1. EXTRACTS FROM THE FIFTY-SECOND ANNUAL REPORT OF THE MINISTER OF EDUCATION.

MANUAL INSTRUCTION.

Staffing.—On the 30th June, 1928, there was in the employ of the various Education Boards a total of 120 full-time specialist teachers engaged in giving instruction to senior pupils in woodwork, metalwork, and domestic subjects, besides twenty-three specialist instructors in elementary agriculture. These teachers were classified as under. Class VII is the highest, and in Division I are placed those teachers whose classification is based on academic or professional qualifications equivalent to at least a University diploma involving three years' preparation of University standard.

Full-time Classified Teachers in Manual-training Classes as at 30th June, 1928.

Olympia.	Div	Division I.		Division II.		
Class.	Men.	Women.	Men.	Women.	Totals.

V	8		17	8	3 3	
IV	4	1	15	9	29	
III	1	4	10	7	22	
II	\ldots 2	4	10	4	20	
I	1	14	9	4	28	
Totals, 1928	17	23	65	38	143	
Totals, 1927	16	20	65	40	141	

In this table are included nine teachers (four men and five women) on staffs of junior high schools and one supervisor of needlework in primary classes.

The average rates of salary on the 30th June, 1928, were as follows: Men, £360; woman, £224; both, £302.

The following are some particulars of the number of schools and the number of pupils receiving instruction in manual training during 1928:—

Elementary agriculture: Number of public primary schools, 1,939; number of pupils, 45,313.

Elementary science: Number of public primary schools, 40; number of pupils, 3,309.

Woodwork: Total number of pupils attending special centres was 21,643, of which 17,015 attended from public primary schools and 1,453 from private schools, the remainder attending from junior high schools, secondary schools, or secondary departments of district high schools.

Metalwork: Total number of pupils attending special centres was 1,173, of which 82 attended from public primary schools and 31 from private schools, the remainder attending from junior high schools, secondary schools, or secondary departments of district high schools.

Domestic subjects: Total number of pupils attending special centres was 21,449, of which 15,860 attended from public primary schools and 2,008 from private schools, the remainder attending from junior high schools, secondary schools, or secondary departments of district high schools.

Financial.—The total amount due by the Department to the Education Boards for the salaries and incidental expenses for the year 1928 was approximately £69,874, made up as follows:—

Salaries—						£	£
Full-time assistants						42,984	
Full-time student to	eachers		•. •			164	
$Overtime \dots$						74	
Capitation for pa	rt-time	teachers	(including	comi	mercial		
instructors in d						1,283	
		Ü	,				44,505
Incidental allowances							10,189
Capitation grants							15,180
Total	•						£69,874

In addition, the Department provided handwork materials for use in 1928 costing some £9,065, and also refunded to Education Boards the actual receiving and distributing charges, amounting approximately to £1,346, involving a total expenditure of £10,411.

The above figures exclude salaries and incidental allowances payable in respect of manual-training classes conducted by Technical School Boards.

TECHNICAL EDUCATION.

GENERAL.

Number of Schools.—The number of technical high schools open during 1928 was fourteen, in addition to which there were seven organized technical or art schools offering full-day courses. From the 1st January, 1927, the New Plymouth Technical Day School was amalgamated with the New Plymouth High Schools, and the statistics as far as the full-time pupils are concerned are included in the secondary schools report.

Technical classes were conducted at twenty of the twenty-one centres referred to above, and also at eighteen other centres, the total number of centres being thirty-nine.

Attendance.—The following table shows the numbers in attendance at technical schools and classes in 1928:—

	Free.	Other.	Total.
Total number of pupils on the roll of technical high and technical day schools at 30th June, 1928 Total number of students in attendance at other technical classes (i.e., part-time and evening classes) during 1928	6,992 5,286	222 5,677	7,214 10,963
Grand total	12,278	5,899	18,177

In the technical high schools and technical day schools the total enrolments increased from 7,193 in 1927 to 7,817 in 1928, an increase of nearly 9 per cent.

