

1919.
N E W Z E A L A N D.

DEPARTMENT OF LANDS AND SURVEY:
S U R V E Y S
(ANNUAL REPORT ON).

Presented to both Houses of the General Assembly by Command of His Excellency.

The SURVEYOR-GENERAL to the Hon. MINISTER OF LANDS.

SIR,—

Wellington, 14th July, 1919.

I have the honour to present herewith the report on survey operations for the year ended 31st March, 1919.

I have, &c.,

E. H. WILMOT, Surveyor-General.

The Hon. D. H. Guthrie, Minister of Lands.

R E P O R T .

THIS report deals with survey operations for the year in a general way only, leaving details to be found in the tables attached and in the reports supplied by the Chief Surveyors filed as departmental records.

Under the heading "Rural Surveys" in Table B, an area of 302,369 acres is shown as completed work, against 343,525 acres for last year. The decrease of 41,156 acres is due partly to the small field staff available, and partly to the fact that so many of the surveyors have been employed on the surveys of small estates for soldier settlement instead of on large blocks of Crown lands.

The area of Native lands surveyed during the year for the same reason shows a decrease from 271,481 acres to 241,927 acres. The cost of rural surveys remains the same as last year—1s. 6d. per acre—but Native surveys have gone up 1d., being this year 1s. 7d. per acre. The increase is in the cost of the work done by private surveyors, which amounted to 95 per cent. of the whole, and is no doubt accounted for by the difficulty of obtaining labour and the consequent high wages paid. A summary of the work executed during the year will be found in Table A.

TABLE A.

Class of Work.	Area.	Average Cost.	Total Cost.
Triangulation, by staff surveyors	Acres. 146,516	0·67d. per acre	£ s. d. 414 13 5
Topographical, by staff surveyors	345,845	0·92d. ,,,	1,327 2 11
Rural, by staff surveyors	289,063	1·50s. ,,,	21,714 12 8
Rural, by staff surveyors (costs unobtainable)	45
Rural, by licensed surveyors	10,486	2·15s. per acre	1,128 18 9
Rural, by licensed surveyors (costs unobtainable)	2,775
Village and suburban, by staff surveyors	944·87	15·00s. per acre	712 9 6
Village and suburban, by staff surveyors (costs unobtainable)	257
Village and suburban, by licensed surveyors	107	14·53s. per acre	77 15 0
Town, by staff surveyors	172·74 (in 92 sections)	37·77s. per section	173 15 5
Town, by licensed surveyors	38·20 (in 115 sections)	18·6s. ,,,	106 18 9
Native Land Court, by staff surveyors	13,119	18·35d. per acre	1,003 2 11
Native Land Court, by licensed surveyors	193,744	19·35d. ,,,	15,623 10 11
Native Land Court, by licensed surveyors (fees paid by applicants)	35,064
Mining, by licensed surveyors (fees paid by applicants)	992·5
Roads, by staff surveyors	Miles. 124·33	£22·46 per mile	2,793 10 9
Roads, by staff surveyors (costs unobtainable)	3·25
Roads, by licensed surveyors	3·78	£43·30 per mile	163 14 0
Roads, by licensed surveyors (costs unobtainable)	5·7

TABLE B.

Land District.	Rural Surveys.	Native Land Court Surveys.
Auckland	Acres. 73,081	Acres. 138,499
Hawke's Bay	23,099	49,496

Otago	85,484	..
Southland	7,509	1,522
Totals	302,369	241,927

MAJOR TRIANGULATION.

No field-work has been done, and further field data will be required before the computation-work can be proceeded with. In an appendix will be found an interesting report by the Chief Inspector of Surveys on the 8 in. micrometer theodolites used.

MINOR TRIANGULATION.

Although all work of this class except what is absolutely necessary for the proper location of and check on settlement-work has been stopped, 146,516 acres are shown under this heading, at a reasonable cost of under $\frac{3}{4}$ d. per acre. The only districts in which this class of work was undertaken were Auckland and Nelson.

TOPOGRAPHICAL.

Under this heading 345,845 acres, at a cost of 0·92d. per acre, are shown. This work is done as a preliminary to settlement surveys, and this year was undertaken in Auckland, Otago, and Nelson.

STANDARD SURVEYS.

