of the timber has gone up 3s. The other things would follow in proportion.

58. With regard to profit, you said—as far as I remember—that all the millers wanted was a fair return. What is a fair return?—On the money invested in our concern, if we could get 7 per cent. we should be thoroughly well satisfied, as things are.

59. *Mr. Morris.*] With reference to the question of jarrah: when the Jarrah Company first established offices here they sold the timber at a very low price to introduce it to a new market, did they not?—Yes.

60. At practically below cost-price?—That I do not know.

61. You have not been able to make any profit?—For the last two years I said we had made no profit from our West Coast sawmill.

62. Do you know from your experience whether millers can supply builders with their requirements, doing without the merchant altogether?—I should be quite willing to show the Commission our day-books for a month's sales. I do not think they would think the millers able to supply builders' requirements.

63. You do not think it possible for the millers to supply the builders direct?—Certainly I do not. They could not do it.

64. *Mr. Barber.*] You said that your experience was that builders came to you and preferred wet scantling to dry scantling?—We get orders on our books for scantling, and if we send out the wet we shall have fewer complaints than if we send out the dry. I do not think the wet is so good, myself.

65. The evidence given by the president of the Builders' Association yesterday was in the contrary direction. Do you consider him a better authority on building than yourself, who have had no experience in building?—I should say he is.

66. A better authority as to the suitability of particular timbers for a builder?—Certainly.

67. You stated that the gross profit for your timber-yard was between 15 and 16 per cent.?—That is so.

68. How do you arrive at the gross profit? What do you mean by "gross profit"?—A gross profit is a profit made between the cost of a thing and the price you sell it at, and all expenses are deducted from that to get the net profit.

69. The expenses have all to be paid out of this percentage?—Yes. All labour has to come out of it.

70. What other charges?—Rates, taxes, bad debts, all sundry expenses.

71. If that is all you pay out of it, it is not really a gross profit, and it is not a net profit. You pay something out of it, but not everything?—The books of our company are audited by a public auditor, and I can ask him to give evidence if members of the Commission wish it.

72. I want to know what this gross profit is. Is it just the difference between the bare cost of the timber delivered in your yard and the selling-price?—Yes.

73. At what price is the timber charged to you from the mill in which you have a half-interest?—We charge it from the mill at the price ruling at the time.

74. But what is the price?—The same as we are paying now—6s. 9d. and 8s. 6d.

75. And there is no profit from that mill at all?—For the last two years there has been no profit.

76. The other part-owners are running the mill without receiving anything at all?—That is so, for the last two years.

77. According to that, the price of timber must be invoiced to your timber-yards at too low a rate?—We do not like working for nothing. You understand that? We are hoping for better things.

78. You say that times have been very bad in the timber trade in Christchurch: do you think the timber business has suffered any worse than kindred industries, such as the boot trade or the woollen trade?—I think it has. I think, looking at it from a common-sense point of view, that a man, before he starts to build a new house, has to clothe his family and buy everything that is necessary.

79. *Hon. the Chairman.*] He can leave building a new house till better times?—Yes. I maintain that when things get bad, the first business to suffer is building.

80. *Mr. Barber.*] You do think that the timber trade has felt the depression more than the boot trade or the woollen trade?—I know nothing about the boot or the woollen trades, but I certainly think, looking at it generally, that the timber trade must feel the depression worse.

81. Is your company a public company?—No, a private company.

82. Are there any public companies carrying on a timber business in Christchurch?—I do not think so.

83. Have you any idea of the value of their shares?—No.

84. Are their shares quoted at all?—No, I do not think so.

85. With regard to jarrah, what is the price charged in Christchurch for it?—I have not got the list with me, but I think it is £1 2s., basis. Previous to that it was £1 1s. There is a 1s. rise.

86. How long ago is it since this rise took place?—One rise in jarrah before the present Jarrah Company had anything to do with it. There has been a rise of 1s.

87. When did the Jarrah Company take it over?—About twelve months ago, and there has been about 1s. rise since then.

88. *Mr. Arnold.*] Did I understand you to say that your association favoured an import duty on Oregon?—No. I certainly did not say that. I favour a duty, personally.

89. You said that there was no understanding between your association and the Builders' Association?—That is so.

90. Do you know that the Builders' Association has recently passed two resolutions with regard to the duties on Oregon?—Well, I heard it stated so here this morning.

91. Do you know that it is suggested that the second resolution was passed in consequence of pressure being brought to bear, either by the merchants or by the sawmillers? Do you say that the merchants did not bring any such pressure to bear?—I say this: that the merchants have never approached the builders in any shape or form, and I attend every meeting, and I am likely to know. There is absolutely nothing in it.

92. *Mr. Stallworthy.*] When the freights went from 2s. 9d. to 3s., did the price go up?—I cannot tell you the exact time the price went up.

93. Did the merchants bear that loss?—I do not think so. My list only goes back to October, 1900.

94. You have no recollection?—No.

95. When freights go up 3d. per hundred has it been the practice to advance the price of timber 1s. per hundred?—It has not been the practice.

96. *Mr. Mander.*] Can you buy Oregon now as cheaply as you could a few months ago?—I do not think so.

97. That accounts for you putting the price up?—I do not think the price has been put up.

98. I understood it had gone up by 1s. recently?—(No answer.)

99. *Mr. Ell.*] Are you a manufacturer?—No, nothing at all.

100. *Mr. Hanan.*] When did you have your best year for profits?—The Exhibition year.

101. Take the following year?—I cannot tell you from memory.

102. Have you got your balance-sheet, and when did you balance last?—At the end of September last year.

103. Did you show a loss or a profit?—The balance-sheet showed a profit.

104. *Mr. Ell.*] There seems to be some misunderstanding with regard to the question that I put this morning. I asked the question as to whether any timber-merchants had gone out of business, and that was misunderstood by Mr. Field. My object in asking the question was this: Mr. Jacques stated that the price of rough building-timber had gone down from 16s. to 14s. 6d., and I very properly asked if the timber-merchants were able to carry on successfully with the lowered price, and since then had any merchants gone out of business, or were they able to carry on?—I did not have that impression. You simply asked me if they had gone out of business, and I said "Yes, one had."

W. Cook, Timber-merchant, Christchurch, sworn and examined. (No. 56)

1. *Hon. the Chairman.*] Can you give us some information with regard to your business in the timber line?—I am practically not in the timber line.

2. You are down here as a timber-merchant?—My business consists practically of freights only—that is, shipping.

3. You do not retail?—No.

4. Do you take orders from builders?—Practically none.

5. How do you get the trade of shipping?—Most of my cargoes are disposed of to the merchants.

6. You are agent from the mills to the merchant?—Yes.

7. If a merchant applied to you for a certain quantity and class of timber you would forward the order to the mill?—I would forward the order to the mill and deliver the timber. I have three vesesls of my own; otherwise I should not be in the trade, and I should leave the trade entirely.

8. You do not think, then, that it would pay you to purchase vesels for the purpose of starting the trade?—I should be very pleased to sell my vessels to any gentleman at the table.

9. At a profit?—No, you can take them over at valuation.

10. *Mr. Stallworthy.*] They trade to Greymouth, Kaipara, and Westport?—Yes.

11. *Hon. the Chairman.*] What class of timber do you get from Kaipara?—Kauri, totara, rimu, and matai.

12. Then you can get rimu and matai from the Coast?—Rimu from Westport and Greymouth.

13. About how much rimu and matai have you brought from Kaipara during the last two years?—From Kaipara, well, without looking at the books I could not quite tell you, but probably one-half of my cargoes.

14. The other half would be totara and kauri?—Yes, totara and kauri.

15. So that there is only about as much totara and kauri combined as rimu and matai?—Yes, that is so for the last twelve months.

16. Are you confined altogether to rimu from the Coast?—Yes, together with white-pine.

17. What is about the freight from Kaipara here on timber?—Three shillings on kauri, 3s. on rimu, and 3s. 3d. on matai and totara.

18. You land it at Lyttelton, and there will be railage on it from there to the yards, but you do not enter into that?—Sometimes I do.

19. Then, you deliver anywhere?—Yes, whatever suits the merchant.

20. *Mr. Hanan.*] How long have you been trading with your boats?—Not quite a lifetime—twenty-six years.

21. When did you find the trade with the Coast falling off?—Two years ago, fully.

22. Was that due to competition, or was it due to there not being the orders?—It was due to the tightness of the money-market.

23. Not due to the importation of Oregon?—No, sir, none whatever.

24. Do you have any competition, Mr. Cook?—Yes, there is always competition in all classes of business. Any man who has a vessel can compete with me. There is no ring whatever.

25. Who brings the majority of the stuff?—The Union Steamship Company.

26. Do you find it difficult to compete against them?—No, it is the same freight.

27. Can you account for them getting the bulk of the orders?—I cannot fetch more than I am fetching even if I wanted to. The three vessels that I have are fully engaged, and as the merchants must get their timber shipped it comes by the Union Company; but if there were other sailers available it would come by them for the reason that the timber is landed in better order from a sailer than from a steamer owing to coaldust in the latter.

28. You say your vessels are full every time?—Yes, sir.

29. So that the quantity is not falling off?—We were shipping over-supplies in the company's vessels, but we have not done so for three months.

30. Is it increasing?—No.

31. Has it been decreasing?—It has decreased for the last two years.

32. Not from the cargoes you bring?—I was getting timber through the Union Company besides my own vessels in larger quantities.

33. Do you find it pays you?—Not always, but having the carts I have got to keep them running.

34. When did you find you were carrying timber at a loss?—Twenty years ago. It depends on the number of days the vessel takes to make the round—more days more dollars.

35. Did you say you lost money in the shipping trade during the last twenty years?—No, I did not say that, but the trade has fallen off.

36. Have the freights been lowered?—The freight was increased inside the last two years from 2s. 9d. to 3s.

37. What was the reason for that?—It could not be carried on the two-and-ninepenny basis on account of the labour laws.

38. You had to pay more for wages?—Yes.

39. Was that the chief item?—No. Under the shipping laws I have now to carry certificated officers. For instance, a schooner of 100 tons has to carry the same number of officers as the "Mararoa" that carries passengers.

40. Did the Union Company put up their freights?—Yes.

41. As a matter of fact, you are losing money by what you are doing now with your boats, is it not so?—I do not say so. It is not so, not always. It depends on the number of days the vessel makes the round voyage in.

42. On the whole the business pays?—Yes.

43. Do you sell to builders, Mr. Cook?—Unless they take a full cargo. If a builder takes a certain quantity he becomes a merchant.

44. There are no different charges on account of extra widths or lengths?—If a man orders 14 in. timber, of course he has got to pay for it in the extra price because it is above 12 in. I have to pay extra at the mills myself.

45. That difference is made at the sawmills and not at the yards?—The sawmillers get the benefit.

46. With regard to Oregon, do you import that?—Yes.

47. Will you tell the Commission what you land it here at, and what you sell it at?—I do not think I am entitled to do that.

48. The Commission is entitled to know, I think?—I do not think that is a fair question.

49. *Hon. the Chairman.*] You can please yourself?—Then I refuse point-blank.

50. *Mr. Hanan.*] You can give the answer to the Commission in committee?—Any gentleman may have it.

51. Could you not put it down in writing and hand it to the Chairman? That would do equally well. It would not be then public property in any way?—Yes, I have no objection to that if it is not made public.

Hon. the Chairman: Anything that comes to me will not be made public.

52. *Mr. Barber.*] What is the carrying-capacity of your vessels, Mr. Cook?—One hundred, eighty, and forty-eight tons respectively.

53. The price is from 3s. to 3s. 3d.?—Yes.

54. How does that compare with the carriage of Oregon?—Well, I cannot answer that question, and I will tell you why: Oregon is bought c.i.f. Lyttelton.

55. Is it not possible to land Oregon for 3s. 6d. from America?—Seeing that you make such drastic laws compelling even small vessels to carry the full complement of officers in New Zealand waters, that must enter into the rate of freight. When these laws are repealed the question might be gone into, but not otherwise.

56. Do you suffer from greater restrictions than those big liners on the Coast?—What class of vessels?

57. Any vessel—those vessels that are carrying Oregon pine?—I cannot tell you what restrictions they are under.

58. They come exactly under the same conditions as you do?—There is a vast deal of difference in a steamer carrying 5,000 tons having to be manned by first and second officers, and a schooner going to sea carrying 100 tons registered, and because she crosses 300 miles of ocean she is compelled to carry first and second officers, but if she goes 299 miles she can start with a first officer.

59. Is there no means of reducing the freights by increasing the capacity of these boats where you would have no greater restrictions?—I cannot tell you anything regarding that question.

60. *Mr. Stallworthy.*] What is the average length of your trips to the Kaipara?—Twenty-one to thirty-seven days.

61. Do you get good cargoes to Kaipara?—Yes, sir.

62. *Mr. Mander.*] Can you load your vessels half-way up the mast in coming here?—No, sir.

63. You could not put your own son as a mate, nor can you employ Chinese cooks?—Yes, I have got to pay them colonial wages.

64. The American vessels come here and run under their own rules and conditions, and are more favourably treated than you are as a Britisher?—I could not tell you that. I do not run their vessels, and I do not know.

65. *Mr. Field.*] If the American vessels were loaded up to 14 ft. above the deck, could you do so also?—No. We are resctricted to one-twentieth on deck. A vessel carrying 50,000 ft. of timber will be allowed to carry three to four thousand, if the timber is not too heavy, on deck. If you have a full cargo of kauri you would be able to bring down another five or six thousand extra on deck.

66. How deep would that be on the deck?—Probably 18 in.—that is, if you take the deck all through.

HENRY J. NIGHTINGALE, Builder, Christchurch, sworn and examined. (No. 57.)

1. *Hon. the Chairman.*] What is the nature of your business?—I am a builder.

2. We shall be glad to have some information from you regarding the building trade?—I can speak as to Oregon against rimu, and concerning the parts building-rimu is suitable for.

3. Would you tell the Commission what part of a building rimu is unsuitable for?—Yes, I think so. I think rimu is very unsuitable for any place where it is plastered over. Scantlings are always wet when you get them, and so it twists when drying, and so cracks the plaster. Another reason is that in nearly all plastered walls you will see a stain or mark opposite the stud, and it does not keep straight. These are the particular reasons why rimu is not suitable for plastered walls. Rimu is suitable for ground floors, joists, and suchlike, and for rafters and roof-timbers, where they are not long. I heard it asked to-day what would they do with this resinous rimu, and in my opinion that would do in many places for plates, and last almost as long as totara.

4. *Hon. the Chairman.*] Is resinous rimu difficult to get nails into?—Yes, it is rather difficult to get nails into, especially lining-nails, but with the larger nails it is not so difficult. There are a great many places where you do not require to put many nails into it.

ERIC GOLD SMITH further examined. (No. 58.)

1. *Hon. the Chairman.*] Have you the copies of those questions which we were asking for before?—They have all been sent in to the Commission.

2. You might state the number of mills there are on Crown lands?—There are four on Crown leases at Oxford—one of 240½ acres to Howard Bunn, another to Edward Feary of 200 acres, John Rossiter 200 acres, and Ryde Bros. 200 acres. Those are all the mills.

3. How long have these leases been in force?—I am not quite sure. They are not finished—they are let for seven years.

4. But if the timber is cut, what then?—But the timber is not cut—they are working on them.

5. The evidence we had down South is that they can cut out 200 acres in about eighteen months?—It depends on the mill.

6. How long do you think it will take to cut those out?—It will not take very long. I have not been up there. They pay 6d. a hundred royalty for birch and 9d. for pine.

7. How is the royalty estimated, by the standing bush or by the output?—By the output.

8. They pay on what they put through the mill?—Yes, and then there are splitting licenses.

9. *Mr. Ell.*] With regard to the class of timber growing upon the greater part of the area, that you say is under milling-timber?—It is principally birch. There are a few rimu, white-pine, and matai trees scattered about.

10. But not sufficient of those kinds of timber of the valuable kind to justify putting in a mill to mill it out?—No.

11. What kind of birch?—Black. There is very little of it on the high ranges, and no good for milling.

12. So that, although there is a large area, as stated in the return, it is of very little value for milling purposes?—Yes.

13. And what little rimu and totara and white-pine there is would not pay for putting a mill in?—No. You could not reckon it as milling-timber. There is a little black-birch and very little totara.

14. *Mr. Hanan.*] Do you think the areas taken up by the sawmillers should be increased or decreased?—If he cuts it out to a profitable purpose, I do not see that it would matter.

15. Do you know anything of the North Island bush?—Yes.

16. How does it compare with the milling-timber in Southland in regard to quality and quantity per acre?—There is no comparison at all with the bush in this district.

17. And the West Coast?—I do not know anything about the West Coast. I know, in the North Island there is different bush altogether. We do not see any black-birch there except in the high ranges—the bush there is principally good timber.

18. In your opinion, is it desirable that a mill should go through the bush before settlement?—Certainly, and it should be followed up with settlement.

19. Have you formed any opinion on the subject of forest-conservation?—I have not given the matter very great consideration.

20. Do you think we ought to give more consideration to forest-conservation?—I think it ought to be conserved.

21. Why have you come to that conclusion?—Because I have been in the North Island and seen so many valuable bushes burned. I have been all over Hawke's Bay, Gisborne, and Moutoa districts. If a mill went through first you could cut all the valuable timber out, and you would not be at such a loss.

22. *Mr. Ell.*] You mean burnt in course of settlement?—Yes.

23. *Mr. Hanan.*] Can you suggest any place where we could establish State forests?—I think the matter has been taken in hand so exhaustively that they are conserving forests as much as they can.

24. Are there any particular classes of trees that you would suggest?—Well, the forests are all so mixed. There is hardly a place where you can get a forest, say, of rimu. There are white-pine forests, but the average bush in the North is so mixed.

25. *Mr. Jennings.*] Can you remember the amount of bush that was destroyed in Dannevirke by accidental fires: do you remember the big fire there twenty years ago?—Yes, it went all through the land we were cutting up there.

26. There are many instances where bush has been destroyed by fire?—It has been destroyed, but sometimes it is not destroyed although a fire may go through it. If a fire goes through it quickly, as it does in some places, it does not destroy it.

27. *Mr. Leyland.*] Would you not deem it wise to first settle all the open lands if there was no market for the milling-timber?—Yes, if you have open lands fit for settlement.

28. If there is plenty of open land in the hands of the Maoris, do you think it wise that those lands should be made available if it is possible before putting settlers on the land and destroying the timber if not near a mill?—Yes, I am of opinion it should be. Of course, in the North Island there has been a difficulty in acquiring them.

29. *Mr. Clarke.*] Did I understand you to say that the amount of timber within these areas was a mere guess?—The milling-timber?

30. Yes?—No. What I wanted to explain was this, that they have no system or proper way, in my opinion, of deciding it. You have to take an acre here and there and count the trees, and then you know what is on that acre. You can then strike about the average of what the whole bush would run, but where that is not done it is simply an estimate.

31. It would surely be somewhat approximate?—It would be somewhat approximate.

32. Otherwise what value are these printed documents that state that within a certain area there is a certain amount of milling-timber if it is mere guesswork. It would be more correct to say they are approximate estimates?—Very approximate, I should say.

33. But within a given area supposed to contain a certain number of acres, it would not vary a great deal?—I think the opinion amongst the millers is that it would vary very much.

34. There might be more and there might be less?—Yes. You cannot tell unless you make a proper inspection of the bush. Of course, there are experienced men who may be able to arrive very closely at the amount of milling-timber in the bush, but there are very few of them.

35. In many of those returns given in the various provinces, have the areas been surveyed or merely approximate?—I only know of one place where a survey was made—in the big Motu bush. We took an acre and counted the trees, and got an approximate idea of the amount of milling-timber to the acre, and then struck an average. We would take that average to be about the amount of milling-timber in that neighbourhood of 1,000 acres; but even that is approximate.

36. *Mr. Morris.*] There is no extensive sawmilling business carried on in this district?—No, not at the present time.

37. *Mr. Barber.*] Are there no timber reserves in this district at all?—There are lots of reserves, but the timber is of very little value. It is mostly birch and very stunted.

38. *Mr. Stallworthy.*] In referring to the report you said the estimates were very approximate—you did not mean very close?—No, rather the other way. I mean it should not be taken as very close.

39. There are some areas not even explored yet?—I should say there are a lot, but not in this district.

WILLIAM GOSS further examined. (No. 59.)

1. *Hon. the Chairman.*] Do you wish to say something further?—Yes. May I be allowed to make an explanation with regard to the question raised here this afternoon as to whether anything had been done between the Builders' Association and our association in regard to the duty on Oregon. I just wanted to state that the question of a duty on Oregon has never been discussed in our association. As a merchant, I might say that there are very few in our association who are interested in mills, and therefore they look at it in this way, that it matters not to them whether Oregon or red-pine is sold, and the question of the advisability or otherwise of a duty being imposed on Oregon has never been discussed by our association, and we have never been approached by any one in connection with our association.

2. *Mr. Leyland.*] Those opinions you have expressed are your own?—Absolutely.

3. Not as the representative of the association?—No.

4. *Mr. Mander.*] I suppose you would rather sell Oregon if you made a bigger profit out of it?—Yes, that is all we are here for.

5. *Mr. Barber.*] You attended with the deputation asking the Premier for an increased duty?—As a sawmiller. The reason I made that statement is that I am president of the Merchants' Association, and as such I think it is only fair that the position of the other merchants should be explained to the Commission.

6. When you appeared with that deputation you represented the millers only?—I was asked by the millers to be present.

7. *Mr. Ell.*] You are a manufacturer, and there is a lot of talk about the manufactured articles sold by merchants?—Yes.

8. The price of kauri doors in 1894 was 4s., and the price now of 6 ft. 8 in. by 2½ in. is 8s. 6d., which shows over 100 per cent. increase. Can you say what there is to justify that increase?—I think that is a question that probably the Commission would get better information about in Auckland. There is only one firm in Christchurch that has been manufacturing doors. As a rule, the others have done so in a haphazard way, but not made a business of it, and we have always been dependent on outside supplies of doors. As a matter of fact, I have always up to the last year or two had my doors from Auckland, and their price has always governed our price. I know that I can buy doors made in Christchurch cheaper than I can get them from Auckland, and I am therefore buying them here. I do not manufacture stock doors myself. I might say that I consider the price of doors, taking everything into consideration, is not out of the way at present.

9. Notwithstanding the great increase?—No. I might say the doors at that time were not paying us.

10. There is another item, glass doors, 13s. in 1894, and £1 10s. now?—The same thing applies to them. Our price is absolutely guided by the factory price. I might say that those doors at that time were always made by piecework, and I understand that they are now made by day labour, and that is one reason why the price of doors has increased, because piecework, I understand, is being abolished; but, so far as the merchants are concerned, they are absolutely guided by the factory price, and doors made in Christchurch now are cheaper to us than getting them from either Auckland or Dunedin, and therefore we buy them locally.

11. *Mr. Field.*] Do you know anything about rimu timber being unsuitable for the framing of houses?—I think I explained that—I do not think it is unsuitable.

12. Have you heard it is unsuitable for framing for plaster-work? What proportion of the houses is plaster-work?—In Christchurch we build probably a little bit better class of house than in most other parts of the Dominion, and therefore in Christchurch our houses, except the back parts, are almost always plastered; but what I think is referred to now is a house finished in roughcast, being plastered inside and roughcast outside. I think the studs should be dried, and that would get over the difficulty. When I say "dry" I mean seasoned.

GREYMOUTH, THURSDAY, 15TH APRIL, 1909.

F. W. FLANAGAN, Commissioner of Crown Lands, Nelson, sworn and examined. (No. 60.)

1. *Hon. the Chairman.*] You are Commissioner of Crown Lands for the Nelson District?—Yes.

2. You know the purposes for which the Commission is sitting, and we wish to hear from you respecting the working of your timber leases, the number that is now in force in Nelson District, the probable time the areas they have now in hand will keep them, together with any further information which you may think might be of service to the Commission. You had better make a statement first, and then the Commissioners will question or examine you generally?—Very well, sir. As you have permitted me to make a statement in my own way, I shall confine myself to the queries contained in Nos. 5 and 6 of the order of reference. I am most familiar from experience with these branches of the subject. First: As regards the areas of Crown forest held for sawmilling purposes. There are thirty-three licenses in existence in the Nelson Land District, all of them

issued by the Warden under the Mining Act. They cover an area of 14,490 acres. The names of the licensees and the areas held are as follows:—

Schedule of Areas leased for Timber-cutting in Nelson Land District.

Name of Licensee.	Section.	Block.	District.	Area. A.	R.	P.
Bowater and Bryan	..	XII, XVI	Mawhera-iti	753	0	0

Twenty-three of these licenses are held in Buller County, seven in Inangahua County, and three in the County of Collingwood, north Nelson. The estimated area of Crown lands still available for sawmilling purposes, but not taken up, amounts to a total of 1,936,000 acres.

3. That is bush land fit for sawmilling?—Yes, carrying, say, 3,764,633,000 sup. ft. of milling-timber, chiefly birches. In addition to that there are about 133,000 acres of forest reserves, carrying, say, 243,140,000 sup. ft. of milling-timber, chiefly birch. These are reserves distinct from the forests over which milling-timber licenses are granted. They are reserves set apart under the Land Act for forest, scenic, or climatic purposes. There are also about 330,000 acres of alienated forests, comprising private and native lands, carrying about 775,300,000 sup. ft. of milling-timber, chiefly birch. Thus there are of Crown lands, Native lands, private lands, and reserves a total of 2,399,000 acres, or 49 per cent. of the total area in the Nelson Land District, carrying 4,783,073,000 sup. ft. of milling-timber. The timbers which make up that total are white-pine, black-pine, red-pine, yellow-pine, and silver-pine, also black-birch, brown-birch, silver-birch, cedar, and miro. I have left out, of course, a number of the smaller timbers that cannot reasonably be called milling-timber. I may point out that by far the greater portion of this forest area is inaccessible for milling purposes, or, in other words, at present it is of no commercial value owing to its inaccessibility. My estimate is made from the data on filed reports in my office, and is as fair as can be obtained in the absence of an actual survey. Details of the quantities of each class of timber are as follows:—

Quantities of Timber on Crown, Native, and Private Lands, and on Reserves.

——	White-pine.	Black-pine.	Red-pine.	Yellow-pine.	Silver-pine.	Black-birch.
	Sup. ft.	Sup. ft.	Sup. ft.	Sup. ft.	Sup. ft.	Sup. ft.
Crown lands	34,120,000	94,000	342,820,000	1,439,000	1,309,600	459,834,000
Native lands	2,971,000	640,000	22,620,000	..	..	16,964,000
Private lands	23,064,000	4,549,000	11,739,000	594,000	272,500	112,981,000
Reserves	1,034,000	223,000	27,574,000	1,000,000	500,000	61,926,000
Grand totals	61,189,000	5,506,000	510,404,000	3,033,000	2,082,100	651,705,000

Quantities of Timber on Crown, Native, and Private Lands, and on Reserves—continued.

——	Brown-birch.	Silver-birch.	Cedar.	Miro.	Totals.
	Sup. ft.	Sup. ft.	Sup. ft.	Sup. ft.	Sup. ft.
Crown lands	1,757,988,200	1,162,060,000	4,845,000	123,000	3,764,632,800
Native lands	49,730,000	10,620,000	..	..	103,545,000
Private lands	313,085,000	97,992,000	1,755,600	60,000	671,743,100
Reserves	93,056,000	47,330,000	9,500,000	..	243,143,000
Grand totals	2,213,859,200	1,318,002,000	16,100,600	183,000	4,783,063,900

4. *Mr. Barber.*] No totara at all in these forests?—No, none to speak of. The only totara left is what they call mountain-totara, which is stunted, and which exists in a few patches in the northern part of Nelson. The totara is cut out. I wish to deal now with the administration of the Crown forests in respect to the timber industry in the Nelson Land District. The administration of the timber is practically in the hands of the Warden. I have got nothing whatever to do with it except to collect the rents and royalties. In other words, the ordinary regulations which exist in districts outside of mining districts are not in force in Nelson. The regulations under which a timber license is issued are the Mining Regulations.

5. *Hon. the Chairman.*] Is the whole of Nelson classified as a mining district under the Act?—Practically so. The whole of the County of Buller, the whole of the Counties of Inangahua and Murchison, and about four-fifths of the remainder of the province is in mining districts; but although all timber licenses are granted by the Warden, he does not do so on his own behalf—he does so in nearly every instance in this district on behalf of the Land Board under section 147 of "The Mining Act, 1908." There have been created what are called "Land Board's timber areas" and "Warden's timber areas." The Counties of Collingwood and Takaka, in northern Nelson, are Warden's areas. The Commissioner of Crown Lands has nothing whatever to do with the leasing of these areas for sawmilling purposes, or with the disposal of the revenue derived therefrom. The revenue collected from these timber licenses is goldfields revenue, and by Act of Parliament forms portion of the county funds. The Counties of Buller, Inangahua, Murchison, and Westland are Land Board timber areas, and, although they are Land Board areas, the Mining Act places the granting of timber licenses in the hands of the Warden exclusively. All applications are made to the Warden who grants the license, or refuses it as he thinks fit. The money accruing from all licenses on Land Board areas is paid to the Receiver of Goldfields Revenue, while the Receiver of Land Revenue is responsible for it. It is territorial revenue. Having had three years' practical experience in collecting this revenue, and having in the course of my duty as Commissioner of Crown Lands to go minutely into the question of the administration of the timber regulations, I have come to the conclusion that it is neither in the interest of the sawmillers nor of settlement that there should be dual control. The Warden when he grants a license practically divests himself of all further responsibility. He is supposed to keep the sawmillers up to the regulation by inspection, but he, as Warden, has no staff. The staff that performs that work is the staff of the Land Department when they can be spared from their ordinary duties as Crown Lands Rangers. In a district like Nelson, which is so difficult to travel over, what is wanted is a proper and systematic inspection, not necessarily a rigid inspection, but such as will insure that the regulations are being administered quite as much according to common-sense as to technical requirements. I may say that the regulations are not enforced in this district, and in some instances they could not be rigidly enforced. The regulations for the administration of timber licenses are drawn up, as I have said, under the Mining Act, and sawmilling is regarded by the Act as a mining privilege. I do not think myself it was contemplated that sawmilling, considered as a separate industry, should be carried on in the way laid down by these regulations. The quantity and quality of the bushes do not warrant the restrictions imposed. For instance, the license is for 200 acres. The licensee may, however, have reserved for him three additional areas of 200 acres each, making up in all a total of 800 acres. The Warden may grant a fourth additional area of 200 acres in exceptional circumstances. According to the terms of the regulations, the licensee must surrender his original license before he can obtain a license for a reserved area. In course of time each reserved area becomes the license, and the licensee is qualified to apply for another reserved area, so that he has always a total of 800 acres, or 1,000 acres, as the case may be, in hand. Now, it is impossible, except in very few cases, in Nelson District to enforce this procedure. The forests are not milling-forests in the true sense of the term. For example, a man may take up his license and reservations—800 acres—but on his license (200 acres) he may not have the class or quantity of timber he requires to execute an order. Say, rimu is necessary for his business. It may be on No. 3 reserved area. You cannot in such circumstances compel the licensee to abide strictly by the regulations and cut on his license without imposing a hardship in some cases. The sparsely timbered nature of parts of the country (I am speaking now of Nelson District) accounts for the fact that the regulations have not been enforced to their full extent. But laxity has become general, and abuses have crept in owing to want of systematic inspection to ascertain the true character of the forest. A matter for regret in connection with the existing system of control is the waste of timber, which in some cases is reckless. This occurs to a great extent. Some sawmillers in working out their milling areas do everything in their power to fulfil the conditions of their licenses in the matter of clearing the forest and preventing the destruction of small timber. There are other sawmillers, however, who do not. I believe that with a proper system of inspection—I mean reasonable inspection—the amount of timber wasted could be materially diminished. There is another serious defect in the administration of the timber

regulations under the Mining Act, and one that ought to be remedied without delay. I refer to the delay of the sawmiller to cut out his area in a reasonable time, so as to leave the surrendered areas available for the purpose of settlement. In this respect the sawmilling regulations are not carried out in a manner calculated to promote land-settlement. Considerable friction has taken place in the Nelson District owing to a bad feeling having been engendered between a sawmiller and a possible settler, the former blocking the latter indefinitely. These sawmilling licenses run from three years to forty-two years—twenty-one are for forty-two years—and it is quite possible under the existing administration on one pretext or another for a licensee to hold a milling-area for forty-two years, and shut up the land against settlers meanwhile. If the administration was under the control of the Lands Department I believe there would be less friction in that respect, and settlement would increase in some districts where, to my knowledge, it is being kept back. Indeed I can point to several instances in very inferior forests covering good land where the sawmiller has quarrelled with a possible settler, and thwarts him by passive resistance. In the administration of forests under the Land Act and State Forests Act the licensee has to cut his area out within a prescribed time, and therefore settlement follows him. Now, if that system were observed in mining districts you would have the land cleared and settled to a far greater extent than at present. The term of the original license for forest areas throughout Nelson District should be the same as that prescribed by the Forest Regulations under the Land Act (four years), except in three localities, where it may be said that sawmilling is carried on as an industry on commercial lines. These localities are Karamea, Cape Foulwind, and the Grey Valley. Speaking under a sense of responsibility, I can state that these are the only three localities in the Nelson District where there is any scope for the further development of the sawmilling industry.

6. You say these are Karamea, Cape Foulwind, and Grey Valley?—Yes. I estimate that there are in Karamea 7,000 acres of what might be termed fair rimu forest. At Cape Foulwind I reckon there are about 6,000 acres of what might be termed fair milling-forest, and about 6,000 acres in the Grey Valley. I should say, however, that even in these three localities I do not suppose there is more than twelve years' cutting of red-pine. Further, in these three localities the sawmillers are, to my own knowledge, carrying on the industry under a great disadvantage, and if I had anything to do with the administration of the forests in mining districts I would recommend a change from the system that exists at the present time of limiting the miller to a specific area, irrespective of the size or value of his plant, and substitute the Forest Regulations under the Land Act, which regulate the area held by the horse-power of the mill, the maximum area being fixed at 1,500 acres. I would have the licensed areas carefully inspected, and reports furnished from time to time to the Commissioner of Crown Lands and the Land Board as to the manner in which the areas are being cut out and cleaned. I think that that should be done in fairness to the State and to the miller. I know that some people hold the opinion that impediments should be put in the way of the sawmilling industry, so as to preserve the forest. Although I sympathize with those who desire the retention of the forests, and regret the great destruction of forests that has taken place, there is, however, this view of the question to take—viz., the progress of settlement. Is settlement to be stopped? Granted that sawmilling were to cease, there is no guarantee that the timber will not be destroyed by fire. In travelling over the country one becomes convinced that it would take an army of Rangers to prevent fires taking place. One of the regulations under the Mining Act is a direct incentive to destruction of forest. I refer to sleeper-cutting licenses. For the expenditure of 5s. a man can take out a license and roam over the whole of the Crown forests cutting out sleepers. He fells the yellow-pine or the silver-pine, cuts off the sleeper length and leaves the tops of the tree, which, when they become dry, are highly inflammable, and so the surrounding forest is in imminent peril of destruction. Persons with experience know that it is very difficult to prevent the destruction of timber by fire, even under the most perfect system of safeguard, especially after three or four months of dry weather. Drought almost invariably produces bush-fires, especially in birch-clad country. I attempted to protect an area of 3,000 acres of the finest milling-timber in New Zealand, situated at Wai-iti, near Waimea Plains, Nelson. It had been for several years a State forest, but last year, as a result of the protracted drought, a fire spread from freehold lands and destroyed it in one night. Both in the interest of the State and of the milling industry, the administration of the Crown forests in mining districts should be improved. That is my opinion, based on an experience of three years' close observation.

7. *Hon. the Chairman.*] In what time do you expect the leases now held by the sawmillers to run out?—That is a question which it is impossible to answer, because a sawmiller can take up a lease, say, next week for forty-two years, and, under the existing regulations as administered, he can hold it for several years, just as it suits his purpose.

8. Without cutting any?—According to the way the law is administered. There was a case tried in Inangahua about three years ago, in which one sawmiller (Archer) took an action against another (McMahon) because the latter, in plaintiff's opinion, was not cutting continuously. Warden Kenrick gave judgment in favour of the plaintiff. There was an appeal against the decision, heard before District Judge Haselden, and Mr. Kenrick's decision was upset. Judge Haselden practically laid it down that a miller cuts continuously so long as he executes the orders that come in. In the case under notice the miller was cutting on private land and shepherding his Crown area.

9. Does the Board or Commissioner grant any forty-two-years licenses?—Not a single license is granted by the Land Board: the Mining Act does not permit of it. Section 149 of the Act provides as follows: "In any case where the Governor is of opinion that application for timber-cutting rights within a Land Board's timber area may be dealt with by the Warden more conveniently than by the Land Board, he may authorise and direct the Warden to deal with and dispose of the same on behalf of the Land Board. . . ." Subsection (*c*) of the same section provides that "The Land Board shall not grant any timber-cutting rights within the area."

10. They have no power to grant any?—No. Under the existing Mining Regulations, where provision is made for timber-cutting rights, it is stated, "The Land Board shall not itself grant any timber licenses or other timber-cutting rights within the aforesaid areas." These are the areas notified by Order in Council as Land Board timber areas. What the object was in creating "Land Board areas," and then by regulation and by the Act preventing the Land Board from administering them, I do not know, seeing that the revenue derived from these areas is territorial revenue: the contribution to the local body is paid by the Lands Department. There does not appear to be any valid reason for creating Land Board areas by specific regulation conferring on the Warden the exclusive right to deal with them. The truth is that the Mining Regulations do not regard timber-milling as a separate industry, but simply as a mining privilege. One result of this is the difficulty of protecting Crown forests under the existing conditions. I might state that any holder of a miner's right can obtain from the Warden a right to cut timber for domestic purposes; he cuts when and where he chooses, and the Warden does not know. Again, if a man has a mining privilege he is entitled to cut Crown timber on his claim without asking the Warden's consent. Further, there are what are called "hand-sawing and timber-splitting warrants," under which any man may hold 20 acres and obtain the right to cut timber. He is prevented from using it for milling purposes except for his own use, but he does so. These regulations are laid down, but there is no proper inspection, and consequently the licensees ignore them. The Lands Department has Rangers going round the country inspecting Crown leaseholds, but mining privileges are outside their duties; these are in the hands of the Warden. We have a set of regulations for the governing of State forests and ordinary forests, but the Warden can grant mining privileges therein without consulting the Lands Department. The Lands Department has nothing to do with the granting of timber licenses in the Counties of Buller, Inangahua, and Murchison.

11. *Mr. Morris.*] You think that it would be to the advantage of the sawmilling industry that this dual control should be abolished?—I do, and from conversations I have had with different millers in the Nelson District, I believe that they are of the same opinion.

12. I think the regulations whereby the Warden is empowered to administer this part of the land business is framed because he is more get-at-able than the Land Board, his Court being spread over the entire district?—That may be so. In Reefton, however, there is a local Lands officer, and there is one also in Westport. There have been no complaints from southern Nelson as to delays in issuing leases of Crown lands under the Land Act. I do not see why there should be any delay as to business in connection with timber licenses. If the Lands Department had control of the timber business it would be worked by the Land Board in conjunction with the land business.

13. You said you did not think it was to the advantage of either the sawmiller or the State that the miller should be compelled to cut these areas consecutively?—What I meant to convey was that, as regards areas which cannot be fairly described as areas carrying a large amount of rimu or any valuable timber—sparsely timbered places—it would be inequitable to enforce the regulations. Supposing you took up 800 acres, and there was very little good rimu on your license; say you received a large order for rimu, would it not be like imposing an undue hardship on you if you were forced to cut out according to regulation and consequently lose that order? The regulations say that the sawmiller must cut out his licensed area before he starts on his reservations. I know a case at Inangahua where a miller had a contract to supply timber to the Consolidated Goldfields Company; rimu was required; there was, however, no rimu on No. 1 reserved area, therefore he was allowed to cut on No. 2, and to put in a tramway there. If the miller had been kept to the strict letter of the regulations he could not have carried on his business.

14. Then the configuration of the country is often a bar to a man cutting out an area, and puts him to expense in carrying out the regulations?—That is so. I have often noticed that in travelling round the country. The fairest way to deal with these difficulties is to leave the solution of them to a good Ranger, or change the system—count the milling-trees, assess their value, and abandon the area-limitation in special cases.

15. We have often experienced the difficulty you mention. A man may have rimu on his area and white-pine on his reservation, and he wants to operate on both. What scheme do you propose to improve this?—My suggestion as regards sparsely timbered country or inferior forest would be to abolish the system of granting 800 acres—*i.e.*, 200 acres in his license and three reservations of a similar size. Have the land examined as to its timber-carrying capacity, assess it, and dispose of the timber either by lease or by auction.

16. What area do you suggest, or would you make these areas commensurate with the value of the plant put on them?—That is rather a difficult matter to deal with. It would not do to crush out the small men; the big men would become monopolists.

17. Would you suggest an area?—That would depend on the character of the bush. If there were a number of small men in a mixed forest I would not wipe them out, but if there were a large area of good milling-forest available it would be only fair to a man engaged in the industry to encourage him to adopt modern appliances and put in an up-to-date plant. The district, the character of the forest, and many other circumstances have to be taken into account in considering this question.

18. What would you consider a fair amount of timber to put up a modern plant that would cost £4,000 or £5,000?—I cannot say. The Nelson District, generally speaking, cannot be called a legitimate milling district. Nearly all the mills are antiquated and small. In Nelson there are eighty mills—over fifty in north Nelson.

19. They supply local wants?—Yes. In Inangahua County the timber is not cut for export; the majority is cut to supply props, &c., for the mines and local requirements. The same may be said of the mills on the coast between Westport and Mokihinui. At Karamea, Ikamatua, and Cape Foulwind there are millers engaged in the industry in a legitimate way.

20. *Hon. the Chairman.*] Export millers?—Yes.

21. *Mr. Morris.*] With the object of converting the timber into a marketable product you are opposed to the miner being allowed to go where he likes and cut laths out of it?—Most decidedly. He cares nothing about milling or the preservation of the timber or about settlement. That is my experience.

22. You think the miner should follow the miller?—Yes.

23. He can get his timber even if the miller has gone through the bush?—Yes.

24. With regard to the Warden and the case before his Court, nothing was put forward as a sufficient and good reason for relaxing the regulations?—No. In dealing with cases you ought to interpret the regulations in a common-sense way. There are certain people in every walk of life and in every industry who will not work according to laws or fair play. The regulations are made for these men, not for those who make an honest attempt to obey them.

25. *Mr. Hanan.*] Can you say of your own knowledge that this matter and the desirability of vesting the granting of these licenses in the Land Board has been brought under the notice of the Land Board?—I myself brought it under the notice of the Under-Secretary for Lands in September, 1906.

26. Were you the first?—I cannot say.

27. Has anything been done?—Practically nothing definite. I believe there was an attempt last session, but it did not prove successful.

28. What was that?—I cannot tell you. I have no official knowledge of it.

29. What reply did you get from the Government?—The usual reply—that it would be carefully considered.

30. How long ago is that?—About eighteen months ago.

31. Had the matter been raised before that?—I cannot say. It might have been raised by the Commissioner for Westland. I wrote making certain suggestions on the experience I had gained as Commissioner of Crown Lands.

32. Was there any general complaint made to you by the millers or the people?—No, but I had gone through the district and inquired into the matter thoroughly, and saw where, in my opinion, improvements could be made. I considered that part of my duty.

33. How many mills have shut down during the time you have been there?—I do not think any mills have shut down.

34. How many hands are engaged in the sawmilling industry in the district?—I dare say in the whole of Nelson about 480.

35. Directly or indirectly?—Directly.

36. Are the majority of the mills working full time?—I cannot say. It does not come within my functions to inquire.

37. What is the name of the case you have given us?—Speaking from memory, I think it was the case of Archer *v.* McMahon

38. When was it decided?—In the District Court at Reefton in May, 1906.

39. Could you give us the section on which it was decided?—Regulation 109 of the Mining Regulations under "The Mining Act, 1905."

40. Give us the section on which the interpretation was based?—Subclauses (1), (4), and (5) of the regulation which I have quoted.

41. What was it?—The point was raised as to what interpretation was to be put on "continuous working operation cutting timber."

42. Is there no time mentioned in the regulation within which a mill must be established?—Yes, within six months.

43. And what is the forfeiture?—The licensee forfeits his license if he does not comply with the regulation.

44. Within six months?—That is a matter for the Warden's discretion: he may extend it on valid and satisfactory reason being given.

45. Where does he get that discretionary power?—In the regulation.

46. By what regulation?—Regulation 109.

47. On what do you base your opinion?—On practice and experience.

48. Within what radius have you mills working in Nelson?—About 110 miles from Nelson City.

49. Is the nearest mill working within a hundred miles?—The nearest is about sixty miles distant—in Collingwood County.

50. Are there many hands employed there?—I cannot say—probably about fifteen.

51. Do you know the area held by that man?—There are three millers there; one has an area of 160 acres, and the others 200 acres each.

52. What are the royalties?—They do not concern me; they are paid to the Receiver of Gold Revenue; the areas are in what is called a Warden's timber area. In Wardens' areas royalties are paid to the Receiver of Gold Revenue, who pays them into the Treasury as goldfields revenue. These royalties form portion of the funds of the Counties of Collingwood and Takaka. I am only concerned with Buller and Inangahua, where the royalties are territorial revenue.

53. What is the price paid for bush sold by private owners?—I do not know. That is a matter regulated by the millers' requirements. For instance, there are some millers not far from Nelson who must get bush by hook or crook or close down.

54. What is the price? Do you know?—I do not know. Millers have come to me inquiring for forest, stating that the royalty on private property was too high.

55. These areas are very rough?—You are referring to the estimate of Crown forest. Of course, the estimate is approximate in the sense that no survey has been made. I have taken out the quantities in each survey district. I have travelled the whole district, and know it intimately.

56. Have you had any bush experience?—I was born in bush country.

57. How does the bush in Nelson compare with here?—Nelson is much inferior. There is no timber in Nelson that can compare with the timber you saw yesterday at the back of Jack's mill.

58. How do the mills compare?—Superior to the Nelson mills generally, judging from what I saw yesterday. With few exceptions the Nelson mills are antiquated.

59. Is this bush found mostly in mountainous country?—Some on slopes, the great bulk in mountainous country, and very little on the flats. In Karamea millers are now cutting on land very difficult to work.

60. Can you say if the applications for licenses are increasing in your district?—No; they are about stationary.

61. Can you give us the licenses of a few years ago?—I have not the data at hand. Royalty has increased owing to the putting into operation of a completer method of collecting it than what obtained some years ago.