In the evening and part-time day classes the apparent reduction in numbers as compared with the previous year is probably due mainly to the fact that the numbers for 1928 are those on the rolls of the schools at the 30th June, whereas in previous years the total enrolments for the whole year were included.

Staffing.—On the 30th June, 1928, there were 305 full-time assistant teachers on the staffs of technical schools, besides a large number of part-time teachers. There were also twenty-one full-time student teachers, ten being males and eleven females. The following table shows the classification of the 305 full-time assistant teachers, Class VII being the highest:—

	CI.	CI.		Divi	sion I.	Divis		
	Class	3.		Men.	Women.	Men.	Women.	Totals
VII	• •			• •	1		4	5
VI	• •			7	7	6	7	27
V				22	6	15	23	66
IV				27	8	10	17	62
III	• •	• •		27	13	20	2	62
II ·				17	7	9	10	43
Ι	• •	• •	• •	19	15	4	$\frac{1}{2}$	40
Tot	als, 1928			119	57	64	65	305
Tot	tals, 1927	• •		111	53	66	65	295

It will be seen from the above table that the main increase has been in the number of Division I teachers (graduates).

The average rates of salary on the 30th June, 1928, were as follows: Principals (male), £649 (excluding house allowance). Assistants—Men, £401; women, £261; both, £345. All teachers (principals and assistants)—Men, £427; women, £261; both, £365.

With the inclusion of manual-training teachers employed by Education Boards the average rates of salary for all teachers (including Principals of technical schools) graded under the Regulations for Manual and Technical Instruction were as follows: Men, £408; women, £249; both, £346.

EVENING TECHNICAL CLASSES AND PART-TIME DAY CLASSES.

Classes were held at thirty-eight centres, as compared with forty-one in the previous year. The number of individual students was as follows:—

In classes conducted by Technical School Boards		 	8,787
In classes conducted by Secondary Education Boards		 	193
In classes conducted by Education Boards		 	450
In classes conducted by High School Boards			,
In classes conducted by University College Boards	• •	 	399
Total			10.069
$egin{array}{cccccccccccccccccccccccccccccccccccc$	• •	 • •	10,900

Note.—Oamaru transferred from a Technical School Board to a High School Board.

Of these students 5,286 held Government free places, classified as follows:—

			Males.	Females.	Totals.

TECHNICAL HIGH SCHOOLS, TECHNICAL DAY SCHOOLS, AND FULL-TIME DAY CLASSES.

At the 30th June, 1928, the numbers of pupils taking the various courses provided were as follows:—

Cours			T)		TI 4 S	Percentag	e of Totals.
Cours	se.		Boys.	Girls.	Totals.	Boys.	Girls.
Industrial			2,034		2,034	51.8	
Agricultural			359	• •	359	9.1	
Domestic				1,019	1,019	i i ••	31.0
Commercial		i	759	1,778	2,537	19.3	54.1

				198,823
• •	• •			9,910
				£188,913
	nd stude	nd student teache	nd student teachers	1,900 9,542 nd student teachers 22,507

The above figures include salaries and incidental allowances payable in respect of manual-training classes conducted by Technical School Boards.

2. ABRIDGED REPORT OF THE SUPERINTENDENT OF TECHNICAL INSTRUCTION AND THE INSPECTORS OF TECHNICAL SCHOOLS AND MANUAL-TRAINING CLASSES.

SIR,-

Education Department, Wellington, 8th August, 1929.

We have the honour to submit, in accordance with the regulations, the following report on manual and technical instruction for the year 1928. We have, &c.,
W. S. La Trobe.

F. C. RENYARD.

W. S. Austin.

The Director of Education, Wellington.

I. TECHNICAL INSTRUCTION.

ATTENDANCE.