Work on these very useful surveys has been continued by Messrs. C. A. Mountfort, W. T. Neill, and H. M. Kensington, in Napier, Dunedin, and Auckland respectively. In Napier and Dunedin very

little now remains to be done, but in Auckland, owing to the growth of the city, many miles of streets are still without standard blocks. The high standard of accuracy so necessary in this class of work has been well maintained by the experienced officers above mentioned. After completing the Napier work Mr. Mountfort took up rural standard surveys in the neighbourhood of Feilding, where the trig. stations had in many cases become useless for checking work on account of the views between them, and from them, to check-points having become blocked by plantations and buildings.

SETTLEMENT SURVEYS.

Of these, which comprise Crown lands, land for settlements, and land for discharged soldiers, the bulk appears under the heading of "Rural" in Table A, the acreage there shown being 302,369 acres, while the remainder includes village and suburban and town lands totalling 1,309 acres. In Table B the rural acreage has been allocated to the various land districts.

NATIVE SURVEYS.

During the year staff surveyors completed the survey of 13,119 acres, while 228,808 acres was surveyed by private surveyors. The area surveyed in each land district is given in Table B. The surveys under this head have mostly been subdivision surveys of blocks of which the periphery surveys had been already completed.

GOLD-MINING SURVEYS.

The area returned under this heading is very small, being only 992 acres. The surveys were made by private surveyors, the fees being paid by applicants. The cost per acre cannot therefore be given.

COAL-MINING SURVEYS.

No surveys of coal-mining areas were made.

INSPECTIONS.

There being only one Inspector, the work of inspection has been carried on by Chief Draughtsmen and staff surveyors. In consequence there has not been so much of this very necessary work done as I could have wished. As pointed out in previous reports, absence of inspection has a tendency to induce carelessness in some surveyors, the more so as it is difficult for them to get good field hands. Generally speaking, I am pleased to note that the result of the inspections made has been to show that satisfactory work is being done, though an amount of remissness and carelessness has been revealed sufficient to show that more inspection-work is urgently required.

PROPOSED OPERATIONS FOR 1919-20.

Triangulation.—Owing to the depletion of the field staff and the need for economy during the war the major triangulation was for the time being discontinued, but it is hoped that a start may again be made some time during the coming year. No minor triangulation save such as may be absolutely necessary for the connection and control of settlement surveys will be undertaken.

Standard Surveys.—These surveys will probably be principally carried out in Auckland, though an endeavour will be made to organize a staff for this work so that in the near future it may be undertaken in a more comprehensive manner. The approximate cost of this class of work is about £50 per mile, and part of this cost—in ordinary cases two-fifths—is borne by the local body. The great value of these surveys is recognized by the City Councils of Auckland and Dunedin (in which cities for years past standard-survey work has been in progress), and they are only too pleased to contribute on these terms. In addition to the standard survey of Auckland, which will be continued by Mr. Kensington, the rural standard-survey work will be continued by Mr. C. A. Mountfort. In future all standard surveys will be controlled direct from Head Office.

Topographical Surveys.—Under an arrangement with the Defence Department the work initiated by Colonel Gibbon, of publishing topographical contour maps of the Dominion, is to be carried on by this Department. Up to the present it has not been possible to do so, but I hope during the ensuing year to be able to get together a small staff and make a beginning. The maps will be very useful to the travelling public, especially to motorists, and should meet with a ready sale, by means of which a large portion of the cost of production will be covered.

Settlement Surveys.—At the close of the year there were in the hands of the staff and temporary surveyors 596,856 acres of settlement lands and 75,670 acres of Native lands, while in the hands of private surveyors there were 30,826 acres and 287,977 acres respectively. The allocation of this work among the several land districts is shown in Table 4. As is always the case, and more particularly so at the end of last year, for reasons already given, these figures include a large acreage of which the field-work has been completed, but of which the mapping will not be finished till July or August, during which months many of the surveyors will be called in from the field to the office. In addition to the allocated work, Chief Surveyors had in sight 13,180 acres of settlement land and 3,970 acres of Native lands to be allocated later on. The work now in hand, together with that as yet unallocated, and the survey of estates that from time to time will be acquired for soldiers' settlements and for ordinary settlements, and of Crown lands to be offered for settlement, will occupy most of the staff surveyors fully for the ensuing year. As the urgency of providing land for discharged soldiers increases, it will probably be necessary to supplement the efforts of the staff by placing contracts in the hands of private surveyors.