62. You cannot give us a comparison between now and five years ago as to the number of mills working?—No, because there were not the same statistics recorded then as there are now.

63. Have the mills increased or decreased?—They have remained just about stationary. There are very many in north Nelson that have been working for thirty or forty years, but they are practically idle most of the year.

64. In your opinion, will the cost of milling-timber go up in your district? Do facts point to that?—I would not like to express a definite opinion: it is largely a question of supply and demand.

65. Seeing that you have to bring timber further to the town or market, and that valuable timber is less easy to obtain, does it not mean that the price will go up?—I should say that it is inevitable up to a certain extent. Haulage from inaccessible localities will add to the cost.

66. What big timber-fires have occurred in this Dominion within the past five years?—I do not know of many big fires. I had experience of one big fire in Nelson last year; it extended over 25,000 acres of Crown and private lands.

67. Have you had experience of any others?—Not of any large destructive fires. Of course, I see results of fires while travelling about. For instance, a few days ago I saw that the scenery along the Buller Road had been set fire to in five places.

68. *Mr. Jennings.*] Do I understand you to say that after the 800 acres are cut out an additional 200 acres can be supplied to the sawmiller?—Yes, as he cuts out. For instance, when he cuts out the original license and surrenders it he is allowed to take up another area of 200 acres reservation.

69. And does that continue?—Yes, it continues.

70. In addition to the fires that go through the bush, are you aware of any other deterrents which act in a manner destructive to the timber, such as gales, blight, and so forth?—Yes, gales to a certain extent, and so does blight, if you can call the excess of drought blight. Last season when we had ten or twelve weeks of it in Nelson some of the birch on the clay ridges began to die.

71. In your opinion, do you think it is possible to preserve or conserve the timber altogether?—It is possible, but it is very improbable.

72. It would mean a great expense to the Dominion, would it not?—I do not think, no matter what the expense was, that you could invent any system that would insure its protection.

73. In reference to timbered land that has been cleared by the sawmiller, what is the general effect upon it for farming purposes?—The general effect on it for farming purposes in a mining district is very little, because, as I have said, the regulations have not been observed with regard to cutting out properly or cleaning up. Where timber is badly cut out it is really harder for the farmer to make headway than it is to clear a selection out of virgin bush.

74. Is it land that would be suitable for agricultural purposes?—Not primarily—it would eventually. It is safe to say it would be suitable for pastoral purposes, as the great bulk of the land of this district is; but it is only a matter of time when the land you consider fit for pastoral purposes becomes fit for agricultural purposes.

75. *Mr. Field.*] How many acres of milling bush containing rimu would you say there was in the Nelson and West Coast district?—There are in the three localities I have mentioned 7,000 acres and two lots of 6,000 acres each. These are what I would call areas above the average in quality of milling-timber areas in Nelson District.

76. In addition to that I suppose there is a large area of milling-bush, such as beech and sparsely scattered rimu?—An enormous area. There is a very large area of brown-birch. There is a very valuable area of brown-birch in Nelson that will some day be utilised and its full value realised, because I do not suppose there is a better timber than brown-birch when properly seasoned.

77. *Hon. the Chairman.*] For what purposes is it suited?—It is suitable for bridge-construction and small furniture. I had a table made from a piece of brown-birch which was in the battery-building at Reefton. It was twenty-five years old. Millers and builders do not like brown-birch because it warps.

78. *Mr. Field.*] When you mentioned 6,000 acres, does that cover the area which the mills are now milling?—Yes, it does.

79. Well, apparently timber-milling in this district so far as rimu is concerned will be a thing of the past very soon?—In Nelson District, yes, very soon. I should say within a dozen years even at the rate at which the mills are working now. I refer to what you may call the rimu available, but there is a large area which is too inaccessible to be worked.

80. Then, in your opinion it is useless giving the sawmillers such a term of years to cut out the bush as would justify them in putting in an up-to-date and expensive plant?—Yes, so far as Nelson District is concerned. My experience is confined to Nelson. From the Ikamatua Railway-station southerly is in Westland, and all the land we saw yesterday is in the Westland Land District.

81. You approve of giving millers such a quantity of timber as will justify them in putting in an up-to-date plant?—I do where there is available forest.

82. You are aware, I suppose, that there is an increasing demand for large pieces of timber as the buildings become larger?—Yes.

83. And you are aware that the mills as at present constructed cannot deal with those large pieces?—That is so.

84. The largest mill we saw yesterday would not deal with pieces more than 30 ft. in length?—No.

85. Would you be in favour of giving those people such quantities of timber as would justify them in putting up a plant to deal with large pieces to supply the increasing demand?—I could not give an unqualified answer to that question. If you did so the tendency might be to create a monopoly.

86. But you would be largely guided by the amount of money a man would expend?—Yes, as regards districts where it is recognised that the industry is likely to be permanent.

87. With regard to the land we saw yesterday, to what use can it be put when the timber is taken off?—Well, it could be used as mostly all land is for the purposes of settlement. Of course, a lot depends on its position and aspect, and also on the class of man you put on. I would not call a lot of the land we saw yesterday absolutely poor man's land. It is land that could be put to practical use and made productive by capital.

88. Is it not true that there is a substratum of cement which keeps the water on the surface all the time?—I do not think so—not up there (Grey and Arnold). You are referring probably to what is known as moorland or *pakihi* land, which is surcharged with water, such land as that which exists between the River Buller and Cape Foulwind and Charleston. There are 12,000 acres of *pakihi* there, which it is impossible to render useful until you break through cemented gravel and the iron pan, which vary from about 2 ft. to 3½ ft. below the surface. There is *pakihi* in patches, wet or dry, all over southern Nelson District. You find it where formerly yellow-pine had grown.

89. Do you think it would be possible to deal with that pan, as you call it?—The problem is under consideration now, I understand, by the chemist attached to the Agricultural Department. I wrote to the Under-Secretary for Lands, and he has taken the matter in hand; an analysis is being made to see if it is possible to penetrate the iron pan. If it is possible to do so the *pakihi* will become a very valuable area of land fit for agricultural purposes if fertilised.

90. And it is of vital interest to the whole country?—Yes.

91. If you cannot do that, do you think you could get forest-trees to grow there?—I do not think so, unless the area can be drained. The trees that were originally there were yellow-pine, which grow in sour swampy country; the trees were burnt out probably by Maoris. All that country between Westport and Charleston was covered with yellow-pine at one time.

92. If you cannot get rid of the water it is practically useless for all purposes?—Yes. Some of the Cape Foulwind *pakihi* is leased on grazing tenure. What induced me to take action with respect to the *pakihi* was the knowledge that where miners had cut races and deposited the soil on the surface danthonia was growing, also clover and cow-grass.

93. *Mr. Leyland.*] You say that the administration of the timber is practically in the hands of the Warden?—Yes.

94. I suppose some timber is under your administration?—Not one acre so far as the granting of sawmill licenses and timber privileges is concerned.

95. Do you know how the royalties are collected?—Yes, I have got to do it, or at least I, as Commissioner, have to see that it is done. The Receiver of Land Revenue is responsible for the revenue, it being territorial. The sending-out of the accounts is part of the Warden's clerks' work, but any dereliction of duty in that respect recoils on the Lands Department. If royalties are not paid within reasonable time the Receiver of Gold Revenue sues on Commissioner's advice. The dual control in this matter is unsatisfactory.

96. Are the royalties collected on the sawn timber or on the estimated standing timber?—They are collected upon the sawn output. Millers pay 1s. an acre rent, and rent ceases as soon as the royalty overtakes it.

97. Then, the rent is refunded in royalties?—The rent of the license ceases while the amount is more than covered by the royalty paid.

98. What becomes of the royalties?—It becomes territorial revenue.

99. There was a recent Act of Parliament by which the local bodies in the North were given half the royalties?—Yes.

100. Does that not apply down here?—Yes. You are referring to the Timber and Flax Royalties Act. I pay the local bodies *half* the royalties obtained from timber and flax in Land Board timber areas. In the Wardens' timber-areas the *whole* of the royalty on timber goes to the local body—I never see it; it is goldfields revenue.

101. Do you suggest that the local bodies should be deprived of one-half of the revenue?—No, I do not at all. And I may state here that the administration of forests in mining districts in Nelson and Westland by the Mines Department confers no pecuniary benefit on local bodies or sawmillers beyond that conferred by the Lands Department. The Land Boards direct, after advice of local bodies, where the royalties are to be spent. The reason for refunding to the local bodies half the royalties on timber and flax is not altogether for the purpose of assisting local bodies' finance, but for the purpose of maintaining and keeping up the roads which are used by sawmillers.

102. Do you give them anything for the purpose of opening up bush tracts?—No, not for that specific purpose. I send to the local body, stating that, say, £300 is due to it as half royalties on timber and flax. I forward a schedule, and ask that there be noted thereon the roads or tracks

on which the money should be spent. That is called the scheme of expenditure. The information is sent back to me, and I submit it to the Land Board for approval or alteration. We know therefore where the money is to be spent; we have a check upon the local body. It cannot spend one penny until the Land Board approves of it. If the money is spent on any work that the Board has not approved of, the members of the local body are personally liable for the amount. As I have already said, the royalties are not paid as a contribution towards the local body's finance, but to help the upkeep and the opening of roads to mills which use the roads for traffic.

103. You made the suggestion that instead of granting a sawmiller an area of land he should be given a quantity of timber. Have you ever thought of the time you would allow a miller for cutting out a million feet of timber?—That would depend on the cutting-capacity of the mill and the quantity of the area.

104. You misunderstand me. Supposing you grant an area of 6,000,000 ft. of timber, what length of time would you allow the miller to cut that out with a view of conserving the timber-supplies: would you make it a limited time?—I would err on the liberal side there, because if he were to cut out his area in a proper manner and assist the Government by leaving the land free for settlement as he gradually cuts it out, then there should be consideration shown to the miller—it is a matter of give and take.

105. *Mr. Clarke.*] With regard to the amount of timber in your district, the return dated 1907 states that four-fifths of it is birch?—That is quite right.

106. That is approximate only?—Yes.

107. Does that include those timbers that are in inaccessible places?—The latest estimate includes the whole of the timber.

108. So that a large proportion of the remaining one-fifth of the milling-timbers would be inaccessible?—Precisely.

109. Then, the amount of timber in that sense, excluding the birches, is really a small amount after all?—There is a very small amount of timber available for milling purposes exclusive of birches in Nelson District.

110. Then, with regard to birch, would you suggest that, if recognised as a valuable milling-timber at present, it should be retained for future purposes or for the purpose of assisting agriculture in various ways with regard to climatic and other effects?—Well, of course, that opens a very large question. I believe that everything should give way to settlement, and in a country like Nelson, where 49 per cent. of it is bush, the question is whether you are going to proceed with settlement and clear off the timber or conserve the timber and arrest settlement.

111. Do you believe it would be advisable to cut the 4,000,000 acres of birch down for settlement?—I would not cut the whole of that down, nor will it ever be necessary to do so on account of the high altitude of much of it, but I would not stop settlement in low-lying country for the purpose of retaining the birch growing there. It is much better to have settlement, in my opinion.

112. Have you not considered the after-effects of cutting down the timber?—That is a difficult question to deal with—it means reafforestation. Under the present land laws if a selector takes up an area of, say, 600 acres, he is supposed to clear it, and he is only conforming to the regulations respecting improvements when he does so. As I have said before, you must either have settlement and no timber, or timber and no settlement. Which are you going to have?

113. Would it not be advisable to have a mixture of the two?—Yes, that is possible. In my district I have advised the settlers not to cut out all the timber, but to retain some of it.

114. In regard to replanting, I think you said there were some large areas where timber would not grow. Have you had any experience with the growth of foreign timbers?—No.

115. Then, any statement you make as to it being unsuitable would be simply your opinion, not based on actual observation?—I only expressed an opinion which is a matter of knowledge. A man does not require much scientific knowledge to know that you cannot get timber to grow where water is lying permanently on the land.

116. Is that the condition of it?—Yes, of a large area. It is up to one's knees in water in some places—a *pakihi* swamp.

117. And before you could get the trees to grow it would be necessary to deal with the water?—Yes, to penetrate the iron pan and cemented gravel that lie underneath, which are impenetrable at present. You cannot drain the swamp; it is flat.

118. *Mr. Barber.*] I understood you to say that there was a reserve of 800 acres always kept for a mill?—Not a reserve of 800 acres, but three reservations of 200 acres each and one license of 200 acres.

119. Then, 800 acres is the total the licensee could get?—Yes, unless his areas are four miles distant from a railway-line or port, in which case the Warden may grant an additional 200 acres.

120. He could not get 1,200 acres?—Not unless he puts up a separate plant.

121. Then, the limit allotted to any one mill is 800 acres?—Yes, with a possible additional 200 acres, as I have pointed out. A firm may take up another area, but there must be a separate plant erected on it.

122. Now, with regard to the destruction that takes place, do you find that much valuable timber has been burnt by dredging companies and those who have mining plants?—Yes.

123. There is a means by which they can secure a prospecting area?—Yes.

124. Have you found much destruction of timber in those prospecting areas?—To put it in a bluff way, they are in many instances the enemies of the forest. The trees are destroyed and fired sooner or later. There is more damage done to forest by the nomadic mining element than by any other section of the population.

125. And do you think they should be controlled by the Land Boards?—Yes; the Crown Lands Rangers would by inspection keep them under control, and the Commissioner deal with them. Under existing conditions the Commissioner of Crown Lands, although he is supposed to control Crown forests, is "a man-of-war without guns" in a mining district.

126. *Mr. Ell.*] You told us in your statement that, through the Lands Department not being able to exercise that control which they should exercise with regard to forest lands in the land districts, there is a great waste of timber in the areas cut out by some of the millers?—That is undoubtedly the case.

127. You have no authority to send your Ranger in or compel the miller to cut out the area clean?—The only course I can take under those circumstances is to ask the Warden to do it.

128. And if he does not choose to do it?—I have no power.

129. And has he no one to send into the milling districts to see if the milling is done properly?—No; he uses my officers for that purpose. If the Warden wants a report he asks my Ranger to furnish it. I allow the Ranger to inspect and report if he can be spared, because it is to the public advantage that I should work with and assist the Wardens. The Warden not only controls the timber industry in Nelson District, but he practically controls the Land Board. The Board cannot dispose of an acre of land in Nelson inside the mining district without the Warden's consent.

130. How many Rangers have you got?—Two at present, one working Nelson, another Westport and Inangahua.

131. Does that work take up the whole of their time?—Yes, it does, if their work is thoroughly done.

132. So that you cannot allow them to do this work of inspecting the sawmill areas?—No.

133. After a license is granted, except there is a complaint by any one to the Warden about the boundaries, no inspection of the area takes place?—No, unless I discover something in the course of my duty.

134. And he can do as he likes?—Yes.

135. And consequently there is a great waste of timber?—Yes.

136. Now, with regard to the sleeper-getters, how many are employed in your district?—I could not give you the exact figures—say, nine. They work ostensibly for the railways. The sawmillers also cut sleepers. They pay 2d., and the sleeper-getter pays 3d. per sleeper, and sells to the Railway Department for 3s. 6d. per sleeper. The sleeper-getter cuts in any forest that is not leased to a sawmiller. They have power to enter a forest and cut a sleeper out of it on a 5s. license. They can go where they like and do practically what they like.

137. And if a tree is economically handled there is a possibility of cutting twelve sleepers out of it, but they may only cut two out of it?—Yes. Nelson District is almost denuded of good trees. One sleeper out of a tree is about the average now.

138. Have you had any experience with regard to the amount of waste in this method of getting sleepers?—Yes. The Government has, in my opinion, lost hundreds of pounds through the destruction of forest by these sleeper-cutters. They defy inspection. They are not confined to a licensed area. They can cut sleepers and take them out at night. The sleepers are sold to the Railway Department. These sleeper-getters are nomadic; they evade the Rangers frequently. Some of them used to cut down trees they knew would not pass as railway sleepers, and dispose of them for about 2s. each as posts and piles. They have thus evaded royalty. This abuse has been stamped out to a great extent.

139. Looking at the matter from a national standpoint, do you think this method of obtaining sleepers is a costly method?—It is undoubtedly a costly method so far as the Dominion is concerned.

140. They are extremely costly sleepers to the country?—Yes. Every sleeper costs the country, I should say, about 10s. It is also unfair to the sawmiller, who has to pick up the fallen timber in the forests which have been overrun by the sleeper-getters.

141. Would you advise putting a stop to it?—I would.

142. Now, with regard to the burning of timber, a fire took place in some 3,000 acres?—Yes.

143. What was the character of the forest?—Good totara, which had been preserved as a State forest—about the only area of valuable timber under the State Forests Act in Nelson. This forest had been protected by myself and predecessors for several years. During a season of drought, however, a fire started in some neglected country-blackberry and dead birch, and spread to and through this forest and destroyed it. This area was consequently released from reservation last session of Parliament.

144. You said that was the only experience you had had of any considerable amount of bush being burnt?—That was the only forest to which my attention was directed officially.

145. And you have been in the bush all your life?—Yes, practically more or less experienced in bush all my life.

146. With regard to the Wardens, I understand they grant licenses without previous inspection or knowledge of the character of the forest or land?—Yes, I know that from my own Rangers. The usual practice is that if there is available an area unapplied-for the Warden will probably grant it. That is unfair to the sawmiller, because a man may come in behind him after he gets a good plant installed.

147. Does the sawmiller pay on the output in your district, or does he pay on the number of acres or the estimated number of trees?—He pays on the output.

148. The actual output?—Yes.

149. There is a temptation to be somewhat careless by the way the tree is cut?—Yes, that is so. If a man has good security, however, it pays that man to be honest. That is so, and it is quite natural.

150. You say these sleeper-getters are people who are practically free-lances and can do what they like?—Yes, they can do what they like. The whole difficulty, I think, rests in the fact that the preservation of forests has not been seriously considered. Originally—and that position still obtains—in the mining districts everything was subordinated to mining.

151. The sum total of your experience is that dual control is a mistake, that the Government should put an end to it, and that the whole of the sawmilling area should be placed under the control of the Lands Department?—Yes.

152. With regard to bush lands, have you considerable areas of that?—Very large areas of brown-birch.

153. Do you think it would be a wise thing on the part of a Forestry Department to provide for tests and examinations of this timber with the view of showing its value if properly treated?—I do think so. It can be used for many purposes which at the present time the public is not aware of.

154. Do you think the difficulty of sale is due in some measure to the want of understanding as to how to treat the timber?—Yes. In a new country people slum over matters of first importance, and afterwards are brought to realise the value of things. That is what we are beginning to do now.

155. You say that the people of Nelson, so far as rimu is concerned, have only about twelve years to go?—Yes, and then they will have to turn their attention to birch.

156. That being the case, and seeing that our population is rapidly growing, and that our plantations are not sufficiently advanced to produce timber earlier than forty or fifty years hence, do you think it would be a wise thing to make some reservations to provide for the future needs of the country until such time as our planted trees have matured?—Well, that can be done in cases where prospective settlement admits of it—say, on high ranges where settlement will not extend.

157. Are there not lands in your district of such a broken and precipitous character that it would be better to keep them in standing bush?—Yes, very high lands containing birch—brown-birch and silver-birch.

158. Silver-birch is a good milling-timber?—Yes.

159. And good for even building purposes?—Yes. Silver-birch grows above the altitude limit of settlement.

160. Now, from a national standpoint—and you are one of the officers who have to administer our lands—do you not think it desirable that we should make some reserves?—Yes, I think so. There are forest reserves made already in the Nelson District. It is very desirable that we should have reserves.

161. *Mr. Arnold.*] I understood you to say that a miller first of all got a license for 200 acres, with a reserve of 600, making a total of 800 acres, and that when he worked out the first 200 acres he was at liberty to operate on one of the next 200 acres, and that his reserve was consequently automatically increased if he so desired it by a further 200 acres?—Yes, that is so, and it keeps the area perpetual.

162. That is, without putting down a second plant?—Yes.

163. So that he might go on till he had had twelve or sixteen hundred acres if the land was available?—Yes, certainly.

164. *Mr. Stallworthy.*] Have you any idea of the number of mills in your district?—There are eighty mills altogether, but fifty-six of these are old mills which are simply used for supplying local requirements, and the timber is cut off private lands.

165. Do you know about the number of men employed in the sawmilling industry in your district?—About 480 employed directly.

166. In reference to the holding of licenses, you said there were thirty-three licenses in your district, and that some people held a license for forty-two years. Can you give us the average life of a license?—No, I could not. There is no data on which to build a reliable estimate. Some hold for five years, others for fifteen, and others again for twenty years.

167. What royalties do they pay?—They pay according to the schedule in the regulations under the Mining Act. I will quote the royalties for your information:—

Rate of Royalty on Timber cut under Sawmill Licenses issued under the Mining Act.

	Per 100 Sup. Ft. s. d.
Class I,—	
Totara and matai not less than 25 ft. in length, puriri, maire-ranui, silver-pine, and pohutukawa	2 0
Class II,—	
Totara and matai less than 25 ft. in length, rata, tangeao, manuka (tea-tree), manoao, tanekaha, kawaka, kaikawaka	1 0
Class III,—	
Rewarewa, mapau, toro, hinau, miro, black and brown birch ...	0 6
Class IV,—	
Mountain and silver beech	0 6
Class V,—	
Rimu (red-pine), kahikatea (white-pine), kamahi, pukatea, tawa ...	0 6
Class VI,—	
Blocks for paving sluices	0 2
	Each.
Railway-sleepers	0 2
Class VII,—	
Puriri, totara, silver-pine, and matai posts and sleepers shall be charged under Classes I and II, according to the description and length of the tree.	
	Per 100.
Other posts, rails, and sleepers	8 0
Fencing-stakes	4 0
	Per Cord.
Firewood	1 0

168. They pay according to the sawn output?—Yes, the bushes. They are not put to competition in this district.

169. Do you not think that payment upon the sawn output leads to a good deal of waste in cutting the log?—I dare say it does, but the waste is unsaleable. There is considerable waste in some mills.

170. Do you think it would be better to charge on the log?—I think the sawn output is the fairest.

171. Although the timber is allowed to waste?—There is bound to be a certain amount of waste. The stuff that is called "waste" could be utilised if you had a market for it, but there is no sale for it.

172. You think it is fair to pay on the sawn output?—I think so, as a compromise.

173. *Mr. Mander.*] In the matter of royalties, do you not think that the same law should apply to both Islands? Is there any reason why the royalty should be less on the West Coast than in the North Island?—I do think the same law should apply. The rates of royalty to which I have referred apply all over New Zealand—to mining areas in Auckland the same as in Nelson—there is no exception made. Where the forest is ordinary forest land outside a mining district the regulations under the Land Act apply. You will therefore see that our forest areas are worked under separate sets of regulations, those under the Mining Act being different from those under the Land Act. The Land Act regulations are the fairest and most workable.

174. In regard to land-settlement, is it not a fact that in mining areas land can only be leased from year to year?—No, that is wrong. You can lease land in mining areas in this district for twenty-one years, and on renewable lease if the area applied for is not auriferous. It must, however, be approved by the Warden. For instance, if a man applies for 200 acres of land and the Land Board approves, I forward the application to the Warden for his approval. Land is very rarely disposed of for cash. The Mining Act gives more power to the Warden with regard to the sale of lands and the leases of lands than the Land Act does to the Land Board.

175. In the district I represent if a person wants to lease a mining area he is told that he can only lease it from year to year, for the reason that it is under the Mining Act?—That may refer to a piece of land that is wanted for mining purposes. If the Land Board adopted that attitude in Nelson close settlement would cease.

176. *Hon the Chairman.*] A lease does not bar mining?—No.

177. *Mr. Mander.*] You say the land here is unsuitable for agricultural purposes at the present time?—I was referring to *pakihi* land, open areas, and forest areas generally swampy.

178. I noticed some pines growing in similar land the other day, and they looked healthy: do you not think that land that would grow pines would also grow other classes of timber?—White-pine grows on damp land; beeches will not grow there. It all depends how you treat the land. It might be drained and sweetened. I believe that no land is absolutely useless. Land that will grow weeds will grow grass; it is all a matter of cultivating on a scientific system.

179. Do you think the Government should take into consideration the question of planting a large area of this country with trees for future use?—That would require very careful consideration; the closest inspection and care would have to be given as to the nature of the soil and the suitability of the climate, which are factors in tree-production.

180. Do you not think it would be more advisable for the Government to take the question of afforestation of these lands into consideration rather than the idea of preserving or conserving the existing forests?—Yes, I do. I take that view of the question, because you cannot have both settlement and the retention of the bush.

181. Do you know anything of the North Island at all?—Only of the Province of Wellington.

182. I suppose you are aware that in kauri districts there is far greater danger of fire than in districts along the coast here?—So I have heard; I cannot speak from practical experience.

183. *Mr. Barber.*] With regard to timber areas, is it possible if a large area is available for a man to get 1,000 acres?—Yes, by obtaining a fourth reserved area. Ordinarily he can take up altogether 800 acres—that is, he has his original license of 200 acres, with three reservations of 200 acres each, and an additional 200 acres may be granted by the Warden. As soon as he has cut out his first 200 acres he becomes entitled to a further reservation of 200 acres, thus maintaining perpetually a total of 800 acres, or 1,000 acres as the case may be.

184. So that in the end it might go into thousands of acres?—Yes, if no other man obtained areas behind him and blocked him.

185. *Mr. Hanan.*] What section is that in?—It is in the Mining Regulations—Regulations 108 and 110.

186. We should have that on record; it is very important?—The regulations were in force before the passing of the consolidating Act of 1905. They are in force now.

187. *Mr. Barber.*] Does that apply to the Mining Act or the Land Act?—It applies to both Acts, or rather, to the regulations under these Acts.

188. *Mr. Morris.*] I know a good deal about these regulations, and I think there is a doubt regarding these 800 acres about which you have been questioned several times during your evidence: that is all a miller is able to take up?—That is all. As a rule there is a condition respecting distance from a railway-station to which I have already referred, which permits of 1,000 acres being acquired.

189. But there is nothing at all to prevent anybody else taking up all the adjoining lands?—There is nothing to prevent that being done.

190. *Mr. Field.*] If it is taken up a man cannot extend his area?—That is so; he cannot extend—he is blocked.

191. *Mr. Ell.*] With regard to sleeper-cutting licenses issued by the Warden, I understand that a man holding one of these may cut wherever he likes: does that not create a very great

element of danger as to fire through the withered and dry strippings of the trees?—Yes, he fells the tree, leaving the tops, which soon become dry and inflammable, and being yellow-pine the danger is very great to the surrounding forest.

192. *Mr. Morris.*] I think, in speaking with regard to rent at 1s. per acre, that that had reference to royalty, and that it only applied to the sawmill area?—It applies to the sawmill licensed area, and also to the reserved areas. All sums paid as royalty go towards satisfaction of rent.

193. The land and the reservation is not credited with royalty—the Crown gets that?—Yes, that is so. For the three reservations usually granted to the sawmiller he has to make an annual application, which appears to be hardly necessary.

194. You do not approve of that?—I do not.

195. With regard to sleeper-getters, you disapprove of them having a roving commission?—Yes, from a national point of view I do.

196. Now, with regard to sleepers, say a man wants a thousand: he will go into a very fine piece of bush, cut down a tree, take a length out of the middle of it, leaving about 3 ft. at the bottom and nearly 4 ft. at the top, all of which under proper economic conditions could be utilised—he just takes the part of it that is easiest to take?—I have had such cases reported to me by the Crown Lands Rangers.

197. *Mr. Ell.*] It is a very dear business, that is all I have to say?—There is no reason why he should have that preference. The sawmiller cuts sleepers under his license, but does so in such a way as to clean up the forest.

WILLIAM HENRY BOWATER, (of the firm of Bowater and Bryan), Sawmiller, Westport, sworn and examined. (No. 61.)

Witness: On behalf of the Westport sawmillers and employees I extend to you a hearty welcome. We are all looking forward to some results from the Commission. I regret I have not been able to go into this question as exhaustively as I should have liked, owing to my not having sufficient time at my disposal during the last fortnight. However, I shall do my best. It has been said that the millers of the Dominion have put the f.o.b. rate of timber up to an exorbitant price. Now, I think, when I produce figures later on, you will see that these statements are not correct. The selling-price has only advanced 6d. per hundred feet during the last five years. I am speaking of my own district, and it cannot be said that 6d. is an excessive advance when you consider the increased cost of haulage, maintenance, labour, and other expenses in connection with getting timber, many of which have been imposed by the legislation of the last five or six years. The importation of Oregon pine, we contend, is a mistake from a national point of view, when we have timber which is suitable for our local requirements. That being so, it must be a bad business from the Dominion as a whole to import timber from abroad. For the sake of argument we will suppose we have two cottages to build. One we build of Oregon, and the other of red-pine. In the case of the Oregon cottage you have only the cottage in the country and the Americans have your money, but it is different in the case of the red-pine cottage, because in that case you have both the cottage and the money in the country. I think this is a strong argument against the importation of Oregon in competition with our own timbers. It must not be overlooked that the f.o.b. rate of timber, or, in other words, the price of timber, represents not less than 75 per cent. of labour. Then, in the matter of freight, 75 per cent. of that is labour. In connection with our tram-lines for the carriage of timber, it is all labour employed in the country, with the exception of the iron rails. Apart from the freight on our railways being chiefly labour, the freight of shipped timber by sea is largely labour—labour employed in the country. We know, too, that we have had railway and shipping freights bumped up on us during recent years, and there has also been an increase in the cost of labour. Leaving that part of the question, and coming to the more minute cost of production, I will deal first of all with insufficient areas and bad tenures. The areas held by sawmillers to-day are quite inadequate to admit of the construction of an up-to-date plant for milling purposes. Our maximum holding is confined to 800 acres, unless we happen to be four miles away from a port or a railway, when we are permitted to hold, under the Act of last session, an additional 200 acres, bringing the total area up to 1,000 acres. We sawmillers know perfectly well that even 1,000 acres is not nearly sufficient to warrant us putting up a proper modern plant. Suppose you submitted that 1,000 acres to auction, including the land and timber, what would it bring in open market? Why, it would not bring nearly so much capital as is required to build a modern plant on it. How can millers under these conditions of tenure put up a modern plant such as is required for cutting a proper area of timber? Formerly the 800 acres was sufficient, for the simple reason that as the railways extended the millers could put their mills alongside the railway-line at a comparatively small cost, and fell their timber practically on to their benches. At that time, nine years ago, we were cutting timber under those conditions, and landing it on the wharf or f.o.b. at 5s. 6d. a hundred feet. We were then making money; at any rate we were making a living, which is more than we can say we are doing to-day. Although there has been a rise of 2s. 6d. in the price of timber, the conditions obtaining now as compared to then are more than the rise represents. We had no tramways to maintain—in some instances we pulled the timber right on to the skids at the mill, in others we had short lines—and millers at that time simply planked down their mill in the thickest of the bush, where it was heaviest, and the more sparsely timbered areas were left there. Now we are working with much-increased cost of production. In regard to the tenure, although we have no objection to working under the Mining Act, we think that we should not be compelled to go to our solicitor to make an application every year for those reservations. We think that is an

unnecessary expense. The mill area is granted usually for twenty-one years—it has been in our case, and the reservations for one year—that is, three reservations, making up a total of 600 acres for one year each. That seems to me to be a piece of absurdity. If the sawmill area were granted for five years, and the reservation for twenty-one years, there might be some sense in it. The present conditions seem to be the height of absurdity and expense on the miller. We should like the mill areas extended to, say, about 800 acres, and three additional reservation areas of 700 acres each, bringing the total up to 2,900 acres—that is, if we obtain our areas in the same way that we do now. This, we think, would give us a fairly good area on which to put a plant, and a man then would be justified in putting such a plant down as is required for cutting long lengths for our warehouses that are being built in the cities to-day. It is a well-known fact, and it has been thrown at millers that they cannot cut long lengths. Why? Chiefly because we have not been asked to do so in the first instance; and, secondly, because we have not got the plant. We have not laid ourselves out to do that work. The reason of that is that the areas are not sufficient to warrant the expenditure on a mill capable of handling 40 ft. of 50 ft. lengths. I have a good number of figures regarding the cost of production which I will be pleased to give the Commission in committee. I do not know that I can say any more with reference to the general argument. I have, in addition to the figures, written declarations which I will be pleased to give the Commission in committee; but the people are reticent about making these figures public property. I will likewise be prepared to give evidence in committee on these matters which I do not feel disposed to make public. I might generalise by saying that in the Westport district we find that the cost of production ranges from 7s. 4d. to 9s. 8d. per hundred feet. Those mills that are less advantageously situated have, of course, the dearest production—they are not exporting. I might say that they are mills that cater for local requirements, therefore we have not taken their figures into account very much. I do not know that I can say any more in respect to these figures except that I might touch upon the rate of wages ruling in our district and the number of men employed as compared with this time last year. The total number of men employed in the Westport district this year is eighty-one; last year at this time it was 110 men. Wages during the last five or six years have increased about 20 per cent., which accounts to some extent for the increased cost of production. Then, in regard to our haulage, where we started to cut nine years ago we had bush practically to the mill; now we are over three miles from the mill. We are bringing in our logs with horse traction; the areas are insufficient to construct steel tramways and put in locomotives, and we have to content ourselves with horse traction, which is the most costly. It is costing us on an average 1s. per hundred feet to bring the logs in from the bush to the mill, and that is a charge on the production the same as the 20 per cent. increase in wages. Then, again, there is the maintenance of these lines to be taken into account, which, of course, will bring the increased cost up to something very considerable. I do not know that I can say any more. I think I have said all that I am justified in making public.

1. *Mr. Morris.*] Your business is chiefly in local trade, I think?—Yes, we are engaged in both retail and wholesale trade. In one mill we are cutting for export, but at the present time there is no export. I did the usual round of soliciting orders about six weeks ago, and landed in Timaru. There I found a boat unloading half a million feet of Oregon pine. As a result I wired my partner that there were no orders, and to reduce the hands, which he did. The Oregon being landed then was, I understand, being sold at 12s. It is impossible to land timber from Westport to be retailed in Timaru at that figure, so there was nothing to do but to shorten the hands.

2. So that at the present time you have no export orders in hand?—We have a little, but we are going very slowly. At the present time we are working with seventeen men short of our complement, and the principal number of these were engaged in the export trade.

3. You have had to put off seventeen men owing to the want of demand?—That is so.

4. There has been a great outcry about the increased cost of buildings: has the cost increased in Westport in the last five years?—I could scarcely answer that. Of course, we all know that the cost of everything has gone up, and the cost of building has gone up too. Material has gone up, and it is likely that the cost of building has gone up; but I think that the increased cost of timber has had very little to do with the increased cost of building, because when you go into the matter you will find that in a house that will run into £1,000 in Wellington, Christchurch, or Greymouth there will be only about 14,000 ft. of timber in the whole house. Supposing the timber has increased 6d., which we all admit, what is the cost of that on the whole building? It is only 5s. per thousand feet. The whole thing is not £5 from a timber point of view, and how the increase on a building can be caused by the millers I fail to see.

5. On a house containing 10,000 ft. of timber that would only amount to £2 10s.?—That is so.

6. Does that represent anything like the increase in the price of buildings erected in Greymouth?—I could hardly be sure on that point, but I do not think it would. I could not say definitely, because I have not made inquiries. I think the buildings have advanced considerably more than that—that is, the cost has gone up considerably more than is warranted, seeing the small increased cost of timber.

7. Do you attribute the slackness of trade altogether to the importation of Oregon?—Not altogether. I think, of course, that the stringency in the money-market has something to do with it; but we brought that on ourselves to some extent. If we are going to import and send our money out of the country, of course the money will become scarce in it.

8. *Mr. Hanan.*] Have you got a schedule of current prices? And if so, will you put that in?—I have not any schedule of the selling-price of timber—I presume that is what you mean—but I can give you the prices. The present export price of timber is 6s. 9d. per hundred feet for scantlings O.B.; dressed lines, 8s. 6d.—that is, our first quality. It averages in the majority of cases slightly under 8s.

9. Is that f.o.b. Westport?—Yes, and the same figures apply to Greymouth.

10. Can you give us any idea of the prices five years ago for the same items?—Then, we were working under an entirely different price-list. The merchant then took the whole contents of a log at 7s. 6d. Now, of course, timber is classified. Some time back we brought scantling sizes down to meet the unfair competition of Oregon. They were sending two or three classes of Oregon, which we found were competing with our red-pine, and we reduced the scantling sizes to compete with the Oregon. In consequence of that, and seeing that our marginal profit is none at the present time, we had to put up the dressed lines to compensate for the loss on the scantlings.

11. Has the kauri gone up in the last five years?—The water freights have gone up. It went up 3d. per hundred feet in the last twelve months.

12. Tell us how you get your stuff to market. Is it by water-way?—In the Westport district, speaking of our own firm, we have an 8d.-per-100 ft. freight to the wharf. We then send our timber by steamer the same as from here. The other millers on the Government line towards Seddonville are working on a 1s. 3d. freight basis. Our railway freight for the whole district averages about 1s. That put on to the shipping freight runs our freight up to about 4s. per hundred feet.

13. Would you tell us where your best market has been during the last three years?—Christchurch and Timaru. We have sent a little into Wellington, but not very much.

14. When did you have your best year at these places in point of profit?—About four years ago.

15. What about the Exhibition year? What about your output then as compared with previous years?—Of course, there was a great demand for timber during that year, and a great quantity left the Coast during that time. I think that during the year there was not so much selling locally. As far as Westport is concerned, that was so. The local demand has become greater since that time, but we have had no difficulty in supplying orders.

16. Do you supply local orders?—Yes.

17. There has been no complaint about them not being supplied?—No.

18. Do you supply timber to the Government?—Yes, the Government railways.

19. Have you been able to supply all the orders requisitioned for during the last three years for timber?—I think so.

20. To the Railway Department?—I would not say we have been able to do so to them. The Railway Department wants a perfect timber, and we have not been able to arrive at a price that would pay us to cut for them. They want the timber suitable for cabinet-work, and only want to pay the rough-timber price for it.

21. The reason orders from the Government to you millers have not been filled is on account of some dispute as regards prices?—I am speaking of our own firm. At times we refused to supply the Railways because it does not pay us to supply the class they want.

22. What is it?—Rimu for building carriages—perfect stuff. It can be got at a price.

23. Do their orders amount to much? Do they use much timber?—I think they use a considerable amount of timber.

24. How many mills have you working at Westport?—Three.

25. How many did you have five years ago?—Two.

26. When was the last mill erected?—It was not erected. We sold a property in the Grey Valley and purchased one at Westport to concentrate our efforts in Westport.

27. Was that because the mills you had were not able to supply the orders?—No.

28. Why did you purchase it?—To enable us to hold areas that otherwise we should not have been permitted to hold by law.

29. Is that mill working now?—Yes. I might say that if the law would allow us to concentrate our efforts on one plant instead of three we might then be able to make something out of the timber. At present we have to employ three engine-drivers to do the work of one. I think the regulations should be altered in the interests of the millers and the country.

30. What does tramway traction cost you?—£2 10s. to £2 15s. per chain. There are thousands of pounds' worth lying idle. That is where our profits go.

31. What is your cutting-capacity?—About 10,000 ft. per day.

32. What is your output at present?—Very small since Christmas—only about 70,000 ft.

33. Six months ago?—Probably about 80,000 ft. a month.

34. When did you first find your orders falling off to any appreciable extent?—About ten months ago—coincident with the time that Oregon began to come into the country in quantities where it comes into competition with our ordinary building-timber.

35. What was the price of Oregon then in Christchurch? Do I understand you to say that ten months ago you found Oregon coming into the Christchurch and Timaru markets to such an extent as would cause a falling-off in your orders?—Yes.

36. Can you state the extent to which Oregon has come into Christchurch?—I am not in a position to give that, but you can get it.

37. Do you know what the red-pine timber-supply is?—I am not quite sure, but I should imagine that within the past it would amount to about forty millions a year.

38. What is the proportion of the supply of Oregon?—I am not quite prepared to answer that question, but the figures can be got. Of course, when I say forty millions I am taking in the Exhibition time. It fell off very much this last twelve months. Now there is practically nothing going there from our district.

39. Seeing the amount there is coming in these last three years and comparing it with the amount of the sales of New Zealand timber, do you think that is sufficient for you to say that your orders have fallen off to an appreciable extent on account of Oregon coming in?—I do, for the simple reason that it came into our markets. There are a great many markets it is not likely to find its way into in the interior.

40. We were told that Oregon does not find its way into the country districts of Canterbury?—I believe so.

41. Do you know if there is much of a profit on Oregon?—I am not quite prepared to go into that, but I should think that those who want to import Oregon want that which they will make the most of.

42. You say that you attribute the slump to the importation of Oregon?—Largely.

43. Can you give me a few facts on which you base your opinion?—While there has been a depression all over the colony, Oregon has been coming in very rapidly during that depression. If Oregon had been excluded we might have been able to tide over that depression, but it has made it very bad for us. Oregon coming in at a time when we could not afford to lose the little trade that we had has practically put us out of the market.

44. Has any timber-merchant cancelled his orders with you on account of Oregon pine coming to this country?—Yes, they have wired to us not to send them for three or four months.

45. And what is the reason of that?—Overstocked with Oregon pine in some instances—not in all.

46. But were they not overstocked with other timbers besides Oregon pine?—Yes, I think so in some instances.

47. Does that not point to the fact that there has been a falling-off in the building trade?—That is so, yes. I am prepared to admit that.

48. Do you not think that is the chief reason why the sawmillers are slack to-day?—Probably it is. I should say it is the chief factor, but Oregon pine is a very close second.

49. In Southland there is a slackness, and very little Oregon pine goes down there. They attribute it largely there to the fact of the tightness of the money-market and also to the building trade having fallen off?—Yes.

50. As to the question of duty, what do you suggest in the way of dealing with the importation of Oregon pine?—Well, I look upon the matter of a duty as a question of policy. It is hardly a question for the millers to place a duty upon the imported article; it is simply a question of policy and protection. I consider it is to protect our labour, pure and simple. That is what is wanted. We have more costly labour in this country than they have in the country where the Oregon pine comes from.

51. Would not that increase the cost of building houses in the cities?—Well, it might to some slight extent. As I said before, I think I made it fairly clear that the cost of the timber has very little to do with the increased cost of building to-day.

52. When you send for the imported article the money goes out of the country. Now, do you not recognise that in timber you do not have an annual crop? It is a rapidly vanishing quantity?—That is so.

53. And do you not think it is desirable to conserve such an asset to some extent?—I do not think so. I think it would be a waste of time and money. You are paying too much to conserve it. Having turned it into money, what would that be worth to you in fifty or sixty years' time. I do not think it is a good business proposition.

54. You only look at the needs of to-day so far as timber is concerned?—Yes. To some extent we could conserve it on the hilltops and in more inaccessible places. It will be opened up eventually, no doubt, as the colony gets older, but at the present time I really think it is out of the question to conserve our forests. If you could cut that timber and promote settlement and turn that timber into money, there is the interest on that money.

55. Where are you to get the timber in the future to meet future needs?—That is a question to be faced. I certainly would favour tree-planting, and I undoubtedly think that should be done.

56. Do you know how long it takes for trees to grow?—New Zealand woods take a considerable time. I do not think we have any data to show how long it does take. I have not seen any.

57. In face of such a fact and after what we hear now about our forests being cut out in thirty or forty years, will not the scarcity of timber be a serious question for the future generation to face?—It might be in two or three hundred years to come.

58. How long would you give it in this part of the country?—That is a very difficult question to answer. I should have to traverse the country to see, but the resources of the West Coast are practically untouched. It is only just a little strip alongside the railway-line which has been milled. If you get a plan of the railway-line you will see so many dots where the timber is being cut.

59. Do you say the timber is as good as it was twenty years ago?—Yes, but the cream of the timber alongside the railway-line has gone.

60. Is not the bush more difficult to work now?—Yes, that is so, because we are confined to a certain radius from the railway-line.

61. Can you state what the difference in the cost of production is now compared with ten years ago?—Yes, the cost of production now is fully 40 or 50 per cent. more than it was ten years ago.

62. Now, in another fifteen years' time, what would you say would be the increase in the cost of production?—That would entirely depend on the legislation of the country.

63. Would it not increase as they have to go further back?—Well, I do not think it would, because if the areas were enlarged and the restrictions taken off——

64. What restrictions do you suggest should be taken off?—The restrictions in regard to holdings and the tenure of the areas increased proportionately with the expenditure. We might go ten or fifteen miles away from the railway-line and bring it in that distance as cheap as we now can with horse traction, but it is a question of capital.

65. If there had been no alterations in the direction you suggest, is it not reasonable to conclude that in the next ten years there will be a substantial increase in the cost of production?—Yes, I do think it is reasonable, but I think we might cheapen the cost of production. It is in the hands of the country to do it.

66. Even if those restrictions are not removed?—I do not think that. If the restrictions are not removed it is impossible to cheapen the cost of production; it will increase. If other things increase, of course the cost in the production of timber must increase. That is inevitable.

67. That means the price of timber will increase?—Yes, undoubtedly.

68. With the increase in the cost of production?—Yes.

69. You heard Mr. Flanagan's evidence?—Yes, part of it.

70. You heard his evidence with reference to taking the power of issuing licenses for timber areas out of the hands of the Warden and placing that power, and also the control of the forests, in the hands of the Land Board?—Yes.

71. What are your views on that question?—Personally I do not know that it matters much from which Department we obtain our areas, so long as we can procure a sufficient area to warrant our putting up a fairly modern plant. I do not think it matters twopence to the miller whether he obtains his area from the Warden or from the Land Board; it is a question of sufficient area.

72. You heard him give a reason why it should be done—he objected to the Warden—and it is a question of working the bush to the best advantage?—I do not know whether it would be an improvement. Probably it would be to have it administered by the Land Board.

73. Would you object to it?—I do not think I would.

74. Do you know the reason why the Warden had that right?—Well, because we are working under the Mining Act, and the Warden administers that Act.

75. Do you think it would be better if under the Land Board Act?—I would not say it would be better, but we think it would be better to give us larger areas. That is what we are after. It matters not to the miller whether he gets his area from the Land Board or from the Warden.

76. Has the building trade fallen off in your town?—No, it has increased somewhat.

77. Are there any timber-merchants there?—No, there are no timber-merchants.

78. You supply the timber to Wellington?—Not of late, we have not.

79. Do you allow a discount to the timber-merchants in Christchurch?—Yes, a discount of 2½ per cent.

80. Are you a member of any sawmillers' association?—Yes.

81. What association?—The Westport Association.

82. How many members belong to the Westport Association?—There are seven mills in the association.

83. When was it formed?—When it was formed it was only to control the local trade—that was about five years ago.

84. What are the objects of the association?—To place the trade, if possible, on a fair and sound commercial basis.

85. Do you find there is much cutting between the millers?—Yes, there is always a lot of cutting, because, unfortunately, if a man is going to build a house he would tell Jack or John what he was doing, and it was to prevent that sort of thing that we formed the association.

