GOVERNMENT MONETARY COMMITTEE.

STATEMENT SUBMITTED BY THE TREASURY ON BANKING AND CURRENCY IN NEW ZEALAND.

Pre-war System.

The framers of our banking legislation, the essential portions of which are contained for the most part in the private Acts governing the several banking institutions, evidently intended that the complete gold standard should operate in this country. Trading conditions, however, led in fact to the adoption of a sterling exchange system. Thus the regulative provisions of the several Acts, which are practically uniform on essential points, were and are still practically inoperative.

It might perhaps be mentioned here that we had a gold currency before the war, but then a gold currency is not the only or even an essential element of the gold standard. Great Britain, prior to the suspension in 1931 was operating on a full and free gold standard without a gold currency for internal circulation. The essential elements in the gold standard are—

(*a*) That the whole monetary resources of the country, both cash and credit, shall be regulated by the quantity of gold held within the country for monetary purposes:

(*b*) That gold shall ebb and flow freely into and out of the country in maintaining the foreign exchanges within the "gold points."

That is to say, the total amount of monetary media and therefore the price-level must be directly affected by the flow of gold into or out of the banking gold reserves of the country. Such a monetary system can operate successfully only in a country where the banking system is practically self-contained, and credit expansion is governed by bank advances. As will be demonstrated, these conditions do not apply in the case of New Zealand, and, judged on the essential points mentioned, this country was never on the gold standard.

The principal pre-war regulative provisions, contained in the several private Acts governing the different banks operating in New Zealand, provide in effect—

(*a*) That the notes in circulation shall not exceed the total of the coin bullion and public securities held in New Zealand, or more than three times the coin held in New Zealand:

(*b*) That the debts, engagements, and liabilities shall not exceed three times the coin, bullion, and public securities held in New Zealand:

From a regulative point of view, the first provision says, in effect, that the note-issue shall not exceed three times the metal reserves. The reference to Government securities is presumably to ensure ultimate redemption of the fiduciary part of the issue in the case of a bank failure.

The second provision is evidently intended to limit the credit structure that might be created by the banks. In Great Britain, of course, the ratio of cash to liabilities is governed not by legislation, but by the traditional policy of the banks. In New Zealand, however, it was apparently intended to provide by law that credit expansion through advances should not exceed three times the amount of coin, bullion, and public securities held by the banks. Thus a high ratio of cash to liabilities was to be maintained. The words "intended to provide by law" are used because the wording of the section in question is practically unintelligible in the light of present-day banking practice in this Dominion.

Apart from the legislative provisions, however, the banks no doubt have their own rules concerning the ratio of cash to liabilities, but even so, the other provision limiting the note-issue to three times the amount of coin held has not in fact been the controlling factor of the volume of credit and the price-level. For the June quarter of 1914, for instance, the note-issue amounted to £1,700,000, whereas coin held amounted to £5,280,000. In this instance, the note-issue could legally have been increased to nearly £16,000,000, provided the required amount of Government securities had been purchased. This possible maximum issue would not have been advisable in practice, as gold was in circulation at that time, and could be demanded from the banks. Still, the fact that the maximum note-issue amounted to over half the deposits (at that time about £29,000,000) is a clear indication that further credit expansion was not prevented by lack of cash resources. Further, a study of the published banking figures over a period of years will show that deposits and advances have varied without any apparent relationship to notes in circulation or cash resources, and, in fact, in a manner that would be quite inexplicable in a self-contained banking system.

The explanation, of course, is that our banking system is not self-contained, in that the banks normally hold a large amount of funds in London. In fact, these London balances are the real regulative factor and the key to our whole banking system. This system has evolved out of our economic conditions, and, in general, has functioned smoothly without effective legislative regulation.

In New Zealand there is no bullion market, no bill market, or short-loan market, and generally no money-market in the full sense of the term. The all-important work of our banks is financing our external trade, which per head is one of the highest in the world. Furthermore, a very large part of our trade is with Great Britain wherein is situated the premier international money-market of the world. Under these circumstances, supported by the ties of empire and the fact that this

country has been borrowing steadily in Great Britain practically ever since these Islands were brought under the British flag, the dominating portion of our banking business has centred in London.