HEAD OFFICE DRAUGHTING STAFF.

The calls for work for other Departments during this year have been fully up to the usual volume, and in spite of a diminishing staff have been met, although with difficulty.

Probably the map-work of the Department for publication has never been at so low an ebb, both in quantity and quality, as at the present time. Reproduction of maps has had to be made without revision as a temporary expedient, and the slowness with which printing has proceeded has prevented many maps from being put in hand at all.

Originals for new four-mile maps for the South Island have been completed and await printing, and the City of Wellington map has been brought up to date.

Town plans have continued to come in, and the number has been maintained, and no doubt will now increase with the change from war conditions. A general reorganization and overhaul of the publications will be carried out as soon as the projected replacement of staff can be effected.

DRAUGHTSMEN'S EXAMINATION.

This examination was held on the 3rd September, 1918, when ten candidates sat, two of whom, Mr. Saunders and Mr. Elvy, obtained second-grade certificates, and Cadet Nightingale passed the elementary stage, while several others have but one subject to complete to obtain this grade. Draughtsmen generally hardly seem as yet to realize the importance of this examination to their future prospects, more especially the younger men, the older men usually being already otherwise qualified for passing the salary bar of £300 per annum.

SURVEYORS' BOARD.

Examinations were held in September, 1918, and March, 1919. At the former eleven candidates sat, two passing; and at the March examination four sat and two passed. The return of many pupils and cadets from military service will bring a considerable increase in the number of candidates for the next ensuing examinations, and certain concessions have been agreed upon by the Associated Boards for this class of candidates.

TIDAL SURVEY.

The work for the year comprised the predictions for the year 1920 at the ports of Auckland and Wellington, and the completion of an additional harmonic analysis to determine the tidal constants at Auckland. The computations were carried out, as in former years, by Messrs. Gillespie and Williams.

The mean sea-level at New Plymouth was determined from a year's record by an automatic tide-gauge, and was referred to permanent bench-marks.

An inspection of the tidal stations at Auckland, New Plymouth, Wellington, Lyttelton, Dunedin, Bluff, and Westport was made by the Chief Inspector, and levels were taken to connect each of the automatic tide-gauges to a permanent bench-mark.

The work connected with the preparation of the necessary data to enable a tide-table to be prepared for the year 1921 for the ports of Auckland, Wellington, Lyttelton, Dunedin, Bluff, and Westport was commenced, and will be continued during next year. Dr. C. E. Adams, who was previously in charge of this work, having been promoted to the position of Government Astronomer, the control of the tidal survey was entrusted to Mr. W. T. Neill, Chief Inspector of Surveys, whose report appears in an appendix hereto.

MAGNETIC OBSERVATORY.

The work of the Magnetic Observatory at Christchurch has been carried on by Mr. H. F. Skey, B.Sc. Continuous records of the magnetic elements for the year have been obtained from the self-recording instruments at the Observatory, and also at the substation at Amberley. The Milne seismograph No. 16 has been kept in operation. In addition to the routine work of the Observatory meteorological observations have been taken and supplied regularly to the Dominion Meteorologist and to the local newspapers.

In Appendix II is given the hourly values of the magnetic declination and horizontal force, the vector diagrams, and diagrams showing the magnetic curves for the year. In the report by the Chief Inspector of Surveys (Appendix I) will be found further details as to the work of the Observatory.

If it is desired that the work of this Observatory shall be brought up to a proper standard of usefulness it will be necessary to increase the staff, and in any case it is essential that an understudy to the Director (Mr. Skey) should be appointed.

GENERAL.

During the past year the staff, both field and office, suffered severely by reason of deaths, retirements, and enlistments. The roll of honour has had added to it the names of Surveyors H. F. Edgecumbe, H. E. Girdlestone, and P. C. Gannaway; Survey Cadets A. E. R. Bagnall and A. D. Bines; and Draughtsmen T. L. Folley and O. D. Pearce. There also passed away after a long and painful illness, borne with wonderful fortitude, Mr. F. A. Thompson, Chief Surveyor of Nelson; Mr. A. N. Harrop, Chief Draughtsman, Hokitika, died suddenly; Surveyor R. M. McIvor was a victim of the influenza epidemic; and Cadet W. E. Gourley met his death by accident. The retirements were Mr. H. A. Farquhar, who was for many years senior draughtsman in Head Office, and Mr. A. M. Roberts, one of our surveyors. The enlistments comprised two surveyors, one draughtsman, and two draughting cadets. One draughtsman was also dismissed. The Department has thus lost permanently thirteen officers, and temporarily five officers. On the other hand, I am pleased to be able to report that three surveyors, four field cadets, and four draughtsmen have