86. Supposing the regulations are not observed, is there any penalty?—Yes, there is a penalty of £25 if the rules are broken.

87. Can you say if the conditions are observed?—Yes, fairly well. We have had no friction to speak of.

88. Is there any connection between you and the sawmillers in Greymouth?—We work together. So far as the export of timber is concerned we are compelled to do that, because we send the timber practically into the same market.

89. Are your prices the same as the Greymouth prices for Christchurch and Timaru?—Yes.

90. What profit do you consider it is fair for a miller to take?—Something more than he is getting.

91. What would you say?—I think if we had from 1s. to 1s. 3d. clear profit we should consider we had a very good thing on.

92. In Westport are you working under the Arbitration Court award?—No.

93. Are they in Greymouth?—I do not think so.

94. Is it true you pay higher charges on the Coast than in other parts?—Yes, that is true.

95. You say none of the millers in Westport are making a living?—They are practically living on depreciation.

96. Would you say they are losing money?—Practically, they are.

97. How long have they been losing money?—They have been going back gradually during the last three years.

98. None of them have shut up or closed down?—No, they will not shut up while they can get the bank to advance their requirements.

99. Do they all have overdrafts?—I think so, without exception.

100. I suppose you have a balance-sheet?—Yes.

101. When did you make your last balance-sheet out?—My balance-sheet for this year is not made out so far, but I have it in a rough way. We get at our position every 31st March. I have a balance-sheet here, and will submit it to the Commission later on.

102. Have you any objection to saying whether it shows a profit or a loss?—I have no objection at all in saying that it shows a loss.

103. That is compared with the previous year's working?—Yes.

104. *Mr. Jennings.*] Does your firm supply to any person who wants timber, whether builders or not?—Yes, we do. Of course, in the export trade we do not care about doing it. You cannot

be an exporter and a retailer combined. We realise this, that very often we should be sending our timber away and we should not know the standing or position of those people who are receiving it at the other end. It suits the miller very much better to confine his export business to timber-merchants, because he knows where he is.

105. What I mean is this: Can a local resident obtain timber from you at the current rate without without going through an architect or builder?—Oh, yes! decidedly—most of them do.

106. In reference to the question of sleepers, does the private contractor to any extent interfere with the sawmiller, or is there any hostility between the two?—What do you mean by a "private contractor"?

107. A man who will undertake to supply 10,000 sleepers to the Railway Department?—You mean is there any friction between him and the sawmiller?

108. Yes?—I should think there is. A sawmiller wants to have about five hundred eyes in his head to watch them. He gets on your areas, and you cannot be there every day in the week watching him. There will be one man there to-day and another to-morrow.

109. Have you any objection to his making a living?—Oh, no! we have all got to live. We realise that, but we have a decided objection to paying rent and allowing another man to mess the area up for you. He can get a living without doing that sort of thing.

110. *Mr. Field.*] You say that the milling business is in a very bad condition in this part of New Zealand just now?—That is so.

111. When you say no mills have closed down, I suppose it is very difficult to close down a mill—it is better to keep going?—Yes, we have got to hang on as long as we can. We have had to reduce—we have had men knocked off pretty well for all January, all hands, and we have been running five days a week, and on holidays we also knock them off. If there is any holiday or sports meeting on we take advantage of it and knock them off during the slack period. The men do not like it, but they realise their position, and also realise that there is no help for it.

112. You spoke with regard to the increased price of timber. Had prices been going up to the time Oregon pine came in? I mean, was it by any means necessary that some foreign timber should come in to put an end to the millers' capacity?—I do not think so. I think our positions would answer that question very clearly. The figures will show that.

113. You think that in five years the price of ordinary building-timber has gone up only 6d.?—Yes.

114. You stated that the prices delivered on the wharf were 6s. 9d. and 8s. 6d. What class of timber is that?—Rimu.

115. But what class?—The 8s. 6d. class for dressing-lines. The scantling I think I said was second-class. We term it the off-cut sizes. Of course, people do not care about putting second-class timber into buildings. It is O.B. sizes. The second-class timber we have not a sale for—it is so low that it is not worth bothering about.

116. Is it fit for building purposes?—No; it is really not. Out of shaky heart we make our tramway-rails, and timber that is not fit for sale goes into the tramway-work for our bushes.

117. Have you any difficulty in selling your heart of rimu which contains resin?—Sometimes we have, but not at all times. When there is plenty of cutting you can get rather more of that than you know what to do with, but at a time like this you have no difficulty at all in selling it; but it would not pay you to cut it alone, because there is very little black heart in it. The Railways will not take other heart; they must have black heart.

118. Do you sell it locally?—Yes, and some of the better quality we ship for sash and door work, but principally for door-work.

119. Is it true that Oregon pine is largely taking the place of rimu for framing of buildings?—Yes, that is so.

120. And does that have the effect of preventing you from selling the whole of the output of your log?—Yes, that is the position. We can sell our boarded sizes, but we are making so much scantling that we do not know what to do with it. That is the reason we reduced the price of our off-cut sizes.

121. Speaking from your own knowledge, is good resinous scantling, rough rimu, as good as Oregon pine for framing?—Well, I have had no experience of Oregon pine, but from what I have heard it is certainly better. If I were building myself I would certainly have heart of rimu. You would have a building to last a lifetime, but I doubt whether you would have that with Oregon pine.

122. We have been told that it twists and warps and cracks the plaster?—I think you were told that by someone who wanted a profit out of Oregon pine. It is a singular thing that we have been able to construct our buildings without Oregon pine, and now the article that has been carrying us through is the worst in the world.

123. You said you thought the importation of Oregon pine is a bad thing from a national point of view?—Yes, I think so.

124. What are your reasons?—I think that the duty on Oregon pine is, firstly, for protection, is it not? It is not for revenue purposes. Well, if the duty that the Oregon pine is now carrying does not give the protection sought, I think we should increase it, otherwise you want to wipe it out. What is the use of the duty in that case. If it does not give the protection we want wipe it out altogether and go in for a free-trade policy.

125. Now, supposing Oregon pine continues to come in as it has come in during the last year, what is the future of your mills here?—Well, I think the mills would have very very little future indeed. As mills they would be shut down. Our men and ourselves would probably have to go to Canada or America to supply New Zealand.

126. If the condition of things continues which has existed during the last few months, then the mills must close down?—Yes. We are now having a very bad time so far as the timber industry is concerned, and unless something is done to improve the position there must be a large clearing-out of the timber people in this country.

127. And you know the money goes out of the country also?—Yes.

128. I suppose you cannot tell us very much as to whether the supply of Oregon pine is a very large one—practically inexhaustible?—No, my knowledge of that is very limited. I am not conversant with the conditions in America, but considering the amount of capital they are putting into their mills I should not think that it is a scarce commodity with them. They are spending too much money in building mills for that.

129. Do you say they are building mills now?—Yes, in some parts, so I am told. I have never been there myself.

130. Can you tell us anything about the durability of Oregon pine?—No, I do not know anything about the durability of it. I do know this: that if I wanted to build a house it would not be Oregon pine I would put in if I could get rimu.

131. *Mr. Field.*] What do you think of Oregon?—It is not a durable timber by any means, but that remains to be seen later on when we shall know more about it. It is not a good outside timber. I have no personal knowledge.

132. If it is true that Oregon pine will perish if in an exposed situation for, say, four years, do you think it is a satisfactory timber to use immediately inside a weatherboard?—It is apparently not suitable for inside work.

133. Is it suitable for framing-work?—No, I should not think it would be.

134. If it does not last for more than four years?—Our white-pine is good enough for four years' life, and that is the worst timber we have got so far as durability is concerned.

135. Do you know anything about the durability of our timber if it comes in contact with brickwork. No, I cannot say that I have had much, if any, experience. I have seen Oregon pine in Christchurch and Wellington that has been in for some time, but how long I cannot say, but from reports I have gathered it does not come up to expectations when it comes in contact with brick.

136. Will our timber stand if in contact with brickwork?—I think it does fairly well. Of course, it may be due to the class of timber that is being used. If you put in heart timber against it, then, of course, I should most certainly prefer our heart of rimu. I am quite sure that it is superior to Oregon pine when both come in contact with brick.

137. Do I understand, then, that until Oregon pine came here a year ago we were using our own timber and found it satisfactory for all purposes?—That is so.

138. You find your scantling or O.B. timber lying on your hands?—That is the position.

139. Is it possible for a mill to get along selling its first-class timber only, and thus having the second-class lying on its hands?—Quite impossible.

140. Something has been said about the very small fractional portion of Oregon pine imported as compared with output of timber here. We have in this colony imported about 20,000,000 ft. of Oregon pine whilst our annual output is about 430,000,000 ft., to which, as you will see, the Oregon is only about 5 per cent. Is that a fair way of putting it?—I do not think it is. It is a fair way for the Oregon pine people to put it. Oregon pine has not found its way into the interior. There is an immense amount of timber cut there which is not in competition with Oregon pine, and if that were excluded it would bring up the percentage of the imported article very materially. Then, again, we have got hardwood from Australia, such as ironbark and jarrah, which competes with our timbers—namely, totara and matai—but the competition is not very great. It is our red-pine that comes into competition with Oregon, and it is only in certain districts, and then the competition is with our O.B. quality red-pine, except for special purposes, such as sash-making, because Oregon pine is most adapted for that purpose, the reason being that it does not warp and twist and therefore does not break the glass.

141. So your calculation comes down to a very small proportion if you take off timbers that Oregon does not compete with?—Oregon is only competing with about 70,000,000 ft. of the timber cut in this country. Of course, Oregon is a very small fraction of the whole if you spread it over all the timber that is produced and imported in the Dominion.

142. Now, if you should take off the duty or reduce the duty on large sizes of Oregon pine, what would be the effect then do you think?—The effect would be, so far as I can see, if you take off the duty on large sizes that it would come in and compete with our timbers, because the larger sizes would be resawn and would compete successfully with our timbers for certain purposes.

143. Could they be resawn with sufficient economy to compete with our timber?—I think so. We show 1s. 9d. for cutting and loading. You can surely resaw for considerably less than that price, for the timber is softer, and when you have a square block to work upon. I should say it could be resawn for about 6d. to 8d. per hundred feet.

144. You are aware that we admit the logs free now, whilst from the country they come from they will not allow them to be exported?—Yes, that is the position; they want the labour on the cutting, but we are not particular.

145. Would it be possible to unship logs or large pieces from the boats at some landing in the harbour or bay without going to the expense of wharfage and have them resawn there by running them into mills at the water-side?—Yes, it would be possible if you put the mills alongside the water's edge. You would only have to run it into the mills, and undoubtedly that will be done wherever possible.

146. Were you in Wellington last year where a deputation waited on the Premier, and do you remember any offer being made by the Government to the millers then?—Well, of course, the millers suggested increasing the duty, and it seemed at that time to be the only reasonable way out of the difficulty.

147. Do you remember the millers offering to put their books into the hands of the Government?—Yes, that offer was made.

148. Presumably that offer still holds good?—Yes. All that we ask for is for the Government to place our business on a sound commercial basis.

149. Is it not true that the Government has already fixed rents in respect to Crown lands—that is, the royalties—and also to a large extent the price of labour? In fact, has the Government not already regulated the price of everything in connection with timber?—Yes, that is undoubtedly so.

150. Therefore, there is no reason that the Government should not go further and fix the price of timber?—I think it would be preferable to the present system. The public seem to think that the sawmillers are growing fat, notwithstanding the fact that we find things in a very chaotic state. The millers are not getting a return for the capital invested nor for their labour in running their business.

151. Is it not true that the Sawmillers' Association—combination or ring some people call it—is it not true that they fix the price of timber?—Yes, that is so.

152. If the milling association do it, why should the Government not do it?—There is no reason at all why they should not do it.

153. Perhaps the Land Board should do it?—Yes, we only ask for fairness. I think, if it was left in the hands of the Government, that they would give us a better price than we are getting now without their aid.

154. Some people are under the impression, Mr. Bowater, that the number of mills are being increased, and that new mills are growing up: is that so?—I do not know of any mills growing up. In my district no mills have been established recently with the exception of one little mill, but it is not working. They have knocked off and have gone in for contracting. You could not, however, call it a mill. They have not twelve months' timber to work on.

155. With regard to long lengths, do you think you could, assuming a larger area of timber land was granted, put up an up-to-date plant and turn out timber at anything like the price you can procure Oregon pine for?—I do not think you can compete in long lengths against them because now we cannot compete in the shorter lengths. We could, of course, cheapen long lengths if circumstances warranted us in putting up up-to-date plants The price would be very much below the present prices.

156. *Mr. Leyland.*] Now, with regard to the cause of the depression, you are aware, of course, that our exports have fallen off to the tune of £4,000,000 in one year?—Yes.

157. That is equal to £4 for every man, woman, and child in the Dominion, including Maoris?—Yes.

158. Is it not evident that that must have a great deal to do with the depression and the falling-off in orders for timber?—That is admitted.

159. And do you not think that overproduction has had something to do with the falling-off in sales?—Yes, overproduction has had something to do with it.

160. Do you think that overproduction in timber has had anything to do with it?—Overproduction in timber, yes, I think it has to some extent. All these causes go to make up the whole. We are suffering from a depression here now, and it takes all these causes in.

161. You admit that overproduction is another factor?—Yes, the production exceeds the consumption.

162. Then, necessarily, owing to the £4,000,000 shortage in our exports there has been financial stringency?—That is so.

163. It has also been aggravated by the indirect effect of the backwash of the financial panic that occurred in America last year, and consequently they were unable to buy our wools or spend money with us?—Yes, that probably has had something to do with it.

164. You are, of course, aware that the total import of Oregon is not equal to 5 per cent. of the output of the mills of the Dominion?—That is, when the whole of the mills are taken into consideration, but you are including timber that is exported, which is not right. Why not base your calculations on the timber Oregon comes into competition with.

165. I suppose you are aware that quite half the Oregon exported to New Zealand is still in stock?—No, I am not prepared to admit that.

166. It is a fact?—Is it?

167. Yes, and that would reduce the proportion of Oregon compared with the output of our mills to 2½ per cent.?—Yes, if that is true it would.

168. You have evidently got a mistaken idea that this Oregon is coming into competition with rimu only?—Undoubtedly it is.

169. The bulk of it is coming into and filling the shortage caused by kauri?—No. I think you are to some extent wrong there. In Christchurch I saw Oregon pine cut into four-by-twos, which was going into competition with our ordinary red-pine sent from our own district.

170. I am speaking of the Dominion?—That is so.

171. The proportion of Oregon coming into Christchurch is very small in proportion to the Oregon that has gone into the North Island—very small indeed—for the reason that fully 2 per cent. of the Oregon used has been used to replace kauri, and to replace rimu in places where, according to the evidence before this Commission, long lengths of rimu could not be obtained or could not be got in time for the work in hand?—Who said they could not be got?

172. The architects and builders?—The millers do not say that. The architects and builders are the people who want Oregon, and that is their reason for talking that way.

173. So far as the whole output of the Dominion is concerned, Oregon enters into competition to the extent of 6 in. to every 1,200 in. cut. Is your association a close corporation?—No.

174. Remember I have no objection to your association, because I think it is proper and necessary and that you are absolutely forced to have it?—We take in any millers.

175. Are you accustomed to pool orders?—No.

176. Is it the custom of the association in Greymouth to pool orders?—What do I understand by the term "pool"?

177. The orders go into the central office and are despatched by the association to the mills?—Yes, to some extent that is done, I know.

178. That is a point I want understood. If that is so and a man wants to start a mill and he can come into your association, he will first want his plant, and his next want will be a market. Now, if he can get a market he will not hesitate to start?—Yes.

179. If he knows that he can get a share of the orders coming to the association do you not think that that would have a tendency to make him start?—I do not think so. I have not found that as a result of my experience. It has not operated in that direction.

180. Are you aware that from the West Coast the output from 1905 to May, 1907, increased 7,600,000 ft.?—Yes.

181. Do you not think that that has something to do with the difficulty of finding a market for rimu?—I do not know that that is so. There is a difficulty now because there is no market.

182. There is no market for Oregon either?—No. I beg to differ from you there. Oregon has not fallen off; it is increasing, while our timber is on the decrease.

183. People who have bought Oregon will never buy it again. They have the stocks piled on their hands. If trade falls off generally there will be less Oregon sold?—Yes, that is so.

184. Speaking of exports, are you aware that in 1908 the increased production of white-pine by way of export was between eighteen and nineteen million feet?—Yes.

185. Are you aware that in ten years the output for the mills of the colony has more than doubled—that is, from 1907 and for the ten years previous to 1907. The last official figures shows an increase altogether out of proportion to the increase of population on the West Coast?—Yes, I have no doubt.

186. What is the population of Westland?—I suppose it is from four to five thousand.

187. I mean the whole province, including Greymouth?—Well, I should say about 15,000.

188. In March, 1901, the population was 14,506?—Yes.

189. In March, 1906, five years later, the population was 14,674, or an increase of 168 persons—that is, a centesimal increase of 1·16 during five years. You very much increased your production in that time. In the same period Canterbury increased her population by 16,000, Auckland by 35,000, and Wellington by 38,000; whilst in this district there is an increase only of 1·16 per cent. The Dominion has to-day a population of little over one million, and Westland has a population of one-seventieth of the whole. Now, I want to ask you do you not think that the requirements of the remainder, of the sixty-nine seventieths, are entitled to some consideration?—Yes, certainly I do.

190. With regard to your royalties here, how are they paid? Do you pay on the log—on the tree standing before it is cut, or do you pay on the sawn output?—We pay on the sawn output.

191. How often do you pay?—Every half-year.

192. You only pay for the timber that you actually sell?—We only pay for the timber that we cut.

193. And not until after it is cut?—That is so.

194. Then, you do not pay for the loss in conversion—that is, you do not pay on the 40 per cent. loss?—No, we do not pay that.

195. You do not pay interest nor take risk of fire rates on the standing timber?—No.

196. Do you not think that the millers in the other parts of the colony are in a less fortunate position who have to do all that?—I do not know. It is because we have to take risks of fires. We do not actually pay rates to insurance companies, yet we put a certain expenditure on to an area and if it is destroyed by fire we stand to lose.

197. You do not take risks on standing timber?—We take the risk of being absolutely ruined by a bush-fire.

198. If you paid for the timber on, say, 200 acres, and it was burned you would have to bear it?—Yes, that is so.

199. We have had in evidence before the Commission that the loss in conversion is 40 per cent. on log-measurement?—Forty per cent. Do you count the bark of the log, &c.?

200. The Southland millers pay so much, and they get so much timber. This is how it works out: In buying five millions you pay for it at 6d.—viz., £12 5s. The miller who pays on log-measurement has to pay for seven millions to get that 40 per cent. lost in cutting seven millions reduced to five millions, and he has to pay interest on the total amount, and he has to take the risk of the timber being destroyed in the meantime. I think your system is a right one. Do you not think it would be fair that the millers throughout the whole of the Dominion should have the same conditions that you have in that respect?—Well, I do not think we have got any advantage if you put our price against their price.

201. With reference to keeping money in the country, I think you know that the imports of New Zealand were £17,000,000, and the exports £20,000,000—a difference of £3,000,000 in favour of the colony for 1907. In view of that ought we not to be careful in regard to what we say about keeping money in the colony, as the money we have comes from the excess of our exports over our imports very largely?—That is a question of free-trade *versus* protection.

202. Looking at it from a Westland standpoint, Westland exported 425,011 pounds' worth of timber, and she imported £150,201, or a gain out of her exports of £274,810, and yet we are told that we should keep the money in the colony. Do you not think that is a little bit Gilbertian?—I do not quite follow you. We are all linked together in this Dominion. If you were not here probably I should not be here. You cannot consider small units in that manner.

203. Is it not a fact that, if you have an excess of £274,000 in your exports as compared to your imports, the balance is in your favour?—I am not prepared to go into that.

204. Will you admit that the Official Year-book is correct? This is taken from that?—I do not know what that has to do with our inquiry. I am not prepared to answer that question.

205. We were told that we ought to keep the money in the Dominion?—You go to the extreme. You send the money out of the colony, and do not protect your industries, and you find where you get to in the end.

206. If there be an excess of exports over imports, and the balance in your favour is £274,000, do you not think that to an outsider it looks very small to be talking about sending money out of the country?—I do not think so, that should be our policy.

207. Coming down to the produce of our forests, we exported in 1907 904,486 pounds' worth, and only imported 14,000 pounds' worth. In view of that, do you not think that to talk about keeping the money in the colony makes us look soft?—No, I do not think so.

208. We exported seventy-two millions' worth and only imported fourteen millions' worth, yet we are not expected to take in the other fellow's?—That is human nature.

209. With reference to the importation of Oregon, I want to speak of the urgent demand and necessity of it. We got an illustration of it in regard to cottages which is very wide of the mark indeed. The Railway Department are said to make 2¼ per cent. profit, on Oregon it would be 52½ per cent. Do you not think it is better to carry it at that percentage?—You can carry that line of argument to everything else, which will prove it is not sound.

210. With reference to the timber-crop of ours, it is said that there is only one crop?—Yes.

211. Do we plough for it, or do we sow it?—No, we took it from the Maoris.

212. Is it a national asset?—I presume it is.

213. Does it belong to one generation only?—No, it will be spread over a few generations.

214. Would you be surprised to hear that the highest authority in New Zealand—the Under-Secretary for Lands, who has grown with the timber business—gives it fifty years at the present rate of consumption?—Yes, I believe so.

215. Do you think it would be an advantage to the timber industry if the railway freights were reduced?—I think the railway freights on timber are fairly high, but I cannot see how we can reduce them.

216. What is the freight from Moana on rimu?—One shilling and threepence.

217. What is it on kahikatea?—The same.

218. Supposing you had a mill at Otira?—It is 1s. 3d. up to fifty miles, after that there is an alteration in the tariff. I do not know quite what it is.

219. We have a freight on both rimu and kauri from a station fifty-one miles distant, and we pay a freight of 1s. 5d.—2s. 2d. on the rimu and 1s. 5d. on the kahikatea. If you get the freight for fifty miles for 1s. 3d., do you not think you are being well treated?—That is export f.o.b. timber.

220. For Canterbury?—Yes.

221. Do you not think that is an anomaly that you should have timber carried for fifty miles for 1s. 3d. while we have to pay 2s. 2d.?—Of course, I cannot say what you have to pay.

222. Do you not think that is an anomaly?—Yes; I do not know what is the reason, unless your timber is much heavier in the North. The railways are only common carriers after all.

223. But they charge the same on kauri, and that is lighter?—You want to get at the Railway Department.

224. Your brother millers in the North Island, who are from a hundred and fifty to two hundred miles from the market, are agitating for a reduction in freights: would you be prepared to support them in their agitation?—That question does not affect us here; it is our shipping freight. If you will support us to get a reduction in our shipping freight, then you might reasonably ask us to support you in getting a reduction in your railway freight. The railway freight here is small compared with the shipping.

225. If they got a reduction in freight, would it not help them to compete with you?—That would not help us; we could not get a reduction that would be of any help to us on our short distances of railway. We are in a different position to you in the North; you have got long-distance freights there. What reduction could we get?

226. What are your rates?—Over forty miles and not over fifty miles, 1s. 4d.

227. What is the next stage?—It only goes up to fifty miles.

228. Speaking about the lasting qualities of Oregon, Mr. Morris was showing me, in Dunedin, where it had been there for forty-four years, and was as sound as the day it was put in?—Was it resting on brick?

229. Built in a brick wall, and carrying a brick wall as well?—Are you sure it was Oregon?

230. Yes. If we could show you a cottage fifty years old and perfectly sound to-day, you would consider yourself satisfied, I suppose?—Yes.

231. If we could show you a warehouse built forty-five years ago and the joists as sound to-day as when they were put in, what would you say?—I do not say you could not, but I say I am speaking of my own personal knowledge.

232. You speak of the increase of Oregon mills on the other side. Are you aware that this time last year 90 per cent. of them were closed down?—I do not wonder at that. Look at the price of this timber.

233. I suppose you are aware that the price has gone up, and is going up?—I heard that it has.

234. So that as an element of danger it is gradually growing less? It was also stated that before this time last year we did not bring in Oregon?—I did not state that.

235. It was in evidence just now?—The Oregon about this time last year began to come in in large quantities.

236. And the inference was that we were able to do without it before?—And we did up to a few years ago.

237. Is it not a fact that we have had repeatedly to send to Australia for Oregon to fill our wants in sizes, and pay up to 8s. 3d. freight for it?—I am surprised at that. I think there is something wrong when that condition prevails.

238. Do you not think it was foolish to pay 8s. 3d. and Australian merchants' profit instead of bringing it here direct?—I do not see why you could not bring it direct.

239. You said that there was a prohibitive duty in America on logs, and that that was why they did not come here?—I stated that the American Government wanted the labour on the cutting-up of the logs.

240. There is no prohibition against logs coming in here?—Bring the logs in and let us employ labour here to cut them up, but not the sawn timber.

241. *Mr. Clarke.*] I think you said that the average price was 8s.?—It works out a little below 8s.

242. Is that f.o.b.?—Yes.

243. Do you supply at the same rate to those who are members of your own or kindred associations as to people who are not members of any association whatever?—We do, but we do not supply outside of merchants. We confine our trade to merchants for our own protection.

244. To timber-merchants?—Whether associated or not.

245. Are there any merchants not associated?—Well, that I could not say. I think they are, but I would not be absolutely sure. I have never inquired. As a matter of fact I could not answer the question, because I have not asked.

246. Is there any understanding that you will not supply non-associated merchants?—I think so, but I could not really answer that question.

247. If the millers and the merchants' associations here and in other places are in combination is there anything to prevent a rise in the price at any time?—Timber would come in from other districts. There is nothing to stop other men from going outside and getting it elsewhere.

248. Supposing there happened to be a similar combination elsewhere?—If you want to suppose, I am hardly able to answer that. I do not deny that we confine our business to merchants, and it suits us better. To go into the retail trade we would want to be over there and run yards. It is too big a business to handle. It wants a man over there who knows the people he is to supply.

249. With reference to the consumption of Oregon in this Dominion, it is understood that we are an increasing community in numbers?—Yes.

250. There is not much reasonable doubt but that the Dominion will continue to increase in numbers and the demand for timber will increase?—That will all depend on the policy that is carried out. If we are going to import because it is cheaper, I do not think the increase will continue.

251. You think the demand for timber will go the other way?—Not only on timber, but on other things. We cannot have free-trade on some articles and protection on others.

252. Independent of policy, everything points to a large increase in the population in this colony?—I think so.

253. Is it not a fact that sawmillers here have all their work to do to keep the colony well supplied with timber?—I think they have done it. No doubt that was the cause of a good many mills going up during the prosperous times.

254. Seeing that we have only a limited amount of forest areas to work upon, if we do not increase the number of our mills and consequently the amount of our output, would it not be a reasonable inference that there would be plenty of room to import now and thereby stave off the time when foreign timber will have to be imported as a matter of necessity?—I think it is bad business to buy timber when you have got it at your door.

255. Do you not think that we should take into account future requirements?—Not to any extent. There are places where it may be conserved with advantage, and there are districts where if the timber was cut it would be unsuitable for settlement.

256. Will you admit that if the statements in official reports are correct probably in forty-five years we shall have no milling-timber in this country?—Probably so.

257. Is it not well known that not only here but all the world over the timber-supply is in the same position, and in some places worse than here?—Yes.

258. In forty-five or fifty years' time, if we have no timber left, what is to become of our future population? Are we not to look out for that?—Go on tree-planting.

259. Would it not be wise to go on importing and not increase our timber-mills?—Go on tree-planting. We have only the employment we can give in the colony. We have no other source of income. We have to meet heavy engagements for interest, and the only way we can do that is to employ our own people.

260. Supposing we had our timber cleared out in twenty-five years, should we not be absolutely dependent on foreign supplies?—That would all depend on what you planted. I do not know whether it is known how long it takes to grow a rimu-tree. It takes a very long time, I know.

261. You will take this statement as being approximately correct—that at the present rate of denudation we shall have no local timber left in forty-five or fifty years' time?—From what I know of the country I can say it will last considerably longer than that. It was said some few years back that the timber would become very soon exhausted at the present rate. Is not the rate increasing year after year and likely to go on increasing? As I said before, we are only cutting one little narrow strip alongside our railway. The timber country is practically untouched on the West Coast to-day.

262. It is understood that we only cover a small radius geographically?—They are only approximate.

263. It may turn out that we have less, then. It is not to be supposed that the timber-areas are in excess of the official estimate?—That is so. I favour tree-planting, but not to send out for timber and conserve our forests. To send away our money and conserve our timber at our doors I do not think is good or wise business.

264. You agree in the main that it would be advisable for this Dominion before long to undertake some system of afforestation, without suggesting in what way it should be done?—Tree-planting, I should suggest.

265. And that it is a matter of urgency?—Well, yes, I think the sooner it is done the better. It all depends on how long it takes to grow and mature.

266. With regard to the suitability of Oregon pine, do you not think it is unwise for timber-merchants who admit that they have no practical knowledge of the timber to attempt to discount its value by suggesting it is an inferior timber, in view of the fact that there are some of us here who have had practical experience of it for many years. Would it not be wise, at any rate, to leave that part as unproven?—Well, I do not know. There is a great difference in timber, even in the same classes of timber. I have seen a birch split post standing in the ground for forty years, and I have likewise seen a gate-post fall off inside seven years. You both may be right.

267. In a general way I think you agreed that Oregon pine was not good for outside work?—Well, I stated that my knowledge of Oregon pine was very limited, but it has been said it is unsuitable for outside work.

268. With regard to the question of Oregon pine *versus* rimu for plaster-work, you said you thought any question in favour of Oregon for that purpose would only come from people interested in Oregon. If you knew that in some parts of the Dominion architects are specifying that Oregon pine only shall be used for plaster-work where they have a free range of both kauri and red-pine, would that modify your opinion?—Have those architects had any previous knowledge of Oregon pine?

269. Yes, the one who made the specification is a member of the firm who had to do with the building of that warehouse forty years ago?—Well, what I said only came out as my opinion. I said my knowledge was limited in regard to Oregon pine.

270. *Mr. Barber.*] You said that the cost of production of timber at Westport ranged from 7s. 4d. to 9s. 8d.?—That is so—that is, taking in the local.

271. What do you include in the cost of production?—I include all expenses in connection with producing it.

272. Do you mean f.o.b.?—Yes, that is the cost of production. We have got it all worked out here in figures. Some of the mills at the time were not exporting, and, of course, they got very much better prices than 8s. at their mills.

273. It does not cost that much to produce the timber?—I said this is the production. The figures I gave show the cost of production. The only thing is that some mills are not exporting.

274. Whether they are exporting, that includes railage in sending it to the port?—No, we show that separately.

275. It does not include that?—No, it does not include that in all cases.

276. Then, if you are selling ordinary building-timber at 6s. 9d. and dressing-timber at 8s. 6d., you are going to the bottom of the ladder fast and furious?—That is where we are going.

277. You say that the average price, 8s., is less than the cost of production?—The timber cannot be produced and put on board at 8s. and pay the miller.

278. That is a different thing—I want the cost of production?—I have said I will give that in committee only.

279. The evidence you have given is public, but the evidence you are going to give us is evidence not for publication?—That is so.

280. Do you mean to say that it costs in Westport this price to produce the timber?—It is from 7s. 4d., including all charges.

281. There are other charges outside the cost of producing the timber?—Yes, that is including all charges; but remember this, that some of those mills are not exporting.

282. It has been given in evidence that some mills are supplying timber in Christchurch at 6s. 6d.?—Yes.

283. And I want to know if it costs much more for Stewart Island to produce it in Christchurch at 6s. 6d.?—I do not know anything about Stewart Island.

284. What is the title of your asociation?—The Buller Timber-merchants' Association.

285. And you are not associated with a similar association in Greymouth?—No, the association is perfectly free.

286. I see the last witness to be called is the secretary of the West Coast Trading Company. Your association is not connected with that?—No.

287. Although it is called the West Coast Association it only applies to Westport?—Yes.

288. With regard to the areas of timber, you say there is almost an unlimited area of timber available on the West Coast, and so far you have only been scratching the surface?—No; I said we were working a narrow strip adjacent to our railway-lines. That is in the timber districts. There are places where there is very little timber.

289. And this large area which you say is available, has it been taken up in sawmilling leases?—No.

290. It is still unallotted?—It wants the railways to open it up.

291. And with regard to the mills operating, there is still plenty of land for the purpose of allotting additional areas?—It may be that in some cases the timber may not be available. It may be available by shifting the plant.

292. Now, with regard to the price, you gave an instance of the additional cost in a cottage of 14,000 ft. of timber at 6d.—an increase of 6d. per hundred in five years?—That is as far as our end here is concerned, of course.

293. But nine years ago you were delivering timber on the wharf at 5s. 6d.?—Yes, as far as I can remember it was nine years ago, but it may be nine years and a half.

294. So that in nine years there has been an increase of 2s. 6d.?—Yes.

295. And that is owing to the increasing difficulties in obtaining timber?—Yes, bringing it from the bushes that are now three miles away which were then close to the mill, and also the increase in the cost of labour.

296. What will be the result in the next nine years?—That depends on legislation.

297. The Legislature cannot move the bush nearer?—But they can increase the cost of getting it though.

298. This 2s. 6d. increase in the cost is due to the fact that you have had to go further back for your timber?—Yes, that is so.

299. That is continually going on?—But larger areas will overcome that to a large extent, because you can afford to put more capital into your mills and go further.

300. But you are not restricted now?—We are restricted—our maximum area is 800 acres.

301. And you have unallotted areas all round you?—Who told you so?

302. You did?—No, I said if the timber was available. You may come in and chop the timber down all round us.

303. But up to the present time the areas are available?—No, I do not think so. It all depends on the question whether the areas are available. A man may be in the midst of them, and still have nothing. The legislative restrictions placed upon us have caused the increase of 2s. 6d. to some extent.

304. You said that if large sizes of Oregon pine were imported you knew of places where they would be taken and cut up in order to avoid wharfage?—No, I did not say that. I said there are places where the Oregon could be landed without paying wharfage. We have millers in our country that have wharves of their own, and the timber could be landed there, and resawn into any size required.

305. And then shipped again to another port for sale?—That I do not know. It may not be necessary to ship it—they may have a market handy.

306. Do you not know that whether timber is landed at a wharf or landed on a sea-beach, so long as it is within the jurisdiction of a Harbour Board it has to pay wharfage?—Yes.

307. Is there any place that is not within the jurisdiction of a Harbour Board?—Yes, in Marlborough.

308. Is there any demand for timber there?—Yes, there is Blenheim and Picton. Of course, Picton is a port.

309. Do you mean to tell me that, in a district where there is a local mill, and equipped to the extent that they have their own steamer, it is possible to bring Oregon pine from America, land it at the wharf and cut it there and sell it in the district in competition with the local article?—It depends on what you can get the timber for. I think it is quite likely that such a thing might take place.

310. Well, take the cities like Wellington, Lyttelton, or Dunedin, it is impossible to do a thing like that without paying wharfage, even if you throw it overboard?—The wharfage is only 6d., I presume. I said it might be done.

311. *Mr. Ell.*] Your rates here for white-pine are the same as for rimu?—Yes. As far as our district is concerned we have very little white-pine. We do not export white-pine, and when timber-merchants order it we sell it at the same rate as rimu.

312. What do you do with the white-pine trees in the forests?—We cut those up, but there are very few. We cut them up for local use. We use it in the mines for aix-boxes and for mine-caps.

313. Have you never attempted to create an export trade for white-pine?—No, not from our district. It is not there in sufficient quantities.

314. But you have a mixture of rimu and white-pine?—There are a few places where there is a little white-pine, and no doubt a few cargoes could go away; but the millers have not cut into it. There has been no market for white-pine—it has not been worked up in the Westport district.

315. Has no effort been made to work it up?—No.

316. Would not that help to increase the profits of your mill if you were able to sell all the stuff you could mill?—There is no market here now for white-pine.

317. There is an enormous export of white-pine from the colony?—Yes, there is a large export, and there is some going away from here, but not from our particular district.

318. With regard to the railway rates, I find that the rates for white-pine in Southland are 11d. per hundred; as against 1s. 5d. for red-pine—a difference of 6d. per hundred. If the railway rates on the West Coast were reduced in the same proportion, would that be an extra inducement to the millers to cut the white-pine out of their forests instead of leaving it?—It would be some inducement if you could reduce the working-charges on white-pine.

319. One does not want to see a national asset and the wealth of the country left behind to be destroyed by fire or decay?—No, that is not right.

320. Would not that reduction be an inducement to the miller to cut out all the wealth he meets with in the forests?—It would be an inducement to some extent, but our railway freights here are comparatively small. It is our shipping rate that is our trouble when added on to the railway freight.

321. Are you in a position to supply any timber-merchant in Christchurch who is not a member of the association with timber—can you do so?—Yes.

322. Then you are a free mill?—Yes, we can do it.

323. I want to understand the position. I know there is an association on the West Coast through which the Christchurch merchants obtain their supplies. The Christchurch merchants

agree to take the whole of their timber from these merchants, and not to buy from outside millers: I want to ask you whether you are in a position of entire liberty, and whether you can supply any timber-merchant whether in the Timber-merchants' Association or not?—There are timber-merchants I would not supply, but I do not know whether they are in the association or not. We mostly do supply merchants. We are really not confined to them—I am speaking of our own district. I do not think the man we send it to is a member of the association.

324. I want to know whether you are willing to supply any timber-merchant in Christchurch?—We mostly send our timber to two or four different firms in Christchurch, but outside of those we do not go.

325. Why do you not go outside?—We have done the business with those people for so many years, and we have never had any occasion to go outside of them. Other merchants are getting their timber from other millers; we have each got our own merchants to supply.

326. Have you got an arrangement with those merchants not to supply the merchants outside?—Not that I know of. I am speaking now of the association. Some millers may have that, but we have not got that understanding.

327. So that you are prepared to supply any timber-merchant whether in the association or not?—We have not got any understanding; but, as I have said before, it might be inferred that we have because we only do business with a limited few.

328. I want to know from you whether if a merchant in Christchurch outside the ordinary lot that you send your timber to sent you an order, would you supply him?—It depends who he was. You mention a name and I will tell you.

329. Supposing he is known to be a good mark?—Let him try us and send an order along. You are trying to get me to agree to a thing I do not know anything about.

330. I do not want you to say anything that is not correct. I want you to tell me whether you know, as a matter of business, if you would supply a man outside those you are supplying—whether you would supply that outside man with a line of timber?—I will put it this way—it seems to me the only way I can. If the men we supply or one of those men withdrew from our association, we should still go on supplying him. If you name somebody, and ask whether we would supply him, and tell me whether he is outside the association, I will tell you.

331. You supply at 6s. 9d. and 8s. 6d.?—Yes.

332. Why do you supply at those rates?—How do you mean—why do we not put it up to 10s.?

333. We have had merchants in Christchurch saying they buy the whole of their timber at 6s. 9d. and 8s. 6d. Why do you supply at those exact rates—is it through an understanding you have amongst yourselves?—The price is fixed undoubtedly the same as the price of anything else is fixed.

334. Amongst yourselves?—Yes. We admit that right away. It is very necessary too in the interests of the trade.

335. Who discriminates as to whether the timber should be classed at 6s. 9d. or 8s. 6d.?—The timber-merchant. He sits as judge and jury on the timber, and he alone discriminates.

336. Is it going to affect your profits and the timber industry in this district?—Yes.

337. Have you ever had any discount taken off timber through classification? You have a certain quantity at 6s. 9d. and a certain quantity at 8s. 6d., and when you have got your statement back from the merchant, have you found that they have demurred at giving you 8s. 6d. for a certain quantity of your timber?—Yes, they have.

338. Do they rob you of a good deal in that respect?—I would not like to say "rob."

339. Do they deprive you of what you consider to be a fair price by unfair discrimination?—Yes, we do think at times they are a bit hard on us.

340. They take too much of your 8s. 6d. timber and they call it 6s. 9d. timber?—The Christchurch people have been educated to want a very fine article, one absolutely perfect from their standpoint. They want it as good as they can get it.

341. Can you sell your rough lines more readily in Timaru?—I should say we can, a little.

342. The merchants there are prepared to market your rough stuff more readily than the Christchurch merchants?—With the exception of one man there who likes it as good as he can get it.

343. Do you ship to Wellington?—We have sent a few small shipments to Wellington.

344. Do you find the Wellington people discarding your rough O.B.?—The Wellington people seem to be better judges of timber. If you give them good heart, even if there is a little resinous shake in it, they do not object.

345. Do the Christchurch people object to such timber?—Yes, they want a softer timber.

346. What becomes of the softer timber?—It is used up locally, and the local people like it.

347. Have you any stocks of it in your milling-yard?—Oh, yes!

348. What becomes of that?—It goes to the local market, and it is really a better timber than we are sending away.

349. I think that the resinous stuff is the best?—Exactly about double the life of the other.

350. Have you what they call a slab-fire constantly going?—Yes, fairly constantly.

351. A miller assured me—and he was a man of considerable experience—that he never had a slab-fire?—What does he do with his slabs, then?

352. He told me that he got them to the market, and did not waste quite as much as you do here?—Then the slabs must have been used as firewood, &c.

353. He said he could find a market for rough stuff?—Christchurch is our market, and they will not take it.

354. Then the Christchurch merchants in rejecting the rough timber are increasing the cost of production to the millers here, and they are at the same time preventing the Christchurch people from getting a good serviceable rough timber. If the Christchurch merchants said they

would take the whole output of the log, and that they agreed to pay you 6s. 9d. and 8s. 6d., are they saying what is correct?—No, I cannot say they do that in all cases.

355. There is a good deal of rough timber on your hands that you cannot find a market for?—Yes.

356. What is the shortest length that you can send away from here?—Eight feet; nothing below 8 ft., and there are very few of those.

357. Is it because the merchants there will not have very much of the 8 ft. timber?—There is not much call for 8 ft. timber. You want something longer. They have sixteens, and if they want eights they can saw them in two.

358. Do you find any difficulty in getting rid of your timber when cut into boards on account of the Christchurch people?—Yes, they want more boards, particularly now the Oregon is coming in. They ask for more first-class stuff now than the rougher article, and they are taking Oregon in place of the rough stuff. It has been left on our hands to a great extent during the last eight or ten months.

359. Supposing they took the whole output of the log, say, with a minimum of 8 ft., do you think that your logs would produce more timber than at present?—I think we could, a little.

360. And that would make a difference in your profits?—Yes, it would make a little difference.

361. *Mr. Arnold.*] How often does your association hold its meetings?—Sometimes it goes three or four months without one.

362. Do you attend these meetings?—Yes, at times, if I can get there.

363. You keep yourself posted in the business that is being transacted?—Yes.

364. What is the relationship between your association and the Merchants' Association at Christchurch?—No relationship at all.

365. Do you correspond?—In what way?

366. As to business?—No, none whatever. No correspondence passes.

367. Now, if the Christchurch Merchants' Association sent you an official communication instructing your association—that is, the mills here—not to supply a certain Christchurch merchant or builder, what would be the result?—Well, I do not know that it would have any effect.

368. If they said that a certain merchant or builder refused to join their association, and, therefore, that that person was not to be supplied with timber, what would happen then?—I do not know that it would have any effect at all on our association—I do not think it would.

369. I am not sure whether your secretary will give evidence, or your president, and, therefore, I have to ask if you will say that such a communication has not been received within the last few months, and that your association did not refuse to serve such an individual?—Yes, I can.

370. I can give his name privately, if you like?—I can safely say our association has not been approached by any timber-merchant with a request not to supply any other timber-merchant in Christchurch or elsewhere.

371. Thank you; I will not press that further. When referring to royalties I understood you to say that you preferred the system of paying royalties upon the timber as it stands?—I said there would be less sawmillers; at least, I think there would.

372. I understood you to say that you thought that that was the fairest system of the two?—Probably it would be.

373. Therefore, in your opinion, I presume there should be only one system over the whole of the Dominion?—Yes, I think that would be better.

374. In fairness to all the millers?—Yes, that is so.

375. I understood you to say this morning that you were not working under any arbitration award?—That is so.

376. Have the men a union?—No.

377. Would you tell us what wages are paid to your men, and their hours of labour?—They work eight hours a day, six days in the week.

378. Do you pay for overtime?—Yes, when they work overtime.

379. At the same rate of pay or an additional rate of pay?—It all depends.

380. Do they work on Good Friday and Easter Monday?—No.

381. They could have worked on those days?—They work on Easter Monday, as a rule, but this time the orders were so slack that we knocked them off.

382. When they do work on that day, do you pay more wages?—No. We simply allow them to work, because in bush-work they lose a lot of time throughout the year. It is their desire to work on that day, and not our wish. We never force men to work on holidays.

383. What do you pay your bushmen—have you got a list of wages?—We pay them from 11s.

384. I understand that the association has no agreement as to wages?—No.

385. What is the general wage paid to trollymen?—Trollymen get 11s. a day, sawyers get £5 a week, bushmen 11s. a day to 12s., bush foreman, 13s. These are the wages ruling in our district. R. T. Watson is employing ten men—one at £5 and one at £7.

386. Do you not think it would be fair to all concerned if each mill paid the same instead of entering into competition in that way?—I do not think it would. We prefer to not have an arbitration award, because it brings about a bad feeling.

387. Could you not have an agreement amongst yourselves?—I think that would be only made to be broken.

388. You are aware, of course, that employers as a rule prefer to be placed upon one footing so far as wages and conditions are concerned?—Yes.

389. Wages have been very high on the West Coast?—We have had to pay these wages to induce men to come here. The conditions of living and the loss of time have all to be considered. I do not think the wages are any too high when these things are taken into consideration. The cost of living here is a little higher than elsewhere, and there is a lot of broken time.

390. *Mr. Stallworthy.*] Regarding the sawyer you referred to, is he boss of the mill?—Yes, he keeps the saws in his own time. He is a £5-a-week man.

391. Does he lose time?—No, he is paid by the week.

392. You advocated an increase of the milling areas to 2,100 acres: what would be the life of such a mill to work that area?—That would entirely depend on the trade. Of course, if you were running a mill up to its full capacity, and you are cutting an acre a day, it is easy to reckon it up.

393. How many years do you consider should be the life of a mill to induce you to erect an up-to-date one?—At least fifteen years' life. You would then get the best results out of it, and your tramways and buildings would have done good service. Twenty years would be better.