The total number of students in part-time day and in evening classes was 10,963, of whom 5,286 held junior or senior free places and 5,677 paid fees. Of the total number, 1,172 had been attending day schools for primary instruction in the previous year. From Table J 8 appended to this report it will be seen that 6,207 students, being nearly 55 per cent. of the total, were seventeen years of age or over, while 1,249, or 11.5 per cent., were under fifteen years of age. Of this 11.5 per cent., however, a considerable number—probably at least one-third—were part-time day pupils included among the 947 persons of "no occupation" as given in Table J 7 appended to this report. It is probable, therefore, that less than 8 per cent. of the evening-class pupils were under fifteen years of age. Of this 8 per cent., those under fourteen years of age all held, under the regulations, a certificate of proficiency and were free-place holders.

It is noteworthy that the proportion of girls to boys in the evening classes is only about 4 to 7. This ratio has been decreasing in recent years. This increasing disparity is due mainly to the small and diminishing attendance of girls at technical classes in cookery, dressmaking, millinery, &c. apparent reduction in numbers as compared with the previous year is probably due mainly to the fact that the numbers for 1928 are those on the roll of the schools at the 30th June, whereas in previous years the total enrolments for the year were included.

Tables A and B below give some indication of the way in which the attendance at technical schools has changed in recent years. Columns 1, 2, 3, 4, and 5 of Table A give the numbers according to ages enrolled in technical classes, apart from pupils in technical high schools (and, since 1926, in technical day schools) since the year 1917. Up to 1921 numbers of children attending from primary schools, public and private, for manual training were included, and swell the numbers in columns 1 and 2 for the earlier years. They are now counted in other returns as pupils taking manual training. There has, however, undoubtedly been a real diminution in recent years of the numbers of young children attending The regulations have for many years permitted the attendance of children under fourteen years of age at evening technical classes only if they held certificates of proficiency. The reduction in numbers of young children is not, therefore, due to changes in regulations. It is probably due to the children continuing at day schools—secondary or technical—in preference to going to work and attending evening schools. Columns 6 and 7 of Table A below indicate clearly the trend in this direction, the first-year junior free pupils in technical high schools being practically all the leavers from primary schools of the year before, who continued their day training at technical high schools in the following year.

The totals of columns 6 and 7, as shown in column 8, have increased by about 25 per cent. in the last ten years, but the numbers transferring straight from the primary school to the evening or parttime day classes have diminished by some 40 per cent., while those transferring to full-time technical high schools or technical day classes have increased in numbers by nearly 200 per cent.

Column 5 of Table A shows that whereas in 1917 the females outnumbered the males—due partly to war conditions, and partly to the inclusion of students attending classes in subjects of drawing and handwork for teachers' examinations, in which the women greatly outnumbered the men—in 1928 the number of male students was nearly twice as great as that of female students. This great change is, however, largely due to the fact that girls now receive in day schools the training in domestic and commercial subjects for which they went formerly to evening classes at the technical schools.

In this connection the totals of columns 6 and 7 in Table A below show that, whereas among transfers from the primary schools in 1917 to technical classes of all kinds the number of girls was 70 per cent. of the number of boys, in 1928 the ratio was 79 per cent., the average for the whole period being approximately 76 per cent. Leaving out technical-high-school pupils, the average for the period 1917-28 (inclusive) is 68.5 per cent. For technical-high-school pupils alone it is 82 per cent. The ratio of girl entrants to boy entrants, however, is considerably lower in technical schools than in secondary schools, where it reaches 91 per cent.

Table A.—Number of Students, according to Ages, admitted to Classes at Technical Schools other than Technical High-school Classes; also Primary School "Leavers" joining Technical High Schools in the Next Year.

^{*} Epidemic year.

Note.—The 1928 figures show roll at the 30th June, 1928; not total enrolments as for previous years.

Table B gives figures bearing on the same question. It will be seen that the attendance of students from clerical, commercial, and other occupations largely followed by women has fluctuated about practically the same mean for the last sixteen years, while that of students from professions—more than 75 per cent. being teachers—has diminished largely, the teachers' classes being excluded from the list since 1921, and students in diploma courses at the University colleges since 1925.