returned from the front, most of them towards the close of the year, several being still on departmental leave of absence. At the close of the year there are still absent with the Expeditionary Forces five surveyors, five field cadets, two surveyor's assistants, eighteen draughtsmen, and two draughting cadets—in all thirty-two. It is anticipated that these will all return during the next six months.

During the coming year there will be numerous retirements of officers who have reached the age-limit, and of superannuated officers who have been kept on during the war, and it will be necessary to provide for bringing the staff up to normal by appointing a considerable number of cadets, both field and draughting, and by the appointment to permanent positions of certain temporary officers who have proved themselves capable men. It will also be necessary to employ temporary men during the year. In all appointments it is desirable that where practicable preference shall be given to returned soldiers.

It has appeared to me for some time past that a reorganizing of our office staff is very desirable, and accordingly I submitted a scheme which would in my opinion secure greater economy and efficiency, and, while not depriving the field staff of their recognized right to have a chance of rising to the higher positions in the Department, would permit of draughtsmen also rising to positions of responsibility and consequent adequate remuneration. Though the scheme was approved by the Public Service Commissioner, it has not been deemed feasible that it should be brought into operation while the war conditions still prevail, but I hope that as soon as things become comparatively normal it will be given a trial.

In conclusion, I am pleased to place on record the appreciation by the various Chief Surveyors of the manner in which their officers, both permanent and temporary, have carried out their duties during the year, and I desire to convey my thanks to the whole of the Survey staff for their good work during a very trying period.

APPENDIX I.

EXTRACT FROM REPORT BY W. T. NEILL, CHIEF INSPECTOR OF SURVEYS.

TRIANGULATION.

THE field-work of the major triangulation of the Dominion is at present held in abeyance, and, as a systematic reduction of the observations and the computation of the work cannot be commenced by the office staff until further data are available, no progress has been made with this work except the examination of the horizontal circles of the two 8 in. micrometer theodolites by Troughton and Simms, which were used on this triangulation. This was effected by a harmonic analysis of the readings of the graduated limb by the two opposite microscopes at each 10° division, and has for its object the determination of (1) the eccentricity (E), (2) the point on the graduated circle of the line of no eccentricity (ϵ), (3) the angular distance between the opposite microscopes ($180^\circ \pm C$), (4) the mean uncertainty of any one residual.

If the centre of rotation of the vertical axis does not coincide with the centre of the graduated limb, the differences of the readings of the opposite microscopes at each division of the limb will range, by a regular periodic law, from a vanishing nothing to a maximum between the points on the limb indicated by the line of no eccentricity and 90° on each side of it.

The variable periodic quantity represented by the difference of the readings of opposite microscopes can be expressed by the formula

$$\mu = E \sin (Z + \epsilon)$$

and as the microscopes may not be exactly 180° apart a constant C added to the above formula gives

$$\begin{aligned} \mu &= E \sin (Z + \epsilon) + C \\ &= C + A \cos Z + B \sin Z \end{aligned}$$

if $A = E \sin \epsilon$, $B = E \cos \epsilon$, where Z is an angle found by dividing the circumference of the graduated limb by the number of observations, which is 36 in this case.

Four readings of the graduated limb at 90° apart will suffice to determine the three unknown quantities C , E , and ϵ in the above formula; but in order to determine the eccentricity with greater accuracy, and to eliminate errors in reading and accidental errors of graduation, the circle readings at each 10° division are used.

Each reading of a pair of opposite microscopes furnishes an equation of condition as above, and from these 18 equations the most probable value of the eccentricity is deduced by the method of least squares.

The results for theodolite No. 218 are— $E = 1.53''$; $\epsilon = 0^\circ 05'$; $C = -17''$. The angular distance between the microscopes is therefore $179^\circ 59' 43''$. The sum of the squares of the 36 residuals is found to be 530.28 . The mean uncertainty of each is therefore $\pm \sqrt{\frac{530.28}{35}} = \pm 3.89''$, and mean error of reading of one microscope $= \pm 3.89'' / \sqrt{2} = \pm 2.75''$.