394. If the areas were largely increased, would that not tend to drive other millers rather far back?—I do not think it would. It would simply mean that we have to-day three mills employed, and probably if we were allowed an additional area we should only have one mill. Under the present condition of things we have got to pay three engine-drivers to do the work of one man, and three sawyers really to do one man's work. With larger areas we should have a different system of work.

395. You said you had three mills: what area have you got?—For two of them we have the maximum area of 800 acres each, and the other one is about exhausted.

396. There is, then, no limit to the number of areas you may get?—Oh, yes! We are only entitled to three areas until we build more mills.

397. You build as many mills as you like and you get more areas?—Yes, that is so; but we must build more mills.

398. Have you refused to supply any person in Christchurch for any reason outside of the question as to whether he was not considered financially a good mark?—No, we have not.

399. You said that wages were responsible for 20 per cent. increase in one year?—Not in one year. I was quoting some figures then spreading over a term of years, and since then wages have increased 20 per cent.

400. You were not paying your sawyer at that period so high a wage?—He was getting from £3 10s. to £4 a week.

401. I presume your association discusses matters affecting your interest; have they ever discussed any proposals or suggestions as to what remedies might be applied to assist you?—Yes, they have dicussed the same question that we are now discussing here to-day.

402. What conclusions have they arrived at?—Those that I am now advocating—viz., larger areas, and a duty on Oregon pine.

403. You mean an increased duty?—Yes, to afford us the necessary protection. If we are going to have free-trade, of course, everything must come down to that.

404. Then you advocate enlarged areas and increased duty on Oregon?—Yes that is so.

405. Anything else?—Relaxing some restrictions.

406. What restrictions do you refer to?—There are a number.

407. Just give us one or two, will you?—In connection with the inspection of machinery there is unnecessary expense. We are ordered to do a certain thing, and when it is done the men refuse to work behind it. We are responsible now. We get orders to put up a certain grade, and if an accident takes place, where are we? The men do not like it. The country is full of these restrictions; they mean much cost, and they are interfering with our liberty too much.

408. I understand what you are referring to. We have such inspection in the North, and we think it is beneficial. You gave us your export prices: will you please give us your retail prices in Westport?—They are 8s. 6d. net—that is, 9s., with 6d. discount.

409. What class is that?—Rimu.

410. For ordinary building?—Yes.

411. What is the price for the other class of timber—that is, dressing-lines?—It runs up to 14s. dressed and seasoned.

412. *Mr. Mander.*] Would you expend a large amount of money in building an up-to-date plant on the off chance of getting some more timber at a future date?—I do not think I would.

413. You would want to secure a fresh area of timber to warrant you in putting up such a plant?—You must have the necessary security for the expenditure of money.

414. If you only had 800 acres to work on, is it not possible for another party to come in and take any further areas away from you?—That has been done time and again; in fact, it has been done very frequently. About twelve months ago we disposed of a property to a Greymouth firm here. We were holding at that time 13,000 acres. We had taken up 800 acres and put a plant on it. A party went behind us and we lost. We had, however, twelve months' law, and we bested them in the end, and we finally sold out to a Greymouth firm. I think such expenditure is unwarranted, and it is a charge on the timber.

415. You stated that the cost of production was 7s. 4d. for rough ordinary building-timber, and 9s. 8d. for the better class of timber. Do you include interest on your capital in that, and were all charges included in it?—No. It is the bare thing. It did not include the cost of management.

416. Then that is really not the cost of the production of the timber?—That is really what it costs us. We get nothing out of it at that.

417. You say that your retail price is 6s. 9d. and 8s. 6d. to the merchants in Christchurch, f.o.b.?—Yes.

418. Would you get a proportion of 50 per cent. first-class out of that?—No, you would not get 50 per cent. Perhaps you might get 50 per cent. of what is sent away, but not 50 per cent. of the whole product of the log.

419. That would be 7s. 7½d., and you would be losing money according to that?—Yes.

420. You are not really making a reasonable profit?—This last year we have lost money.

421. Do you not think, when there is a slump, that it is more necessary that you should be protected than when trade is brisk?—Of course, because then the cost of production increases.

422. Therefore, you think it is more necessary that Oregon should be prevented from coming here when there is dull times?—When we have unemployment in the country I think it should be stopped.

423. You consider it is better to have a dear loaf and money to pay for it than a cheap loaf and empty pockets?—No money at all, and exodus of people from our shores.

424. Have you ever retailed timber?—We are retailing. Two of our mills are retail mills.

425. I presume, in selling the whole output of your mills you do so to get rid of various costs and expenses?—Yes.

426. Do you find there is more responsibility in connection with the retail trade and more capital required?—Yes, and additional charges thrown on to you. You have got to strip the timber to prevent it from going rotten in the yards. There is also much extra cost in handling in the yards.

427. Supposing the value of rimu timber was 6d. per hundred feet in the log to-day, what would that be worth fifty years hence at 5 per cent.?—That is a question of figures.

428. Would it be a business principle to hold the timber for fifty years?—No, if you look at it from a point of interest on the capital value it would be a very bad piece of business.

429. Is it not possible that in fifty years some other material may be used in place of timber?—They will find some other commodity when they find that timber is exhausted.

430. They may have some better means of getting at timber that is now practically inaccessible?—That is so.

431. Do you think that the Crown Land Board's Rangers have got any adequate idea of the quantity of timber there is in the backblocks of this country?—They have an approximate or haphazard idea, and no better idea than the millers have themselves. Some of them say, "There is a fine tree—look at it; there must be 10,000 ft. of timber in that tree," whilst there might not be two or three thousand in it. I would not like to pay on their recommendation.

432. If you were selling the whole output of your mill to two or three merchants, and they were taking all you could produce, would you then think of supplying anybody else outside of these three individuals?—I would refuse to supply anybody else. It would not be to one's interest to go outside of them.

433. Are you not very pleased to give good wages to an extra good man without taking into consideration the labour awards or anything else?—I believe in paying a good man what he is worth. A good man is always in demand.

434. *Mr. Field.*] Mr. Leyland unintentionally put the witness wrong in speaking about the money going out of the country. He said, "Is it not silly to talk about money going out of the country when last year the export products of our forests were £928,000, and the imports of timber £14,000"?—Yes.

435. When he said "the exports of our forests," did you understand him to mean timber?—I do not remember.

436. Would you understand him to mean kauri-gum, fungus, or things of that sort?—No, I would not.

437. He said the imports were £14,000. He made a mistake; the duty is £13,895. If he had looked at the right column in the Year-book he would have seen that the imports were £270,000 and the exports £320,000. Is it not necessary that that should be put right?—I think so. I wondered why there was such a discrepancy. Of course, I have not studied these figures.

GREYMOUTH, FRIDAY, 16TH APRIL, 1909.

ARTHUR FLETCHER, Sawmiller, Westport, sworn and examined. (No. 62.)

1. *Hon. the Chairman.*] Will you tell the Commission what you know as a sawmiller as to your troubles, or what remedy you would propose in your way?—I am not going to enlarge upon the merits of the question, as I have had no knowledge or Oregon pine, and it would not be wise to speak of a thing you were not conversant with. I do know, and it would take a good deal to change my mind, that Oregon is interfering with orders, especially for rough timber from Christchurch. Last July or August was the first time I felt it. I went to Christchurch for orders, and I received word that the yards were stopped and had a large amount of orders on hand. Since then I have not received one order for timber otherwise than for dressed stuff; any miller will tell you that if you are dependent solely on dressing-lines you cannot run your business profitably. As regards the cost of production, I have here tables showing the cost of production from the time the timber is felled (or, rather, before—from the time the tramway is built) to being put alongside the ship.

2. Where is your mill situated?—About four miles along the Cape line from Westport.

3. Is it near the line?—Within three-quarters of a mile. These figures I can prove are based upon the output of the mill and the hands employed, and as far as I know are correct. We count tram-line 9d. per hundred feet.

4. What length it is?—From the railway-line to the terminus about two miles. The total cost of putting on the trucks is 7s. 6½d.

5. The total cost of putting on the trucks?—Alongside the ship at the breakwater.

6. When you get it there, do you pay any harbour dues or anything else?—No, the shipper pays these.

7. You deliver it on board?—Alongside: the shippers are responsible afterwards.
8. What is your schedule of prices alongside the ship?—Very nearly 8s.
9. *Mr. Morris.*] What area of bush have you got?—We have cut out our 500 acres.
10. Can you obtain any more?—We are fenced in.
11. What is the cost of your railage?—Eightpence.
12. That is the minimum?—No, that is the charge on the Cape line—the Harbour Board line.
13. How do you manage to dispose of your rough timber?—I have been putting it in with export timber, and there is a considerable local trade in Westport these last two years, and I managed to get rid of the majority of it.
14. What do you consider would be a fair area for a sawmiller to be allowed to hold so as to enable him to put in a first-class mill capable of producing timber as cheaply as it can be produced?—I am more in favour of it being granted on the million feet of timber, as the areas in our district are very scattered.
15. You think the mill should be in proportion to the quantity of the timber on the land?—Yes, even if it were 4,000 acres, so that the timber would warrant you in putting up a suitable plant.
16. Do you know that it costs from £2,000 to £3,000 to put in a first-class sawmilling plant. What number of million feet would you consider it proper for a man to have?—That is a matter that I have not worked out.
17. Would you say 25,000,000 ft.?—Yes, you would require all that.
18. By what amount is your output being reduced since Oregon first began to come into the market?—About 5,000 ft. a week; we are cutting less now.
19. What was your output before?—From fifteen to sixteen thousand feet.
20. You are now reduced to about 10.000 ft.?—From eight to ten thousand feet a week.
21. *Hon. the Chairman.*] What is the strength of your mill now?—Eight hands.
22. What would be the top amount—say the produce per week?—Running full, about 25,000 ft. per week when double-handed, but we have never done more than 20,000 ft. single-handed.
23. *Mr. Jennings.*] What is your output per day?—About 1,600 ft.
24. Have you been long in the sawmilling business?—About two years.
25. *Mr. Barber.*] What did you say was your cost of production?—7s. 6½d.
26. So you are working on a profit of a little under 6d.?—Under 6d. I am not allowing for depreciation in that.
27. Have you any local market?—Yes, a fair local market.
28. At what do you sell to the local consumer?—About 8s. 6d.
29. Only 6d. more than you sell to the merchants?—That is all.
30. Do you belong to the association?—No.
31. You sell to the public at 8s. 6d.?—Yes, net.
32. *Mr. Ell.*] Yours is a free mill?—Yes.
33. Which district do you supply?—We ship all to Lyttelton.
34. Do you supply any particular merchants in Christchurch?—We supply one man ever since we started—William Cook.
35. You sell all your output through him?—Yes.
36. *Mr. Stallworthy.*] You have only one mill?—That is all.
37. What does it cut per month?—I could not say definitely—I think 50,000 ft. was the best month.
38. What does it cut now?—It is not running 30,000 ft. per month.
39. Although 50,000 ft. was your record?—Yes.
40. How many do you employ?—Six men and three working partners.
41. You say that tramming costs 9d. How do you arrive at that? Is that based on a year's cutting?—On last year's cutting.
42. Did that include the cost of the erection of the tram?—The erection of the tram-rails and the material.
43. Is the tram a new one?—Of course, the end towards the bush is new; the other is nearly worn.
44. Do you put the cost of the whole tram against last year's output?—Only the cost of the tram from year to year, and the wages.
45. You do not reckon the cost of the tram from the beginning of the work against last year's output?—No.
46. *Mr. Mander.*] Do you think, if there were no Sawmillers' Association in the country, timber could be cut and sold at less profit than at present?—I do not.
47. In calculating profit, do you calculate interest on capital, depreciation, life and fire insurance?—That does not cover depreciation—depreciation would show that we were losing.
48. *Mr. Hanan.*] Can the witness tell us why he has not joined the association?—That was merely a personal matter with our senior partner at the time of putting the mill up.
49. Do you think it would be to your interests to joint the association?—I think it would.
50. Would you get better prices?—You are likely to, and you are not likely to get cut down.
51. Are you selling much under the association's price now?—Very little.
52. Do you think timber is going up in price?—It has not gone up much.
53. Do you think it will go up?—Under the present conditions I do not see how it can help going up.
54. *Mr. Clarke.*] I should like to ask if Mr. Cook, of Lyttelton, is interested in the mill?—No, he is not.

55. Who is the senior partner you refer to?—His name is Smith. He has sold out now, but the company is still "Smith and Co."

56. *Mr. Ell.*] What kind of timber are you milling?—Red-pine for export, and a good deal of birch for local bodies, mines, and so forth.

57. What kind of timber is there in the forest you are working?—It is inferior. It is inferior to what you inspected the other day—rimu, beech, and a little silver-pine.

58. Any cedar?—No.

59. Do you find a ready market for the beech?—Only occasionally—for the mines and local bodies.

60. Do you export any beech?—No.

61. *Mr. Stallworthy.*] Would you get as many orders, or less, if you joined the association?—I could not say

62. Would the association give any orders?—I suppose they would if they had them to give.

63. *Mr. Mander.*] Do you not think that one very good phase of the association is that they act on co-operative lines and distribute orders?—Yes, I think the association is an advantage.

64. *Hon. the Chairman.*] Do you cut any sleepers for the Government?—Not so far.

65. Does the Government take many sleepers?—None whatever. The Harbour Board takes some, and the Government take none.

GEORGE JOHN ROBERTS sworn and examined. (No. 63.)

1. *Hon. the Chairman.*] What are you?—Commissioner of Crown Lands for Westland. I prefer to put before the Commission a statement in writing. I have divided it into three heads—namely, alpine timber, forest timber, and mountain-forest timber.

2. You might explain that?—The alpine timber occupies the country from 2,000 ft. above sea-level to the "grass-line," but it is not millable. It amounts to 520,000 acres, and the area of mountain forest is about 1,041,280 acres. Part of that timber is millable, but I do not say it is millable at present.

3. The timber is millable, but the access precludes it from being milled?—Yes, that is so.

4. *Mr. Morris.*] What class of timber is it?—All kinds up to that height, and some of it very good milling-timber up to 2,000 ft.

5. *Hon. the Chairman.*] Which do you call the best milling-timber, rimu or birch?—Rimu by a long way.

6. What proportion would there be, do you think, in that milling-area?—The timber varies very much in our country here. Down south, for instance, a large area is covered by black-birch, and up north there is no such birch. My statement includes the whole of the milling-timber, including birches and trees of all kinds:—

The Westland Land District occupies the central portion of the western watershed of the South Island. The main length is 225 miles, and its average width twenty-seven miles. The area is 6,086 square miles, composed for the most part of the great central snow-clad mountain-chain and its outrunning ranges, intersected by narrow valleys, and subsiding westward into undulating plateaux, river straths, and shelving coasts.

The main range (Southern Alps), which is the dividing elevation or backbone of the South Island, constitutes the eastern boundary of Westland for its entire length. This mountain system is snow-covered almost from end to end, and its ice-clad lofty peaks uplift from the snowfields which cap the less abrupt elevations, and which fill the immense intervening hollows (*névés*). Subsidiary ranges, varying in height, radiate chiefly from "knots" in this great central chain, and are snow-coated most of the year. From these, again, ravined ridges descend steeply into the valleys or fall abruptly to the level of the inland plateaux of the littoral country. The westward faces of these spurs at one time formed the sea-wall. From the sheets of *névé* snow, alluded to above, numerous glaciers, with feeders from the lateral ranges, extend down the upper main valleys, presenting every form of ice-action, and from these the principal rivers take their rise. Parallel with the central mountain-chain and linked to it by low narrow saddles in the northern districts are isolated mountains, varying in extent and height, which are the remnants of an ancient granite range that once extended along the old coast-line. The bold flat-topped Paparoa Range lying between the central Grey Valley and the sea-coast is another island hill. And the seaward country between Jackson and Big Bay, in the far south, is wholly occupied by high outlying hills directly connected with the inland ranges. From Jackson Bay to the northern boundary of the district there is an almost continuous extent of drift country lying between the foothills of the great mountain-chain and the sea-coast; a continuity of broad-topped hills and hillocky ridges of moderate elevations; immense terraces of glacial drift, undulating plateaux, river straths, and shelving coastal lands.

Thus Westland may be roughly classed into two divisions—viz., highlands and lowlands, the former consisting of the great main range (Southern Alps) and its western mountainous offshoots, with numerous intervening valleys; the lowlands again comprising the champaign country between the highlands and the sea-coast

Generally speaking, the whole of the district is covered with dense forest, from the sea-beach to the grass-grown tops of the high ranges, even the broken mountain-faces being wrapped with exuberant foliage.

The height of the "bush-line," or, as we term it, the "grass-line," above sea-level varies all over Westland, sometimes dropping to 2,800 ft. and again rising to 5,000 ft.; the mean height may be taken as 3,500 ft. In a few localities the forest is slowly forcing its way upwards.

Alpine Forest.

From the "grass-line" (3,500 ft.) down to 2,000 ft. the forest may be termed "alpine," and consists of numerous varieties of scrub and various kinds of small trees, stunted, twisted, and gnarled by frequent gales and snowfalls. In certain localities, such as the upper Grey basin, the Mahitahi, Landsborough, &c., the bush forest grows right up to the grass-line—stunted, but yet a forest-tree; in such places there is rarely any alpine scrub. This alpine forest as yet has been incapable of commercial use, the scrubs not being of any known value and the stunted trees below the scrubs being only fitted for woodwork for mountain roads, mines, or firewood. However, with a view of utilising this alpine bush for wood-pulping, under the provisions of section 72 of "The Land Laws Amendment Act, 1907," two wood-pulp reserves, aggregating 50,000 acres, have been located in the Taramakau Valley, and a company has taken up an area of 30,000 acres and is now importing the necessary machinery, and expects to commence operations at an early date. Should this venture prove successful, it is assured that other mills will be started, as there are large areas available in all parts of the mountain country which carry forest reputably suitable for the manufacture of wood-pulp.

(The approximate total area of "alpine forest"—*i.e.*, from 2,000 ft. up to the "grass-line"—is 812·5 square miles, or 520,000 acres.)

Mountain Forest.

Along the seaward faces of the ranges outrunning from the main divide and the diversified slopes of the intervening valleys, up to 2,000 ft. above sea-level, there are immense quantities of high-class milling-timber, such as red-pine, totara, cedar, beech, and even rata (the latter with a fair workable barrel). All such timbers are tough, with nicely figured grain and well fitted for all industrial purposes in which strength, flexibility, durability, or ornamental beauty is desired. This great belt of timber is for the most part at present not come-at-able owing to the initial cost of procuring the timber and the expense of transport which prevent its commercial exploitation.

The mountain-valleys of the larger rivers—viz., those which flow from the main divide—have in their lower portions fairly flat floors where the rivers are flanked by high, narrow-topped drift terraces, which are covered with good commercial forest, but of no great local extent. Small flats and narrow, level-surfaced, well-timbered areas on the immediate banks of the rivers are ordinary features, but these have become much reduced in extent, owing to the continued damage by floods. Consequently it may be confidently affirmed that while in all the inland valleys there are large quantities of fine milling-forest on the bottom-lands, the flanking terraces, and lower hillsides, yet these timbers are only available at present for mining purposes, bridge and road-works, or for the scattered homesteads of such settlers as dare the reclamation of the wilderness.

Difficulty of access and consequent cost of cartage for the most part preclude all present attempts to commercially utilise the forests of these mountain-valleys; and all attempts in the past at utilising these swift, snow-born rivers for flotation of timbers have been disastrous and ruinous.

(The approximate total area of "mountain forest"—*i.e.*, between 600 ft. and 2,000 ft. above sea-level—is 1,627·8 square miles, or 1,041,280 acres.)

Forest in the Lowlands.

As noted above, the lowlands comprise fairly high hummocky rounded hills, glacial moraines of all classes, high table-lands, broad plateaux, immense areas of sea-formed terraces, lacustrine formations, and the ordinary fluviatile deposits in the numerous river-valleys.

Dispersed all over these lowlands are numerous lakes. All vary in character—coastal tidal lagoons, shallow reedy sheets, deep hill-girt waters. The deeper lakes occupy the basins scooped out by ancient glaciers that have receded ages ago. Some, again, are slowly filling up with the shingle poured into them by the mountain rivers and streams, whilst others are rising very slowly but definitely (such as Lakes Brunner and Ellery), and a few are only remnants of very extensive sheets of water, as the high marginal lake-formed terraces of Lake Brunner and others prove.

In conjunction with their effluents these lakes in some cases form valuable waterways for the transport of timber, minerals, produce, and goods.

Numbers of *pakihi*, or open lands, of more or less extent, occur all over the district, these, of course, being devoid of forest.

Leaving out the lands already denuded of bush by the settler, sawmiller, and miner, and also the comparatively small areas of the lakes, *pakihi*, rivers, and swamps, we may say that the whole of the lowlands is covered with forest. The varieties of trees differ considerably according to soil and altitude. Kamahi and rata are the chief timbers—very useful for firewood and mining purposes—and, being spread nearly over the whole district, constitute an inexhaustible supply. Rimu is the chief milling-timber, and this also, intermixed with miro and hinau, is widely distributed from the seaboard to the interior uplands. Valuable stretches of white-pine belt the low-lying coastal lands, river-margins, environs of lakes, and swampy depressions; and the same may be said of the silver-pine, though numerous detached areas of these timbers also occur on many broad terraces where free drainage is checked by the impervious nature of the impacted glacial drift on which the soil rests. Patches of black-pine (matai) are met with, generally on the deep alluvium of river-bottom landss; also rarer clumps of totara. Stunted totara frequently occur on the small ridges and hollows of the strips of the sand-dunes along the sea-coast; while cedars, more or less singly, are scattered along the flanks of the inland hills and all over the lower terraces and plateaux, but rarely within six miles of the coast. Very often isolated "islands" of fine tall cedars occur in the saddles between the interior highlands and the foothills and the elevated terraces of the lowlands. Kowhai never grows large, and is rarely found inland, but often lines the sluggish streams and lagoons immediately along the sea-coast, but

owing to its small size hereabouts it is of no commercial value. Broadleaf is found in dry bottom-lands, mostly in scrub form and in patches, but scattered isolated mature trees of workable size occur in many localities. All the forest in a narrow strip along the sea-coast is "wind-clipped," the result of exposure to the prevailing westerly gales from the open ocean being that all these timbers, great and small, are toughened, and full of "pattern," as the furniture-men say.

"Windrows" are of infrequent occurrence, and we only know of four of any magnitude—viz., in the Taramakau, Thomas, Arawata, and Ahaura Valleys. These are invariably due to the easterly gales which at times sweep up the eastern faces of and over the main divide, to roar down the Westland valleys, often for a few days, and do immense damage to much of the inland forest.

At irregular intervals—from eight to twenty years—we have heavy successive falls of snow, often followed by a great easterly wind, the double effect of the snow and wind-pressure being to devastate the forest, principally in the belt lying between 1,200 ft. and 2,500 ft. above sea-level. Sometimes the strip of fallen timber extends right along the mountain-faces on the mountain-range, with breaks here and there principally on the subsidiary ridges and spurs where partial shelter obtains. Again, it frequently happens that the main gale and snowfalls are confined in extent and strength to the north and south, and thus certain forest lands are either swept or escape damage. The effects of this extraordinary weather-damage to the mountain forests remain for many years, for in scrambling up through the bush which so closely coats our hillsides we often fall in with a belt of fallen timber, and experience much toil and vexatious delay in dodging a way over and under the interlocked abattis of prostrate tree-trunks, greasy with decay, and smothered in between with a dense undergrowth eagerly pushing its way into the unwonted sunlight. A certain quantity of forest is periodically destroyed by landslides and river-floods. In the higher regions of the watersheds of our great alpine rivers an iregular descent of small snowslides occurs; these gash lanes through the alpine forest, leaving streaks of bare rock and shale completely swept of vegetation. At long intervals immense avalanches plunge down from the high, surcharged snowfields and ice-filled gullies, tearing away large quantities of forest, eventually sweeping into and often completely filling up the whole valley-floor, and there overlying a fair extent of timber. Again, in the inland valleys, during the intervals of rest, the mountain-sides become gradually covered with a coating of dust, sand, and disintegrated shale, derived from the frost-riven rocks above the bush-line. This shale and dust coating is constantly working its way down through the bush (which roots into and partially binds it), partly by gravitation and partly by snow-thaws, until it reaches the base of the mountain, and there for many years may remain at rest. Eventually a wave of shingle (the residuum of some great avalanche higher up the valley) raises the bed of the river and forces its waters against the toe of this shale-screen; the boulders driven by this raging current pound and hammer down the loose drift, with the frequent result that large slips, loaded with timber, come down for thousands of feet. Often this shale accumulates on these sidelings, being held back by the tree-trunks and matted undergrowth until it fairly curves out into an unsafe bulge, which, on becoming saturated with water and receiving the impact of a sudden thaw, streams downward in forest-devastating strength. Frequently the whole of the sides of a great inland valley are screened by the accumulated rock-waste and shale of ages past, and these so completely overgrown by scrub and forest that hardly a break is visible in its splendid canopy of varied greenery. But, as noted above, the "safety" slope of the water-soaked mass of loosened mountain-waste eventually becomes so weakened that even such a "shoogle," as the continued tremor of an earthquake sets the shale into such destructive motion that the valley now presents aspects of bare, rugged faces, destitute of all vegetation except that clinging to those portions of the ridges and spurs which from their rocky nature and location were immune from this disaster.

All the large Westland rivers carry ice-water down for eight months in the year (some more or less), and are therefore clogged with glacial silt. The head-waters are constantly choked with immense quantities of glacial *dèbris*, cliff-waste, and avalanche-detritus. All this is crushed down the channels into the wide river-beds on the lower country. Although this wear-and-tear may be said to be constant, yet that is so only in degrees, for there are periods of partial rest and abnormal activity. Sometimes, after a shale-laden mountain-slope has been quiescent for ages, the disintegrating effect of many frosty winters, the infiltration of increasing soakage of decomposing water, and, it may be, the impact of a heavy snowslide from the higher tops, induce an enormous landslide, which roars down into and fills the whole valley with a huge commingled mass of snow, rock, slush, scrub, &c., all of which is slowly swept onward by successive floods and by filling up the water-channels, and devastates the adjoining country. Now, the rock-*dèbris* of such an avalanche does not descend in an even manner, but rolls forward in what may be termed "shingle-waves" (referred to above), and it is these "rollers" which wreck the loose river-banks, and not altogether the flood-waters, as is usually thought. This "shingle-wave" travels slowly down the river-floor, alternately swinging from side to side, and eventually, by raising the river water-level, overflows and covers the adjoining flats with drift and sand, ruining farms, roads, and bridges. Notable examples are the Grey, Taramakau, and Hokitika Rivers. Of the Taramakau we have a clear history of the "shingle-wave" from its commencement in the enormous landslide in the Otira Gorge in 1873 (the *dèbris* from which first destroyed the road and bridges in the lower part of the gorge), and thence we can track its devastating course right down the Otira and Taramakau Valleys, as year by year it rolled down, wiping out the main road and farms as it passed along, until to-day it is almost abreast of Kumara.

But wherever a Westland river emerges from a lake and therefore does not carry down shingle its loose gravel banks are intact. A notable instance is the Arnold River, which, while descending rapidly, does not destroy its banks, as the mountain rock-waste or shingle is bottled up in Lake Brunner. Similarly the Okarito River, heading from Lake Mapourika, does no damage all down its tumultuous course. This is also fact: those rivers which have done the greatest damage to the

adjacent forest-covered lands are those upon whose banks settlement has not taken place in recent years.

Fires never cause any serious damage in the lowlands. This is owing to the humid climate, for it may be confidently asserted that it is impossible to burn the standing forest, and the extreme difficulty of getting a "good burn," even of fallen bush and other undergrowth, is one of the greatest drawbacks to our pioneer settlers. Along the main roads the "second growth" has to be periodically cut down, and, when dried, is frequently fired, but in no case does the fire extend into the adjoining forest. In a few localities, where immature bush, intermingled with manuka scrub, skirts the road, the fire may spread for a few chains, but does no damage to any commercial timber. In a short time these semi-burnt areas are again overgrown.

Sometimes the sheep-farmers who in summer depasture flocks on the grass lands immediately above the bush, set the strong, coarse herbage in a blaze, and consequently fire the adjoining alpine forest, which is thereabouts chiefly composed of stunted brooms, akeake, yellow-pines, &c., all these shrubs being full of turpentine and therefore very combustible. Nevertheless, such fires rarely extend more than a short distance down or along the faces of the mountains, and, as only a few scattered grass-grown hilltops are available as sheep-pastures, a very small area is liable to be burnt. Comparatively small scattered acreages of timber in the lowlands are killed by water being damned back by landslides and also by the *dèbris* and tailings from gold-mining and sluicing claims, but the total damage from these sources during the past forty-five years aggregates comparatively a small acreage.

In Westland, wherever the forest has been destroyed by either natural or artificial causes, its recuperative powers are magnificent, for whenever spaces are swept of bush by landslides in the highlands, almost immediately these bare streaks are covered with greenery, usually in the first place fuchsia and lacebarks, and in a few years these gaunt scars are quite healed up, and it takes the expert's eye to detect the locations of the original slips. Likewise in the lowlands the abandoned sites of sawmills, mining camps, or other artificial clearings are soon covered with luxuriant small bush. In fact, our settlers experience considerable difficulty in keeping down and effectually getting rid of what is known as the "second growth."

In ancient times this district was occupied by a forest, of which only a few isolated gigantic trees now exist, and these are scattered singly all over the lowlands; they comprise white, red, silver, and black pines, hinau, totara, manuka, and beech, as well as birch. A small number are still erect and flourishing, but others again have fallen, and startle the bushman, when they happen upon them, by the huge size of their prostrate trunks. So far as we yet know, no extra large trees are to be met with on the highlands of Westland; they all occur on the lowlands between the foothills and the sea-coast.

One marked feature of our forest is the absence of old trees—that is to say, no decayed matured trees, either standing or fallen, are to be seen. In the highlands, certainly, dead fully matured trees occur amongst the beech, cedars, and totara in the higher mountain forests, but rarely below 1,500 ft. above sea-level. As this upper timber naturally decays, rimu and other kinds which are completely new to higher lands are taking their place, and these young, immature trees may be easily picked out as they dot and fleck, by their bright foliage, the sombre older forest.

All over the lowlands, in almost every place where clearings in the forest are made or occur through landslides, certain shrubs, plants, and ferns (totally distinct from the ordinary bush undergrowth) forthwith spring up with a strong and vigorous vitality, thus showing that in ancient times the district was, more or less, destitute of bush, and was assuredly mostly covered with the ordinary vegetation characteristic of open country. Contemporaneously with these scrub and bracken-fern growths, possibly the old giant forest, previously noted, may have been distributed over this champaign country in clumps and irregular strips, whence the present forest may have gradually spread and, owing to climatic changes, obtained complete possession, the seeds of the previous open-country growths meanwhile lying dormant in the soil, ready to shoot up when exposed to direct sunlight.

(The approximate total area of forest in the lowlands—*i.e.*, between the seaboard and 600 ft. bracken?-fern growths, posibly the old giant forest, previously noted, may have been distributed above sea-level = 1,181·0 square miles, or 755,840 acres.)

(The total area of forest in the Land District of Westland = 3,621·3 square miles, or 2,317,660 acres.)

Forest Areas.

Area of "alpine forest"—*i.e.*, from 2,000 ft. (above sea-level) up to the "grass-line" = 812·5 square miles, or 520,000 acres.

Area of "mountain forest"—*i.e.*, between 600 ft. and 2,000 ft. above sea-level = 1,627·8 square miles, or 1,041,820 acres.

Area of "lowland forest"—*i.e.*, between sea-coast and 600 ft. above sea-level = 1181·0 square miles, or 755,840 acres.

Total area of forest in Westland Land District = 3,621·3 square miles, or 2,317,660 acres.

Areas under forest, and amount of milling timber thereon, as follows:—

Crown lands, 1,250,000 acres, with 4,250,000,000 ft.
State forests, 500 acres denuded of all milling-timber.
Forest reserves, 50,000 acres, with 10,000,000 ft.
Scenic reserves, 13,000 acres, with 65,000,000 ft.
Miscellaneous reserves, 75,000 acres, with 400,000,000 ft.
Alienated forests, 140,000 acres, with 900,000,000 ft.

The above figures represent the approximate amounts of "milling-timber" of all kinds, and not the estimated quantities of the two or three varieties which are at present milled. If the foregoing estimates are halved we have the approximate figures which represent the sawmilling timber at present commercially available.

The estimated area of Crown lands held for sawmilling purposes under the Land Act, or the Estates Forests Act, showing in each case the name of the licensee and the acreage held, is as follows:—

Ahaura District.

Licensee.	Area held (Acres).	Distance from Railway (Miles).
C. Long and E. Clark	397	0¼
W. A. Sadler	100	10
A. Southorn and E. Olsen	600	5
G., E., and G. Erickson	200	8
John Drake	495	8
T. W. Tymons	200	7
A. Southorn and E. Olsen	780	7
T. W. Tymons	364	7
W. Thorp, H. Myers, and T. Southorn	200	11
Bignell, Gieseking, and Lynch	400	2½
W. Fisher	398	9
G. Erickson	400	8½
Thorp, Myers, and Southorn	300	11
G. Hahn	365	1
Paparoa Coal Company	400	1
Hamer, Jones, Wright, and Donaldson	600	½ to 1½
A. Brown, W. A. Sadler, and J. Molloy	380	9
Bignell, Gieseking, and Lynch	551½	4
G. Hahn	200	On railway
Tymons, Uddstrom, and F. Nyberg	200	,,
D. McLean and J. White	80	,,
W. A. Sadler and J. Molloy	198	4

Twenty-two holdings, comprising 7,808 acres 2 roods, in areas from 80 to 600 acres. Many of these have been cut out, and records do not show whether they have been surrendered or not.

Grey District.

Licensee.	Area held (Acres).	Distance from Railway (Miles).
G. T. Moss	570	On railway
G. T. Moss and G. Grant	512	5
J. Marshall	800	3
A. Olsen and W. Gleeson	191, 1,100	1½

C. Priest	200	8½
F. P. Watson	200	9
Moynihan and McGrath	400	9½
K.K. Sawmill Company	800	9½

Twelve holdings, comprising 6,393 acres 2 roods 30 perches, in areas from 200 to 1,000 acres.

Hokitika District.

Licensee.	Area held (Acres).	Distance from Railway (Miles).
South of Arahura.		
J. C. Malfroy and Co.	200	3
Meharry, O'Malley, and Donaldson	800	5
Tamminelli	200	7½
Coote, Morris, and Co.	200	6
South of Hokitika.		
Woodstock Sawmilling Company	800	4
Perry and Hegan	1,600	0 to 2
Hansen	200	...
Diedrichs	800	6
Morris and Roberts	800	2
D. H. Roberts	800	2
Stuart and Chapman	800	2
Bagnall	800	9

Twelve holdings, comprising 8,000 acres; from 200 to 800 acres in each area.

Ross District.

Licensee.	Area held (Acres).	Distance from Railway (Miles).
Stuart and Chapman	400	...

Okarito District.

Licensee.	Area held (Acres.)	Distance from Railway (Miles).
L. Zala	200	...

The estimated area of Crown land still available for sawmilling purposes, but not taken up, showing the districts in which the areas are situated and the total area in each district: Grey County, 189,904 acres; Westland County, 417,156 acres.

The Westland Land District is wholly within a mining district. All Westland, Grey, Inangahua, and Buller Counties are set apart as Land Board timber areas, and are administered by the Wardens. Accordingly any person desirous of obtaining any timber-right must apply to the Warden of the several Mining Courts. On receiving such application the Warden at present forwards it to the Commissioner of Crown Lands, who in turn hands it to the Crown Lands Ranger for his inspection of the area applied for. We next return the application to the Warden's office, with accompanying Ranger's report, affirming, modifying, or protesting, as the case may be, from a Lands point of view, when the Warden finally deals with the case. We afterwards plot, as best we can, the areas granted on our maps, and the Ranger inspects these and other mills periodically, and furnishes quarterly reports.

A sawmiller is allowed to take up 800 acres—*i.e.*, one sawmill area of 200 acres and three reservation areas of 200 acres each; but if he is more than four miles from railway or port, then he may obtain an additional reservation, or 1,000 acres altogether. He must declare his sawmill area, and after cutting out the timber, he surrenders it and takes on the next reservation as a new sawmill area, and so on.

Applications for right to cut timber in Westland are made to the Warden under "The Mining Act, 1908," and the regulations made thereunder.

At present in Westland there is a system of dual control, which makes it rather difficult to effectually supervise the industry. Applications have to be made to the Wardens of the different Courts, of which there are several, from Ahaura in the north to Okarito in the south. Hitherto these have been granted on the poorest of descriptions, with a rough sketch-plan attached. The result of this is that the Rangers have great difficulty in locating these areas and keeping the lessees to their own ground. "The Land Act, 1908," section 312, provides that the Land Board may also grant these areas, but by No. 117 of the above-quoted regulations the Board is expressly excluded from granting any timber licenses or timber-cutting rights.

Section 149 of "The Mining Act, 1908," gives power to the Governor to do this if he "is of opinion that applications may be dealt with by the Warden more conveniently than by the Land Board."

On the areas and reservations being granted, as there is no mention made of supervision by the Wardens' officers, and as the revenue is territorial, the Crown Rangers have been undertaking the work. But this quasi-dual control has not proved very satisfactory. The Westland County Council would prefer the Lands Department to have control, and in February, 1908, a deputation of the leading sawmillers interviewed the Under-Secretary for Lands at Greymouth and earnestly besought him to the same effect. Mr. Kensington assured him of his wish to accede to their request, and accordingly an Amendment Act in that direction was placed before the House, and the necessary clauses actually passed the second reading, but were afterwards thrown out.

At present the Wardens insist upon sawmillers taking areas and reservations in one fairly continuous block; but, despite our protests, late Wardens granted these considerably apart, with only long narrow strips of connecting lands between the several allotments. This, as they assured, complied with the Act, which provides that the areas and reservations should join each other. This extraordinary interpretation of the statute permitted the "gridironing" of the country and a virtual local monopoly of the milling-bush. So it may easily happen again that a Warden may quite conscientiously adopt the same view and re-establish the old system.

Again, the Wardens necessarily can have little knowledge of the various milling-areas which are constantly coming under official decisions; whereas the Commissioner of Crown Lands has, from his own and his surveyors' inspections, an intimate acquaintance with each district and its varied aspects, whether from sawmilling, mining, or settlement points of view.

When we have decided to cut up any bush land for settlement we receive a preliminary report from our officers, and, having obtained the Warden's consent (to whom we report as to the land not being auriferous and only containing enough milling-timber for the settlers' own use), the block is surveyed and subdivided into suitable sections, which are forthwith offered to the public. A fairly complete check against the chance of parting with any marketable milling-timber is that the Surveyor, who has necessarily traversed the whole block, has to report to us on each subdivision, especially noting its value, any milling-timber, &c.

In the past, as in the present, some have taken up forest lands on account of these containing a large amount of milling-timber, but very few settlers have ever taken up this heavily timbered land to clear it for grass or crop. The one or two who have done so have merely cleared an acre or so in the suburbs of a township, or, as in the case of "Master's Clearing" on the Greymouth–Marsden Road, made a failure of it in every way. This class of land will not pay to clear in Westland, except perchance in the Upper Grey district, where the brown-birch occurs.

All the settlement lands proper in Westland are located on the lightly timbered bottom-lands in the river-valleys, along the coast, or on the "faces" and "shale slopes" of the inland hills, where there is a fair depth of soil and natural drainage. The adjacent lands, on the terraces and high lands, are selected in small areas, by the settler who has to extend his holding and provide some winter feed and shelter for his young stock. And, unless the sawmiller removes this heavy timber, these lands in the main cannot be profitably occupied. In this aspect the miller becomes a benefactor, and also, by his trawmays, clearings, and cuttings, enables road access afterwards to be more easily provided. The sawmill hands, with their wives and families, are good cash consumers of farm-produce, and thus provide markets for adjacent farmers.

Hence, as the settlement of the milling-timber land is consequent upon and involved in its denudation of forest by the miller, and as the Land Board has the final apportionment of such territory it is considered very advisable that it should have full control throughout the procedure. Still it is difficult to compel millers to clear all milling-timber off each area. There are in some places areas of fallen, crushed trees, due to storms, which would not pay to disentangle; many mature trees when fallen are found to full of "shakes" or splits, and are therefore unmarketable. Milling-timber growing on broken lands, such as faces of terraces, in gullies, and also on tops of isolated plateaux, cannot be economically taken out, as tramways cost too much to reach the bush. Certain varieties of timbers are either not often marketable or not in demand at all, such as hinau, kawhaka, rata, kamahi (red-birch), brown and silver birch. For instance, a few years ago no miller cut white-pine, as it would not pay, hence all these several varieties, although strictly large enough for milling, are left standing, and, together with other smaller forest, often give an "uncut" appearance to many areas. The sawmillers in some localities are now reworking old areas for white-pine, and in some localities are at present either to close down or to cut white-pine on their reservation. In short, the sawmiller, in the main, does cut out all the marketable timber; it does not pay him to leave it behind.

Since "steam-power bush-haulers," instead of the old methods of horse and manual power, have been used, timber is hauled to the mills from localities which formerly had to be abandoned, as it would not pay to put special tramways in to get it out, and consequently the bush is better cut than formerly, and many areas which were scamped in first cutting have subsequently been cleared up.

One of the chief reasons why the sawmillers' operations are by law confined to his sawmill area, before being allowed to cut on the adjoining reservation, was to enable the Lands Department to place this denuded area in the market as soon as possible—that is, before the "second growth" sprang up; but, as shown above, it has been virtually impossible to insist upon this. Nevertheless a time-limit should be set, at the end of which period the miller must vacate those lands, which could be leased to settlers.

I consider it would be much better that millers bought timber either by auction or on grant of application in one or more instalments. By the present method the sawmiller has to keep a book in which is duly set down the timber cut, and he sends in at end of each quarter a sworn declaration as to the class and amount of timber he has cut for that period. The Ranger visits each mill, compares the miller's statement with the mill-books, and next checks these figures with the railway, steamer's, or carter's returns. This would appear a good method of audit, but yet it is difficult often to properly adjust discrepancies, as at the beginning or end of each quarter there is almost always an overlap, more or less, between the railway and other carriers, as the timber may be standing in trucks, &c. But one especial reason for abolishing the present system of payment by royalty is in those cases where the sawmiller is cutting on Crown lands and adjoining freeholds, &c., simultaneously. Here it is often very difficult to arrive at the true amount of royalty due to the Crown or local body.

The present system of the survey of sawmill lands is very unsatisfactory. A rough diagram often accompanies timber applications, which are forwarded by the Wardens for our report, and we are quite unable to locate the areas. Many areas were granted on such sketches, and we can only plot them vaguely on our maps, and the Ranger has great difficulty in picking the boundaries up.

By the regulations the Warden may order a survey, but the cost is not to exceed £5. Now, a proper survey in accordance with the Survey Regulations should be made, so that the various areas can be correctly placed on our application maps. The survey should also define adjoining freeholds, reserves, &c., and completely do away with the present vagueness of these boundaries, thus preventing vexatious overlapping.

All outside and internal boundaries of the several sawmill areas and reservations should be clearly cut and well pegged, so that the Ranger or the public would have no difficulty in following and inspecting the leased areas. The sawmiller should recut these lines periodically.

The conservation of forest or scenic reserves has always engaged our serious attention. Owing to the present regulations not compelling the sawmiller to have the boundaries of his reservations well cut, we have been obliged to re-mark some of them, especially in protection of these reserves. In one case the foreman of a mill cut into the back of one reserve unknowingly, but immediately desisted when apprised of the situation, and also paid full royalty. Fortunately very little harm was done to the reserve. Thus the want of a properly surveyed and well-cut boundary-line may easily lead to irreparable damage being done to many of our beauty-spots. The sawmillers have always been willing to safeguard these, but their bushmen can easily and unwittingly do them harm in the absence of a guiding-line. Our Rangers report upon all these reserves periodically.

With regard to the afforestation of lands denuded of timbers by the sawmillers, opinions differ considerably. Poor wet land is hardly worth planting, as witness the slow growth of trees on many old sawmill areas. Some think it would do to simply allow the "second growth" to spring up for a few years, and then to thin out all the rubbish, while others believe it would pay better to grass even very poor land than to replant it with forest. In any case the reclaimed areas must be fenced, otherwise cattle would damage them.

In conclusion, I desire to acknowledge the good feeling which has always existed between the sawmillers and our Department in settling any differences. And I beg to express my thankful appreciation of the courtesy and willing assistance of the Wardens of the district.

7. You have no means of estimating the proportion that rimu bears to the rest?—We did get out information of that type some time ago, which I sent to Wellington, and you could get it there. With regard to the two Wardens, they have completely fallen in with what we want, but with the late Wardens here I had a very great deal of difficulty. They looked upon this matter from a legal point of view. If a man brought in a sketch-plan and showed a sawmill at one place and a reservation half a mile away and sometimes an area a chain wide, they looked upon them as connected, and I am quite sure the Wardens were wrong in that matter. When this matter was put before our present Wardens they fell in with our proposition, which is the present way of doing it, but it is quite likely that if new Wardens were appointed they would look upon it in the same way as the late Wardens—viz., from a legal point of view.

8. *Mr. Morris.*] With regard to the area allotted, I see in the paper there are new regulations gazetted. Do you know anything about them?—Yes, but Mr. Jourdain could give you more precise information, because he has drawn them up. They were to be published some time ago.

9. I see it has been decided to allot the areas in proportion to the horse-power of the engine used in the mill. Do you think that is the best method of dealing with this question?—Well, I will answer it in my own way. You see, I am no sawmill expert at all, but I look upon it from the point of view of settling the people on the land. The faster we can get the timber off the land the better; and the more powerful the plant is the quicker we shall get all the timber, and in that I am fully in accord with the extended areas being granted to the millers.

10. *Hon. the Chairman.*] But what if they cannot get rid of the timber when they get it?—That may be. I cannot discuss that side of the matter at all. The quicker we can get the timber off the land the quicker we can get the settlers on to it, so that if we can get a powerful mill on to a piece of land it stands to reason that the mill will cut it out quicker.

11. *Mr. Morris.*] The question of the reservation of the sawmill areas at the present time, I suppose, is to be abolished. Do you believe in allotting the land to the sawmillers as at present, that several areas have to be renewed annually in the Court?—No, I do not. I believe a man should get a lease of the whole area in one block; but prevent a man taking up a large block and preventing the Lands Department settling people on it in that way. I think a block should be cut up into the present areas.