On the other hand, there has been a tendency for the entries of students from the engineering and building trades to increase, especially in the last four or five years, partly due to increased activity in these trades, but largely also to the operation of Apprenticeship Committees under the Apprentices Act. 1923.

The changes which have taken place in the work of the technical schools have thus been in the direction of making the training of boys for industrial occupations much more prominent, with a corresponding reduction in the attention given to general and continuation work, and to classes for amateurs.

Note.—The 1928 figures show roll at the 30th June, 1928; not total enrolments, as for previous years.

There are no special changes to report in connection with the staffing of technical classes, the quality and character of the instruction, and the provision of buildings, furniture, and equipment. The remarks in our report last year on these matters apply equally to the year now under review.

[†] Technical day schools counted with technical high schools.

II. TECHNICAL HIGH SCHOOLS AND TECHNICAL DAY SCHOOLS.

ATTENDANCE.

The enrolment at technical high schools and technical day schools of full-time pupils taking courses under the Regulations for Manual and Technical Instruction was 7,214 at the 30th June, 1928, as compared with 6,720 at the corresponding date in the previous year. The enrolment of 7,214 included 3,930 boys and 3,284 girls.

Of the boys 2,034 took industrial courses, 359 agriculture, 759 commercial work, 676 a general course, and 102 an art course, all numbers being higher than for the previous year. Of the girls, 1,019 took the domestic course, 1,778 the commercial, 238 the general, and 249 the art course—higher numbers than for the previous year in the domestic and art courses, but slightly lower in the commercial and general courses.

STAFFING.

The full-time staff of the technical schools, including technical day schools and technical high schools, increased from 295 for 1927 to 305 for 1928, and the proportion of teachers with qualifications at least equivalent to the diploma of a University college increased from 55.6 per cent. to 57.8 per cent., the average salary being also slightly greater than in 1927. In 1920 the proportion of teachers with the higher qualifications was 41.6 per cent., so that a very marked improvement has taken place in the last eight years in the academic and professional qualifications of the teachers.

BUILDINGS AND EQUIPMENT.

Buildings and equipment have been maintained in good order and condition during the year, and some necessary additions have been made. The question as to how to provide for the large numbers enrolling in the four main centres must soon become very urgent, and the establishment of subsidiary schools in these centres has been discussed, but cannot be finally determined until the general policy in regard to post-primary education has been settled.

CHARACTER AND QUALITY OF THE INSTRUCTION.

In the main the teaching in the technical high schools and technical day schools is effective for its purpose, which is to provide the pupil with an all-round preparation for entering on some specific occupation. The tendency noted in our report last year for teachers to rely too much on tradition and too little on active investigation by the pupils themselves is not peculiar to technical high schools, but is peculiarly dangerous to the type of education which they should provide—a type that should have a particularly direct and intimate connection with and bearing on the life and industries of the people.

When inspecting the work of the teachers we too often find that men and women with good practical experience and a wide knowledge of industrial conditions are content, when they become teachers, gradually to lose contact with industry and to immerse themselves more and more in a formal and academic treatment of subjects in which in their earlier days they have shown a vital interest and a fecund knowledge, both intensely stimulating to the young student, and infinitely more effective educationally than mere pedagogical skill applied in the inculcation of ideas put forward by the teacher with the contemptuous ease of practised familiarity, and often, therefore, regarded by the pupils simply as pawns in a useless game.

The following tables give some particulars of certain courses in technical high schools, the periods quoted being those actually given in certain schools, it being impossible to show what, on the average, is the time devoted to each subject in each course.

The courses shown in Table C for schools A and B are those provided in large technical schools in the main centres for pupils who, though interested in engineering or industrial subjects, wish to matriculate in order to go on to the University to take higher courses leading to their chosen profession.