For theodolite No. 219 the results are— $E = 3.53''$; $\epsilon = 103^\circ 12'$; $C = -23''$. The angular distance between the microscopes is therefore $179^\circ 59' 37''$. The sum of the squares of the residuals is found to be 166.84 . The mean uncertainty of each is therefore $\pm \sqrt{\frac{166.84}{35}} = \pm 2.18''$, and mean error of reading of one microscope $= \pm 2.18'' / \sqrt{2} = \pm 1.54''$.

TIDAL SURVEY.

During the first part of the year Messrs. Gillespie and Williams prepared the tide-tables for 1920 at the ports of Auckland and Wellington. The method of computing the predictions was that which was introduced by Dr. Adams, a brief description of which is given in the annual report for 1910-11, and a more detailed account in Appendix No. 7, Part II, U.S. Coast and Geodetic Report, 1894, under the title of a "Manual of Tides" (Chapter V, page 183), by Rollin A. Harris. The heights and times of high and low water were checked at intervals of a lunation by the formula given by Sir G. H. Darwin in the Admiralty Manual of Scientific Inquiry, page 89, and the diurnal inequality was examined to see that it followed the same rule as shown on the tide-gauge records. The diurnal inequality is a portion of the lunar tide which depends, at a given port, wholly upon the declination of the moon, the effect being a difference in height of the alternate tides when the declination of the moon is north or south of the Equator.

A simple explanation of this phenomenon is afforded by the equilibrium theory of the tides worked out by Newton. This theory is not entirely satisfactory, and in some respects it is inaccurate; nevertheless it furnishes a guide for the discussion of tidal observations, and its usefulness in explaining some of the peculiarities of the tides is generally recognized.

Referring to Fig. 1: E and M are the positions of the sun and new moon with respect to the Equator AB on 21st December, 1911. The shaded portion represents the form of the ocean due to the combined attractions of the disturbing bodies. At a port P in the Northern Hemisphere it is apparent that there is a difference in the height of the tide at P , and twelve hours later at P^1 , and that in both hemispheres the difference increases with the latitude, but at ports on the Equator the successive tides are equal. When the new moon is on the meridian of a given place the tide under the moon occurs in the daytime, whilst the tide opposite the moon is the night tide. This

gives, in the Southern Hemisphere, when the moon's declination is south, the day tide at H higher than the night tide at H¹.

Seven days later when the moon is on the Equator the day and night tides are equal in height (Fig. 2) at all ports. Again, in fourteen days from the new moon the position of the moon is at M₂ (Fig. 1), and it is now full moon, during this interval of time, since the moon transits about fifty minutes later each day, the morning tide at the beginning of a lunation becomes the night tide at the end of it.

Further, a consequence of the inclination of the plane of the Equator being greater than the inclination of the plane of the moon's orbit to the place of the ecliptic is, for the Southern Hemisphere, that new moon occurs in the summer months south of and during the winter months north of the Equator, as is obvious from Fig. 3, which shows the relative positions in June and December.

These considerations give a general rule for the diurnal inequality as follows: That in both hemispheres the day tides are highest in the summer, and the night tides in the winter.

The tides on the New Zealand coast follow the general rule, but there are places where the diurnal inequality sometimes becomes so large that there is only one tide in the twenty-four hours, and at Singapore, although this port lies close to the Equator, the diurnal inequality is very large.

For the future the computation of the predictions will not be continued by the computing division at this office. Arrangements have been made to have the curves for six ports—viz., Auckland, Wellington, Lyttelton, Dunedin, Bluff, and Westport—run off by the tide-predicting machine at the National Physical Laboratory, England. The computing staff at this office will perform the analyses for these ports annually to determine the tidal constants required for setting the machine.

The harmonic analyses involve an enormous amount of numerical calculation. By the introduction of the printed computation forms the work is performed in a systematic and mechanical manner, but as it is found that certain abridgments of the numerical work can be introduced without impairing the accuracy of the results a certain amount of saving will be made in future reductions.

The tidal station at New Plymouth was visited, and the mean sea-level has been derived from the records of the automatic tide-gauge for a period of one year.