12. As to a great many of these sawmill areas that are held now, some parts of them would probably be very fair land for settlement purposes, while other parts would be practically useless?—That is quite true.

13. Some of it contains white-pine and other parts red-pine, so that it does not appear to be a judicious arrangement to try to confine a man to any particular area, because he may not have a sale for that stuff on that particular area?—You are quite right. It is a very great difficulty, and a difficulty that has to be faced. As I said before, on the area given you could not cut white-pine, as it would not pay, but if you let the settler in there he would probably cut down that white-pine as useless timber. The same thing applies to that famous timber kawhaka. It is one of the finest timbers in the world, and they do not know the value of it.

14. In your experience you have found that the majority of white-pine lands here are best for settlement purposes, as they grow better grass than rimu country?—Yes, but a good deal of white-pine is growing on swampy country. In fact, white-pine grows on partially dry country, and not thoroughly dry.

15. Do you consider that 5,000 acres would be a sufficient area for one mill?—Well, I could not say on that point. As I said before, I am quite willing, from my point of view, to leave that to the experts. To get the people quickly on the land is the main object. From a settlement point of view all this timber land is waste land, and it is no good to anybody. We divide it into big runs and lease it to people, and they put a few cattle on it.

16. Take a 5,000-acre area, yielding 10,000 ft. per acre, as an average of the class of timber that you are putting on the market to-day, that would only produce a total of 250,000,000 ft. If the sawmiller made a profit of 1s. per hundred on that output he would have £500 per million feet. Now, that, with interest and wear-and-tear, and the first cost of his plant, would not be

sufficient to cover the first cost of the concern?—Let me put it in another way: In conducting the affairs of Westland here with regard to land we have always followed out the policy laid down by the Government, and that was to put this objective before the people—viz., to put the people on sufficient land to enable them, say, at the end of twenty years to make an independency—of course, not necesarily rich, but with enough to carry on without hard work. We want to do the same in connection with any industry we are connected with. If it is pointed out to us that the sawmillers want 5,000 acres of this land I am sure we are quite willing to give it to them.

Mr. Morris: That is satisfactory.

17. *Mr. Hanan.*] I presume the difficulty in connection with dual control, referred to by Mr. Flanagan, is not new?—No, not with us.

18. It was reported to the Department in Wellington?—That is so.

19. What are the royalties payable?—They are as follows: Totara and matai (not less than 25 ft. in length or 12 in. in diameter) and silver-pine, 2s. per 100 ft.; Totara and matai (less than 25 ft. in length or 12 in. in diameter) and rata, 1s. per 100 ft.; rimu (red-pine), kahikatea (white-pine), and kamai, 6d. per 100 ft.; blocks for paving sluices, 2d. per 100; railway-sleepers, 3d. each; railway-sleepers, if under lease, 2d. each; other posts, rails, and sleepers, 8s. per 100; fencing-stakes, 4s. per 100; firewood, not less than 1s. per cord.

20. Do you advocate any increase or alteration in the schedule of royalties submitted by you?—I do not. If in any way a reduction of royalties would assist in getting our people on these lands I would be very willing to advocate it.

21. What is the price paid for bush held by private persons?—I really cannot tell you that, but I am sure you can get it from some of the millers.

22. Can you tell me if applications for timber-milling areas have increased during the last three years for sawmilling purposes?—Yes, from memory I should say they have increased.

23. Can you give the Commission the figures?—No, I have not got them here.

24. You can give us, though, for the last three years the number of applications for timber areas for milling purposes?—Yes, quite well.

25. Will you submit that later?—Yes, directly. The number was twenty-eight.

26. You are in favour, I understand, of enlarging the timber areas to be given for sawmilling purposes?—Well, I think I tried to explain that I was in favour of extending the sawmill areas if that led to quicker denudation of the timber for settlement purposes.

27. Do you not think that enlarged areas would give the man with capital a great advantage over the man of small means in the sawmilling business?—It may have that aspect. Things change. In bygone times here we had the small digger, who, with the exhaustion of surface gold, had not sufficient capital to work his finds, and so the industry began to fall away. The capitalist then stepped in, providing water and extensive plants, and so the industry passed practically in many districts out of the hands of the small man to those with more means. So also with the timber industry, I reckon in many districts eventually it must necessarily pass into the hands of bigger men, for the reason that more capital is required owing to the increasing difficulty of reaching the timber and placing it on the market.

28. Do you find anything in the way of dummyism in connection with sawmill areas?—No, I have not had anything of that yet.

29. Is there a syndicate in connection with sawmill areas?—Not to my knowledge.

30. Have you had any complaint about an unfair amount of timber land being granted to any one person?—No; but at times if a man takes up an area it comes before the Warden, and it may be that the adjoining sawmiller may oppose the grant, and they may fight this out. In some of these cases it comes to a matter of adjustment.

31. Is there any person in this district under your jurisdiction holding an undue proportion of timber-area country?—No, I do not think there is.

32. There is no unreasonable amount held by any person?—No. I have here some examples: my Ranger is travelling constantly throughout the district, and he does nothing else; he furnishes me with reports upon everything in connection with the timber, and I have never heard of a report to that effect.

33. What are the names of the persons who hold the largest number of areas, the number of the areas, and their respective acreage, together with the date on which they were granted?—Yes, I can comply with that information; it is as follows:—

Name of Holder.	Acres.	Years granted.
A. Southorn and E. Olsen	1,380	1908
J. Marshall	800	1906–7
Gardiner and Todd	800	1906–7
Ker and others	980	1904–5
Baxters	1,308	1900–8
Stratford and Blair	2,677	1900–8
G. D. Wilson and Co.	1,522	1905–8
K.K. Sawmilling Company	2,200	1905–8
Morris and Daly	1,000	1907–8
D. H. Roberts	1,800	1906–7
Stuart and Chapman	1,200	1907
Meharry, O'Malley, and Donaldson	800	1907
Woodstock Sawmilling Company, R. Taylor, and Maloney	800	1908
Perry and Hegan	1,600	1908
Diedrichs	800	1907
Morris and Roberts	800	1906–7
Bagnell	800	1909

34. Here is Stratford and Blair, who have 2,677 acres: How long have they held that?—I have no information here of that.

35. How much of it has been cut down?—I cannot tell you.

36. How long will it take to cut it out?—That I cannot answer.

37. Coming to the next—Baxter Brothers, 1,308 acres: How much of that is cut out?—I cannot tell you on that point.

39. Are there any other large areas held beyond those which you have quoted?—Not so large as that.

40. Are they the largest holders?—Yes, that is all they hold in this district. I think that is right.

41. Is there anything to prevent the holders of the properties you have just referred to acquiring further timber areas?—Not unless they put a mill up.

42. Then, they can acquire further areas?—Another thousand acres.

43. Notwithstanding the fact that their areas at present held may not be cut out?—Yes, that is true; they can if they put up a separate mill.

44. Then the only condition to the limitation of their holdings is the erection of a mill?—That is so.

45. There is nothing to prevent a man acquiring a monopoly of this district?—No, there is not.

46. Do you think that the discretion of the Board should be extended in regard to the granting of licenses?—Undoubtedly.

47. To the tenure of licenses?—You will please understand that the Warden does the business. When you refer to granting a man extra reservations that comes before the Warden.

48. Do these regulations apply to mining areas or only to Crown lands?—I understand to Crown lands.

49. It does not then apply to land that is administered, so far as timber areas are concerned, by the Warden?—No, I do not think so, but I am not quite sure on that point.

50. It simply applies to State forests?—Yes, that is so.

51. It does not meet what you complain about in regard to other lands, in regard to enabling larger areas to be held so as to get timber removed as quickly as possible. This regulation does not then apply to lands which are timbered in respect to which a license is granted for sawmilling purposes by the Warden?—No, I do not hold it does.

52. Do you think it should be extended to that?—I do.

53. Do you know what areas are held by the State sawmill in this district?—There is one at Runanga, where the State collieries have got a special reserve, and they cut timber there. It belongs to them, and we do not get any royalty.

54. You cannot give us the area of the land held by the State for the purpose of its mill?—If you order it it can be supplied to you quite easily.

Hon. the Chairman: Please supply that in your evidence.

[Subsequently supplied: Mr. Bishop, Manager of the State Coal-mine, Greymouth, reports as follows: "We have no particular area of timber land set apart for sawmilling, but cut timber from State Coal Reserve for our work. Approximate area so far operated upon, 400 acres."]

55. *Mr. Hanan.*] In respect to land where bush has been removed, can you say, generally speaking, if such land has been used for cropping purposes?—Not for cropping purposes—cropping will not pay here.

56. Will oats grow here?—They cut them into chaff.

57. Is there much cropping does in this district?—No.

58. Is there much grass land in this district?—Yes, a fair amount of that. They put all land into grass.

59. Is it good for that purpose?—Some of it is very fine.

60. Do you find that when the timber is removed there is a good crop of grass?—Yes, it grows good grass.

61. Is there anything in the soil against cropping?—We have not got a harvesting climate. Very often we have a wet summer.

62. Is it true that the ground will only grow rushes when the timber has been removed?—Wherever there is not good natural drainage you cannot have good land. For many months the land is often saturated.

63. Are there many Crown tenants holding bush in this district?—A good number; they cut the bush down and put it into grass.

64. Do they burn it?—Yes, after it is fallen. Some have taken it in different parts of the district, and they have taken up denuded areas abandoned by the sawmillers, and they are converting it into grass land now.

65. Are they prosperous by simply growing grass?—Yes.

66. That pays them?—Yes. I may say that last year we had not a single defaulter. Every man paid his rent.

67. Are you in favour of setting aside more timber areas?—For special purposes, yes, certainly.

68. What suggestions would you make in that direction regarding this locality?—We have schemes out for forest reserves all through the district, and we have several laid out on paper inland of this place. We reckon the State Coal-mine area is sufficiently extensive as a timber area to supply Greymouth.

69. What amount have you reserved?—About 80,000 acres.

70. Is it good milling-timber?—Portions of it.

71. Is it accessible?—Not very, at present.

72. As a matter of fact you are disposing of accessible timber areas and reserving inaccessible timber areas for public purposes?—It virtually amounts to that, although that is an extreme phase of the matter.

73. Is there much burning of bush in this locality?—No, very little. I know of a fire that occurred in this district. Some fallen timber took fire, and, being a very dry season, it extended over a lot of other fallen stuff, but a fire of that description only occurs on the face of the terraces or on the tops of the plateaux. You cannot burn standing bush here. You can burn birch in the north, but the main bush in this country will not burn.

74. Taking the last fifteen years, can you tell us the amount of bush that has been cut out for sawmilling purposes?—I can only give you an approximation of that, because I am sure we have not got the information.

75. Is there any record of the areas that have been cut out and granted for sawmilling purposes, and what has been cut out during the last fifteen years?—We have had a certain amount of record, but not a very accurate record. I am sure of that.

76. Can you not get that information respecting the timber licenses that have been granted, &c.?—A certain amount of it can be obtained.

77. Do your books not show the timber areas?—Yes, undoubtedly. You have to plot them on paper. In the past these records have not been very well kept, and not very well now.

78. In what respect are they deficient?—I will get a map and show you.

79. This map, Mr. Roberts, shows what?—It shows the areas granted.

80 Have you not got these on paper in your books?—We have not got books.

81. Not in the Warden's Court?—They have the whole of this information.

82. Can I get a statement showing what licenses have been granted? How do you know the number of licenses granted?—They come into my office sometimes for report. In the past the Warden granted these areas irrespective of me altogether.

83. Do you take a record of the applications that come in, together with the names of the applicants and the area supplied?—In recent times we have taken a record.

84. Do you at the present time, when an application is referred to you by the Warden, take any particulars from that application—viz., the name and address of the person, the amount held by him, the amount applied for, and where situated, &c.?—Certainly. It is down on this map.

85. Have you anything in your books apart from this map?—Yes.

86. I can get from the Warden here a statement showing the number of licenses granted, and also the amount of bush cut out during the last fifteen years?—I cannot say what the Warden can give you. I would like to point out that the present Wardens are most willing to help us in any and every way.

87. There is nothing to prevent the Warden working in conjunction with your office?—Nothing. He does so, and most amicably.

88. Are you in favour of forest-conservation?—To a certain extent.

89. Are you in favour of afforestation by planting?—Not in Westland.

90. Is it not a fact that this district is eminently suitable for tree-planting?—I do not think so.

91. Do you base that upon the growth of the other trees coming on?—Yes.

92. Do you think that their growth is a slow process?—Yes, very slow.

93. Do you recommend the planting of New Zealand trees or imported trees?—Imported trees always.

94. What are your reasons for holding that opinion?—We have only got totara or silver-pine that is worth growing here. I think it is a foolish thing to put in a rimu-tree when you can get a better one.

95. Is your idea to cut out the forest?—What I look at is this: You have got a great amount of mountain-slopes left behind you still, and they will last a long time.

96. They are inaccessible?—I do not say that altogether. They are in big gullies, and in other parts of the world they would be taken out. I maintain that in this great mining district, in the meantime and for generations to come, there is sufficient timber to meet requirements.

97. That is in Westland?—Yes, right down for over two hundred miles.

98. Is it not a fact that the cost of production is increasing?—I think it is.

99. Is that owing to the inaccessibility of the timber?—I think from what I hear it is.

100. It will follow as the mills have to go back to the hill country that the cost of production will increase?—Undoubtedly.

101. The price of timber will go up?—It might.

102. Is it not reasonable to conclude that timber will reach such a price as to be beyond the reach of the small man?—Yes, it might be.

103. Do you favour an export duty being placed upon New Zealand timber, such as kauri?—Please understand that I am Commissioner of Crown Lands, and I am not here to give evidence as to my private opinions.

104. As an official you do not care to express an opinion, but as an individual I hold such an opinion is legitimate; you are not gagged?—If that is to be put down in evidence as my private opinion I will give it to you.

105. Do you favour an export duty on New Zealand timbers?—If there is an equivalent. If we put an export duty on timber it is natural the man on the other side will want something for that. If he sends us in something I am quite willing.

106. The point I want to make is this: are you in favour of placing a duty on timber coming into New Zealand?—Coming into New Zealand? Certainly, I am.

107. Are you in favour of placing a duty on timber being exported from New Zealand, such as kauri?—Yes, if the exportation does not harm the trade and wages of the country, I am quite willing to have an export duty put on it.

108. You know that kauri is becoming diminished?—That is true.

109. What about hardwoods? Would you favour them coming in free?—I should be very pleased to see them coming in free, especially for our bridges. I think it is a pitiful sight to see our bridges built of timber from abroad.

110. *Mr. Jennings.*] How long have you been Commissioner of Crown Lands here?—About seven years. I have been thirty-three years in Westland, and I have tramped over it from one end to the other. I have been along the main range for 250 miles. I have either been to every valley or looked down into it.

111. Your deduction is founded not only on the Ranger's report, but from your own observation?—The bulk from my own observation.

112. Of course, it must be approximate?—Decidedly.

113. What is the position of Maori bush lands?—We have about 14,000 acres of grazing reserves belonging to the Natives—some up to 5,000 acres in extent.

114. Do the Maoris lease to the Europeans?—The Public Trustee has charge of the Maori lands, and leases them.

115. Are they principally bush lands?—Yes.

116. Do you know what royalties are paid?—No.

117. Speaking generally, is the land after being denuded of the timber suitable for pastoral or farming purposes?—Only certain portions.

118. What portions?—In the river-bottoms; the land right and left of the river is suitable for settlers, but when you get back to the forest it becomes very poor.

119. Further south, how is it?—Quite the same way.

120. In reference to settlers obtaining bush lands to cut the timber down, do they supply sleepers at all to public departments?—Very few of them. I do not think there are more than three or four who do that, and they are small settlers.

121. What is your experience of the small men who supply sleepers to the Railway Department? Statements are made that the timber is wasted by the small man?—Quite right; shamefully wasted.

122. My experience is totally different in the North. I think the contractor for sleepers there is generally an experienced man. Of course, the quantity is not the same. Have there been any complaints at all in regard to men supplying sleepers to the Department getting leases?—No.

123. What do they do in reference to getting bush lands for sleepers?—They can take an area of 20 acres, and they can go into the bush and get an area of silver-pine, which very often grows in clumps. They can take this area and cut the silver-pine out of it. At present silver-pine is so scarce they have to go a long way back, and that means cutting a track in to get the timber out. Hence when a man cuts down the larger trees if he finds they have got a hollow he will not take them. If he were nearer the railway-line he could use it. Any amount of timber is left back in the bush in that way.

124. How many are employed privately supplying sleepers outside of the sawmills?—I think about fifty. The number has dwindled down.

125. What is the average for ten years? It is a very great industry in some places?—It was, here, a few years ago.

126. You mentioned about auctioning the timber: would you have any reservation made so far as the areas are concerned?—Yes, I think that is a very good regulation that has been published in the *Gazette* about the power of the mill being according to the amount of the land. I am interested in that in this way: that I want to get this heavily timbered land that the settlers cannot do anything with at present into grass as soon as possible, and the quicker the miller takes the timber off the land the better. In that way I am willing to believe in it.

127. You believe in the settler getting a show?—Yes, but the miller must go ahead. Further, the miller confers a benefit in this way: that we have to road these lands, and as the miller has tramways we make use of them very often.

128. Do you think sufficient reservations have been made for scenic purposes?—Yes, we have the whole of Westland portioned out.

129. *Mr. Field.*] You think the Westland land is unfit for tree-planting?—I do, in the main.

130. On some portions you might plant foreign trees?—Yes.

131. Would it be desirable to plant them in these portions?—I suppose from the point of view of posterity it might be.

132. You know that in the North the Government is planting land unfit for other purposes. Is there much of that class here?—A little.

133. About this *pakihi* country with the cement-bed, do you think that is likely to be improved?—I do not think so. Of course, you can improve any of the land if you put money into it, but in many cases you have to fairly make the soil. Most of the *pakihi* lands have been occupied by forests—yellow-pine, which grows on wet land. Near Cape Foulwind you have the same, formerly an old sea-bed. Here you have the same subsoil—sometimes only a few feet deep, but it may be two or three thousand feet in thickness, so that it is impossible to sink boreholes, as they do in some parts of England, and let the water out. Here you might drain the land, and it is wonderful how the soil responds to drainage.

134. How much privately owned land is there under forests?—About 140,000 acres.

135. Regarding these royalties, do you consider them to be full royalties?—Yes, on the timber cut.

136. Do you not think the Commissioner is a little severe?—I do not think the land is worth the money.

137. At any rate you consider them full royalties?—Yes, that is so.

138. With regard to the cost of survey, who do you think should pay the cost of a proper survey of bush land and the resurveying and cutting-up of old lands?—I think the miller ought to pay that.

139. It is a fairly costly matter?—We can have the survey made for £15 per 200 acres.

140. That becomes a fairly heavy charge on the miller with a large area?—Not comparatively—the settler pays more than that. If a man comes to us for land we charge the survey fees right out. I should adopt the same system with regard to the mill. He would get his rental back out of the royalties, but we should have the advantage that we should have him pinned down to the distinct boundaries, and we could locate the areas on the map. I would like to show you a sample or two on the map now, and they were granted by previous Wardens. [Witness illustrated his argument.]

141. These are pieces selected by the millers themselves?—Yes.

142. What is the method of assessing the quantity of timber on which you charge royalty?—We do not do that.

143. How do you fix your royalty?—At the end of each quarter the miller has to send in a sworn statement.

144. Do I understand that it is assessed on his statement?—Yes, it is checked in this way: the Ranger compares that with the miller's books, and sends me in a declaration, and finds a discrepancy, as the case may be, either against or for the miller. Then, again, all the timber has to be railed, and goes through the Railway Department. He goes to the Department, and checks again, and we check again at the end of the year.

145. Your method is different from that followed in other places?—Yes, because through the railway system we have got an actual check.

146. Does not the Crown charge on the sawn output?—No, on the actual timber cut.

147. In Southland and other places they charge royalty on the timber cut, not the actual quantity in the log?—I do not know about Southland. I understand that there they sell the timber as it stands.

148. About the question of large mills, you said that the granting of large areas would have the tendency to give the big men an advantage over the small one?—Yes.

149. I suppose you agree that it is necessary to have large millowners to compete successfully with foreign timber?—That might be.

150. We should require larger mills than now to deal with longer lengths?—No doubt of that.

151. From that you think that large mills will be necessary?—I do. I think they are the coming feature of the industry.

152. Did you say that no royalty is allowed the Lands Department by the State mill?—No royalties.

153. Is nothing allowed the Railway Department for the carrying of the State timber?—They charge full on it.

154. About the reserve Crown areas of timber being inaccessible in most places in this country, what do I understand you to say?—Mr. Hanan put the phrase "inaccessible," and I allowed it to pass, but it is not altogether inaccessible. There is more than plenty of timber along the railway-line and roads; but it is quite inaccessible for the millers to get into that land; they would have to make a tramway into it.

155. I suppose the inaccessibility will decrease as time goes on?—Certainly; it is decreasing every day with the introduction of our roads.

156. About the millers taking up adjacent areas, is that a real right which is of any value in practice, or are those areas very often taken up by somebody else already?—In some cases they are surrounded by other people's reservations.

157. *Mr. Leyland.*] Speaking of dual control, I take it that your object is to bring that before the notice of the Commission with a view, if possible, to get the anomaly adjusted?—That is so.

158. We have been told that certain lands here, after being cleared, grow rushes only. Do you think it would grow larch and other trees?—Yes.

159. Do you not think it would be a very wise think in a policy of afforestation to have that land replanted?—I think it would be better to spend the money in draining the land and putting settlers on it.

160. I understood that it was land that would not grow crops?—I do not say that. All the land in New Zealand will grow rushes if it is not drained. If you drain the land the rushes die out. In fact, with our land here—inland country—where they are subject to floods, one of the most successful farmers has a portion of his land full of rushes, because he says that in the winter his cows do better there than in the open country, because the rushes protect the grass from frost and floods; and he has got his land completely stumped. Every now and then he ploughs the rushes under for manure, and deliberately allows them to come up for that purpose.

161. Did you say that you would not be in favour of a duty on kauri if it affected the workers?—Yes, that is my private opinion.

162. Seeing that there are at least five thousand employed in the kauri industry, would you favour an export duty?—I said it would be advisable if it affected the labourers' interests. That is just my private opinion.

163. Putting it from this point of view: the kauri millers have invested and paid very heavy royalties—according to themselves, 4s. 3d. per hundred. If we alter these conditions, and compel them to pay interest on that money, will it be fair to put the duty on kauri?—You confer an honour in asking me my private opinion. These are matters I have never looked into.

164. Your evidence will carry very great weight with the outside public?—I would like to have this put into the report: that my opinion outside my Department is not worth having.

165. *Mr. Barber.*] In reference to this question of extended area, is not the arrangement made or proposed to be made likely to induce a man to put in a very powerful second-hand plant? A man doing that would practically have an unlimited area, and all he has to do is to buy a second-hand boiler or engine and get an area of 1,500 or 2,000 acres?—No, it is not a fair arrangement to put up a machine of that sort. I will give you an instance of that in the past. Over where the State Coal-mine is now certain speculators got ahead of the Government and took up a sawmill area. We were watching very keenly, hoping that they would not have the mill up to date. They put on a 2-horse-power engine, and the Warden reckoned that that was enough, and that the men were entitled to the grant, because they had a sawmill on the ground. The Warden said that the regulation did not specify what sort of a sawmill it should be. That should be altered so as to provide against the second-hand machinery you speak about.

166. *Mr. Ell.*] You speak of cedar as being one of the best timbers in the world in your opinion; yet there is no market for it?—That is my opinion.

167. Do you not think it is desirable for the Forestry Department to make known the value of such timbers?—Quite true.

168. And in a great market like Christchurch to have examples of the uses to which the timber might be put, so that the millers would be able to find a market?—I think you are quite right there.

169. Is it not a fact that, through a ready market not being available, that timber is left behind in the bush?—That is so.

170. With regard to white-pine?—It is so.

171. And with regard to cedar and other timbers not marketable, but which are useful timbers nevertheless?—Quite so.

172. Do you not think that we should have a Forestry Department with trained foresters to study the value of the timbers and make it known?—Quite true. I am with you there.

173. I think you said you entirely approve of the miller preceding the settler?—Quite right.

174. And there should be no variation of that where the land contains milling-timber of sufficient value to justify a mill being put in?—Quite right.

175. You said sufficient scenic reserves have been made in this district?—Yes.

176. These have been set aside by the action of the Land Board, but not gazetted?—Some are gazetted. Up the Otira Gorge and down to the Bealey, that is all gazetted.

177. *Mr. Arnold.*] You say that after the miller worked out his area the Government made use of the tramway. Do you mean the track or the rails?—Simply the road where they have made cuttings; they save a lot of expense.

178. The Government do not use the tramway?—No, except where the miller has abandoned the whole thing.

179. When a miller is about to vacate his area and it is found that the tramway is of some value to the Government, valuation is never paid, is it?—No, never asked for. You see in most cases now a miller puts down iron rails and takes them up again. In some cases they even take up wooden rails and sleepers if they are not worn out.

180. So that a miller never gets compensation either for rails or anything else, or valuation of any kind?—No, except in this case, if a man has cleared the bush and put the land into grass or cultivation we put a value on that, and we load the section with that value, but we do not put an excessive valuation on it, because in that way if a bit of land costs £100 to clear and the man can show proof of that, the small settler who goes into that has no £100 to pay, and we tell the man that, say, £200 is what we value it at, and in every case they take our valuation on that basis.

181. That is to say, you load the lands to that extent to the incoming tenant?—Yes.

182. But the miller does not benefit by that?—Whoever has done the clearing we give the allowance to.

183. You hand the loading over to the miller?—Yes, but we do not hand over an excessive loading. We say what we think is a fair reward for reclaiming some of the land from the wilderness, and it is not fair to allow another man to go in there without paying for it. That is recognised all over Westland.

184. *Mr. Stallworthy.*] Is there a large quantity of cedar going to waste?—Yes, a large quantity in places. It is a queer timber in that it prefers damper localities, and prefers a height of about 2,000 ft. above sea-level, and in the saddles you get perhaps 200 acres of nearly pure cedar, and in that case it is valuable for bridges. In the upper Whitcombe Valley, nearly up to the pass, cedar is growing on both sides of the valley, and the cedar there is decaying. It is dying out, and red-pine is following it up. You can see it going up the valley, but there is a forest of cedar. That is the only place I know of in Westland where there is an actual forest. There is a large quantity there. In the saddles it will be very difficult to get it, and it would not pay the miller to go in there.

185. You say it is very useful for inlaid work, and there are other purposes for which it is useful?—It is a very fine timber for furniture, and I am not quite sure whether it would not do for fencing. It splits very easily, and it is a very hard timber to season.

186. *Mr. Mander.*] Do you think it would be better to estimate the quantity of timber allotted to the miller rather than the area of land he shall cut over?—I have not thought of it.

187. Do you not think the miller who takes up 500 acres of land that only contains half the quantity of timber that another 500 acres contains is heavily handicapped?—I think the miller will look after his interests keenly enough.

188. Is it not a fact that the land varies very much, and in some areas there may be much more timber than in others?—That is true.

189. And the man who takes up the area with the lesser quantity on would be very heavily handicapped, would he not?—You mean with regard to the duration of the forest for his mill.

190. Yes, it would be much more expensive?—What I propose is that the amount of timber should be assessed and the timber sold out to the miller, and consequently it would not matter how much the acreage was. A man would buy, perhaps, 20,000,000 ft. of timber, and it may be he would require a very large area compared with another man buying 20,000,000 ft. occupying only half the area, but one man would have heavier expenses.

191. You think it would be better to have an estimated quantity of timber?—I do, and I am pleased to see the *Gazette* notice published that they are doing something in that direction.

192. Of course, you consider it a better business proposition on the part of the Government to put settlers in the country rather than hold the timber for an indefinite period?—Well, that has to be carefully looked into. The timber is of great value, of course, and so is the settler, but we have got at present any amount of land for the settler and plenty of land for the miller, and I think we could adjust those points quite easily.

193. Do you think it would be a fair proposition to ask private individuals who have purchased large blocks of kauri timber at high prices, and who have run very heavy risks, to hold their timber for, say, forty or fifty years for the benefit of the State?—I think it would be for the benefit of the State—timber of that class.

194. Although they bought it on the understanding that the markets were open to them?—You must compensate those people if you do that.

195. But without any compensation do you think it would be fair?—I do not think it would.

196. You are aware that in kauri bushes there is very much greater risk of fire than with the bush down here?—So I am told.

197. And, of course, you know that interest on money accumulates very rapidly, and I suppose you could build a house fifty years hence of the most expensive material for much less than you could get the timber for. Putting the royalty on kauri now at 3s., if you held that for fifty years it would amount to 12s. or 14s. per annum. Would it be a good business proposition to hold that timber all that time and run the risks?—I do not think it would.

198. *Mr. Clarke.*] With regard to cedar, we have had it on sworn testimony that there is no suitable timber in the Dominion for venetian-blind making. Have you any knowledge as to whether that has been brought before the venetian-blind makers or cabinetmakers—the cedar timber?—I know a firm in Hokitika which used to use cedar for venetian-blinds, and of recent years they have given up using it because it warps.

199. *Mr. Morris.*] Do you not consider that the present rent charged to the millers of 1s. per acre acts as a deterrent to dummyism?—Yes, it does in a measure.

200. The millers are not likely to take up any more land than they require if they have to pay 1s. per annum for the privilege of holding it?—I have not found any cases of that sort.

201. *Mr. Field.*] Taking the new regulations mentioned in the telegrams in this morning's paper, do you think they would be useful to Westland?—I think they would be useful to Westland unless the Commission furnishes a report to induce the Legislature to alter the whole thing. I think it is a step in the right direction.

202. Do you say that you do not think it applies to Crown lands?—Yes, but it is a step in the right direction.

203. You think it should have extended to mining lands as well?—Yes, I think so, if you cannot do better. I should prefer to sell the timber right out.

204. *Mr. Morris.*] You told us the State pays no royalty?—Yes.

205. Do you not think they should pay a royalty on the timber they sell to people for house-building purposes?—I have to conserve the Government interests on Crown lands in Westland. The Mines Department has a State coal-mine there. They have taken the coal and timber out, and I want those people to pay me royalty. I want to get credit for that amount of Government material that is used, but at the present time I do not. In other places, such as Westport, they pay a coal royalty there, but here we do not, and it is the same with the timber. I am not passing any stricture on the authorities for not paying me this royalty, but I think they ought to do so for the benefit of my Department.

206. The revenue suffers through their not paying this royalty?—That may be.

207. As our bushes are getting cut out the miller has to go further back as a natural consequence, and that costs a good deal to get the timber to the mill. That of itself would be a good and sufficient reason why he should get a larger area granted to him?—Yes, that is something in his favour.

208. Now, you were questioned a good deal by some of the Commissioners in regard to not having a record of the land cut out. I think it is about eighteen or nineteen years ago that this question of granting rates to the millers on the bush was decided, and those rates were granted without reference to the Lands Department?—They have been ever since. The two Wardens in my district do not send me any information on the matter at all. I do not know anything about it. They can grant timber areas without reference to me at all, but the position was so bad that after consulting those two gentlemen who are now in office they fell in with my wishes in the matter, and the result is that everything is referred to me.

209. That accounts for the reason you gave in answer to the question put to you that there has been no reference made to your office about those grants at all?—No.

WILLIAM JAMES BUTLER sworn and examined. (No. 64.)

1. *Hon. the Chairman.*] What are you?—A sawmiller at Ruatapu, Hokitika.

2. You are aware of the matters that the Commission is inquiring into, such as the cost of felling timber, the cost of milling, the price when sold to the consumer, and so forth?—Yes.

The following statement was then made by witness :—

I should like to call the attention of the members of the Commission to the fact that the last inquiry held under State auspices in reference to the timber industry was in 1896, when a conference of those interested was called in Wellington. It will be remembered that at that time the trade from a miller's point of view was practically as bad as, or worse than at present. Some of the remarks of the late Premier, who opened the conference, are worthy of note at this time. Addressing the conference, he said, "You have been called together to deal with one of the most important industries that we have in New Zealand. An industry which, to my mind, in the past has been neglected, and it is only now that we are waking up to the fact that unless some steps are taken—steps of a practical character—the result will be detrimental to our country and extremely prejudicial to those who are interested in the industry. If you look back upon the condition of our forests and timber lands a few years ago, and if you ask yourself the question to-day: Has any benefit been derived by the country and the people generally and those most directly interested in the industry? the answer must absolutely be in the negative. Why, they have gone on year after year, large sums of money have passed through their hands it is true, they have cut millions and millions of feet of timber; but as far as they are concerned, there is no profit left, and I have found them very little better off to-day than when I knew them years ago. It shows that there is something wrong. If it is wrong to the millers it is wrong to the State, and the State has not been getting that value that it should. Has it done good to those engaged in the industry—I allude to the workers, to the mill hands, to the log-getters? No. The competition has been so keen, everything has been cut down so often, that they have made very little, and they are very little better off probably than living during the time they have been engaged in this very hard work. I say it is a matter for colonial concern as to whether this keen competition, this cutting-down of everything without any advantage to either the millers, to the workers, or to the State, whether or not that shall continue. My answer is, No. And you are called together on this occasion, gentlemen, to see whether some steps cannot be devised to remedy this most unfortunate state of affairs." The foregoing might be taken as a charge to the present Commission. The industry has since then been on a fairer basis, the ruinous competition has given place to a more healthy rivalry amongst those engaged in the trade, and the people of the Dominion have generally benefited. We are, however, now assailed with the competition of cheap timber produced by aliens under labour-conditions that would not be countenanced one day in New Zealand. As there is an idea amongst a certain section of the public that the sawmillers are making undue profits, you have been asked to obtain certain information on this subject. For the assistance of the Commission the cost of timber as produced by the miller has been divided into two headings, felling and sawing. There are no fixed or recognised methods of keeping accounts amongst sawmillers, and therefore what one miller might consider a charge fairly attachable to felling another might charge to sawing. For instance, to which of the two headings should depreciation of mill plant be charged when such depreciation is due to the short life of the bush holding? I do not mean depreciation of the mill plant due to wear-and-tear; but I contend that there is a great depreciation of mill plant that is due to the short life of the forest, and, as I say, where one miller might consider that a reasonable charge against the sawing, another might charge it to the log, and in comparing the two that fact should be taken into account. It must be recognised that in erecting a sawmill plant, which strictly has to deal with the sawing, a large proportion of the cost is expended on fixtures that have no value beyond the period during which that mill can be served with logs. The difference of the cost of such fixtures and their value when the mill has cut out the bush attached to it is a fair charge against production, and it may be charged either against the cost of logs at mill or against cost of sawing. In either case, although it must for the purposes of current accounts be an assumed amount, it has a value of much greater moment than is generally recognised. Of course, in the matter of depreciation, for the purpose of current accounts you can only take an assumed amount, because no man can know when the life of that bush will be done. For the purpose of making the figures clearer I would submit a third heading covering general charges not strictly chargeable to either felling or sawing. I estimate the cost of production on the West Coast as follows :—

	Per 100 ft. s.	d.
Logs at mill, including royalty	2	6
Sawing, and loading on trucks, including depreciation of mill plant ...	1	8
General charges, accident insurance, fire insurance, rates and taxes, mortgages, rejects, railway penalties, demurrage, clerical and office expenses	1	2
Total	5	4

This is the total cost as loaded on to railway-trucks. In addition to this there is the railway freight to ship's side, and that varies with the different mills; but the average can be taken at about 1s. There is a maximum cost here of 1s. 3d. When I say "maximum" I mean that the mills working on the Coast do not exceed that charge. In this connection I may state that, as I have not been engaged in sawmilling on the West Coast since 1901, the above costs of milling are based upon observations more than actual accounts. As bearing on the increased price of timber to-day, as compared with ten years ago, I submit the following list of rate of wages paid on the West Coast in the year 1898: Bushmen, 9s. per day; snigger, 9s. per day; winch-driver, 7s. per day; tracker, 8s. per day; trollyman, 8s. per day: Mill—Sawyer, 10s. per day; tailer-out, 9s. per day; head breakdown, 9s. 6d. per day; tail breakdown, 6s. per day; fiddler, 6s. per day; engine-driver, £2 per week; "slabby," 7s. per day; head yardman, 8s. 6d. per day; assistant

yard (youth), 5s. per day. The close proximity of the bush to the mill and other facilities were such that our wages-cost of timber loaded on railway-trucks was much lower than the cost would be to-day. As Butler Bros. have not recently be selling to any New Zealand market I have no evidence to give on the subheads "cost to merchant" and "cost to consumer." Upon the subject of selling to the consumer direct, however, we have always found when dealing from the West Coast that it was a necessity to deal through the merchants. The method of transport to Wellington or Christchurch prevents sending definite specifications with sufficient accuracy to insure success in supplying retail orders. Respecting Oregon pine: For the information of the Commission I may state that, having acquired a block of bush south of Hokitika, our firm decided that it would be advisable to investigate American methods of milling, and to purchase suitable plant for cutting out the above-mentioned bush. With that object in view I (with my brother) went to Canada and the United States. We arrived at Vancouver last May. We found that orders for two to three million feet of Oregon pine of the class known as "merchantable" had been placed by several New Zealand firms. We were able to procure copies of specifications of sizes ordered, and were offered similar lines at $17 per thousand (this is a little over 7s. per thousand feet) c.i.f. Auckland, Wellington, or Lyttelton. Upon inquiring at the shipping company's office we found that the rate of freight from Vancouver to New Zealand ports was £1 5s. 6d. per thousand feet, or a fraction over 2s. 6d. per hundred feet. This meant that the f.o.b. price was about 4s. 6d., which, considering the advantages enjoyed by the American miller, is a fair price for the class of timber supplied. It must be remembered that the home consumption absorbs the better classes of timber, such as selects, clears, edge-grain clears, deck-planks, &c. We wrote to our friends on the Coast here, pointing out what we thought would be the upshot regarding the importation of Oregon that was then coming along. I think that the present state of affairs fully bears out that forecast. The quotation given us was on what is termed the twelve-dollar basis, as defined by the Pacific Coast Lumber-manufacturers' Association. Now, upon this basis, while such sizes as 6 by 1½ and 8 by 1½ merchantable would be 5s. 4d. per hundred feet, the same sizes in selects would be 6s. 7d., in clears would be 8s. 5d., and in edge-grain clears would be 9s. 3d. The sizes given above are not exceptional in this respect, but are taken because they formed a large proportion of the orders being shipped. It will be seen that the class of timber being shipped to New Zealand bears about the same relation to the total output of the Pacific Coast mills that seconds rimu, for instance, does to our New Zealand mills. The superior quality in relation to our second-class rimu is due to the general superiority of the Pacific Coast forests over ours. That merchantable is a quality that is produced in excess of usual trade requirements is clear from the fact that, in the conditions of sale as set out by the Pacific Coast Lumber-manufacturers' Association, the proportion of all superior classes to merchantable is limited in a specified order. That is to say, they will always accept an order having an unlimited proportion of merchantable (see Rule No. 2). It means that in dealing with logs as they come to the mills a large quantity of the rougher grades is unavoidably made, and it pays the miller to quit those grades at a price at which it would be impossible to produce them if they were not produced in conjunction with higher-priced timbers. It will be readily understood that were there a market for the second-class rimu at anything near the present cost of firsts it would mean a considerable lessening in the cost per hundred feet of the whole output. Such market is shut off from the West Coast by the excessive freights. These are (with fair reason from a carrying point of view) the same as for firsts quality, and, forming as they do such a big proportion of the ultimate cost to the consumer, they place it beyond the millers' control to reach the market. After considering the position from the American side we were induced to communicate with our friends in New Zealand, pointing out the serious blow that was impending to the New Zealand milling industry. I consider that the disadvantages under which the New Zealand sawmilling industry is carried on are such that we cannot live against the American sawmiller, who has the following advantages: (1) Larger and better plants, (2) lesser charges, (3) cheaper labour and unrestricted labour-conditions, (4) longer hours, (5) cheaper freights, (6) better forests.

(1.) *Larger and better plants* are rendered possible because of the extensive holdings of timber lands which are permissible, there being practically no legislation limiting their extent. Besides the forest that may be held by the proprietors of any mill, there are numerous firms who, having no mills of their own, hold and work timber lands and sell logs to the milling companies. The extensive sheltered coast-line and inland waterways of Portland, Puget Sound, and British Columbia, so universally available for the transport of rafts of logs, give to the mills on the coast such a wide field for supplies from outside sources that the depreciation due to the cutting-out of bush which forms such a big item in connection with an ordinary New Zealand mill need not there be taken into account. I was informed that in British Columbia a "limit" of 640 acres could be procured from the Crown for twenty-one years at an annual rental of $140, equalling less than 10d. per acre, and that a royalty of 5 cents per hundred feet was charged for the timber. In the past there has been no restriction on the number of limits taken up by any company, and there have been no rates or taxes in respect of such holdings. For the purpose of estimating the quantity for royalty purposes the land is "cruised," or inspected, and the estimate is generally liberal to the occupier. From the fact that the American forest carries much more per acre than the New Zealand forest the rental per acre forms a much smaller charge per hundred feet than would be the case in similar bush to ours. Some of the sections on Puget Sound cruised 125,000 ft. per acre. In the Washington and Oregon States, which also ship timber to New Zealand, extensive timber holdings have been acquired under what is known as the Stone Act (1880). Under this statute any United States citizen can acquire 160 acres upon payment of $2·50 per acre. It has been common practice for large companies to acquire immense areas through the medium of individual citizens in the above manner. The American miller is better able to equip and maintain an up-to-date plant, for the factories that are able to make the best sawmilling machinery in the world at

the cheapest rate are right at his door. The economy of a better and more extensive plant over a simple, cheap one can only be realised when the life is long enough to bring the depreciation charges to an even amount per hundred feet in both cases. For this reason what would appear to be an economical plant might, when depreciation charges were added to cost, turn out dearer timber than a more obsolete plant. What I mean to convey is this: that unless there is sufficient area granted to a plant it is very little use putting in a better and what would necessarily be a more expensive plant with the idea of reducing the cost of production, because depreciation on that higher-priced plant would add to the total cost of the timber to a much greater sum than that produced by a more obsolete plant that had not such a heavy depreciation charge to meet.

(2.) *Lesser charges* per hundred feet are assured in administration where a greater output is controlled from one centre. There is no workers' accident insurance to be borne by the American miller. The men pay their own insurance, and the employers generally act as agents on commission. Rates and taxes on mill property are nominal. In some cases the local bodies give a bonus to induce a manufacturer to locate in their particular district. Compare this with the fact that at Naumai, Kaipara, the White-pine Company paid for rates and taxes, rent of foreshore, and mill-site a sum equal to 4½ per cent. on their called-up capital.

(3.) *Cheaper labour, &c.:* Most of the mills round Vancouver employ Japanese and Hindoos in all but the prominent positions in the mills. Such positions as sawyers, saw-doctors, head yardmen, &c., are filled by white men. At Bellingham, an important United States export centre in Puget Sound, Japanese are also employed. At Portland I did not see any Japanese, but there is a lot of cheap Italian labour available, as the mills are mostly situated on the riverside near the city. At the Rat Portage Mill, New Westminster, British Columbia, I noticed only two white men in a large mill where all the rest were Japanese. At the Hastings Lumber Company's mill the majority of the men in the mill are Japanese, getting from $1·50 to $2 per day, and in the yard the rank and file are mostly Hindoos at lower rates. In order to have something definite on the question of coloured labour I visited the Pacific Coast Lumber Company's mill during the time that they were shipping a New Zealand order, and took a photo of the group of Japanese yardmen actually engaged handling timber for New Zealand. I questioned the white man in charge respecting the rate of wages paid to these men, and I was told $1 per day. This is for a ten-hours day. The rate of wages being paid in the forests were on about the same basis as are paid in the Auckland District. The amount of labour available at the time of my visit was appalling. The manager of the Pacific Coast Lumber-mill assured us that he could procure two thousand men in two hours. Apart from the Japanese and Hindoos there are hordes of Europeans, who, carried westward ho in search of the best place to settle, find themselves dumped on the limits of the continent, having passed the better fields, but without the means of returning eastward.

(4.) *Longer hours* mean not only more work for the day, but it also means 25 per cent. more utility derived from all the plant per day. The best-equipped mill in the world is valueless as a profit-earner when it is idle, and conversely the profits from invested capital are immensely increased by longer hours of action. Where there are so many charges which are constant per day the longer hours worked reduce these per hour or per hundred feet to the extent of 20 per cent.

(5.) *Cheaper freights* are obtainable from Vancouver to our markets than we can procure between our own ports. The rate, as before mentioned, per the Alley Line (subsidised by the New Zealand Government) was £1 5s. 6d. per thousand feet, being about 2s. 6½d. per hundred feet, while from Greymouth to Lyttelton the sea freight is 3s. Added to this we have railway freight 1s. 3d. per hundred feet, making 4s. 3d., or 1s. 6½d. more than the freight from America. I may state in connection with these freights that the vessels which are bringing this timber in some cases, besides carrying Asiatic crews, are free from the shipping regulations imposed upon New Zealand boats. It is quite a common thing to see deck-loads on these boats 12 ft. and 14 ft. high, which would not be allowed in vessels trading in New Zealand waters. At the same time, Americans, although we allow them to trade from one port to another in New Zealand, will not allow any foreign boat to trade between any two of their ports.

(6.) *Better forests:* The American forests are better because they contain more timber per acre, they are mostly accessible by water, and the timber is lighter to handle and more symmetrical. The greater quantity per acre makes the logging much cheaper because the cost of such work as tramways or hauling-roads and the moving of hauling plants, &c., is spread over a greater quantity of timber. The foregoing costs are strictly in proportion to the acreage worked, irrespective of the quantity contained thereon. The splendid waterways for floating logs add greatly to the value of the forests. The timber being lighter and more symmetrical admits of being dealt with by automatic devices that could not be applied to our irregularly shaped and varying-sized logs with anything like the same success.