The course shown in Table C for school C is a general course as given for pupils in a technical high school in a country district where there is no other post-primary school. It necessarily approximates more closely to the general or professional course of the ordinary secondary school, all the boys, however, studying agriculture in all the years, and all the girls home science.

In Table D details are given of courses in several types of technical schools for boys preparing for apprenticeship in the various engineering trades. Schools A and B are large city schools, C and E schools in centres of intermediate size, and D is a school in a small country town. The courses are therefore thoroughly representative of the work done in technical high schools, and it will be seen that satisfactory provision is made for the general subjects—English, history and civics, mathematics, science, and drawing—while, in addition, a treatment is included of special subjects occupying about one-third of the time, and in all cases including applications of science and drawing to simple problems in the theory and practice of the mechanical trades.

In Table E similar details are given in regard to technical-high-school courses for boys intending to become builders or building tradesmen. Schools A, B, D are large city schools, while C is a school in a thriving country town.

In Table F agricultural courses are shown for four schools, A being a rural technical high school specializing in agriculture, though offering also a general course for boys and girls, a commercial course, and a domestic course for girls. In this school the prescriptions followed in the several branches of agricultural instruction are highly specialized, very practical, and well illustrated by work on the school farm, which is sufficiently large to enable practical work in animal husbandry to be done and observed, as well as the ordinary operations of cropping and agriculture. There is no set time for work on the farm, except for such routine operations as are carried on by the boys outside ordinary school hours. A large part of the class-work in animal husbandry and agriculture is conducted in the field, but the boys do not, in general, spend short periods of school-time in actual farm operations. One or two boys at a time may have a day off school to work on the farm, with the instructor or with the farm-manager. By adopting suitable class-room methods this can be done without interfering with the progress of the pupils in their classes. The work of the laboratory and class-room is in this way very closely interwoven with the field-work.

In school B, also in a country district, all the boys take some agricultural science, but some take more practical work in the first two years, though after the second year the course is directed towards satisfying the requirements of the Matriculation Examination, as indicated in Table C for school C.

In school C, Table F, which is a large city school, excellent laboratories and workshops are available, but the school lacks facilities for practical agriculture and field-work. The course is, however, attended largely by boys living on small farms in the suburban areas.

School D, in a country town in the centre of a dairying district, offers a two-years course, which is taken mainly by boys coming in from the surrounding dairy-farms. The school has no farm, and is unable, therefore, to deal adequately with subjects easily provided for in school A of Table F. The course, however, is very practical, and is becoming very popular with the sons of dairy-farmers. What the school sets out to do in this course is to give the boys some instruction in dairy science and in farm book-keeping, and some training in woodwork and metalwork. It differs from school C mainly in that it does not give any instruction in agriculture.

For boys living on farms, and able, therefore, to correlate their school-work with their farming experience the courses in schools B, C, and D possess considerable value, and are certainly preferable for many of these boys to a more general type of education. For the town boy who wishes to become a farmer the most suitable course is that offered by school A, which provides in its hostel and on its farm a thorough going farm atmosphere, and in its specialized courses very practical instruction, demonstrated on the farm itself, in the application of science to agriculture and husbandry.

E.—5.

III. MANUAL TRAINING.

13

ATTENDANCE.

The number of pupils receiving instruction in woodwork, metalwork, and domestic subjects at special manual-training centres rose from 39,098 in 1927 to 44,265 in 1928. Of this total, 7,816 came from junior and senior high schools and district high schools, and 3,492 from private schools. In advanced nature-study and elementary agriculture, involving practical work in experimental plots, 45,313 pupils in the upper division (Standards IV to VII) of 1,939 schools received instruction under the supervision of itinerant instructors, who visited the schools in general at least once in each term. These instructors also supervise the science teaching in the upper division of forty schools, generally situated in the cities, where provision cannot be made for instruction in elementary agriculture; in such schools some 3,300 pupils took the general elementary science course. It is noteworthy that approximately half the total number of these schools are situated in the Wellington District.