Inspections of the tidal stations at Auckland, Wellington, Lyttelton, Dunedin, Bluff, and Westport were made, and the automatic tide-gauges connected by levelling to standard tide-poles and to permanent bench-marks at these ports. My thanks are due to the Harbour Board authorities at these places for assistance in this part of the work.

A comptometer computing-machine was installed in the computing division during the year.

MAGNETIC SURVEY.

It is now twenty years since the field-work of the Magnetic Survey was undertaken in the Dominion, and in order to detect the secular changes in the magnetic elements it is desirable that a number of the original stations, particularly those in the immediate vicinity of the seaports, should be reobserved.

The Magnetic Observatory at Hagley Park, Christchurch, and the substation at Amberley, were visited in connection with a general inspection last March.

The work of the observatory in connection with the running of the recording instruments has been continuous, and valuable records of the magnetic elements have been secured.

The measurement of the curves and the reduction of the results for publication has fallen into arrears, principally on account of the observatory being understaffed. Prior to the war full tables of the hourly values of the declination and horizontal force were published in the annual report of this Department, but since 1914 the only results published were the monthly means for 1915 and 1916 of these elements and the seismological records for 1915 in the *New Zealand Journal of Science and Technology*. The full records together with the other arrears mentioned will soon be ready, and will be published when the present positions with respect to shortage of paper is relieved.

The mean annual values of the magnetic elements as far as they are available at present are shown in the table below:—

Table of the Mean Values of the Magnetic Elements at Christchurch Observatory.

Date.	Declination E. of N.	Annual Change.	Horizontal Force.	Annual Change.	Vertical Force.	Annual Change.	Inclination South.	Annual Change.	Date.
1902	16 15·1	+ 3·2	C.G.S. Unit.	— 25	C.G.S. Unit.	— 9	67 40·8	+ 1·5	1902
1903	16 18·3	+ 3·5	0·22694	— 25	0·55277	+ 19	67 42·3	+ 1·8	1903
1904	16 21·8		0·22644		0·55286		67 44·1		1904
		+ 2·63		— 22	0·55307	+ 28		+ 1·78	
1910	16 37·6	+ 1·4	0·22511	— 27	0·55474	+ 23	67 54·8	+ 1·4	1910
1911	16 39·0	+ 2·5	0·22494	— 23	0·55497		67 56·2	+ 2·0	1911
1913	16 44·0	+ 0·8	0·22449	— 35	0·55478	+ 40	67 58·2		1913
1914	16 44·8	+ 2·2	0·22414	— 27					1914
1915	16 47·0	+ 2·8	0·22387	— 32		+ 2		+ 1·65	1915
1916	16 49·8	+ 3·2	0·22355	— 27					1916
1917	16 53·0	2·8	0·22328	— 23	0·55486	+ 34	68 04·8	+ 1·9	1917
1918	16 55·8		0·22305		0·55520		68 06·7		1918

The mean variation of the declination for the period 1902–18 is found to be increasing at the rate of 2·54' per annum.

APPENDIX No. II.

MAGNETIC OBSERVATORY, CHRISTCHURCH.

By H. F. SKEY, B.Sc.

DURING the year the Adie magnetographs at Christchurch and the Eschenhagen magnetographs at Amberley have been kept recording, and tables of the values at each hour of the year 1918 have been prepared from the resulting magnetograms for magnetic declination and magnetic horizontal force. Seasonal and yearly vector diagrams and mean monthly, seasonal, and year mean diurnal variations are shown in plotted curves. The increasing mean diurnal range is shown on the monthly diagram for the years 1917 and 1918.

The customary meteorological observations have been made daily, and published for public information. Milne seismograph No. 16 has been kept in good working-condition throughout the year, and the seismograms developed, but pressure of work has prevented the completion of the measurement of the records. The elimination of accidental errors in the vast amount of figuring involved in the compilation of the tables of hourly values has this time taken much longer than usual. The resulting mean values for 1918 are as follows:—

Magnetic declination	16° 55·7' E. of N.
Magnetic horizontal force	0·22304 c.g.s. unit.
Magnetic inclination	68° 06·7' S.
Northerly component	0·21338 c.g.s. unit.
Easterly component	0·06495 "
Vertical component	0·55516 "
Total magnetic force	0·59828 "