The foregoing are a few of the advantages which tell against the New Zealand miller when brought into competition with them. Other matters affecting the timber industry are the questions of preservation of our forest and afforestation. These questions alone are of such importance to our national welfare that if dealt with in a practical manner they will justify the present Commission. That the New Zealand forests should be preserved all those who are truly interested in the timber industry, and those who take an intelligent view of the country's future welfare, fully recognise. The period during which they should be preserved is, however, open to question. Most of our forests are mature, and, like a ripe crop of wheat, should be garnered, and such land as may be better suited for reafforesting than for agricultural purposes should be replanted. To leave our forests growing in the hope that the crop will increase is not a sound policy, because the decay of the matured trees quite neutralises the increase produced by the rising saplings. In all our forests are to be found trees in all stages, from the seedling to the fallen and decaying "old man." This condition has existed for centuries, and would continue so if undisturbed. It must be admitted that the value of our forests as timber is only a live value when the trees have been manu-

factured into lumber, and it would be just as foolish, economically, to preserve forest-timber when it can be realised as it would be to cease cropping wheat land while there is still a demand for wheat. The idea of preserving our forests for posterity by buying foreign timber, however unselfish it may appear from a national point, is manifestly unfair to ourselves and to that posterity which we desire to benefit. Admitting that we should provide posterity with forest reserves, it would be better to realise on our present forest as soon as possible and replant better timber. Taking our rimu, for instance, at the present standing value of 6d. per hundred feet, and assuming that the existing forests of New Zealand will supply our demands for seventy-two years, any matured forests now growing that will be remaining at that time will have cost 16s. per hundred feet compound interest at 5 per cent. on its present value at 6d. It is contended by some, who have in reality narrower interests at heart, that by buying American timber we are saving our forests for posterity; but viewed from a national standpoint it must be wrong to hoard up timber at such a cost, more particularly when by doing so we are stifling our most important industry. The preservation of our forests should take the form of disposing of forest lands for milling purposes only (except those areas preserved for scenic purposes), and timber should not be destroyed for pastoral purposes. The indigenous forests of New Zealand do not regrow after being worked as do the forests of America, and therefore any timber which is left in old workings is practically lost. Encouragement, therefore, should be given to insure the cleaning-out of any workings and to lessen as much as possible the waste in manufacture.

Respecting afforestation: Roughly speaking, those countries, such as Germany, France, Norway, and Sweden, which to-day manage their forests on scientific principles, have passed through four stages of forest-development. In the earlier stages of settlement the forests appear to be so abundant that they were destroyed to give place to pastoral pursuits. Then, as settlement grew, the local demand for timber induced more care, and the forests were protected for the sake of the material supplied. Third, the increasing and constant demand for timber in all branches of commerce led to the recognising of timber as a crop like other agricultural crops, to be harvested and made to grow again. Finally, the forests were safeguarded and made to yield a maximum crop. It is chiefly owing to the fact that the timber is so slow in coming to maturity that it becomes necessary for the State to undertake replanting. Any idea of replanting our native trees for commercial purposes may be dismissed for the reason that they are so slow in growing. Authorities have given the period required for maturing our principal timbers as follows: Rimu, 400 to 500 years; white-pine, 370 to 600 years; black-pine, 270 to 400 years; totara, 470 to 800 years; kauri, 600 to 3,600 years; cedar, 150 to 400 years. It is questionable, however, if any accurate data have been obtained respecting the rate of growth of our forest, such as might be obtained by accurately measuring and recording the size of each tree on a given area and remeasuring the same area after a given period. Mr. Perrin (Conservator of Forest, Victoria) stated at the Timber Conference, 1896, that in the matter of hardwoods there were many Tasmanian, New South Wales, and Victorian trees that would suit our climate. The best eucalypti grown in Victoria fit for sawmilling in thirty to thirty-five years are red-gum, box, and stringy-bark. For softwood the American redwood would be an excellent timber to plant, being very rapid in growth, and while growing it is uninjured by grass-fires. It has been tried in isolated cases in the Auckland Province, and is peculiarly suited to that climate. In the Eastern States of America replanting is being extensively carried on. In Vermont, for instance, a law was enacted in 1907 providing for the yearly distribution of seedlings and transplants from State nurseries. The seedlings planted consist largely of American white-pine, while Scotch pine and red-pine are also largely used. Practically the whole supply is composed of coniferous trees. The jack pine, which is largely used for railway-ties in Canada, is found to be particularly suited for dry sandy soil unfit for agriculture. Tree-planting was encouraged on the Canterbury Plains in the early days by the fact that timber was not assessed as a land-value, and that a bonus in the shape of 2 acres of clear land was given for each acre of plantation. At present plantation is discouraged. Definite information on the methods employed in Germany, France, Norway, Sweden, and India should be procured and submitted to representatives of the timber industry for suggestions, with a view to establishing a State Forestry Department on commercial lines. A School of Forestry should be established to educate those whose duty it should be to look after this most important branch of our national institutions.

Speaking further of the competition which our millers have to contend against, I may add that the local bodies in America will sometimes give a bonus to a manufacturer to put a plant in their district, and they will do that in competition with a neighbouring local body; and there have been cases where the manufacturer has gone from one body to the other to get a higher and better bonus for putting in his plant.

3. *Hon. the Chairman.*] Have you any further statement to make?—I would like to take this opportunity of refuting a statement that has been made by the Minister of Railways.

4. Where and when was it made?—At a meeting held in the North Island.

5. We have nothing to do with that?—It is a statement that appeared in the newspapers.

6. But it does not bear upon this inquiry?—Then I have no further statement to make.

7. *Mr. Morris.*] As a practical sawmiller, give us your ideas as to the amount of bush land that a sawmiller should be allowed to hold or that would be sufficient to warrant him in putting up a thoroughly up-to-date plant?—I think that the area should insure, say, twelve years' life of a mill.

8. *Mr. Mander.*] That would be the minimum, I suppose?—Yes.

9. *Mr. Morris.*] What would you consider an up-to-date plant should turn out per annum?—It is not long since I saw a mill going up which it was anticipated would turn out half a million feet per day. On the other hand, you have mills here that cut only 5,000 ft. per day.

10. Would you call an output of 5,000 ft. per day that of an up-to-date plant capable of turning out timber as cheaply as it could be produced?—No, I would not. I think that the area should insure twelve years' life for the plant.

11. During that twelve years, of course, you would reckon on recovering the total cost of the plant and interest on the money laid out?—Yes.

12. So you would have to write off each year as the bush got cut out one-twelfth of the total value of your mill?—Yes.

13. About the wages to-day as compared with 1901, you have some knowledge of the increase?—From what I have heard that others are paying that were employing the same labour, I recognise that the increase is very considerable. We are paying labourers 10s. per day.

14. They are not expert men?—No.

15. *Hon. the Chairman.*] What are your sawmill hands getting?—We are not employing any sawmill hands.

16. Do you know any that are employed in the place?—I have been told that they are getting as high as £5 per week for sawyers, and that the men in the mills are getting 12s. per day at the tail of the break-bench.

17. What are they getting at the front of it?—Five pounds; the head sawyer is getting that, and his assistant at the tail about 12s. per day; the head of the breakdown 12s., and the tail 11s. This is purely hearsay evidence.

18. *Mr. Hanan.*] You gave up milling some years ago?—On the West Coast.

19. How long ago?—1901.

20. You have been milling for how many years previous to that?—Twenty years in different capacities.

21. Did you give up, having made money or lost money?—I had made money. In giving up here on the West Coast we sold out to advantage to ourselves.

22. Am I justified in assuming that up to eight years ago, when you gave up business, you had made a sum of money of a considerable amount?—No, I do not think we made as much as if we had been engaged in any other industry.

23. Have you any objection to saying how much you made?—Yes.

24. You bought a large area of bush: how long ago?—Two years ago.

25. What was the quantity?—The total acreage of the two blocks is 28,000 acres.

26. How many miles from Greymouth?—One area about twenty miles and the other twenty-six miles.

27. Is that land reached by rail?—One of the blocks of 14,000 acres is.

28. It is close to the railway-station?—Yes.

29. How far away is the other?—Seven or eight miles.

30. At what do you value the bush on these two areas?—£1 per acre is the rough valuation.

31. What is your value, if you were selling out?—£1 10s. per acre.

32. What did it cost you?—£1 per acre.

33. How long have you got to remove that timber?—Indefinitely; we bought the freehold.

34. You have given considerable study to this question?—So.

35. And you have come to certain conclusions?—Yes.

36. In coming to a conclusion in regard to this matter of the importation of Oregon, I take it that you have knowledge of the amount of the importation of Oregon into, say, Christchurch?—I have not a definite knowledge.

37. Do you not think that you ought to have some knowledge?—I did not think it was necessary for me to have that accurate knowledge in coming to the conclusion that I have arrived at.

38. But in order to arrive at the conclusion as to whether Oregon was displacing West Coast timber in the Christchurch market or not, would you not have that information before us?—I think, if I had information that there was a substantial quantity coming into that market of such sizes as I knew would come into competition with the rimu, that that would be sufficient to form the conclusion that it would affect the rimu trade.

39. What figures had you before you?—I had an offer of timber at 7s. a hundred feet—$17 per thousand. That runs out a little over 7s. c.i.f. at Lyttelton.

40. Have you come to any conclusion as to the extent to which the importation of Oregon is affecting the sale of New Zealand timber in the Christchurch market?—I am led to believe that some ten or twelve million feet have come into Christchurch and Wellington.

41. Within what time?—Since I visited America in May last year—within the last twelve months.

42. Knowing that fact you have also, I take it, considered what quantity of timber has gone from the West Coast to Lyttelton?—I have not those figures.

43. You should have, however, to arrive at that conclusion?—I do not think so.

44. How can you tell whether Oregon is seriously interfering with the sale of New Zealand timber in the Christchurch market?—Because I know there are sizes coming in there that would be used in place of rimu.

45. What quantity has been coming to Lyttelton during the last nine months?—Lyttelton and Wellington, 10,000,000 ft.

46. What quantity of West Coast timber has been going into Wellington during that period?—I do not know.

47. According to a return here for the nine months from the 1st July, 1908, to the 1st March, 1909, the quantity of Oregon pine from British Columbia was 3,614,198 sup. ft., or a value of £115,071. Then, we had Oregon pine from the Western States amounting to 202,825 sup. ft., of a value of £728. That is a return furnished by the Collector of Customs at Lyttelton. How does that tally with a statement made just now?—That is what I would assume would have come in as part of the 10,000,000 ft. to the two ports.

48. Do you not think you should have some figures to enable you to make a comparison between the importation of Oregon pine as compared to the West Coast timber?—Although I have not the actual figures of the quantity, I know that there is a greatly diminished quantity going into these markets.

49. During what period?—From May last until to-day.

50. On what do you base that?—From information I have received from millers engaged in the trade on the Coast.

51. You do not know it of your own knowledge?—Not beyond that.

52. Have you received any letters from timber-merchants at Christchurch?—No.

53. What steps would you suggest in order to place the sawmilling industry in this country on a proper basis?—I should suggest the imposition of a duty on Oregon pine of such an amount as would allow the sawmillers engaged in the business to put their timber on the market at a fair profit.

54. What would you suggest?—I take it that this Commission is inquiring into what will be a fair price, and they would be better able to answer that than I would.

5. You are a practical man, and what would you suggest?—If it were landed in Wellington or Lyttelton at 11s. 6d. per hundred feet it would allow the millers here to compete against it.

56. What duty would you say should be imposed on Oregon pine, and how would you apply it—on large lengths in balk?—On all classes.

57. Do you know the present duty?—Two shillings per hundred feet.

58. What increase would you put on?—I think an additional 1s. per hundred feet.

59. Do you agree that the tightness of money has anything to do with the slackness of trade in the sawmilling industry?—It has, undoubtedly.

60. Would you say that it is the chief factor?—No, as applied to the West Coast.

61. Why do you come to that conclusion?—Because I consider that the Coast is more affected by the importation of Oregon than the other centres; and, although in the other centres the tightness of money may be the chief factor, it is not so here.

62. How many feet have been displaced in Christchurch during the last nine months by the importation of Oregon?—About 4,000,000 ft.

63. Oregon was responsible for that?—I think so.

64. At what do you value that?—Eleven shillings, c.i.f., Lyttelton.

65. When did the falling-off take place?—I believe it commenced during my absence from New Zealand.

66. At what date?—Since last May.

67. You are aware that there has been a falling-off in the sawmilling trade in Southland?—From the fact that I have heard so.

68. Are you aware that very little Oregon goes down there?—I have also heard that.

69. Do you know Mr. Massey, the big sawmiller in Southland?—By repute; I have never met him.

70. What is your opinion of the class of Oregon that is coming into the Christchurch market?—The class is merchantable.

71. Mr. Taylor, a builder in Christchurch, said that the Oregon coming into New Zealand was of the lowest, cheapest, and coarsest grade?—I do not agree with that; there are lower grades.

72. Have you seen the timber imported?—I have seen some landed in Wellington.

73. You cannot speak of Christchurch?—No, beyond the fact that it is generally of a class that is merchantable.

74. Do you agree that Oregon is lighter, stronger, and better timber than red-pine?—I believe it is lighter, but I do not believe that it is stronger.

75. Have you any rule of tests?—Mr. Gillies, engineer, of Greymouth, has made some tests.

76. What test did he apply?—A breaking test—taking rimu and Oregon pine, supporting each end, and taking it as a beam.

77. Do you think if we had to do without the imported timber that the building trade would have been hindered?—I do not think so; we did without it before.

78. According to Mr. Petrie, the architect, if we had to do without it the building trade would have been hindered?—I do not agree with that.

79. Do you agree that it would mean more costly buildings?—Not more costly than red-pine.

80. Do you not think the coming of Oregon has helped to keep down the price of red-pine?—I do not think so.

81. Mr. Petrie also says they would have had to use kauri or some Australian timber?—I do not know of any difficulties that cannot be overcome in getting long lengths of red-pine.

82. Have you got it?—Yes, in this district.

83. Now, speaking not as a sawmiller but as a citizen of New Zealand, do you think it is desirable to increase the duty on Oregon pine?—I do.

84. Is it not a fact that in Christchurch they have a difficulty in getting seasoned red-pine?—I do not know.

85. Is the timber you send into Christchurch market seasoned?—Generally not.

86. Do you know if large sizes of Oregon pine go in there?—No.

87. Is it not a fact that they go into the large buildings?—I do not know. I do not know that there are so many large sizes of Oregon coming in.

88. Is it not a fact that there is a famine in the timber-supply of the world?—I do not think so.

89. How do you account for the fact that nearly all the advanced countries are adopting improved measures in the way of afforestation?—It stands to reason that it must be more convenient for them to have such supplies at hand, apart from the climatic influences.

90. If older countries have found it necessary now to establish a Forestry Department, does that not point to the unwisdom of our cutting out our timber here at the rate we have been doing?—I do not think so. I think it is better to realise on what we have and reafforest.

91. And not conserve our timber for future needs?—I would not save it for the future to the exclusion of the present—use it as it is used now, and not waste it.

92. Would you say that the present way of using it is on right lines so far as the future needs are concerned?—With slight modifications, yes.

93. What are the modifications that you suggest?—That endeavour should be made to place the inferior timbers on the market. There are plenty of uses to which they could be put.

94. What would you suggest in the way of putting inferior timbers on the market?—A cheaper shipping freight from here to Lyttelton.

95. You have Mr. Cook's boats and you have the Union Company's boats?—They both trade here.

96. Do you suggest that they are in a position to reduce freights?—I do not suggest that.

97. Then you do not look forward to any reduction in the water-carriage freights or railway freights?—No. As applied to the West Coast a reduction of railway freights would not make much difference.

98. Well, how are you going to get this timber you refer to to the market?—One thing that would undoubtedly assist it is the exclusion of foreign timber.

99. Would not that make building more costly?—No more costly than it has been in the past.

100. What is to prevent the price of timber going up if you have no importation?—Well, I think the State should adjust that matter.

101. In what way?—In about the same way that they adjust the rate of wages. We have a minimum rate of wages, and why not have a maximum rate for selling timber at.

102. Settled by a Court?—Yes, settled by a Court.

103. That when timber went up to a certain price the duty would come off the imported timber?—Yes. If red-pine ever went above a fair limit, then it would be quite right to reduce the duty on Oregon pine, and allow that to come in to adjust matters.

104. Are there any reasons why Oregon pine is being sold so cheaply at the present time—any special reason operating?—I think the chief reason that started it here was a slump in the American mills, but having found a channel for that class of timber I think the likelihood is that it will continue.

105. Has it not been on account of the rate-war in the American States?—The shipping rate?

106. Yes?—I am not aware of that. I believe one thing is that the subsidy that was being paid to those boast annually would assist cheap freights. The subsidy was being paid by the New Zealand Government.

107. But those boats carried other stuff besides timber?—Just so, but chiefly timber.

108. Then your markets here are Wellington and Christchurch?—That is so.

109. Do you agree with the statement made by a timber-merchant in Christchurch that very little Oregon pine gets into the country districts of Christchurch?—I should imagine that would be the case.

110. You know what the duty on Oregon pine is?—Yes.

111. Take a million feet of timber, what would be the royalty the Government would obtain on that amount of New Zealand timber?—That is a matter of figures. At 6d. per hundred feet it would amount to £250.

112. Take the same quantity of Oregon pine imported into New Zealand, what would the Government get?—Four times as much a thousand.

113. The Government would get more by importing Oregon pine than in the royalties on the same quantity of our timber?—Yes, but there are other sources besides royalty. What I mean to say is this, that besides the royalty that would be paid to the Government on that New Zealand timber there is the railage. There is the fact that the whole of that money is in circulation within the colony. That is a great thing. I take it that £1 put into circulation in any district passes through a number of hands, but, while each might take 10 per cent. out of it, it will do 10 pounds' worth of business. Buying Oregon means taking cash out of the country.

114. But you must remember that the timber is gone for good: when you cut down the timber the raw product is gone ?—Yes, but on the other hand the raw product is of no value at all so long as it is not converted. There is no use in having a tree there to gaze on.

115. But you do not manufacture trees like you manufacture bricks?—Why not?

116. The timber is gone?—So is the clay gone.

117. But there is more clay than there is timber?—Still there is this advantage in the timber, that it can be grown again, and the clay cannot.

118. In what time?—Thirty or forty years.

119. What timber can grow in that time?—Coniferous pines.

120. Where would you plant them?—On all suitable lands.

121. Would you plant any here?—Yes.

122. You heard what Mr. Roberts said as to the trees he would plant, and he advocated imported timber being planted?—Yes.

123. Is your opinion the same as his?—My opinion agrees with his.

124. And you would plant imported timbers?—I should, undoubtedly.

125. *Mr. Field.*] What do you think is going to be the result to the milling industry on this Coast if the present conditions of things continues?—Well, it is not very hard to see that it will come to something like the condition that we had before the 1896 Conference. The millowners were just working—they were collecting the wages for the men only. They were making nothing on their capital which was invested, and they were working harder than any of the men themselves. That condition is not entirely removed to-day.

126. With your present knowledge of the Oregon-pine trade, would you enter into the sawmilling business on this Coast in competition with Oregon pine?—No. I might state that there has been a statement made that a firm on the West Coast, after investigating the sawmilling methods in America, were putting in a plant here to compete with Oregon timber. Now, I should like this

opportunity of stating that far from putting in a plant to compete with Oregon timber, from what we saw we are fully convinced of the folly of attempting to compete against American conditions. I do not know of any firm that could compete with those conditions. I might say further, in answer to anything that might be advanced as a reason why we are still continuing, that, having acquired a block of bush before we went there and before the present slump came about, there is practically no other course open to us but to continue the erection of the mill, trusting to the good sense of you gentlemen to put the timber industry on a sound basis.

127. You were asked how you came to arrive at a certain conclusion, and you stated you were largely influenced in arriving at that conclusion by the fact that Oregon pine is being imported into Christchurch and Wellington at prices less than the rate charged for red-pine imported to those ports?—That is so, yes.

128. In regard to the block of land you acquired, I suppose you are not the only one in it?—No, it is held by a company.

129. There are number in it?—Yes. There are 40,000 £1 shares.

130. Now, of the 28,000 acres, does pretty well every acre contain milling-timber of a commercial value?—No, on the block we are operating on we estimate about 10,000 acres of millable timber in a block of 14,000 acres. In the other block I think there are 2,000 acres of millable bush.

131. Two thousand out of 14,000?—Yes. When I say "millable" I mean millable under present conditions. I do not say that in the future some effort may not be made with improved methods, but with the present methods I think that 2,000 acres would cover the millable timber on the second block.

132. That is, 12,000 acres in all out of 28,000?—Yes.

133. Now, from your observations in America would you say there were indications that the supply of Oregon timber there was very large indeed, or is it true that it is running out?—I should say from the indications that it was very large. I take as one indication the fact that there was a new mill going up near Vancouver, at New Westminster, at an estimated cost of a million dollars. I was told that the amount of timber contained in the structure would be about 3,000,000 ft. The estimated output of that mill would be half a million feet per day when it was running. Well, in the face of that, when such a mill was being erected during practically slump times, it did not appear to me to indicate any shortage of timber-supplies.

134. Did you see anything over there to indicate that there was any restriction being placed on the export of logs from either America or Canada?—The only fact I noticed while there was that a raft of logs that was destined for Bellingham was held up at Vancouver Island by the Canadian authorities.

135. In regard to the duty on Oregon pine, do you think it would be safe to take the whole or any part of the duty off the large pieces? If the duty were reduced or taken off altogether, would the large pieces be brought in here and resawn at prices by which they could successfully compete with our rimu trade?—I think it could.

136. Do you think it could be done to avoid wharfage?—I do not see how that could be done. It could be done very conveniently at either port. It is rather against our interests to say how it might be done, because there is such a looming possibility of it coming along.

137. You do not want to make any suggestions?—No.

138. You showed us some photographs to-day. Could you have taken photographs of the mills in the States showing the employment of the black labour?—I do not think I could.

139. Are the conditions of labour different there?—There is no great amount of Asiatic labour used in the States.

140. What is the proportion met with in the States mills?—As a matter of fact, I do not know that I saw any Japanese working in the States mills beyond the fact that when at Bellingham I was informed by one interested in the milling there that they employ them, and find them very good.

141. *Mr. Leyland.*] South of the Canadian line?—Yes, but very close up.

142. *Mr. Field.*] You say, in the States this type of labour is employed much longer hours and at cheaper rates than in this country?—Yes. I base that upon this fact, that I know Italian labour is cheap, and I saw a lot of that employed in the mills south.

143. It has been suggested that, as the imports of Oregon pine into this country every year were only 5 per cent. of our total output of timber, therefore Oregon pine could not be competing to any appreciable extent with our timber trade. What have you got to say about that?—The total output from all the mills in New Zealand?

144. Yes?—I might explain that the Oregon pine does not affect the output of all the mills in New Zealand to the same extent. There are only certain points where it does come into competition with them.

145. Will you describe what you mean?—For instance, I have here some figures derived from Mr. Kensington's report as to the timber produced in New Zealand during the year 1906. The summary of this statement is this: that taking the Auckland District there are 190-odd million feet produced, and there is possibly only 4,500,000 ft. affected by Oregon pine; in Hawke's Bay, 5,000,000 ft. affected; in Wellington District, 10,000,000 ft. affected; in Marlborough, 2,400,000 ft. affected; and Westland, 44,000,000 ft.; Otago, 1,000,000 ft.; and Southland, 8,000,000 ft.: making a total of 78,800,000 ft. that is affected by Oregon timber. There is a matter of over 300,000,000 ft. that is exported from New Zealand to foreign markets, or does not reach the parts where the Oregon pines goes, and which cannot be said to be affected in any way by the importation of Oregon pine.

146. You say it affects 78,000,000 ft.?—Yes, and taking 20,000,000 ft. of Oregon on that basis alters the percentage materially.

147. In the 78,000,000 ft. is there any first-class red-pine?—Yes, I would take it that there would be all classes.

148. There is a portion of that 78,000,000 ft. that is not affected by Oregon pine—namely, the finishing-lines of red-pine?—Yes, because they would be included in the total output of those districts. Of course, it would be a matter of impossibility to arrive at any definite figures.

149. It is said that the whole of the Oregon pine that comes in is not placed in competition because it is stacked in yards; but is not a fair proportion of our timber also stacked in yards?—I should think that all that which is placed in yards goes there in the ordinary course of business. There is a large amount of rimu stacked in the yards, and that Oregon pine which is stacked in the yards is taking the place of the rimu that was reserved there. If it is not actually used it is ousting the rimu from those stacks.

150. What sizes of Oregon pine come into this country—have you seen any shipments arriving?—I have seen specifications of the timber being shipped.

151. Is it mostly large sizes or a good sprinkling of small sizes?—There is a big proportion of small sizes—3 by 2, 4 by 1½, 2 by 5, 3 by 5, and so on. There are some lines of 14 by 3, 14 by 2, and 12 by 3. There are two lines in an order of a million that might be called beams amounting to 55,000, and a big proportion of those are in short lengths that would not be beams, so that there is a very small proportion of the specifications that contain such beams as Mr. Hanan referred to.

152. A large proportion of the specification shows small sizes?—Yes, a great proportion.

153. I understood you to indicate just now that the millers would do what they promised to do last year—namely, mill at Government prices?—Yes. Speaking for our own firm, I am sure they would be agreeable to that, provided we were protected against the foreign product. I do not think the millers would willingly agree to the Government adjusting our prices unless the importation of Oregon was stopped.

154. You would not mind if you got a price guaranteed to you?—We should not mind if we got a fair price. We should allow the Government to fix these prices in a proper way, provided we are guarded from undue competition from the Oregon pine.

155. Do you think that a Government tribunal—say, a Land Board—would be able to fix the price just in the same way as the timber associations do at the present time—do you think it would be feasible?—Yes.

156. It is done now by a certain body of men, and you do not see why it should not be done by a body of men set up by the Government?—Yes, in a similar manner the Government, or a Board, constituted by the Government, go through some process with respect to the wages, fixing the minimum.

157. Do you think the other sawmillers would be willing to have a Board set up something like the Board under, say, the recent Act, which provides for the protection of importations of harvesting and agricultural implements when trade is paralysed by foreign importations?—Yes.

158. That Act provides for a Board of commercial people when it is found that the foreign article is unduly competing with our own. Do you think that would be advisable in this case?—I think it would be very acceptable to the millers, and beneficial to the country.

159. You are aware that in the case of potatoes and flour the amount of duty can be regulated under the same Acts—that is, if the price of the New Zealand commodity goes beyond a certain figure, the duty is reduced accordingly on the imported commodity, so that the foreign product can come in free altogether. Do you not think that the same principle could be applied to timber?—I think that it could.

160. At any rate, you think that the millers would be quite willing to leave this to the Legislature and the Government to deal with?—I think so.

161. I suppose you are aware that the Americans protect their industries against us?—Yes, and more than that; I am aware of this fact, that we are importing from America some—you can get the figures out of last year's Year-book—some 700,000 pounds' worth of stuff in excess of what they take from us. From Canada, too, we import no less a sum than £130,000 in excess of what they take from us. I take it that this is hard cash going out of this country. Not only should timber be assisted, as I have indicated, in that way, but if I may be permitted to suggest it to the Timber Commission, I think other industries should be protected in a similar manner.

162. So long as the prices here were not exorbitant?—Yes, just so.

163. Do I understand you to say that the Americans will not allow a British or a New Zealand vessel to trade between their ports. Can they not unship part of their cargo here and there as we do here?—They will not allow any foreign boat to do so, owing to the coastwise laws. They will not allow a British boat to trade between Honolulu and Fr'sco. Our mail-boats there have to get a special permit, which is only granted by the Americans because they have not got a boat there of their own.

164. Now, you evidently know a good deal about the timber trade: is it true to suggest that Oregon was coming here in considerable quantities prior to a year ago?—I do not think it was.

165. It is only during the last year that sawmillers have felt the pinch?—Yes, that is so. I do not say that there was not some coming forward, but it was in small quantities.

166. Do you know what Australia is charging by way of duty on foreign timbers?—I think it is 2s. per hundred feet. Of course, Australia is interested in getting softwoods into the country. They have all the hardwoods.

167. Softwoods do not compete with their timber industry, and yet they charge 2s. per hundred feet duty on them?—That is so; they charge duty on softwoods nevertheless.

168. As a sawmiller, do you know anything regarding the difference in price which a sawmiller can afford to take for the total output of his mill as compared with what he can afford to take for fixed orders for fixed sizes?—My answer must be qualified in this way: it depends what the fixed orders exclude. If fixed orders are continually coming in, I take it that you would mean,

for instance, as in the present case, where there are orders coming forward for dressed lines only. In that case if it excludes a big proportion of other stuff, for which there was previously a sale, it means that an increase is necessary, and that increase must be sufficient to make up for the lost timber that is left behind.

169. Suppose you are a sawmiller and I am buying your timber, could you afford to let me have the total output of your mill, sawn in any sizes you like, without being sorted to suit my needs —could you afford to let me have that at a greatly reduced rate as compared with an order sent to you for specific sizes?—Yes, undoubtedly. I may explain to you that there are so many constant charges in connection with the running of a mill, that if you can get a market for the lower grades and sell them, you distribute your charges over a greater quantity of timber, and, therefore, you can dispose of the whole output at a much lower rate. There are certain qualities of timber that, in spite of orders, are contained in the log which you have to deal with, and you cannot help dealing with them whether you like it or not.

170. You know something of the qualities of timber: will you give us your opinion and conviction as to how far, if at all, Oregon pine is superior to our timber for ordinary building purposes?—I do not consider it is anything superior to red-pine.

171. Not in any shape or form?—I do not know if it has any characteristic that might make it valuable; in a particular line it might be more valuable than rimu that has not that characteristic. I do not think it is more valuable for household work than rimu.

172. Do you know that it is reported that Oregon will not last more than four years if exposed to the weather?—I have heard that said, but I have not seen the report.

173. If that is so, do you think it is a safe timber to use inside weatherboards where a certain amount of damp may be assumed to come?—It would certainly not appear to be. We know that generally the bottoms of studs will decay, and if it is timber that will not last more than four years exposed it is not fit for the lower part of the framing of a building.

174. Supposing you were offered your choice as to whether you would have merchantable Oregon pine on our rough rimu with resin-marks, which would you take?—I would take the rimu, without any hesitation.

175. *Mr. Leyland.*] You have evidently given a great deal of attention to this question, and I can say that I agree with very many of your deductions, although in some of them I do not quite see eye to eye with you. Have you read the report of the British Royal Commission of 1909 on this question, which I may say is considered one of the most valuable contributions that has ever been produced on this question?—I think I have read extracts from it.

176. It is being quoted all over the world at the present time. The finding of that report is that there has been a general rise in the value of timber during the past twenty years throughout the world?—That is so. We recognise that all materials have risen in value.

177. They also say that so far as Europe is concerned the rise is more real than it appears. The grades have come down?—No, I am not surprised at that.

178. The cost of timber is estimated to have gone up fifty per cent. within the last ten years—are you surprised at that?—No.

179. The United States Department of Agriculture gave evidence before this Commission, and the officers from that Department stated that the rise in price from 1886 to 1908 was over 100 per cent., and that the rise was specially conspicuous during the last ten years?—That is in Europe.

180. No, that is their experience in America?—That is not my experience in New Zealand.

181. They also estimate that there will be very little timber in the United States in twenty years' time?—If they do not replant.

182. They cannot replant and grow in thirty years. Would you be surprised to know that during the ten years preceding 1904 the United States of America paid per annum, every year, $13,000,000 to Canada for timber?—I believe they did. They got a lot of pulp-wood from Canada. I believe the pulp was their chief importation from Canada.

183. I do not think pulp-wood is included?—It forms a big item.

184. It comes under the head of Baltic, but it is made into pulp in Canada?—A lot goes into the United State and is pulped there. The Canadians were trying to shut down the export of pulp-wood.

185. Twenty years ago 40 per cent. of the lumber went to the United States and 60 per cent. to Great Britain, whilst to-day those percentages are reversed?—I should not be surprised.

186. Would you be surprised to know that they estimate a further rise will take place in the next ten years of another 50 per cent.?—That would not surprise me. Generally speaking, I find the most surprising thing is to find anything to be surprised at.

187. Then you are not surprised that timber has risen in price, and is likely to continue to rise in price?—There is the increased cost of production.

188. Then we must raise the price of timber accordingly?—Certainly.

189. Something has been said about large plants: you would never dream of putting a complete American plant up in this country?—No, not under our usual holdings.

190. Would you dream of putting the plants we saw the other day into the holdings in which you are interested?—No, I would not.

191. You know when they speak of "timber" in America they mean the standing tree, and when they speak of "lumber" they refer to the sawn stuff?—Yes.

192. In Ontario they are in closer touch than we are with the forests and the West?—Are they in closer touch than us? Can they take timber over those Rockies to Ontario as cheaply as they can carry it in New Zealand? Are you not aware that freights are so excessive there on the railways that in some cases the timber is specially stacked and put through a drying process, and all lumber is dressed, to lessen the weight and thereby reduce the freight?

193. They are not excessive compared with out freights?—They are excessive compared with freights from the Pacific Coast to New Zealand, and therefore Ontario is not on the same footing with us.

194. Ontario is in the central belt of Canada?—It is on the east of the Rockies.

195. Is it not a fact that America is a country of high tariffs?—I believe it is.

196. Do you know the duty imposed by the United States on Oregon from Canada?—No.

197. You know the United States is a competitor in the world's market?—Yes.

198. Would you be surprised to know that the duty imposed by the United States is $2 a thousand feet, as against our $5, of £1, per thousand feet?—I should not be surprised. At the same time, in view of what you have just quoted—viz., that the American forests are so short and that they have to import so much—it does not seem to be reasonable.

199. It is misleading to quote a 1903 price-list?—I did not quote a 1903 price-list. I brought it in to show the difference in the values of the different classes. I still based it on the 12-dollar basis at which we were quoted.

200. You mentioned that the freight was £1 5s.?—That is so.

201. You are aware that we were inaugurating the service at that time?—I do not know.

202. That was an exceptional quotation?—I do not know.

203. Are you aware that the present ship discharging is getting £1 15s.?—I do not know that.

204. It is so?—Is there any information to that effect?

205. We have it from the captain himself. I have also had to pay £1 15s. myself as freight per thousand feet; so you see that freights are rising, and you will admit that prices are rising?—I have not had any quotations since, so I do not know.

206. You went over there, and you got certain impressions as the result of your visit. Of course, you know that either you or I or any one else in coming to conclusions on a visit of that sort might easily form wrong impressions?—You will admit the same?

207. Yes. In the Auckland papers, some time ago, a very large portion of this statement was printed and circulated. I think it was given to them by Mr. Ellis. There was also a statement that you had been interviewed. I want to tell you that those impressions differed so much from mine that I came to the conclusion that one of us was wrong, and so I cut the copies out and sent one to Portland to the gentleman who was President of the Board of Trade there?—And he was interested in sending Oregon timber here.

208. I also wrote to the New Zealand Government Agents in Vancouver?—Who is also agent for the export of Oregon pine.

Mr. Leyland: He tries to get some business, and he makes reports and writes to New Zealand. He is not in such a position that he would tell wrong things.

Sproul and Bleakley, Manufacturers' Agents, Hardwoods and Australian and New Zealand Products, Shippers of Fir, Cedar, Redwood, Spruce, Sugar and White Pine, Salmon and General Brokers, 719 Pender Street, Vancouver, B.C., 20th January, 1909.

Messrs. Leyland-O'Brien Timber Company (Limited), Auckland, N.Z.

GENTLEMEN,—

We are pleased to have your letter of the 2nd ultimo with newspaper-cutting containing the statements made by Mr. Butler on his return to Auckland. The writer met this gentlemen on many occasions during his stay in this city.

About six weeks back we sent an article to a reporter friend on the *Auckland Star*, under the name of "Pacific," and gave him authority to print the same on condition that our name did not come out, as we are not desirous of falling foul of any one party in New Zealand, being Government agents in this territory. If the *Star* was willing to accept our conditions of insertion you have probably read the same ere this reaches you, and if so, we think it goes into the question of wages paid and Oriental labour fairly extensively. From time to time, if the *Star* is agreeable, we will be prepared to follow the article up with others.

In case it was not inserted we will quote the following from it:—

"Quite a lot has been said about the low cost of labour in Canadian and American mills, but the following may interest your readers: Sawyers receive £1 0s. 10d. per day, and the wages per day run down to 10s. 5d. for all white men, with the exception of one or two labourers. Loggers supplying timbers from the bush receive £1 0s. 10d. per day, and the head campmen as much as £1 9s. 2d. and £1 13s. 4d. per day. Shingle-cutters are paid by piecework, and make 11s. 2d. per day and upwards. It is to be noted that the latter are Asiatics. In Canadian mills the majority of yardmen are Orientals, and you will find Chinese, Japs, and Hindoos working alongside each other. Their pay runs from 4s. 2d. to 6s. 3d. per day, but then they do not get through the same amount of work as white men. Let no person run away with the idea that the mills wish to employ Oriental labour. They are forced to do so. . . . The question naturally arises why are they employed in Canadian mills. The reason is simple: it all rests upon the unreliability of the white men. The miller wants white men, but when trade-conditions improve, and larger wages are available in the country districts, they will go out in a body, and leave the mills without labour."

It is therefore a matter of the mills choosing the lesser of two evils. They know it would be more to their advantage to employ white labour, but the white man will make use of the mill so long as it suits him; the Asiatic, on the other hand, although not such a good worker, which fact necessitates about double the number being employed than in the case of his white friend, will stand by the mills in and out of season.

The hours of labour are ten per day—namely, 7 a.m. till 6 p.m., which includes an hour for lunch.

In order to give you the best official information, we wrote one of the largest mills in British Columbia, and the manager, in replying, says he does not wish us to use the name of the mill, as it is strictly against orders to give out information of this nature. Perhaps it will be better for us to extract from his letter, as follows:—

"For your information I give you figures from our annual statement for 1907—our statement for 1908 has not yet been made up. Our logs cost us $9·25 per thousand (feet). Our manufacturing, including sawing, shipping, planing, selling, drying, and insurance, $4·43. Our taxes are 48c. per thousand on basis of the cut, making a total cost of $14·16.

"At the recent freight-rate fight in the United States before the Interstate Commerce Commission, it was shown by figures from 400-odd mills that the average cost of producing lumber was, I think, $4·22. I think this is the exact figure; anyway it was something over $4.

"Mr. Butler states in his interview that it cost only 1s. 2d. to put lumber through the dry kiln and on to truck. No doubt Mr. Butler has repeated a statement as given to him, and have no doubt that there are mills whose labour-bills would not amount to more than that if favourably located, and in asking an ordinary millman what it cost him to produce he would only give him the labour-cost; but I think when the repairs, saws, and a thousand-and-one other items of expense are taken into consideration, with their depreciation, that we are about as low as any of them. Our figures are made up in the following way: At the end of the year all mill supplies, insurance, taxes, and 6 per cent. on mill proper (not on our timber holdings, as we figure that they take care of themselves)—we figure no depreciation on the mill—are charged to lumber, and cost per thousand is figured on a basis of lumber cut.

"Mr. Butler says that it is an inferior quality that is shipped to Australasia. This is not correct. I think that in an average log we would cut about 20 per cent. clear, which is not shipped unless ordered, about 40 per cent. merchantable, and 40 per cent. No. 2, which latter has to be sold at less than the cost of the log (to the domestic market.) He also speaks of the 40,000 acres recently purchased in New Zealand. I do not think he could buy a like area here at the same figure. He probably does not know that the $140 per year that he speaks of is only the tax, and that stumpage has to be paid when timber is cut. As to the supply being inexhaustable, this, of course, remains to be seen. What he says about Oriental labour is true to a great extent, but it is not from choice that the mills here employ Oriental labour, but from necessity. As an illustration we recently put on four white men in place of eight Chinese, and find that we have made a saving of several cents per thousand in piling our lumber. The white men receive $2·25 and Chinamen $1·35, but Oriental labour is not desirable, and it is only necessity that compels the mills to employ them.

"May say that our Chinese labour runs from $1·35 up to as high as $4 per day. We have no white labour in our employ at less than $2·25, and our average wage-list is a fraction over $3, and the Orientals are only employed as unskilled labourers."

We think these remarks explain the position fairly well. So far as the timber rights in this province are concerned, the Provincial Government will not sell any further limits.

It rather surprises local millmen when we tell them that the duty imposed on rough lumber by New Zealand is £1 per thousand. Take the United States, for instance, a competitor in the business, and she only levies a duty of $2 per thousand, and representations are now being made, and it is very possible that the present Congress will place rough lumber from Canada on the "free" list. The remarks made by Mr. Butler as regards the inferiority of the lumber shipped to New Zealand, as our mill friend points out, are very wide of the mark. The inferior lumber is only used for domestic trade, and some is shipped to north China. Mr. Leyland will remember the rigid inspection that is passed over all lumber intended for export, and the amount that is often culled out. The choicest merchantable only is exported, and the difference in cost between this and the lower grade which comes next is $1 per thousand. This lower grade is termed "common merchantable." The E list, copy of which you doubtless have, of course, gives all information regarding the grading, and that in itself is sufficient to prove the incorrectness of Mr. Butler's statement. The mills on this coast will only continue to ship to New Zealand so long as that market responds to and is prepared to meet the prices they ask. Therefore with an increase in price of fir lumber, which New Zealand buyers are not prepared to meet, the trade would immediately cease to your Dominion.

The steamers of the Alley Line during the past twelve months have carried on an average to New Zealand 3,200 M. feet per steamer every two months. Outside what these steamers have carried no other lumber has been shipped to New Zealand from British Columbia, but five or six cargoes, both by sailers and steam, have been despatched from Portland, Oregon.

In conclusion, we can only say that we think the average wage paid throughout the mill referred to above of $3 per day, covering both white and Asiatic labour, appears in quite a good light when compared with the rates of pay received by wage-earners in New Zealand, and, although the cost of living is higher here, still at the same time it is not to the extent of the increase of British Columbia over New Zealand wages. This in itself is a clear refutation of the argument of cheap labour, and if the mills are in a position to cut lumber at lower rates than in New Zealand they deserve every credit for the same, as they have placed considerable capital out for the most up-to-date appliances and costly machinery, and deserve everything that comes to them.

We are very glad indeed if this letter proves of service to you, and will be pleased at all times to furnish you with information. Yours very truly,

SPROUL AND BLEAKLEY.

Witness: I would like just to record my thanks to the writer of that letter for the general courtesy he showed me during my visit to Vancouver, but there are certain of these statements that do not answer what I have stated. In fact, generally speaking, it fully substantiates all that I have stated on the questions dealt with.

210. *Mr. Leyland.*] I want you now to read this quotation in inverted commas?—I might say respecting that letter that it is only side-tracking the question, as it were. It is not a question with the New Zealand miller as to whether it is white labour or coloured labour, or whether he pays higher wages. The main thing is that that timber displaces our workers. I am free to admit that in one mill where I stated that the timber was put on the trucks at 1s. 2d. I got that statement from the manager of the mill. In that mill the sawyer was getting $7 a day—a mill at Revelstoke—but that man was worth every cent of it in comparison with the ordinary man. It is quite a revelation to see some of those expert men handle machinery. There is just as much difference between an expert handling that machinery and any ordinary man doing so as there is between Roberts the billiard-player and an ordinary muff off the street striking a billiard-ball. It is just the same with the experts of those mills. But the other employees there were not getting those wages. The fact remains that as the result of the wages paid that mill was sawing, dressing, and kiln-drying all timber and putting it on the trucks at 1s. 2d. per hundred feet. This is the quotation referred to: "Referring to the newspaper slip that you sent us, saying that 'an American miller could lease a square mile of timber land for twenty-one years at $140 a year, and have no taxes to pay,' we would say that the writer of the article evidently refers to conditions that once prevailed in British Columbia, but which never existed here, and have recently been discontinued there; but even then the statement is erroneous, as the privileges mentioned were subject to a further charge of 50c. per thousand feet on all timber cut. While the Government has discontinued granting these facilities, there are a great many of the privileges in the hands of the people who have held them for years, and which will still be available for years to come." I would call your attention to the fact that this exactly coincides with what I said to-day.

211. This is from a gentleman in very high repute, and who would not condescend to make a wrong statement. He is respected along the whole Pacific Coast. Of course, Hindoos are British subjects?—Yes.

212. Coming to the importation of Oregon, you quoted Kensington. I want to show that it is largely taking the place of kauri. Mr. Kensington says in his last annual report, "This timber (Oregon pine) for some purposes is a good substitute for kauri, and, owing to the greater remoteness and scarcity of the latter, also the increasing difficulty of obtaining adequate supplies of suitable native-grown timber to meet local requirements, regular importations of Oregon or other pine in increasing quantities must be looked for in the future." I must say that in our end of the Island we must have it?—As long as you do not put it in Wellington and Christchurch we do not mind.

213. As it affects the colony it does not reduce the output of kauri, because there are a dozen candidates for every stick that comes off the saw, but it does this: kauri is being used, to our disgrace, for rough joisting, whereas timber like Oregon is a good substitute and can be got in long lengths at short notice. It enables us to sell kauri for 19s., and if we can put this on our wharf at 9s. the difference is 10s., inclusive of duty, and we are no worse off?—Does it not occur to you that we shall be most happy to supply you with rimu from the West Coast? I think we shall be very glad to supply the Leyland and O'Brien Timber Company with long lengths of rimu.

214. With reference to the stocks, is it not a fact that before we imported direct we had practically no stocks in Christchurch?—Of course, you could not have stocks of Oregon before you imported.

215. We had stocks of rimu, and stocks of Oregon are replacing the stocks of rimu. The merchant in Christchurch is selling his rimu stocks and replacing them by Oregon?—I take it that the Oregon that is in stock there has gone into stock to replace the rimu that used to be held.

216. I want to point out that the stocks have not gone into consumption, but the timber has gone out of previous stocks?—That is so.

217. You said that 11s. 6d. would be a fair price for timber. Now read this quotation:—

The Imperial Export Company (Limited), 18th March, 1909.

DEAR SIR,—

In response to your favour of even date we have pleasure to quote you for Oregon as follows: Auckland–Wellington, 80s., base E list, per 1,000 feet super., No. 1 merchantable quality. Lyttelton–Dunedin from 7s. 6d. to 10s. more.

Prices are advancing, and we fear that in the near future you will have to reckon on a base price 10s. higher.

Anticipating that our quotation will lead to business.

We remain, &c.,

IMPERIAL EXPORT COMPANY (LIMITED),
By TH. DE SCHRYNER,
N.Z. Managing Director.

The Leyland and O'Brien Timber Company (Limited), Auckland.

That is 87s. 6d. at Lyttelton on the basis of E list, is it not?—I did not adjust all this evidence.

218. It is for the short lengths, and the lowest price was on the 15-dollar basis. Now it goes up to $25, but on an average specification there would be a rise of 15 per cent. on the quotation, so there would be a price of 10s. 10d., which, with duty, would be increased to 12s. 10d. But you would specify for 11s. 6d. and the price rising?—I dare say I could get a quotation very much in excess of that. I do not say it is a put-up quotation, but it does not follow that it is the lowest quotation.

219. With reference to logs for export?—Might I read another letter, since it appears to be my privilege to read letters:—

Wickes Limited, Greymouth. Sydney, 27th February, 1909.