STAFFING.

At the close of the year there were in the service of the several Education Boards 143 classified instructors in manual-training subjects, including twenty-three instructors supervising the teaching of advanced nature-study and elementary agriculture. Twenty per cent. of the men and 38 per cent. of the women specialists possessed University degrees or equivalent qualifications entitling them to be classified as Division I teachers.

At thirteen technical schools teachers of woodwork, metalwork, and domestic subjects devoted part of their time to the instruction of classes from neighbouring primary and secondary schools. The headmaster of an isolated district high school took the instruction of his own woodwork classes. Where no more suitable method is possible, resort is had to local part-time teachers, and of these four men and twenty-seven women were employed during the year, the latter number including instructors in needlework at country schools where there is no woman teacher on the staff.

There is usually little difficulty in filling vacancies in the ranks of woodwork instructors. The system whereby in two of the larger cities qualified assistants are trained under experienced teachers continues to work well, and in most cases these men receive first consideration in the making of appointments, but it is found that many men in the trade are desirous of taking up teaching service, and the range of choice is generally extensive. Suitable men for positions as teachers of metalwork are much more difficult to obtain. Losses through marriage and from other causes are frequent on the domestic-subjects side; early in the year university-trained applicants for positions are usually sufficiently numerous, but later on it is found that the supply of the best-qualified teachers is not fully sufficient for the demand. Two women student teachers were in training at manual centres during the year. The student-teacher system is not favoured by the Department unless there is some definite intention on the part of the entrants to pass on to a period of training in the trade or at the University before taking up positions as teachers.

For the Handicraft Teachers' Examination an increasing number of candidates, particularly from the ranks of the present instructors in woodwork and metalwork, are presenting themselves. At the August examination seven candidates secured a pass or a partial pass in two of the three sections, two passed in the first section, and one completed the examination and was awarded the certificate. One of the candidates was specially mentioned for his work in chemistry.

BUILDINGS AND EQUIPMENT.

The only additional manual-training centre established during the year was that at Opunake; but new woodwork and cookery rooms were completed and brought into use at Foxton centre, and a woodwork-room at Mount Cook (Wellington) centre. Grants were authorized for new buildings and improvements in various quarters, and in some instances the necessary work was commenced. Thus provision was made for new centres at Ruawai, Newton East (Auckland City), Piopio, Featherston, Winton, and Wyndham; new buildings at Tauranga; the transfer of the practical rooms at Rotorua to the grounds of the junior high school; the leasing and equipment of woodwork and cookery rooms at Cromwell and Roxburgh; the erection of cookery-rooms at Martinborough and Southbridge, and of an additional woodwork-room at New Plymouth Boys' High School; and additions and improvements to the Normal (Christchurch), Fairlie, and Gore centres. The new block at the Marlborough Junior High School, including practical rooms for woodwork, metalwork, and cookery, was carried so near to completion as to be ready for use at the opening of the following year. Generally speaking, the workrooms and equipment at manual-training centres have been kept in good repair. In some districts the Education Boards have made desirable improvements, particularly in the kitchens, where floorcovering has been laid, and new cooking-appliances and general utensils installed in addition to or in replacement of existing equipment. The regulation grants to cover incidental working-charges are sufficiently liberal to enable improvements of this nature to be made, and there can be no excuse for disrepair of any kind in either buildings or equipment. As far as the teachers are concerned, it is the exception to find any who do not give regular attention to that part of the equipment for the care of which they are directly responsible. In some instances the janitors scrub the cookery-room floors neither sufficiently often nor sufficiently well.

Increasing use is being made of the woodwork, metalwork, and cookery rooms of technical schools where such can be spared for the accommodation of manual classes for which no room can be found at the ordinary centres. In this way provision is made not only for the overflow from the State primary schools, but also for classes from large private schools, and even for classes from secondary schools.

CHARACTER AND QUALITY OF INSTRUCTION.