GENTLEMEN,—

We are writing this for your general information, which in the present depressed state of the timber-markets may be of use to you.

We were in hopes that a rise in foreign timber would soon have taken place. We are sorry, however, that up to the present there is no move in this direction. Very large shipments of Baltic are arriving, and local prices are very low. The same may be said of Oregon, which, although the price has gone up in America, the very heavy arrivals keep the market down. We have been credibly informed some millions will soon be offered on the local market, and expected to realise only about 60s. per 1,000 ft. c.i.f. Sydney.

We have just landed a shipment at 70s. With the leading lines of foreign timber so low there is not much chance for your pine. At present prices, and to make things still worse, freight by steamer is next to prohibitive. Yours faithfully,

HOLDSHIP TIMBER COMPANY,
Per G.H.H.

220. This man admits that it is rising in America?—He is only a selling agent.

221. Do you not think it is quite understandable, if a lot of timber has been ordered here, that the indentors of that timber may be forced to sell at a loss? As a matter of fact, I have bought Oregon at £3 15s. About logs for export, they may have been possibly held up for some other reason than duty?—They were held because Canada did not allow the exportation of its logs.

222. Duty went up on sawn timber?—It shows the necessity of putting duty on logs.

223. With reference to converting large sizes, you as a miller know that you would rather have a log come into your mill than go and pick up a size in your yard and take it into your mill?—That is so, but where you lay yourself out to cut a lot of balk they would come into your yard in the same way as logs do.

224. Have you not loss in conversion?—Yes.

225. So that it is a matter of considerable expense?—Except that you could get junk in such sizes as in the kauri trade. In that case the loss would be very slight. If you want this timber for long lengths for beam purposes, then you will not be cutting it into inch timber, so that the saw-cuts would be few.

226. You have some pieces left that you have to manipulate into whatever you can?—That is a remote chance.

227. You only know the sizes required when you get the order?—I should get a variety that I would not cut to waste.

228. With regard to the relative values of Oregon and rimu?—The rimu here is quite as good as Oregon.

229. The evidence of the values of timber would be of more value if given by an expert architect or builder than by a seller: Would that not be the case?—The same applies to the relative value of Oregon.

230. I am willing to take the evidence of an architect and builder on Oregon?—Do you not think that there are cases where the builders and merchants are interested in the Oregon?

231. *Mr. Clarke.*] In view of the fact that up to the present all the builders have expressed a decided opinion that Oregon should be imported with at least as little restriction as now—and most of them think it should be imported free—in view of these facts, would you not be inclined to give their opinion equal weight with that of an equal number of sawmillers, seeing that they are fellow-citizens and experienced in using timber?—If you take it on a basis of that kind the builders are out of it altogether, because there is no doubt the sawmilling considerably outweighs the building industry.

232. Do you assert that sawmilling employs more men than the building industry?—I do. I say the allied timber trades interested in our New Zealand timber head the list. Take the Government statistics.

233. The builders are not in that?—I produce here a diagram showing the number of persons employed in the principal industries for the years ending 31st March, 1895 and 1908. The red line shows the sawmilling, joinery-work, sashmaking, and coopering, and it is very much in excess of all other industries. It is upon these figures I have based it.

234. In respect of that line, do you include joinery as sawmilling work?—Woodworking. I take it they are interested in our New Zealand manufactures.

235. Do you include the building trade?—No.

236. Then you take the number excluding the final part of the building trade as joinery, and say they are not in the building trade?—How far do you draw the line in building? How far towards the sawmiller do you go in building?

237. Would it not be fair to include in sawmilling the rough product of the tree and the saw, and to include in the manufactured work everything beyond that point? Is it fair for the sawmiller to be able to claim that he should be entitled to call that part of the sawmilling industry to make doors?—Yes. Take Auckland, for instance, with the Kauri Timber Company. You cannot call their factory a building factory; still, in that factory, which is under the same roof as the sawmill, they turn out doors, windows, and joinery-work.

238. You assert that this making of doors is more closely allied to tree-cutting than building?—You have the case in your own town.

239. Is the joiner engaged in the sawmilling industry?—Not when he is building a brick building, and in connection with this Oregon trouble you stated you want your beams for brick buildings.

240. A Christchurch sawmiller asserted that most of his timber, nearly all of his sales, were to builders, the ultimate customer?—Yes.

241. If I tell you they have in Christchurch 300 builders, with no sawmillers at all, how can the sawmilling industry overshadow the building industry?—You are giving an instance of the relative numbers in Christchurch, excluding the West Coast.

242. Assuming that the 300 builders in Christchurch employ on the average six men each, which is a low average, are there 1,800 men employed in the sawmilling in Christchurch?—I do not think there are in Christchurch.

243. The question is this: your evidence is that it is a most important industry?—I say there are more engaged in the timber industry in New Zealand who would be in favour of the exclusion of Oregon than there are builders who would be in favour of its admission.

244. On what evidence do you base that statement?—On my opinion and the statistics that are given.

245. Have you any statistics as to what the builders and their employers think on the matter?—No, but the statistics that are given us as to the numbers.

246. Is there anything relating to builders at all there?—I think so.

247. It has been stated on oath that there are 300 builders in Christchurch, which is not the largest place, and assuming that the other four centres equal that in number or probably exceed it, there would be then at least 1,500 master builders in this Dominion in the large towns, independent of the inland towns. Each of those men must necessarily employ a good deal of labour, and do you not think they would far exceed the men employed in the bush mills, independent of those connected with joinery-work, which is purely and simply building-work?—Take building—confine yourself to the builders—and I think there are larger interests in the sawmilling than there are in the building. How many hands do you estimate there are employed in the building?

248. We will only deal with the one town. Take Christchurch, there are 300 master builders there?—That is nothing.

249. I am quite sure they employ a great many more men than are engaged in cutting timber, or selling it in Christchurch?—I do not think they do. There are over 9,000 bush hands employed in New Zealand.

250. The builders have unanimously said that they consider, in the interests of the building trade and the general public, and as a means of keeping a check on the prices and cost of building, and also mainly as a means of securing more bush supplies, that Oregon or other foreign timbers should be imported as least on the present basis or on an improved basis in regard to the duty. Do you not think that is a substantial argument?—No. The millers say that in order to keep a check on prices we will submit to the Government regulating those prices, and that there is no necessity to import Oregon and keep men idle for the purpose of keeping a check on the price of timber. It should be arrived at in a better manner.

251. Only on this understanding: that the price was fixed to insure you a good profit?—A fair business profit.

252. Would it not be fair also that the Government should fix the price for the other trades, so as to insure a fair profit?—They do so in some cases.

253. Have you ever heard of them fixing a fair price for builders?—They fix the price with regard to harvesters.

254. With regard to the area and the prices that are paid for timber here and the royalties, is it true that you pay royalties on your sawn output here in this district?—That is the custom on the Coast.

255. And would you not consider that it would be a fair thing that the other parts of the colony should be placed on the same footing?—I think it would be fair that all parts of the colony should be placed on an even footing.

256. Now, with regard to the valuation of that piece of ground you spoke of, roughly speaking, I think you said it would run 10,000 ft. to the acre?—I did not say so.

257. Would it go anywhere near that?—That was the estimate that was placed on it by the Commissioner of Crown Lands. I think it was 10,000 ft. per acre.

258. What do you think is a fair average price to convert standing bush into milling-timber per acre: have you reckoned it out on that basis?—No, I have not.

259. Assuming it as stated, as it is in the Government returns, that £15 per acre is a fair price and a good average price for reducing standing timber into milling-timber, would you accept that as a basis?—No, I should accept that.

260. You would suggest that the Government have published a report of that kind without some basis for it?—Their basis may be from some erroneous source.

261. You would not attach any value to the statement published by the Lands Department?—I would not say that; but I would not accept a statement like that as applying to ourselves.

262. Would you give the Commission your opinion as to what you think it would cost?—Yes, if the Commission will wait till I go into the figures.

263. Has not a rather low valuation been placed on it? If it panned out at 8,000 ft. per acre that would run out to about £40?—Supposing it was a low valuation, what then?

264. Well, assuming it costs £15 per acre at the Government price to reduce it, that leaves a margin of £25?—I cannot see where it bears on this question at all.

265. Accept this as the valuation that was put on the ground. You assume that bush to be valued at £1 10s. per acre, and if there is a difference of £25, would not that be a big margin?—I think it would be a big margin. I am sure the company I am connected with would be willing to sell it at a far less margin than that.

266. *Mr. Barber.*] With regard to some of the information Mr. Leyland got from America, you passed the remark that he was an interested party?—I have made that suggestion, yes.

267. By that you infer that the evidence of an interested party is not to carry the same weight as a disinterested party?—In some cases I should certainly think it would be so. Naturally the leaning is that way.

268. In regard to the statement made that there is not a majority of Japanese and Chinese labour employed in those mills, did you ever read the statement made by the captain of one of those vessels that carry this timber?—No.

269. What was the vessel you saw loading?—It was the "Indravelli." She was loading in August or September.

270. The "Mahukona" brought a very large cargo here, and the letter you read was in circulation at the time, and an *Evening Post* reporter interviewed the captain of the vessel and asked whether it was true. The captain said, "That is so: there are no Japs or Chinese in the mills in Washington State, not even a Chinese cook. I do not know what the headmen in the mills get, but the ordinary mill hands get $2 a day, say, 8s." That shows that those men are not underpaid?—The statement I made there I stand to, and whatever that captain has said has not refuted what I have said.

271. He makes a definite statement, and says that there are not a large number of aliens in the mills in the Washington State. We will presume that the mills in the same country employ the average kind of labour?—No, I do not admit that. Canada employs a lot more Japanese and Asiatics than they do in the States.

272. You say you think 1s. would be a fair increase in the duty on Oregon pine?—Yes.

273. You know the present duty is 30 per cent.?—I know it is 2s. per hundred, but it is no definite percentage.

274. And you say it is landed here at 7s.?—I have the quotation here.

275. That is 30 per cent., and you ask for another 1s., which would make it 50 per cent.?—Yes.

276. Now, there are other industries in the colony besides the timber industry which employ a large amount of labour. Take the woollen industry and the boot-factories: would you think it would be fair to put an import duty on articles that are manufactured outside New Zealand and brought into New Zealand in competition with those industries?—Yes, I should put on a protective duty, irrespective of what that amount was.

277. And you then argue that New Zealand should be absolutely dependent on itself?—No, certainly not. I say we should protect our industries, but we must get certain things from abroad.

278. But things that are manufactured in the colony should be protected, and we should rely on colonial manufacture?—I do not go that far. I say that there should be a protective duty put on Oregon.

279. But if you want 50 per cent. duty on timber why should not those who employ a larger percentage of labour not also be protected by a 50-per-cent. duty?—Because it is not necessary to protect them to that extent to enable them to live. I do not know whether you are aware of the fact, but when you speak of the woollen industry, the Kaiapoi rugs are known all over the world. The Kaiapoi rugs can go into foreign markets, but we cannot send our timber into competition with all other timbers all over the world. It is quite a different thing. I am only asking for a protective tariff, not a prohibitive tariff.

280. Do you know the Kaiapoi mills and other mills in the Dominion have had very hard times during the last few years?—I did not know that.

281. Are there any public milling companies in this district?—Yes, I think so.

282. What are their shares quoted at?—There are none that have shares on the market.

283. You say your are paying the labourers 10s. a day?—Yes.

284. Is that the ruling rate?—Yes, I think so. In fact, I think some are paying higher.

285. There is no scarcity of work?—Yes. We have had a lot of applications for work down there since the mills have been shut down.

286. Why does the labouring wage maintain a higher rate than in any other part of the Dominion, seeing there is a depression?—They will get down to about the same condition that we were in in 1896 directly.

287. Has there been a depression in this trade for the past nine months?—I do not say there has been a depression for nine months.

288. How is it that the rate of wages is beyond the rate paid in other centres?—I suppose it is on account of the isolated nature of the Coast. The public works have absorbed a great number.

289. Then, there is no surplus labour?—It is a fact that there are a lot of men out of work now as compared with the number some time back. It is also a fact that labourers are paid 10s. a day.

290. Now, with regard to this large area of land which your company purchased, it was bought for £1 an acre?—Yes.

291. You said you estimated the value of it at £1 10s. per acre?—Yes.

292. Is it milling property?—Not the whole of it.

293. It is all covered in bush?—With different classes; some of it is *pakihi* country and some swampy land.

294. We have been told that no land down here is fit for cropping?—There is some of this land that is of service for pastoral purposes, and some of it is now held under lease for pastoral purposes.

295. What is it that gives you the £14,000 above the price you paid for it?—I may be quite wrong in that valuation. If you can show me that it is not that value I will accept your assurance.

296. You said it would sell for £1 10s. an acre?—I just gave that as my opinion.

297. And you base your view on the prospects of the milling industry in the future?—Yes.

298. And therefore the future prospects have placed £14,000 on these two properties?—About a month after we purchased that property the contract for the tunnel was let, and I consider that that would put up the price of the land on the Coast a lot.

299. We have been told that the milling industry is a diminishing quantity, and that the prospects are so bad that no one will go into the trade, and there is no profit attached to it. That is certainly inconsistent with a prospective profit of £14,000 which your property has already realised?—It is not already realised.

300. Well, it is on the future prospects of the milling industry of this country?—I made the statement that had we known then the conditions that have since come about we should not have purchased that block; but, having purchased it, and having made our arrangements for the plant, we have no other course open but to go on and make the best stand we can.

301. And you do not consider it has depreciated in value at all under the conditions, but has rather increased 10s.?—I think that may be taken as an estimate.

302. Now, in regard to the duty on Australian timbers, you said there was a duty of 2s.?—I was under the impression that that was the case.

303. What timbers?—I thought there was a duty on all foreign timbers except New Zealand pine.

304. You do not adhere to that?—I will adhere to it till I am corrected. At the time I made that statement we were dealing with Oregon pine, and I stated that I thought there was a duty of 2s. on Oregon pine into Australia, because I thought it was correct, and still think it is correct.

305. If a merchant was taking the total output of a mill, what class of timber would he order do you think as a miller?—If he was taking the total output I take it he would take the total output.

306. But he will not take it in the log?—No, that is the output of the bush.

307. In what sizes would he instruct that that timber should be cut in?—He would instruct that it be cut into those sizes most suitable for his requirements.

308. If a man was contracting for a building and he wanted some timber cut, it would probably be the same size that a man received who took the whole output of the mill?—I might tell you for your information, because probably you may not have a grip of it. When arrangements are made for the total output of a mill a specification is given to the miller setting out what he is expected to cover, but the buyer is also bound to take other trade sizes, even although they may not be set out in the specification.

309. Following up that question, you have shown us a diagram containing a comparison of ten years of the timber industry in New Zealand, and you claimed that certain trades were kindred trades to the sawmilling industry. They are all concerned in the timber industry. What is the increase that has taken place in those trades in ten years?—You have it there.

310. That shows that the trade has not been diminishing during the last ten years, but, on the contrary, has increased beyond any other trade in the Dominion?—We are not dealing with twenty years in respect to the Oregon question. We are dealing with the question of Oregon, which has cropped up during the last twelve months.

311. It shows that the timber industry, according to your own definition, has increased beyond any other trade in the Dominion?—Yes, taking the whole of those ten years.

GREYMOUTH, MONDAY, 19TH APRIL, 1909.

WILLIAM JAMES BUTLER, examination continued. (No. 65.)

1. *Mr. Ell.*] You have had considerable experience in milling timber in both the North and the South Islands?—Yes.

2. From your knowledge, out of the total produce of a log what would be the amount of waste?—In the North Island, where we took particular note of that, the waste went about 25 per cent. to log-measurement, and that was white-pine; but I may say that we made it much finer than the local market would take—that is, the New Zealand market.

3. Have you had any experience in rimu, and, if so, how did that work out in the matter of waste?—We have never taken any definite measurement, but I should say that the waste would be 50 per cent. to the log.

4. How do you account for the difference of 25 per cent. waste in milling rimu as compared with white-pine?—Chiefly owing to the market requirements.

5. If the market, then, is found for the timber, there would be no more waste in milling rimu than in milling white-pine?—Practically no more.

6. Then, if a market was found for all the timber that was cut out of a log it would be a material advantage to the people of this Coast?—It would most decidedly.

7. Do you think it would make the difference between the loss and the gain?—I think most possibly it would. There is another thing, that if the cost of production could be extended over a greater product from the log it would possibly bring down the price of the better classes. They could be sold at a lesser rate, and still be profitable to the miller.

8. Are you aware that the Christchurch merchants were selling O.B. timber for 16s. some months ago?—No.

9. And that they are now selling it at 14s. 6d.?—I have not gone into their methods.

10. Are you aware if there has been any reduction in O.B. timber here—that is, free on board?—I believe there has been a generalisation of prices—that is, that scantlings and such timbers that would not be suitable for dressing have been placed at a lower rate, and a slight

advance has been made in the better class. I think generally there may have been a reduction. Well, I suppose, according to the orders that are coming forward, there is really no reduction in price, because lower grades have not been sought for.

11. In the interests of the public and of the State do you think it desirable that an endeavour should be made to find a market for the whole of the output of the log?—Yes, I do indeed.

12. It would be a great saving of the present waste if that were done?—Yes, it would be a great saving.

13. You mean to say that there is much timber left on this Coast that ought to be removed from this Coast into some market centre?—Yes.

14. Now, with regard to the methods adopted by the millers, seeing that the standing forest is a national asset, do you think it desirable that the Forestry Department should see that the miller who is applying for a license to cut timber is experienced, and is thoroughly cognisant with his business, and is equipped with a proper plant before the license to cut is issued?—I do indeed.

15. You think a license should not be given to Tom, Dick, and Harry?—Yes, I think so, and I am not saying that because I claim to have experience. I recognise that a man who is not up to the business is more likely to waste his product than a man who knows his business, and, therefore, the inexperienced man is not in a position to put cheap timber on the market.

16. Do you think it would be desirable on the part of the Forestry Department to employ a thoroughly competent and skilful miller to visit from time to time the various mills throughout the country, and direct and assist by his advice the millers who are milling our timber?—Well, that would be a question for them to decide. I know, of course, that, judging by other experience, they have found it expedient to appoint experts in connection with other industries.

17. The Government have experts associated with our cheese and butter making for the purpose of instructing and advising the farmers of the country in those industries?—Yes, I am aware of that.

18. Would it not be a wise thing to assist and advise the miller, in certain cases, to cut his log and work his mill with the greatest amount of economy in the matter of waste?—I should think it might do. There is great difficulty on the part of millers in getting information respecting their business outside of the experience that they get by going along from day to day. There is no literature, for instance, published in the Dominion that assists the milling industry at all. Moreover, there is very little chance of their meeting in conference for the purpose of assisting each other or suggesting improved methods. Something in that line would, I think, assist the industry.

19. Do you think it possible that a certain amount of waste in cutting might be saved—for instance, as to the way the log is cut, the general method of treatment, &c.?—There is no doubt that an up-to-date plant tends to lessen the waste in conversion.

20. In connection with the butter industry, as you know, experts go to the factory and, when necessary, point out to the management where a saving might be effected and how the butter might be turned out in a more marketable condition. In the same way, do you not think it possible that an expert might be able to advise some of our millers as to the best methods of milling their timber with the least possible waste, and thereby place it on the market with more profit to themselves and a benefit to the public?—I think so, undoubtedly.

21. Now, with regard to the New Zealand woodworking industries—for example, joinery and furniture works, which are employing a large number of hands, and which are producing furniture of a cheap and useful description, thereby enabling our people to furnish their homes comfortably—do you think it desirable, in view of the special suitability of rimu for these purposes, that we should endeavour to conserve the supply of such timbers—I do not say on rich lands, because I do not want to block settlement—I mean that such timbers should be cut gradually, as required?—I take it that you refer to rimu that is specially suited for furniture-work—that is, what is known as figured rimu?

22. I have gone through the factories and have examined the class of timber used, and I know they do not confine themselves to figured rimu. I am talking of the second-class timber that is used in furniture-making—that is, second-class as compared with the figured rimu. This furniture is sold cheaply to our workpeople, and the sap is used very generally?—If upon investigation the Forestry Department found that they could not grow suitable timber in New Zealand for that purpose it would then be advisable to reserve some of our forests for that special use.

23. We have it on evidence from the manager of the firm of Strange and Co., Christchurch, who are large furniture-manufacturers, that they are importing timber suitable for furniture costing from £4 to £4 10s. per hundred feet, as against 13s. 4d. for rimu also suitable for furniture-making. Would such a fact not furnish you with an additional reason that we should endeavour, seeing the great difference in the cost of the imported and the local timbers, to provide a suitable and cheap timber for cabinetmaking purposes?—Yes, but still there comes this phase: that if they pay £4 to £4 10s. per hundred feet for foreign timber you would think that it must have some special and great advantage over the rimu which they can get for 14s. 6d.

24. The point that I want to bring under your notice is this: that if we depend upon the importation of timber it means that the price of furniture will be largely increased to the people of the Dominion?—Yes, that is true. Viewed from that point it is undoubtedly in the interests of the country that certain sections of our forests should be reserved for that particular purpose.

25. *Mr. Arnold.*] You know that Inspectors were appointed to go round the dairy factories to classify the butter and instruct the butter-makers, and that is still going on. Do you know why this was done?—I do not know, beyond the fact that if people can get a better article at the same price they will have it.

26. Was it not in consequence of the people of this Dominion having to compete in foreign markets, and to keep up the credit of the country it was necessary that the Government should see that butter, cheese, &c., were properly classified—is not that the reason?—I think that is so.

27. It was rather for the credit of the country than to instruct certain private individuals?—Yes.

28. You do not suggest that Inspectors should be appointed to instruct in the manufacture of shoes and the making of clothes, and things of that kind?—Not unless the industry was in such a poor state that it suggested the necessity for some such instruction.

29. Do you suggest that the timber industry at the present moment is in such a waning state in consequence of mismanagement or ignorance to require such inspection?—No, I do not suggest that.

30. Do you suggest that the appointment of such people would bring the timber trade on to a better footing than it is at the present time?—It is a question I have not given much consideration to. I think that one who was qualified might be able to give information, but whether we should be justified in making such appointments I do not know.

31. I want to ask one or two questions about Oregon. You told us your opinion as to the mode of working in the foreign market—that is, as compared with New Zealand—the lower rate of wages, the condition of labour, &c.; you do not propose that it would be beneficial to this Dominion if the conditions of labour which you have described were introduced here?—No, I do not. I think that we should endeavour to maintain the conditions that we have.

32. You prefer the conditions which we have in preference to the conditions which you saw?—Undoubtedly.

33. What percentage do you think they have the advantage of us in consequence of their conditions?—I never reduced it to a percentage basis. On a broad guess I should say 30 per cent., or from 25 to 30 per cent.

34. Would you suggest that a 25 per cent. duty on the importation of Oregon would be desirable with the view of meeting the requirements of the timber-millers of this country?—You mean 25 per cent. additional to what we have.

35. Yes?—I think about that would meet the case.

36. Would you have that duty on all sizes?—I should, yes.

37. Now, if there was an increased duty of 25 per cent. placed upon Oregon, to what extent would this cause a rise in the price of timber?—Well, I do not know that it would cause a rise at all, but I think, as I said before, that that difficulty could be met by the Government fixing a maximum price, which the millers, I am sure, would agree to. It could be handled in the same way as flour is handled.

38. The Government have not interfered in regulating the price of timber, and I presume it is a recognised fact that the Government are not likely to interfere in that way?—I do not know.

39. Would it not be possible for your association—which evidently is a corporation connected not only amongst the millers, but also with the merchants and the builders—to place any price on timber that they desire up to the value of Oregon, notwithstanding any duty that might be placed on it, and thus again bring about the condition of affairs that we have to-day, and cause you again to ask for a further increase of duty?—I might explain to you, Mr. Arnold, that I am not connected with any association whatever. I am free to put timber on the market at any price, and sell to anybody.

40. You know there is such an association?—Yes.

41. If there was such an association having a thorough understanding with the merchants in Canterbury, of course it could apply right throughout the Dominion, and if the merchants had a similar understanding with the builders, to such an extent, for instance, that if a merchant in Christchurch refused to serve a certain builder because that builder refused to belong to the Builders' Association, the merchant would be able to communicate that fact to the millers here, instructing them that that man was not to be served with timber. In such a case you will recognise a most dangerous position for the general public?—Yes, I do indeed. I should advise any one that was treated in that way to get an injunction.

42. It would not relieve the position, however?—Well, it might.

43. Is the Oregon the only foreign timber that you would place a duty upon?—Oh, no! I would treat all foreign timbers, except the hardwood from Australia, which does not actually come into competition with our timber; I would let that come in free, because we require it, but I would have a heavy duty on all other timbers.

44. I understand there is not very much white-pine milled here?—No, not much.

45. But there is a considerable quantity of it in the forests?—There is in scattered places. Recently they have milled considerably more white-pine than during the past three or four years, because the rimu trade has fallen off and they have been driven on to the Australian market to keep things going.

46. Would you favour an export duty on white-pine?—No, I do not think so.

47. Are you aware that the butter-manufacturers are complaining that they cannot get their orders supplied for white-pine, for the reason that it is being sent out of the Dominion?—I believe there has been such a complaint, but I do not think there is ground for it. We were milling white-pine in the North Island, and we never had any inquiries from New Zealand that were not satisfied.

48. If it be a fact that the dairymen in Canterbury cannot get their orders supplied, and you are not milling white-pine but passing the trees and selecting rimu only, do you not think it is bad management on behalf of the millers here?—I could not go right into that as to whether it is bad management, but there is a bad connection somewhere, no doubt about it.

49. Would that not partly account for the slump in the trade at the present moment?—Partly so, if our trade is driven elsewhere.

50. There are considerable birch forests in this district, and they are not being milled. What is the reason?—That I cannot say. I know that in the past birch was more generally used

than it is at present for sleepers and bridge-work. It was reckoned to be a fairly durable and suitable timber.

51. Was it exported?—Only in small quantities to the Old Country. There was a test shipment for wood-pavement purposes.

52. Are you aware that it was exported to a considerable extent up to the time that Australia put a duty on it?—No, I was not aware of that.

53. If such is the case, do you think that the New Zealand Government should try to bring influence on the Commonwealth Government to have the duty removed?—Yes, if such is the case.

54. It has been admitted, Mr. Butler, that great quantities of kauri are being exported from New Zealand: does red-pine come into competition with kauri to any extent?—Well, not to a great extent. I do not know to what extent.

55. Do you think it would be wise for us to keep as much kauri within the Dominion as possible, seeing it is timber that is being reduced very rapidly?—I think that certain forests still held by the Government might be reserved and dealt with from time to time.

56. Would you favour an export duty upon kauri?—No, I do not think it would be fair for the Government to impose restrictions on the holders of kauri forests, chiefly because of the chances of fire, which are very great. Those who have not seen a kauri forest have no idea of the risk holders run of their timber being destroyed. I suppose there is no tree in New Zealand that is so easily killed by fire as kauri, and once a fire has been through it the insects get into it and all the sap becomes quite valueless.

57. So you would not advocate an export duty being placed upon kauri?—I do not think so. No. It cannot be saved.

58. You fully recognise that whatever extra cost there might be either in milling, dressing, or manufacturing timber is passed on to the consumer?—Yes.

59. He ultimately has to pay?—That is so, except where the sawmiller kindly goes along losing.

60. The position really is that you would ask for an increased duty on Oregon, which would cause the price of timber to be raised?—I do not think that is going to cause the price of rimu to be raised.

61. You ask that an increased duty be placed on Oregon, and that Australia be asked to take the duty off birch? You would not put a duty on white-pine to protect the farmer who requires it, and you would not protect the New Zealand consumer by keeping the kauri that is required within the Dominion? Is not that a very selfish policy?—No, I do not think so. Respecting white-pine and the farmer who requires it, if by investigation it was found that in the course of a few years white-pine would run so short that the butter industry would suffer, I think the Government should reserve areas for the butter industry. But unless there is information before you to that end it would be quite wrong to shut out all the white-pine forests because some two or three farmers said that in future generations there would be a shortage.

62. I am speaking of present demands?—Of course, I take it from you, there is such a case in existence. Where New Zealand dairy people cannot get white-pine I should advise them to apply to the West Coast Timber Trading Company, and I am sure they will get a supply of white-pine.

63. In connection with milling in the winter season, do you think it is possible or wise that the milling of certain timbers should be done only in winter for the purpose of the better seasoning and lengthening of the life of the timber?—I think that only applies to the deciduous trees; our evergreens do not come under that. That subject was well threshed out at a conference in 1896. I am sure it does not apply to New Zealand evergreen forests. The sap is virtually up all the year round. With the other trees where the sap is down during the winter it is generally conceded that that is the proper time for felling. It is not for that reason that the felling and logging operations are carried on in the winter-time in such countries as Canada; it is because the winter gives them facilities for sleighing over the snow, and so forth; that is why they do most of it in the winter.

64. Even if it were proved that it would be an advantage, would it be practicable to do most of our work in the winter months?—No, because the long rimu logs that would be left lying in the bush for five or six months would get so discoloured in the end as to render them unmarketable. Discoloration takes place very quickly.

65. Would it increase the cost of production?—I think so, very considerably.

66. Have you any mills running at the present moment?—No.

67. *Mr. Stallworthy.*] You will agree that competition keeps down prices?—Yes.

68. And if an import duty is placed on Oregon, will not that reduce competition with rimu and tend to put up prices?—Well, I think, admitting that there might be a tendency to put up prices, that that can be regulated. Because there may be a chance of putting them up is no reason why it should come in and bring trade down to an unlivable basis.

69. Would you think it fair that the Government should place this condition upon it: that the duty should remain as long as red-pine does not rise in price?—I think that is a protection the consumer could reasonably demand.

70. And you think the present prices would be reasonable?—I think so.

71. You secured a considerable area of milling-timber in the North?—Yes.

72. What royalty did you pay for that?—It was sold at an upset price of 6d. per hundred feet on the estimated quantity of the bush.

73. Do you think that was a fair and proper way to estimate the royalty—on the log-measurement?—Well, it came out all right there.

74. I suppose the miller can get a very fair estimate of the quantity before he buys?—Yes.

75. That tends to a lessening of the waste of the cutting?—I think it would.

76. Then, the system down here of payment on the sawn output, is not that an incentive to carelessness?—Although it might appear that way, the miller here is not going to leave any timber in the bush that it will pay him to take out.

77. No, but in cutting logs, he would do it more carelessly?—It comes to a question, if the miller looks at the thing intelligently, as to whether it will pay him to take all out of the log or not.

78. You have 12,000 acres of timber to cut?—Yes.

79. At what do you estimate the life of your mill?—About fifteen years.

80. Have you any objection to stating the estimated cost of your mill and plant?—Roughly, I think it will run into from £12,000 to £15,000.

81. You stated that your rent, taxes, and so forth came to 4½ per cent. on your capital?—That is so.

82. What do you mean by rent? Does that include royalty?—No; the rent was rent of a foreshore—some £3 10s. per annum, and then we had to hand back to the Waste Lands Board 150 acres per annum. Well, the part we started on had more timber on it than the average, consequently, although we cut the quantity, we did not have the acreage. We were made to pay a charge equal to 5 per cent. on the value of the land that we had not handed back. A royalty forms no part of the rent.

83. Was it included in the 4½ per cent.?—No, it was not; it was not a royalty, strictly speaking; our payments were deferred payments for a sale by auction.

84. How many acres did you hold possession of up there?—Close on 5,000.

85. And did the quantity of land held increase your cost—rates and so on?—It increased the rates certainly. For instance, had the bush been on a smaller area we should have had so much less to pay.

86. The system here, I believe, is that you hold 200 acres, whereas up North you held 5,000?—Two hundred acres with additional reservations.

87. Do you not think that the millers in the North are at a disadvantage with the system there as compared with the South?—They suffer from taxation and rates that are not imposed here.

88. *Hon. the Chairman.*] What are these?—Rates on the timber—taxation on timber as a land-value, and that brings it within the land-tax.

89. Not when it is sold by auction?—Yes.

90. What tax follows the auction sale?—We also paid a land-tax on the land that the timber was standing on, although we had no right to that land; but we were held to be occupiers of it, and were therefore taxed on the standing timber and on the land that it stood on, although our only right was to enter upon that land to take the timber off. We had no grazing-rights. We had to pay land-tax and rates on that land.

91. *Mr. Mander.*] Why do you take more notice of the loss of timber up North than down here?—It became necessary for us to tally our logs. Our method there was to tally all logs going into the mill. We, of course, kept a tally of the output, and from this we were able to see what our loss in conversion was.

92. If you have to pay by log-measurement or by lump sum, that timber being your own, you would necessarily take more pains to get the most out of it?—That follows naturally.

93. Can a sawmiller erect an up-to-date plant to cut the timber in the cheapest way unless he has got a sufficient quantity behind him to guarantee that expenditure?—I do not think he can. I think that an up-to-date plant would mean that there must be a large quantity available.

94. Can you tell by the appearance of a rimu-tree whether it contains figured timber or not?—Not with definite certainty, but you can give a pretty good guess.

95. Are there any particular localities in which figured timber grows?—No, beyond that the more matured bush is the harder, and amongst that is the most figured timber.

96. Is it not a fact that there may be two trees side by side—one figured and the other not?—That is so.

97. So that the Government cannot reserve part of any forest as figured?—No, beyond selecting what is most matured.

98. Would the millers agree to a maximum price being put on their timber unless there was a maximum also on the cost of production?—I take it that a Board in fixing a maximum price would be guided by the cost of production.

99. Supposing a maximum price were fixed on the timber sold, and that wages went up, would not that reduce your profits?—Undoubtedly.

100. Then another maximum price would have to be arranged?—Either that or reduce the cost of production.

101. Is it not likely that in cutting out the bush the millers will take out kahikatea and every other timber as it comes?—Undoubtedly; it would not pay them to pass it.

102. Do you not think the competition will regulate the price of timber very closely as well as it does most other things?—I suppose so.

103. Do you not think that there is plenty of competition in the rimu business at the present time?—Yes.

104. Do you not think the introduction of Oregon would reduce the price of building-material for the working-man?—Yes, but I think it would make things far worse for the working-man in the end.

105. Do you not think it would help to bring down the price of rimu?—Not with merchants not interested in rimu.

106. Would merchants largely interested in rimu allow Oregon to bring the price of that down?—No.

107. In regard to kauri, you said you were not in favour of an export duty on kauri?—Yes.

108. You are aware that there is 5s. on logs now and 3s. on flitches of certain sizes?—I think that there should be no undue restriction put on holders of kauri, because the chances of its destruction are so great that it will be a loss to the colony altogether.

109. Do you not think that the Government by taxing timber as a land-value is assisting the destruction of the timber?—It does not tend to its conservation.

110. If a man holds an area for ten years and he loses one-third of the timber, does it not tend to compel him to get rid of that timber as fast as possible?—Certainly. As an owner he realises that he pays a tax on that timber.

111. You are aware that there is a very grave risk of fire in connection with kauri forests?—Yes.

112. Do you think it fair for the Government to expect private individuals to hold kauri timber for the benefit of future generations?—I do not think so.

113. Would it not be wiser for the Government, if it be possible to conserve kauri, to make conditions that it must be cut up in the colony?—That certainly would be a wise thing; it would assure its being used, and at the same time allow of its being converted within a reasonable period.

114. Do you look upon it as a good proposition to hold kauri, which at the present time is worth a royalty of 3s. or 4s. per hundred feet, for forty or fifty years, considering the risk of fire?—I do not think it would—that the accumulated sum from royalty would buy over the timber at the end.

115. *Mr. Jennings.*] Do you know of any sawmiller who, after great trouble and expense in getting his logs through, allows waste to occur?—Well, the word "waste" covers a big ground. He does not wilfully waste timber he can make any profit from.

116. There is no wilful waste?—No.

117. I assume that they are men of experience who know what they are about. Are the timbers of the Dominion suitable for all building purposes?—I think so, except bridgework and so forth, for which the Australian hardwoods are very suitable.

118. Speaking from the point of view of the general public and the setting-up of a Board to decide the prices, you know that that has been done in connection with farming machinery?—That is so.

119. Would a similar Board meet the wants so far as timber is concerned?—I think so.

120. Do you know of any kauri or kahikatea bush held by persons not engaged in sawmilling, but for speculative purposes?—I do not know of any.

121. Have you been engaged in sawmilling on this Coast?—Yes.

122. Can you tell us why there is a very great increase in the cost of timber to-day as compared with five years ago?—I think I went clearly into that. There is increased wages, and the bush is farther away; there are less facilities, and consequently increased cost.

123. Has the increased wages to the workers tended to more efficiency?—That I could not say.

124. *Mr. Morris.*] About the grading of Oregon, what grade is 12 by 2 with knots as much as 6 in. in diameter?—I could not tell you, but they have very definite rules for grading. They not only set down "merchantable" as class so-and-so, but also state that a piece of given dimensions may contain so many knots of a given size, and they can absolutely define the grade to which that particular piece of timber belongs. Speaking of first or second class here, there is a very broad line that is generally decided by the man, but in Oregon they have very definite rules for deciding the grades; but what they are called I could not tell you. [Statement handed in by witness.]

JOHN JACKSON sworn and examined. (No. 66.)

1. *Hon. the Chairman.*] What are you?—Secretary of the Wharf Labourers' Union, Greymouth; secretary of the Westland Trades and Labour Council; and secretary of the Engine-drivers' Union.

2. Will you tell the Commission how the timber business affects the labourers that you represent?—Yes. Well, Mr. Chairman and gentleman, prior to last Christmas there were 210 men engaged on the wharf at Greymouth. The majority of those men were engaged in working for the shipping companies. My return to the Registrar on the 31st December gave the membership of my union as 287, 77 of whom, I might say, were all over the globe, and the remainder were working on the wharf. Seven have been admitted to membership of the union since then, and 88 have had to leave and seek employment elsewhere, and the reason of those 88 having to leave is owing to the non-export of timber. That means there are 129 at present on the wharf, and 90 of those who are working to-day for the shipping companies are not making £1 10s. a week, yet they were all doing fairly well before Christmas. That is directly attributable to the effect of the falling-off of the timber business. The amount of the timber exported has fallen off to such an extent that those eighty-eight men have had to leave, and those that are still remaining are doing very little. You can readily understand that, when a boat like the "Kittawa," taking somewhere about 600,000 ft. of timber, costs approximately £130 to load, whereas if she were taking coal, even if there were two or three levelling-offs—that is to say, shipments to different ports—£20 would cover the whole cost. In some instances it takes very little money to coal a boat, so that it is really the timber trade that we are dependent upon for our livelihood on the wharf—that is, to carry the number of men that the wharf was carrying before Christmas. Now, long before Christmas we realised that this falling-off in the timber trade was going to take place on account of no orders coming to hand to the sawmillers. We also knew there was a large importation of Oregon pine coming to the Dominion, and we believed that that was the chief reason why there were no orders being placed with the West Coast sawmillers, so we joined forces with the employers and urged upon the Government, per medium of the Waterside Workers' Conference which was held in Wellington last July, and also by the Trades and Labour Council Conference which was held about

three weeks later, the necessity of putting a tariff on the Oregon pine, so as to protect our local industry. We realised that the sawmillers on the West Coast employed a large number of people directly in the trade, and they paid them a fairly high rate of wages; and we wanted to show our appreciation of those employers for paying a fair rate of wages without resource to the Conciliation Board or any other tribunal, and, as I say, we joined forces with them and used all our influence to get Parliament to protect the sawmiller and the worker right throughout the Dominion against the importation of foreign timber, which was cut and supplied by cheap labour under sweated conditions. Evidence of that has, I think, already been given to you very ably by Mr. Butler. Now, both the Conferences I have mentioned adopted a motion which was brought forward by myself, asking Government to increase the duty on Oregon pine, and we desire to come forward here to-day and back up that evidence which we submitted to Parliament, and also to the Trades Council Conference nine months ago. We also want to say that while we hope to see a tax placed on Oregon pine, we also hope to see the public safeguarded against the exploitation by timber rings or any other means by which the public will not get the full benefits of the tax placed upon that particular timber that is coming into this Dominion; and, while we appreciate the good wages that have been paid in the past, we desire to say that we want to be protected against any reduction of those wages in future. Evidence has been given before you to the effect that there are no unions in connection with this trade, and probably the person who said that did not have the information or was not aware that there were, but I wish to say that there are two unions in connection with the Westland sawmilling industry. One is the Westland Sawmilling Industrial Union of Employers and has been in existence and registered under the Conciliation and Arbitration Act for a number of years; and there is also the Westland Certificated Engine-drivers and Firemen's Union of recent growth—four or five months' old. I also wish to state that the Westland Union of Employers has intimated that on and after the 1st February a reduction in the wages is going to take place, and those reductions are to be brought down to a minimum which, if I use the word and say it is really disgraceful for a body of men to offer such a wage to working-men on the Coast, I should not be describing it too harshly. I intend to place the list of wages on the table. I might say I wrote to the Sawmillers' Union, and asked them to supply it (the list) to me; but they did not do it, and I had to get it from elsewhere, and there we find that sawyers who are in receipt of £5 a week and over are to be brought down to 12s. a day, and some mill workers are actually to be brought down to 8s. per day. The only men that are going to be paid by the week are the trollymen, and they have to attend to the horses, including holidays and Sundays, at £2 10s. per week. The notice reads, "Wages of Sawmill Employees: We, the undersigned sawmillers in the Westland District, hereby agree to strictly and conscientiously adhere to the payment of the following rate of wages as from 1st February, 1909, it being understood that the rates hereunder set out shall only apply to new engagements entered into on and after 1st February, 1909. We also undertake to furnish discharge certificates to all hands leaving our employ, and on our part shall require production of similar certificates from applicants for employment." Of course, that means that any person who comes from his employment at one mill to another without a discharge certificate will not get employment. Well, gentlemen, one can hardly conceive, in view of the fact that sawmillers have been paying such a high rate of wages, that they will contemplate making a reduction down to those amounts on the West Coast. The Engine-drivers' Union wrote to the Union of Employers, and objected to accept those rates, and said that they would work at current rates amicably with their employers, and submit the whole thing to the Council of Conciliation for settlement thereof; but so far there has been no reply from the Industrial Union of Employers as to what they would do. I believe, at Mr. Jack's mill at Kotuku, on one occasion the men said in a body that they would not go to work at a reduced wage-rate, and they remained off for a day; and it was arranged the same evning they should go to work the following day at the usual rate of wages. In view of the fact that we have been so loyal to the employers and stood by them, I think it unfair that they should submit to the Commission only the figures showing the high rate of wages which they submitted to Parliament last July, whilst the other figures showing proposed reductions have been kept in the background. We as a body of workers desire you to favourably consider the question of imposing a duty on Oregon pine and prevent, if possible, the employers in other countries competing with us while they are employing alien labour at sweated conditions. I think that while we have an industry of such vastness as the timber industry we should protect it against foreign imports, and at the same time see that the industry is regulated so that nobody will be exploited or have to pay more than they should reasonably pay. The workers' suggestion as regards regulating the industry is that the Government should establish State sawmills, and thus regulate the price in the market. I think it has been admitted that there is an excessive price charged for this timber in some towns in New Zealand, but we do not think the West Coast sawmillers get anything more than what they should get for their outlay, and probably not enough. I advocated when in Wellington that the sawmillers on this Coast, who have to pay royalty, railage, and sea freight, do not get anything more than any Government or any person could cavil at. That is so far as the price is concerned, and that I am quite satisfied of to-day, but I do not want to see the wages reduced with the object of increasing the price to the sawmiller, and also putting a tariff on Oregon pine for that purpose. I have a word or two more to say in regard to another question, and that is in connection with the sleeper-getter. I corresponded with some sleeper-getters in our district, and they wrote to me saying that they held a meeting the other day in regard to some evidence which had been brought before this Commission by the Commissioners of Crown Lands at Nelson and Greymouth, who attempted to show that the sleeper-getter was a rather undesirable quantity. It was said that he wastes the timber, and from a question put to Mr. Flanagan by Mr. Morris during the proceedings, it was stated that the sleeper-getters go into the bush and chop a tree down and take one length from it and leave the rest there to be wasted.

and also that they had a roving commission to go where they liked on Crown lands, which was prejudicial to the best interests of saving these forest-timbers. It was also said that they left the tops of a number of trees behind, which were apt to catch fire and do a lot of damage. So far as the West Coast bush is concerned, I do not think it is possible for a fire to do much damage unless it is all silver-pine, and I think the sleeper-getter is just as careful about that as the sawmiller is. The sleeper-getter makes a precarious living by following a very hard and hazardous life; he goes back into the vastness of the mountains to regions that are practically inaccessible to the sawmiller, and gets the timber in small patches, where he sleighs it to the edge of some dry creek and waits for a heavy rain. He then takes advantage of the mountain-torrents to float those sleepers for many miles till he can take them to some railway station or siding. After floating the sleepers down they have to pay a royalty on them. Sometimes they have a number condemned, and they also have to pay a royalty on those. There is also this anomaly about it in regard to those who pass the sleepers: that the person from the Public Works Department will go and pass a body of sleepers that the expert from the Railway Department will not touch at any price, so that certain sleepers can be sold to one Department which would not be accepted by the other. I received a letter from a Mr. White, in Nelson Creek, who called a meeting of thirty sleeper-getters in that district last night, with regard to sending somebody here to give evidence on their behalf. I think it is only fair that you should hear the other side of the question. The letter I received is as follows: "Please let the Commission know that the squarers use every effort to get more than one length out of the trees, and that it is to their interests to do so. We also make all limbs into sleepers that we possibly can, and dig trees out of the ground, the posts being taken off in many places. Do not forget the royalty on condemned sleepers, and let the Commission know that we would be very happy to show them round the workings up here. There are no five-shilling licenses issued up here; the warrants cost £3 3s., paid into Court, and 5s. for miner's right, and the warrant runs out at the end of six months. It costs the sawmiller £5 a year to hold a reserve of 100 acres, while a splitting-warrant may be only a patch of three or four acres, and cannot be more than 20 acres. Also tell the Commission that some of the large millers use to have large areas of silver-pine, and their method of working it was the same as ours—namely, squaring in the bush and splitting in the mills, with just the same waste.—E. White." That is a thing which the sawmiller is understood not to do. I understand the sawmillers have a difficulty with their areas in many places, and the sleeper-getter has gone after them, making good wages by taking up the timber left by the sawmiller.

3. *Mr. Morris.*] Touching the question of the price of labour, do you not consider that it is impossible for the sawmillers here to pay the rate of wages that obtained before Oregon pine was imported into this country?—I do not know. That would really be no reason to reduce the men's wages.