Under the present system of central manual-training centres the special teachers of woodwork, metalwork, and domestic subjects are for the most part isolated, and they are therefore at some disadvantage with respect to a proper correlation with the general work of the schools from which their classes are drawn. In view of such a disadvantage it is surprising to find how few are the exceptions to a very high standard of keenness in work and faithfulness to duty. Practical education of the kind undertaken at the centres has a very strong natural appeal for the pupils, and it is largely due to the high enthusiasm displayed by the children that the teachers maintain a corresponding interest in work which might otherwise become distasteful because of its monotony. Moreover, there is some indication that the teachers are gaining a wider conception of the value of their subjects with respect to the influence of the training upon the general education of the child; unfortunately, however, the conditions, particularly the factor of separation, are not favourable to a full development in this direction, but it is hoped that the definite directions laid down in the Department's new syllabus with regard to cooperation along certain lines will serve to bring the specialist instructor into closer touch with the general staff. In the past the conduct of the work at the centre has been too formal in its nature, and too limited in its scope, with a tendency to follow trade procedure rather than to consider the special educational possibilities. When the ideal arrangement is realized, and every school of any considerable size has its own practical room, and perhaps its "literary morning and manual afternoon," the specialist teacher, as a member of the staff, will be much better placed. In our junior high schools the conditions have moved towards the ideal, for there the specialist is one of the staff, a fair allowance of time is given to the practical side, and suitable articulation is arranged for. The attention given to manual training in high schools continues to increase, but it is found that the necessity for allocating sufficiently long periods to practical work has not always been fully understood; in general, the pupils should be given at least two hours for any one practical lesson, and if manual work is to be considered of any importance at all it should at least be worth the slight inconvenience caused by some little dislocation of the time-table.

HANDWORK AND MANUAL TRAINING IN THE SCHOOLS.

The practical work in elementary agriculture, dairy science, and general science taken by the higher classes of primary and district high schools is for general purposes designated manual training. It is conducted under the supervision of itinerant agricultural instructors in the employ of the Education Boards. In 1928, as in the previous year, there were twenty-three instructors, distributed throughout the education districts as follows: Auckland, 4; Taranaki, 3; Wanganui, 3; Hawke's Bay, 2; Wellington, 3; Nelson, 1; Canterbury, 3; Otago, 3; Southland, 1. The supervising instructors give particular attention to the secondary departments of district high schools, and in a more general way direct the work on their side in the higher classes of the primary schools. In some districts they are required also to assist the teachers of lower classes with respect to nature-study generally. Their advice is eagerly sought by teachers and School Committees in laying out or making improvements in the school-grounds. Under the guidance of some of the instructors forestry on a comparatively large scale is becoming an important feature in connection with the work of their schools; and the majority take a large share in organizing and directing such out-of-school activities as those connected with homegarden and calf-rearing competitions, and boys' and girls' agricultural-club work.

For the purposes of handwork-training taken by classes which do not attend manual-training centres the Department continues to supply material to the Boards for distribution to the schools. The total cost for the year, including all incidental charges, was approximately £10,400. Included in this amount is the cost of a special supply for use in preparatory classes, where handwork now takes a predominant place as an instrument of general education. Experimental investigations are being made with a view to ascertaining to what extent light woodwork might be taken with advantage as a desk occupation in small country schools that are not within reach of manual-training centres. The proposal is to issue a small set of tools and workboards to selected teachers considered capable of handling this branch of handwork with sufficient skill to make it a valuable addition to the teaching-aids employed in developing both manual ability and intellectual acuity, but no definite steps will be taken until the investigations now in progress have been completed.

In the special classes established for the better handling of retardate children manual activity is the main foundation upon which such education as is possible is based. For the use of these classes various kinds of equipment have been provided, and year by year supplies of suitable material are sent out. Such of the older pupils as are considered capable of attempting advanced work attend manual-training centres, if these should be within convenient reach.