4. You do not think it costs them too much to get their timber to enable them to compete with foreign timbers?—Yes, against Oregon pine.

5. You must agree that it was absolutely necessary that they should reduce the rate of wages so as to enable them to compete with the foreign article?—Yes, either that or give up. I understand that there are some millers who have let their mills to a few employees, who are paying the rate of wages that have already obtained.

6. That list you quoted only applied to men who were employed in fresh engagements?—Well, a man leaving one mill and going to another would be a fresh engagement.

7. Do you know that many employees have left their employment and gone to another mill?—There are some, but I do not think many.

8. Have you had any experience at all in sawmilling-work yourself?—No, I have not.

9. All you know about it is what you have been told?—Yes, but I have done a little sleeper-getting.

10. Have you seen the condition which I mentioned the other day—that is, that you could cut a 7 ft. log out of a silver-pine tree and leave the rest to rot?—No, I cut the trees as close to the roots as possible.

11. When this first obtained on the Coast sleeper-getters used to get about five hundred sleepers out of a patch, and a man got into the next patch of timber and took only the stuff that was easiest to work and left the rest behind him?—Well, there is a practical sleeper-getter here who is getting sleepers to-day—a Mr. Dalziell—and you could question him, and you would be dealing with a man who has worked as a sleeper-getter. He is following that line now, and has been for some time.

12. I understand the risk of fire is a serious matter, and miles of tramway have been burnt through the same thing?—Yes.

13. *Mr. Hanan.*] Have you taken out any figures yourself with a view of ascertaining to what extent the importation of Oregon pine displaces the New Zealand timber?—No, I have not taken out any figures myself.

14. Do you know the output of sawn timber in New Zealand for 1907?—No, I could not say.

15. Do you not know the amount exported?—No.

16. Do you know the quantity of timber produced on the Coast last year—the output?—I think it went up to 50,000,000 ft.

17. Am I correct in assuming that during the last two years there has been a falling-off in the output of timber from the Coast, particularly with Christchurch?—The output from the West Coast has been gradually going up until practically the end of last year.

18. And it reached high-water mark then?—Yes, I think so.

19. You have no doubt about it?—As far as I know.

20. You are aware, I suppose, that there has been a slump in the timber trade and building trade in Christchurch?—Yes.

21. And that state of things generally obtained throughout the colony?—Yes, I think so. Of course, there was a large exportation into Christchurch at the time of the Exhibition. That absorbed a tremendous amount of timber, and after the Exhibition was pulled down the timber was, no doubt, used for other purposes. At any rate, there was a falling-off in the amount of timber going there after that.

22. That was abnormal?—Yes, it was at that time.

23. There is very little Oregon pine that goes to Southland?—Yes.

24. And still some of the mills have closed down?—Yes, so I believe.

25. And others, we are told, will also close down, so that that would not point to the fact that the importation of Oregon pine is responsible for the closing-down of the mills in Southland?—No, perhaps it would not, but there is one fact that you cannot get over, and that is this: that 10,000,000 ft. of foreign timber cannot come into a country without doing the local producers harm, because if 10,000,000 ft. of foreign is being used there is every likelihood of that 10,000,000 ft. taking the place of a similar amount which would be supplied by the local producers if the foreign stuff had not come in.

26. But if there is no complaint in regard to Oregon pine reaching Southland, what then?—They have not felt it.

27. Seeing that condition of affairs obtained regarding the sawmilling industry in Southland, does it not show that there are other things operating in connection with the depression in the sawmilling trade in New Zealand besides the importation of Oregon pine?—I dare say there is a financial stringency, and probably the people of the Dominion are not building so extensively as they have been doing in the past, and, no doubt, there are other things operating as well as the importation of Oregon pine.

28. In Southland the building trade has fallen off, also in Dunedin and Christchurch, and consequently there is no demand for timber?—No.

29. That being so, am I right in concluding that your business with Christchurch has fallen off because there is no building going on?—Partly, no doubt, but it would also depend on what way Oregon pine was being used.

30. I want to ask you this question: If you were told in Christchurch, and Dunedin, and Invercargill that the building trade has fallen off, would that not be a sufficient reason why your timber is not being imported from the West Coast and being used in those markets?—That would be certainly a factor.

31. You told us that 10,000,000 ft. of Oregon timber came into New Zealand?—Yes.

32. What was the total output of the mills in the Dominion for that period?—I do not know what the output of the whole of the mills was, but the output of the mills here was still going on steadily—going upwards. They were probably finishing orders previously placed.

33. Let me put a statement to you that has been put by Mr. Butler—would you accept him?—I should say he should be good enough.

34. He has put in this statement the following fact: that there are 351,235,000 ft. of timber not affected by Oregon, and that the quantity affected by Oregon is only 78,833,813 ft.—that is, about one-fifth, according to his showing, is affected by Oregon. In the face of that, can you say that is sufficient to constitute a main factor in the falling-off of the timber industry on the West Coast?—Well, you could not say that if there was only 351,000,000 ft. unaffected by the importation of Oregon pine.

35. Here it is?—I notice that nearly 45,000,000 ft. of that timber affected by Oregon pine comes from Westland. Well, that is a very large item, being nearly one year's production for us.

36. There is no year given?—That is so. But it is quite evident that it hits us much harder than any other part of the Dominion.

37. Do you know the output of the Auckland mills for rimu?—No, I do not. The main fact is 45,000,000 ft., as compared to 44,000,000 ft. from us.

38. I can inform you that two firms in Auckland alone handle something like 30,000,000 ft. annually as their output?—That may be so.

39. And that is simply for local consumption. According to another statement made by Mr. Butler—viz., that Oregon only comes into competition with about 78,000,000 ft. of timber, still, assuming that about 30,000,000 ft. of timber is handled by two mills in Auckland alone, would you say now that the importation of Oregon affects the Dominion so seriously as has been alleged—there is only about 78,000,000 ft. of New Zealand timber affected altogether. Spread that over the colony, and what is the position?—My reply is that the position does not seem to affect us very much when you spread it all over the Dominion. Where do you get your figures from?

40. They have been supplied by millers in Auckland. Assuming it to be a fact that two firms in Auckland handle that quantity of timber—namely, 30,000,000 ft., and that only 75,000,000 ft. is affected, and if you spread it all over the mills of the Dominion, then would you come to the conclusion that this is a matter that seriously affects the whole country?—I could not very well say that it was, assuming that to be a fact.

41. You are aware, Mr. Jackson, that the cost of building homes for the workers has gone up. I know you are a very staunch and loyal supporter of the workers, and they have been complaining about the increased cost. The workers advocate a State sawmill, and contend that that would keep down the cost of timber and prevent the profit going into the hands of the capitalist?—That is so.

42. Would you give preference to the establishment of a State sawmill rather than impose a duty on Oregon?—Yes.

43. If the imposition of a duty means an increase in the rates of New Zealand timber, would you favour it?—Yes, I believe in keeping the foreign article out, especially if we can produce the same thing in the Dominion.

44. Can you do so in the matter of timber?—Yes, we can do so.

45. If the architects and builders tell us that we cannot produce timber to take the place of Oregon, what would you say?—I should admit it for special purposes only.

46. I suppose you would give way to the opinion of architects and builders?—Yes, I suppose I should.

47. Would you class a carpenter as a miller?—That would all depend. If he has had no experience in sawmilling then he would not know anything about it.

48. Nor a joiner?—Nor a joiner.

49. You would separate the sawmilling business from the carpentry and joinery business?—Yes, the sawmiller is confined to the forest and to milling operations.

50. We have a Sawmillers' Union engaged in the sawmilling industry; there are benchmen and those about the mill in the Sawmillers' Union. Then we have a Carpenters and Joiners' Union, but we do not regard them as all engaged in the sawmilling industry?—Certainly not.

51. If we have so many carpenters, joiners, and others affected, that is not a proper way to classify them?—I would not say they should be included. The position is this, that anything that affects the sawmilling industry would probably affect the carpenter. If the sawmiller is not producing timber, unless it is coming in from another country, then it does not make any difference to the carpenter.

52. If you get cheap timber it reduces the cost of building houses, and the carpenter gets more work: does that not follow—the cheaper the article the more of it is used?—That would all depend. Supposing we closed up the West Coast timber industry and depended upon cheap foreign timber, there would be fewer houses wanted on the Coast because there would be nobody in that line here to build houses for.

53. You speak on behalf and as a representative of the workers of New Zealand?—Yes.

54. Then, you would study their interests?—I would.

55. It is desirable to do something in their interests as a whole?—Yes.

56. To do nothing to increase the cost of building?—Yes, all things considered.

57. Is there any suggestion that a ring exists in this part of the colony?—On the West Coast, no, I do not think there is.

58. Do the people here get their timber locally as cheaply as they do in Christchurch?—Cheaper.

59. Apart from the freight and carriage?—About the same, apart from freight and carriage. The Christchurch people have to pay that, and probably they have got to pay a percentage to the timber-merchants, for there it seems pretty extensive. It is quite evident that they have got to pay fairly high for it over there. We get the timber much cheaper here than they do there.

60. Would you favour an increase in the price of timber? Is it desirable in the interests of the workers of New Zealand that there should be an increase in the price of timber?—Well, so far as the worker is concerned, it would not be a very judicious thing for me to say that I would favour an advance in the price of timber, because it is held that they are already paying rather much in some of the centres, and they feel that the timber is being controlled somehow by a ring; but speaking from a West Coast point of view, I do not think that the sawmillers on the Coast are being paid too much for their timber.

61. You are opposed to the increase in the price of timber?—If the sawmillers on the West Coast could not carry on their industry and pay the rate of wages that they have been paying, then I would favour their getting a little more in order that they should make a reasonable profit, and the workers would get a direct benefit of it by the Government seeing that no other ring outside the millers made a greater profit than they should get for the handling of the timber.

62. Rather than that the West Coast mills should suffer, would you have any objection to timber going up in price to the workers of the Dominion as a whole? Would you rather that the workers of New Zealand should pay more for their timber than close up the West Coast mills?—Than close up the West Coast mills, yes.

63. Do you apprehend a reduction in the wages of the workers?—I believe so.

64. Why do you not form a union here?—Well, so far as the engine-drivers are concerned, they have formed their union, and the other sawmill workers are about to form one, although as a matter of fact they should have formed one long ago, but things were then going on all right.

65. I suppose the sawmillers have had a good innings on the West Coast? Have any of them gone bankrupt within the last three years?—I do not think so. They did go bankrupt at one time.

66. Are the men engaged in the milling industry on the West Coast poor men?—They seem to have good homes, and look well on it—pretty fat, and that kind of thing.

67. Have you any gentleman who has got six or seven mills on this coast?—I believe Stratford and Blair have got seven mills, and some of them have got 28,000 acres of bush land recently down in Hokitika.

68. The workers do not view that favourably?—No, we do not.

69. Mr. Jackson, as a representative of the workers, would you give us your opinion upon a suggestion that has been made by Mr. Butler—that is to say, that we should establish in New Zealand a Board something like the Arbitration Court to deal with this timber question, as has been done under the Harvester Trust Bill respecting machinery, and as has also been done in connection with flour, wheat, and potatoes, where there is a Board with power to automatically increase and decrease the duty as these local commodities rise and fall beyond given figures?—I do not know. I should say that anything that can be made in this country in the line of machinery for the sawmiller or for any other person, that if it can be manufactured in this country it should be, and the foreign article kept out.

70. Suppose the timber went up to a certain price, should the duty not come off?—Yes, I understand. So far as timber is concerned, I think that the Government themselves should regulate that by their own mills.

71. Then, with a view of regulating competition in prices, you are strongly of opinion that the Government should establish State sawmills?—I am.

72. What about the State sawmill here: is it working all right?—Yes, and paying good wages.

73. Are you in favour of increasing the areas?—I do believe that the areas should be enlarged.

74. Does that not play into the hands of the big man with money?—I do not favour monopoly at all. As a matter of fact, I believe that the forests should be reserved absolutely and worked by the Government.

75. *Mr. Jennings.*] In regard to your union—the Wharf Labourers' Union—do you know of any branches throughout the Dominion holding a different view to what your union does in regard to the importation of Oregon pine?—No, there is none.

76. Are you quite sure of that?—The Waterside Workers had a conference at Wellington last year, at which all the unions were represented, and the conference was unanimous on the resolution submitted, that Oregon should be kept out.

77. In regard to sending away timber from here on a holiday, would your union refuse to load vessels?—Yes, they would refuse.

78. Even if they were double-paid?—Yes. When we applied to the Court, at the time we got our present award something over two years ago, we asked, I think, for double time on holidays, and the shipping companies only offered time and a quarter for ordinary holidays, and the representatives of the companies before the Court told the Court that the wharf labourers did not want holidays—they merely wanted overtime. Now, to show that were were serious in our contention that we did want holidays, we have never worked on a holiday since. And so, when a holiday comes along, the wharf labourer has his holiday. At the same time, however, we do not bar any one else from working.

79. In regard to these sleeper-getters, Mr. Jackson, in my district, if the proposal submitted with regard to reservations were given effect to, it would mean that between fifty and eighty men would be deprived of cutting sleepers. What would be the result here?—It would throw more men on to the market looking for employment. In Nelson Creek there are thirty sleeper-getters making their livelihood, and cutting from twenty to thirty thousand sleepers a year. They are now working back to the higher ranges—miles beyond the sawmill areas.

80. Following the question of protecting our own industry, would you apply the principle also in regard to wheat?—I would apply the principle all round of protecting anything that we can manufacture, grow, or produce ourselves.

81. Supposing a ring were established in connection with local-grown wheat which rendered the price of bread for the families of the people almost exorbitant, would you still hold that view?—I would not allow exploitation to take place. The Government should arrange that.

82. Then, you agree with what has been done by the Legislature in regard to the Harvester Trust? Do you think that would meet the question if a similar measure were enacted in the Dominion in regard to the importation of Oregon timber? Say, if the local sawmillers put up the price so much that it became almost prohibitive, or at any rate unbearable to the inhabitants, do you not think that it could be regulated by a measure similar to that adopted in connection with the Harvester Trust?—I think a more effective way of regulating the sawmilling industry and practically all industries is for the Government to produce the article themselves.

83. *Mr. Field.*] You have not seen this statement of figures before?—No.

84. You do not feel prepared to discuss it without giving it full consideration?—I am prepared to answer any question.

85. You have not considered it?—Not previously.

86. You have not gone through it carefully?—I just glanced at it, and I saw that the West Coast exportation of timber stood much higher than the rest.

87. As regards the suggestion that millers should mill at Government prices, you are aware that the sawmilling associations, so far as they can, fix the price of timber throughout the Dominion at the present time?—Yes.

88. Do you see any good reason why the Government should not fix the price of timber in the same way?—No, I see no reason why they should not. As a matter of fact, they will fix it if they run their own sawmill.

89. Do you not think it is a possible solution to go one step further, and fix the milling-price as an alternative in addition to the one you have already suggested—namely, a State mill?—I think the remedy I suggest would work out satisfactorily.

90. Do you think it is a fair suggestion for the millers to make?—Yes, from their point of view.

91. *Mr. Leyland.*] How many members have you in your union?—Two hundred and eighty-seven.

92. Have you any idea of the number of members in the Auckland Waterside Workers' Union?—About sixteen hundred.

93. Were they represented at this conference?—They were represented by Mr. Canham and Mr. Gibbes.

94. Do you think it possible that they may have modified their opinions?—They may have. They said that Oregon did not affect them very much up there—it gave them employment, as a matter of fact.

95. If it could be shown that Oregon pine at the present time costs more to purchase than the price which sawmillers in New Zealand are satisfied with—considerably more—would that help you to modify your opinion? If to purchase it to-day would cost considerably more, you would not feel very strong on that point, perhaps?—No, perhaps not.

96. Now, regarding the State sawmill, does it pay any rent?—It does not pay either royalty or rent. The Government could not pay that to themselves.

97. Does it pay any rates?—No, I do not think it does.

98. Has it not a first call on the market for its output in respect to any timber required by the Government?—Yes, it has.

99. It supplies the workers' cottages at the mill at a given price?—Yes.

100. Is it true that the local millers will supply at the same rate and cart it four miles?—I cannot vouch for that.

101. I am told that it is so?—In that case the local miller need not be afraid of competition from the Government.

102. Do you not think that the Government mill ought to pay very handsomely, with all its advantages?—They might let their men work a little easier and pay them better wages.

103. *Mr. Clarke.*] In connection with the statement that the Sawmillers' Association fix the present prices of timber throughout the Dominion, can you see what is to prevent them raising the prices at the present time, or in the future, if they so desire? Might they not at any time raise the price?—Yes, they might.

104. You know of no present machinery to prevent that?—No.

105. From a labour aspect of the question, you are no doubt aware, where afforestation is carried on, it would of necessity employ a large number of men?—Yes.

106. You are also aware that our timber-supplies here are stated by the Government experts to be only capable of holding out, say, for forty-five or fifty years?—Yes.

107. In view of these two facts, would you not recommend that the Government should immediately start some systematic scheme of afforestation, with a view of giving employment at the present time and to provide timber for the future?—I do.

108. *Mr. Barber.*] You said that the price of the labourers' wages was brought down to 8s.?—I said they put in a scale under which they proposed to reduce them to 8s. in some instances. Ten shillings is recognised as the ruling rate of wages in most industries. Of course, the millers have been paying more than that in special lines.

109. Then, the labourer gets 10s. at the mill?—Yes.

110. Are there many mill hands unemployed at the present time?—Yes, there must be a large number. I know that over thirty men since Christmas have made application to me for membership in the Wharf Labourers' Union, and a number of them have been men who work at mills. I explained to them that the supply was far greater than the demand on the wharf, and that times were very bad on the wharf, and consequently they did not join. They went on and looked for work elsewhere.

111. Do you think there is the same percentage of employment as in Wellington?—I do not think there is.

112. Really the times are not so bad as where the sawmiller is not a particular feature?—They are always bad about a place like Wellington. There are always a large number hanging about the wharves there.

113. The position is not so bad here?—No, and I would not like to see it so bad.

114. Has the number of mills increased during the last few years?—I should think so.

115. Considering that we have only a limited output for the timber, and that the market is chiefly confined to Christchurch, do you think that the supply now is greater than the demand?—That is quite evident.

116. Is there any likelihood, even if you exclude Oregon timber, of the demand keeping up with the increased output?—One thing cannot be gainsaid: you cannot bring 12,000,000 ft. of foreign timber into the Dominion and say that it does not affect your own trade.

117. But only a small amount goes into your market?—Forty-four million feet, according to the statement laid on the table.

118. It has been shown that the importation of Oregon is only 5 per cent. of the output of the mills. There might be only 1 per cent. going to Christchurch, so that the percentage might be very small?—Yes.

119. Would you be surprised to hear that cottages similar to those of the State mines, which are rented at 8s. per week, would cost £1 5s. per week in Wellington?—I do not suppose the timber has to do with that.

120. It has been argued that the high price of timber is responsible?—Then there is a timber ring that wants breaking up somewhere.

121. You say there is no timber combination?—You have got the West Coast Trading Company.

122. You think the remedy is to prevent undue prices being charged by the State stepping in and striking a price?—I do, by medium of their own mills.

123. *Mr. Ell.*] You are subject to heavy rainfalls here?—Yes.

124. In consequence of that there is a lot of broken time amongst the men in the mills?—Yes.

125. So that, although they get 10s. per day, when that is discounted by broken time their average earnings would not amount to a rich sum in a year?—They would not reach £2 10s. per week, and the maximum handed in by the sawmillers would scarcely make it a living wage for them.

126. Has the price of timber been reduced here?—I understand that that is so, but I cannot prove it. I believe there has been a reduction, but I never had to buy any myself.

127. How long ago was that meeting?—During these last few weeks.

128. There were statements made that they were paying 6s. 9d. for second and 8s. 6d. for first quality. Assuming that the prices are not reduced, do you think they will justify any reduction in wages?—Certainly not.

129. With regard to discharge certificates and agreements being entered into that a man must produce his discharge before being employed by another miller, how does that operate against a

man being employed by another miller?—We look upon that with disfavour. Any man who formed a union and was instrumental in getting an award made would probably be a marked man, and consequently he would not get the certificate to which he would be entitled.

130. He would be practically placed on the black list and deprived of an opportunity of earning his livelihood?—That is so.

131. With regard to the future needs of the people of this country, do you think it is desirable that we should make provision for the future needs of our own woodworking industries?—I do.

132. Would you think it a desirable thing that our manufacturers should depend on imported timber at 18s. or 19s. per hundred feet when they can have rimu supplied at 13s. 6d.?—I think we ought to have reserves, and I do not believe that the country should be absolutely denuded of its timber and that future generations should have no forests.

133. You do not believe in living for your own day and generation only?—Certainly not.

134. You say that certain mills were let on tribute?—Yes. The millowner says, "You can take this mill for a while," and the men run it co-operatively. Three or four might take it and then employ wages-men. That is so.

135. So you consider that, if half a dozen men working on the tribute system can pay the recognised rate of wages, that a sawmiller ought to be able to do it?—Yes.

136. *Mr. Arnold.*] Have the employers been giving certificates since that date?—I do not think so, so far.

137. Do you know that there is a Sawmillers' Union in Southland?—I do.

138. And that they have an award?—I do.

139. Do you know that according to that award employers in Southland have to pay time and a quarter for all overtime?—I do.

140. And on the Coast they pay the ordinary rate?—Sundays and all.

141. Do you know that for Sundays and statutory holidays they pay double time in Southland, and on the Coast only the ordinary rate?—I know that.

142. So that the miller on the Coast has the advantage of the miller in Southland?—There is this difference: the miller on the Coast pays a higher rate of wages.

143. So far as these two points are concerned?—You are correct.

144. With regard to the cost of living, you have been to Southland?—No.

145. Have you been to Dunedin?—Yes, I have been there.

146. You know the cost of living there is very much lower than on the Coast?—I understand that you can board in the Southland District for 12s. per week.

147. So that a living wage on the Coast must necessarily be higher than in Dunedin or Southland?—That is so.

148. Do you know that according to the Southland Millers' award 8s. per day is the minimum, and that it runs up to 10s. 6d.?—That is so.

149. *Mr. Hanan.*] In some cases higher than the award?—Yes.

150. *Mr. Arnold.*] So that it would be necessary that the workers here should receive a higher rate of wages to be on the same footing as their co-unionists down South?—Yes.

151. Do you say that active steps are being taken at the present time to form a union here?—Yes.

152. You know, of course, that certain people have a great objection to the agitator or labour organizer?—I know it well.

153. If the point brought out by you, in consequence of these certificates local men friendly with the employers do not agree to form unions, does it not follow that an organizer from some other place will come and do the work?—That will be necessary. Of course, all you have to do is to get your union formed and appeal to the Conciliation Board. Once you get preference you are all right.

154. That is one of the primary causes for the necessity of an organizer?—Yes.

155. You have been asked with regard to the Harvester Trust. Do you know how many times that Council has been called upon to sit?—I do not.

156. You do not know that it has only been called together once, that then it was an absolute failure, and that it is not likely to be called again?—No.

157. If you knew that it would modify your views?—Yes.

158. *Mr. Mander.*] Considering the risks with timber at the present time, do you not think it would be better for the men to submit to a reduction in wages to tide over the slump, with the understanding that as soon as there was a demand for timber again the wages would go up, rather than close down the mills and be thrown out of employment?—No; I think it would be better for the miller to tell the men, "We cannot pay the wage-rate now, but there is a mill for you, and run it to the best advantage." The men will then work it co-operatively.

159. Will men work better co-operatively than for a private individual for a week's wages?—Yes, they have more heart in their work.

160. Is it not a fact that men on contract will do the same?—Naturally they will.

161. Providing you did that and there was not the market, what would become of the stuff cut?—Some of the mills would have to close down. Take the dredge industry: there were thousands of pounds sterling dropped, but there was never a suggestion that the men should work for a lesser wage; they simply closed down.

162. Supposing the mills were run short-handed, would it not be more expensive for the millowner to produce the timber?—Oh, yes! I believe that right enough. But I also maintain that once wages are reduced they never reach the old standard again.

163. I suppose you are aware that wages on the Coast are very much higher than in any award given so far?—There is an award in Southland, but the wages here are higher because the men are not paid for overtime, or holidays, or anything of that sort.

164. If you understood that Dunedin was a good market for the Westland timbers, and that there was a lot of Oregon coming into Dunedin, might that not affect the Southland market?—Yes.

165. Therefore you would object to Oregon coming into Dunedin?—I should certainly object to foreign timber.

166. And you will admit that the higher rate of wages for milling must fall on the workers who have to pay the rents of the houses?—I do not think the good wages paid to mill workers very materially raised the price of timber on the general worker.

167. Do you think the Government could produce timber as cheaply as private individuals if they had to pay the same charges?—They would have to produce it cheaper to do it. I think the Government ought to be able to.

168. Do you find in your experience that a man working for the Government will display the same energy as working for a private individual?—Yes; I worked for the Government on a co-operative line, and never worked harder in my lifetime.

169. In regard to the importation of oak and other fancy timbers for the purpose of furniture-making in this country, do you not think the price is merely a fancy one given by people in consequence of the fashions in furniture?—I dare say it is, and they have a perfect right to pay fancy prices if they want to.

170. *Mr. Morris.*] You do not approve of giving these discharges to the men?—No.

171. Do you not know that it is absolutely necessary to do it to fulfil the conditions of the Factory Act?—No.

172. You do not quote the maximum price when you put in the list the West Coast millers prepared. Do you know that the minimum was put in to cover boy-labour employed about the mills?—I know it applied from the headman down to the lowest hand.

173. There are a good many cases in which a man employs his own sons, and it was put in to meet these cases?—I did not see your maximum, although it is much lower than minimum to-day.

174. Read from that pay-sheet for February [handing witness document], and say what you think about it?—"Greymouth Timber Land Company: F. Delore, 16s. 8d.; A. Butler, 12s.; R. Thomas, 11s.; W. Hamilton, 12s.; W. Sheehan, 11s.; G. Webster, 12s.; J. King, 11s.; T. Killeen, 10s.; J. O'Grady, 10s.; E. Bedelph, 12s.; E. Dense, 12s.; T. McAlister, 11s.; B. Lindbom, 9s.; C. Low, 10s.; A. Low, 10s.; J. White, 10s.; F. Low, 13s. 4d.; T. Daly, 13s. 4d.; H. Stevens, 12s."

175. That goes to prove that the statement you made, "that the sawmillers ought to be ashamed of themselves," will not bear looking into?—I did not say that the millers ought to be ashamed of themselves in regard to this pay-sheet. What I did say is that where you propose to make a reduction, where £16 is being paid now it will be £6 and £7 and £8 then—that the sawmillers ought to be ashamed of themselves.

176. *Mr. Arnold.*] Have you any idea why that statement was not enforced in February?—I understand that it was attempted; I understand that in one mill they tried to force a reduction and the men said they would not go to work. The strike lasted for a day. And individually among workmen in other mills men have been asked to accept reduced rates. They refused and left the job.

177. Has it been suggested that the fact of this Commission having been set up has held the hands of the employers in the meantime?—I do not know that it has, but I want to bring under your notice that when you submit your report to Parliament it should be borne in mind that the millers do not intend to carry the present wage-rate out, unless they repudiate the printed minimum wage I have handed in to you.

178. Who is your Inspector now?—Mr. Mostyn. I would like to read the following letter: "To the Secretary, West Coast Timber Association.—DEAR SIR,—I understand it is the intention of your association to advise the sawmill-owners affiliated to your body to reduce the engine-drivers' wages. The members of my union who have charge of engines at the various mills have informed me that, as a matter of fact, you intend making a serious reduction in their wage-earning power. I shall be sorry to learn that this is true; but if it is, I have to advise you that the members of my union will not work at reduced rates. We are prepared to continue at work at current rates and to submit the dispute to the Council of Conciliation for settlement thereof. An early reply defining your attitude towards us in the matter will oblige.—I am, &c., JOHN JACKSON, Secretary." That was on the 5th February, and on the 11the February I received the following letter: "John Jackson, Esq., Secretary of the Westland Engine-drivers' and Firemen's Industrial Union of Workers, Greymouth.—DEAR SIR,—I am in receipt of your letter of the 8th instant with regard to the wages proposed to be paid to engine-drivers at sawmills, and beg to advise you that this is not in the province of the West Coast Timber Trading Company. I understand the wages complained of were fixed by a meeting of the West Coast sawmillers, and would suggest that you address your letter to the secretary of the Westland Sawmilling Industrial Union of Employers, of which body I am secretary.—Yours very truly, EDMUND A. WICKES, Secretary." On the 11th February I addressed precisely the same letter to the secretary of the Industrial Union of Employers, and six weeks after I got a letter from the West Coast Timber Trading Company.—"DEAR SIR,—In reply to your letter of the 11th ultimo, with reference to the wages paid by sawmillers to engine-drivers, I am directed to inform you that a schedule has been sent to each mill showing the minimum rate of wages sawmillers are prepared to pay in engaging hands in the future.—Yours truly, E. A. WICKES, Secretary." That is the same gentleman who told me I should not write to him as secretary of the West Coast Timber Trading Company, but as secretary of the West Coast Sawmill Company. On the 25th March I wrote to Mr. Wickes as follows: "DEAR SIR,—Would you mind letting me have a copy of your schedule of wages which you have sent out to the mills, and oblige, yours sincerely, JOHN JACKSON." I have not received an answer to that yet, and I had to depend upon getting that schedule from another source.

179. *Hon. the Chairman.*] You have heard the evidence, and you know the prices that the timber-millers are getting for their timber. In your opinion do you think they were justified in reducing the wages?—No. I do not. I do not think they should have reduced the wage-rate at all. They should at least have waited to see what the Government would do in regard to placing a duty on Oregon pine.

180. Some of them have sworn that they were losing money, and would you expect them to keep a mill going while they were losing money?—No, no one could expect that—they would have to close up.

181. Was it better for them to make a slight reduction in the wages in order to keep the workers, or to close the mills up and turn the workers out?—I think the workers, as a matter of fact, rather than work at the reduced rate would give it up altogether and turn their attention to some other industry.

ANDREW DALZIEL sworn and examined. (No. 67.)

1. *Hon. the Chairman.*] What are you?—A sleeper-getter.

2. And where do you reside?—At Nelson Creek, Grey Valley.

3. You heard evidence given here to-day with regard to sleeper-getting?—Yes.

4. Will you make a statement to the Commission in regard to your operations in that connection?—Well, there was a meeting called last night at Nelson Creek, at which thirty sleeper-getters were represented, and I was asked to come down here to contradict what we thought was an injustice to us in insinuating that sleeper-getters were destroying the bush more than the millers. I want to state that in the opinion of the sleeper-getters we are of as great a benefit to the country and to the Government as the sawmillers (being producers of revenue as well as the sawmillers), and it would entail a great hardship upon us if our source of livelihood were taken away, and at the same time it would not benefit the sawmiller at all. We hold that there is less waste of timber in the working of the sleeper-getter than is the case with the sawmiller. For instance, when the sawmiller went into the bush he paid a special rate per sleeper or per day to his workmen, and they had to get a specified number of sleepers in a day, otherwise they were not considered competent workmen; they were dismissed. Therefore the trees were knocked down, and we do not deny that some time ago trees were knocked down which would make five, six, and seven sleepers. At the present time when the sleeper-getter goes into that bush he is allowed a license to go into a certain block of country, perhaps a mile square, or whatever the block may be. This license gives him permission to square sleepers on Crown lands, but if there should be a block in that of any special size which is worth taking up a timber warrant for, we take up a warrant, which costs £3 5s. for six months for 20 acres. I believe smaller areas can be taken up. We have always up to now had to pay £3 5s. for a 20-acre block, where there may be only 1 acre of sleepers, and the rest white-pine country.

5. How long does it take you to work out this £3 5s. license?—That would depend on the amount of sleepers. A good workman going into the bush cutting sleepers will average probably eight to twelve sleepers a day, and he has to cut the trees as low down as possible and take out as much as he can. It is better for him to get a bit more off a tree than to lop it down. Certain tracks have to be put in, and it pays him to take as many sleepers out of that track as possible. It does not pay him to waste the timber, and, again, the timber he is getting is so far back in rugged country that it is impossible for the sawmiller to do anything with it. All the handy bushes are cut out now. Where I come from, at the present time there are 6,000 sleepers ready to be floated on the first flood we get. They have to be floated twelve miles and carted four miles to the station. Where these sleepers are now it is impossible for a mill to work, because it is in very rugged country. As I say, it is sixteen miles back from the railway-station, where there is no likelihood of a railway ever coming. Then, in regard to fires in our silver-pine, it is against the sleeper-getter's interest to have a fire in his bush, because if he has tracks laid out he requires all the scrub he can get to carry the horses across them. As I stated, the silver-pine country is wet, heavy country as a rule, in which the horses get bogged. We have to use the scrub for our tracks in order that the horses can get over them, and if we burn away the scrub we have nothing to pack it with, and while 5s. might make a track under ordinary conditions, it will take £1 if we allow a fire to go through. One of the greatest sources of danger from fire in our bush is from the tops of red- and white-pine trees, which you will find lying alongside our silver-pine bushes, especially where a locomotive is working. I spent a fortnight last year putting out fires which were caused by a locomotive. This applies all round in the district where I am. I cannot speak of the Coast as a whole, only from Waireka up towards Reefton. Last year we turned out anything from ten to twenty thousand sleepers, and at the present time there are between six and seven thousand sleepers ready to be floated before the winter sets in, so that will give you an idea of the hardship we shall suffer if our leases are interfered with and we are prevented from working independently. I might state that there is only 10s. or 15s. a day to be made out of it, taking into consideration the difficulties we have to contend with.

6. Is there any co-operation amongst you in regard to the number of sleepers which you mentioned were there?—We usually go in pairs. Two or three men will take up a small block of 20 acres, but you very seldom get a block of 20 acres. The chances are that there will be only 4 acres.

7. How many people are connected with that number of sleepers which are waiting for a flood at the present time?—I should say, roughly speaking, there would be fourteen.

8. How can you decide the ownership after the flood?—They are all branded.

9. Particular brands of your own?—Yes.

10. And then is there any loss after the flood if the sleepers do not get to the lowering?—In a favourable flood ten days will bring them to where we cart from.

11. You do not lose many?—We should lose practically nothing if it were favourable weather, but if a big flood came when we were taking them out the chances are that we might lose 2 or 3 per cent. in some instances.

12. *Mr. Jennings.*] To whom do you supply the sleepers—to the Railway Department or the Public Works?—To both.

13. And is there a scheduled price that you get for them?—Yes, 3s. 3d. per sleeper, less 2d. royalty, and I might here draw the attention of the Commission to the hardship under which we are working in that connection. All our sleepers that are condemned and which the Department will not accept are still charged 2d. royalty. They charge the same price for those sleepers as they do for those that pass the officer's inspection.

14. Have you been cutting sleepers for any length of time?—Between two and three years; I am not an old hand at it.

15. What previous experience had you with woods before that?—I have been dredging most of my life, and the only other experience I have had is through being in timber districts. For the last eight years I have been on the Coast.

16. What are the regulations here—do you supply one class of sleeper?—We have to supply 8 by 5.

17. In what timber?—Silver-pine.

18. You are confined to that?—Well, there have been orders for totara, but this timber is very scarce, and it does not count in our part of the district.

19. Now, in regard to waste in cutting out your sleepers, do you not utilise your logs to the very best advantage, and get as many sleepers as you can out of the tree you cut down?—Well, a man would be foolish if he did not. You want to get as much money for as little work as possible. That is the aim of us all. As Mr. Jackson stated when he read a letter to you, if it was possible at all we should be only too pleased to show you through the silver-pine and red-pine areas where the tram goes through, and we could show where it would be almost impossible to get a tree 6 in. in diameter in silver-pine, and immediately you go to the red-pine you find the tops are lopped off and hundreds of trees wasted, and the rest of the trees are never taken into the mill. I should say it is in the red and white pine where there is this waste. We try to save every stick in the silver-pine.

20. Are the men a decent class of men?—Men who will go out and camp in the bush for a week and only go home on Saturday night are generally a steady class of men.

21. *Mr. Leyland.*] Has there been any rise in the price of sleepers during the last ten years?—No, not that I know of. I believe they were reduced to 2s. 6d. two or three years ago, but that was raised again to 3s. 3d.

22. *Mr. Clarke.*] With reference to the class of labour, I understand you yourself have only been at that occupation a short time, but is it the practice in this district for men to change from one occupation to another? Are they not mostly all-round men who can take on other classes of work?—Well, the bushmen can practically get sleepers if they happen to find good bush to get them in. They can usually wield an axe.

23. Do you find them leaving the bush and taking on gold-mining?—Well, gold-mining is practically a lost industry, barring any big companies.

24. And in the event of the re-establishment of this industry by a company, would you expect that to relieve any want of employment in that way from amongst the sawmillers—would that take up some of your labour?—Most decidedly it would. It would require something of that kind at the present time. If our timber warrants were interfered with, with the thirty men in the little district I am in, and they were thrown out of employment, we could scarcely say how they could be employed. I have been dredging up to two or three years ago, and that is an industry that has gone back, and I have had to leave it.

25. And you would be quite capable of transferring your labour to any other branch of industry if you had to leave this?—Well, I have been in several branches of mining.

26. As to the question of the waste of timber, what is your opinion about the red and white pine? Do you think that should be paid for whether they use it or not, or do you think those getting the timber should be allowed to leave it there to rot?—Of course, the millers say that that timber which is left behind is knotty and second-class, and would be unsuitable; but if it can be worked up under present conditions, it should not be allowed to rot. We should have something done whereby we could use the second-class timber, because it seems wrong that this waste should take place, but under present conditions nothing can be done.

27. *Mr. Barber.*] Besides what the sleeper-getter pays for a license, he has a roving right to go where he likes?—He has a roving right to cut silver-pine, but if I came along I could take any amount I liked, and could prevent any one else coming in if I had a license. It gives me the right to cut the timber on that 20 acres.

28. But if there was not much competition a five-shilling license would give you the right to roam over the forest?—Yes, where there is silver-pine.

29. Can you say why the Government Valuer only values silver-pine at 3s. 3d. and jarrah at considerably more?—No, it is a subject which is discussed very often amongst the sleeper-getters, and we can give no reason except that the Railway Department's officer says they do not hold the rail-dogs so well. As to its durability, it is as good as any timber we have in New Zealand or Australia either. I have seen a 2 ft. red-pine tree taken off a silver-pine tree lying in the ground, showing that this tree must have lain in the ground for some time to allow the red-pine tree to grow over it.

30. *Mr. Ell.*] They are getting some silver-pine trees out of some swamp land near Hokitika?—Yes, that applies to nearly all silver-pine bushes. You sometimes get trees buried in the ground 2 ft. deep, with scrub and cedar growing over the top of them. We like to get that class of timber if we can, because it is generally less faulty. The same thing applies to Reefton. They dig it out of the flat there.

31. An old silver-pine forest?—Yes, that had grown up with wood afterwards.

32. And on those swamps where you get silver-pine, do you sometimes find silver-pine growing underneath those bushes?—Yes, it applies to all bushes.

33. Have you worked in sawmill areas that have been milled for silver-pine?—Yes, I worked in one about ten months ago. I worked for three months after the bush had been milled. I think Mr. Jay or Mr. Blair had the work originally, and we were purely cutting sleepers out of the remains that were left that they considered too bulky to take to their mills. I was two or three months in the bush with one mate. We passed 600 sleepers in the area I have mentioned. My mate and myself cut the silver-pine out after the mill had been through it.

34. In travelling through that area did you find many trunks of rimu and white-pine?—There were practically none. It is generally in *pakihi* bush, where the red and white pine does not grow. Red and white pine will generally fringe round the coast, but there are patches where the red and white pine do not grow.

35. About what area did your work cover when you got those 600 sleepers out?—We did not work a block of more than 40 acres.

36. And you got 600 sleepers which had been left behind by the sawmillers?—Yes.

37. Have you had any experience with regard to any other areas of bush which the mill has passed through?—No.

EDMUND ALEXANDER WICKES, Secretary of the West Coast Timber Trading Company (Association), sworn and examined. (No. 68.)

Witness: I have been connected with the export timber trade from the West Coast since its inception in 1896. There are at present forty-nine sawmills in this district, engaged almost exclusively in the export trade, and by the term "export trade" I mean exported to other portions of the Dominion and elsewhere. Out of the forty-nine sawmills, our association handles the output of thirty-nine mills, and five others are associated, and are working in unison with us, the remaining five mills doing their own business. It is estimated that these mills represent an erected cost of at least £135,000 to the owners, and do not include those in the Westport district concerned in the export of timber from that port.

The company or association was brought into existence in order to avoid the keen competition in prices that was then obtaining, and to overcome the chaotic condition into which the sawmilling trade had drifted; it was found desirable that some organization should be formed, with a recognised head and executive, for the more economic conduct of the business. This organization has at no time prejudicially affected the public of New Zealand, and it will be shown that it is impossible for the mills to work at lower prices than they have hitherto done with a hope of any return for capital invested. The company does not attempt to make any profit, but is simply run as a central agency for the millers.

Prices.—The prices of red-pine timber for the past eight years have been as follows, f.o.b., Greymouth, Hokitika, and Westport. It is understood that the prices quoted in all cases are for the product of the log, in lengths not exceeding 22 ft., and in sizes not exceeding 12 by 12, and less 2½ per cent. discount:—On 1st April, 1901, the price was 7s.; 20th May, 1901, 7s. 6d.; 1st September, 1903, 8s.; 24th November, 1904, 7s.; from 1st April, 1906, to 30th June, 1906, 6s. 6d.; on 1st July, 1906, the price was 7s.; 1st August, 1906, 7s. 6d.; 1st August, 1907, 8s.; 23rd November, 1908, dressing lines 8s. 6d., O.B. scantling 6s 9d.

Exports.—The association's export trade has grown from £12,735 in 1896 to £102,460 in 1908. Of course, this does not include the value of timber sent away by millers doing their own shipping, and it is only mentioned to show the present importance of this industry to the district. During the year ending 31st March, 1908, the total quantity of timber carried over the Westland section of the railways for export was 45,953,421 ft., and this included all white and red pine sent to Australia and elsewhere, and also all sleepers sent coastwise. For a like period ending 31st March, 1909, the total quantity carried for shipment was 43,271,396 ft., showing a decrease of 2,682,025 ft. and including all the items mentioned above. These figures require further explanation, and are more unsatifsactory than appears at first sight, for during the latter period we shipped some 15,000,000 ft. of timber to Australia, as against about 4,000,000 ft. during the year ending March, 1908, so that without an Australian trade the position would have been very serious indeed. This Australian trade is by no means satisfactory, either to the millers or the Dominion, inasmuch as it only absorbs the very choicest portion of our timber, and consequently it is necessary to destroy much of the log that should be converted into a marketable commodity.

While to a limited extent it is possible that the present financial depression may account for some of the slackness of trade, it is mainly attributable to the large importations of Oregon, especially as the serious falling-off in trade is contemporaneous with the large imports of Oregon which have taken place since June, 1908. I can almost say that every foot of Oregon imported displaces one foot of red-pine, as it comes into competition with hardly any other New Zealand timber. To emphasize the seriousness of the position, and as showing the enormous shrinkage of the association's business since the advent of Oregon, the following comparative table demonstrates beyond all reasonable doubt that the slackness in our red-pine trade is due almost entirely to Oregon importations into Wellington, Lyttelton, and Timaru:—

	1907.	1908.
April	1,706,012	2,158,405
May	2,327,643	2,515,495
June	2,764,162	2,374,552
July	2,371,543	1,466,384
August	2,566,682	1,074,803
September	1,822,114	1,073,143
October	2,088,877	527,093
November	2,343,430	636,731
December	3,112,030	766,410

	1908.	1909.
January	1,429,620	229,143
February	2,116,459	412,580
March	2,475,722	599,123
	27,184,294	13,833,862

The decrease in revenue to the Government in royalties and railages for timber exported from Greymouth to our markets within the Dominion for the year ended 31st March, 1909, as compared with the year ended 31st March, 1908, exceeds £11,000. As showing the importance of the timber industry to New Zealand, the following figures are taken from the Official Year-book of 1905, under the heading of "Sawmills, Sash and Door Factories": Number of sawmills, 444; hands employed, 9,111; wages paid, £834,927; timber produced, 336,470,930 ft.; total value, £1,422,950. The figures are the last available.

Remedy.—After going very carefully into the position, and with a full knowledge of the timber industry during the past fifteen years, I say without reservation that there is only one remedy for the existing depression in the red-pine trade, and that is a substantial increase of duty upon all Oregon and timbers of a like nature used for ordinary building purposes. Even in Australia, a country almost devoid of softwoods suitable for building, a duty of 2s. 6d. per hundred feet is imposed on all sizes below 7 by 2½, and 2s. on all sizes above this to 12 by 6. Unless some drastic alteration is at once made the millers will be forced into the position of having to destroy at least 60 per cent. of their building-timber, and only supply such timber as is required for finishing-work, which Oregon cannot be used for. This will, of course, mean reduced labour, reduced railway revenue, and reduced royalties for the Government to collect, while the 60 per cent. referred to must be left in the bush to rot or be burnt. You will please remember that the life of the timber trade in this district depends upon your decision, for the very ports that are most readily assailed by Oregon are our only markets, and this question also seriously affects 750 sawmill-men and others engaged in the milling industry on this Coast who have over two thousand dependants

It will be remembered by every gentleman in the Commission that the Government very promptly and properly came to the rescue of the implement-manufacturers when they were threatened with an invasion by the American manufacturers.

1. *Mr. Morris.*] You can enlighten the Commission, Mr. Wickes, about this combination?—I briefly gave them all the particulars in my statement, and I do not know what more I can say. I have informed the Commission regarding the time the association or company was brought into existence, together with its objects and purposes.

2. Your duties, of course, are shipping timber and distributing orders received by the association?—That is so.

3. You will be able to tell this Commission that as far as the association is concerned you are able to do business with anybody that offers to do business with you?—Yes, that is so.

4. Provided, of course, that the banker's report admits of your supplying them?—Yes, that is so. There are some we will not supply, as you know.

5. You state there, of course, what the association was formed for. Do you consider that the present association controls prices in any way?—No, I am afraid not. There is too much timber cut outside the association for them to really and absolutely control the prices. The timber company or asociation make a price, and others usually follow it. We could not control the price or put it up to any exorbitant figure.

6. The other sawmillers generally work under the Associated Millers' Association?—That is the general impression.

7. That is the only advantage they get by being outside the association?—That is so.

8. They are able to secure orders at a lower rate than the association will accept them at?—That is so. Some of them, at any rate, are getting less than the associated prices.

Mr. Morris: There is no doubt about that.