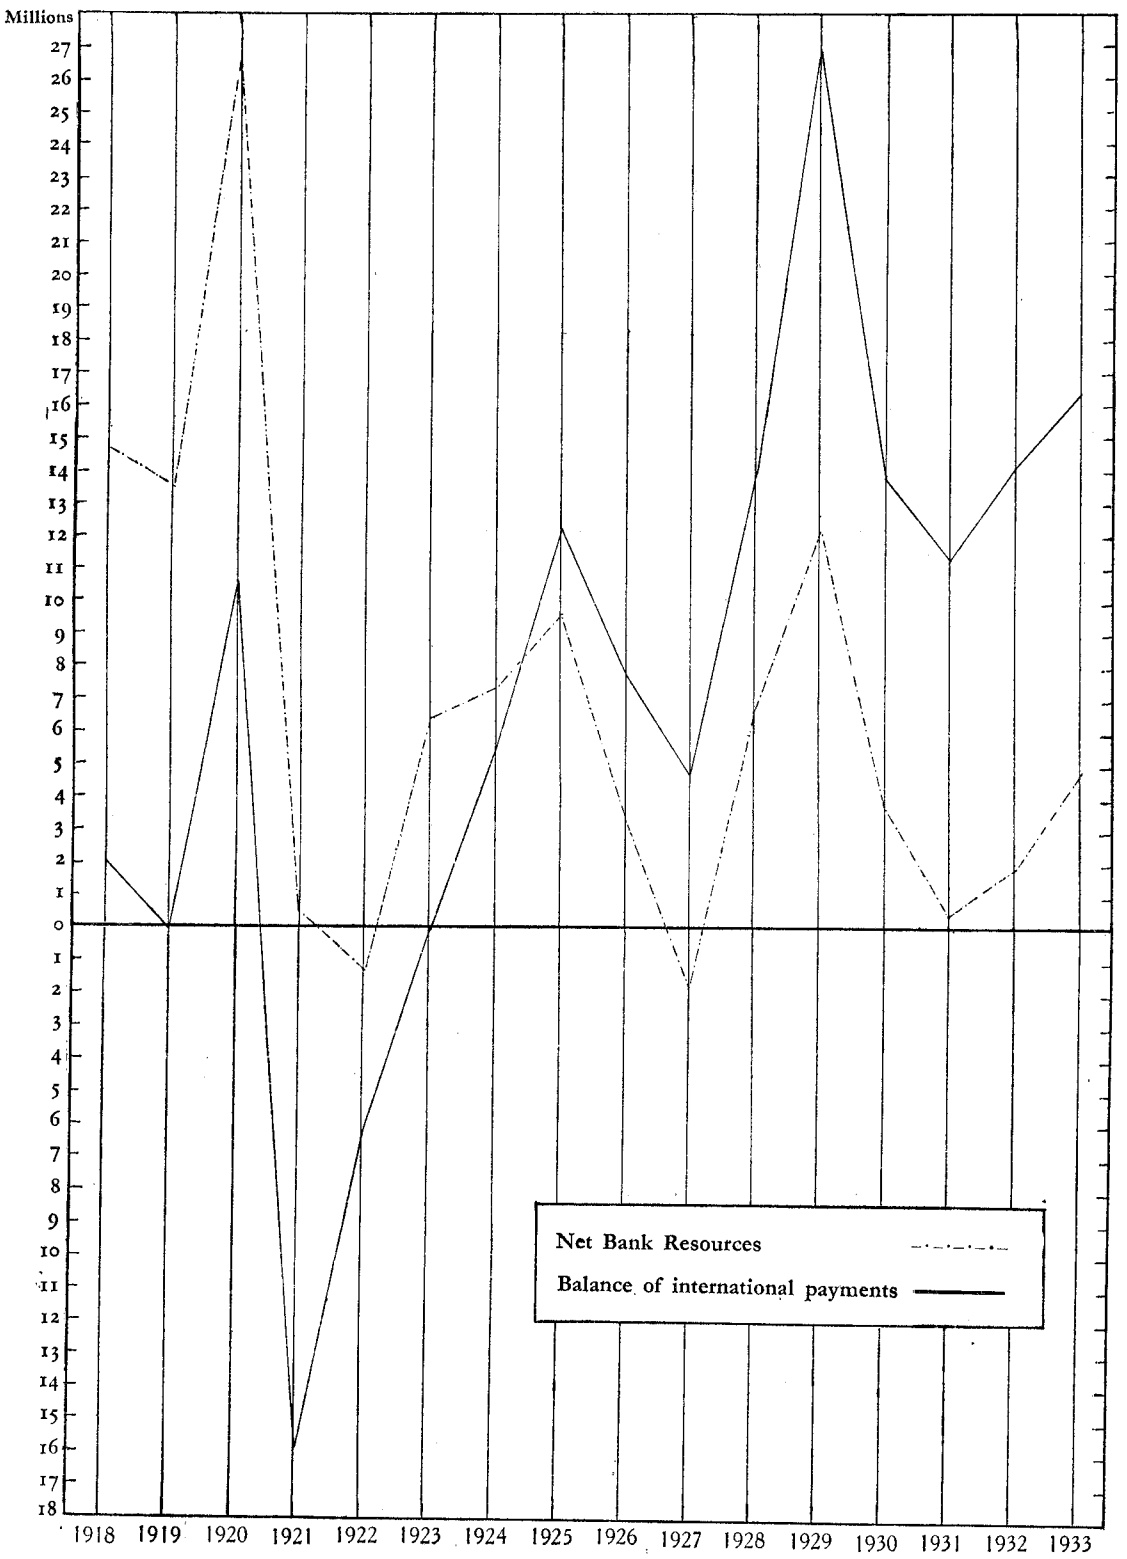
The system is quite a simple one. The banks maintain offices in London, and these offices receive the proceeds of the sale of our exports. The exporters receive credit for the amounts due to them, plus or minus exchange at the ruling rate, in the books of their respective bankers in New Zealand. These credits go to swell deposits. The importers, on the other hand, pay to their bankers by cheque in New Zealand the amount of their debt due abroad, plus or minus exchange on London at the ruling rate, and the British or other overseas merchant receives payment directly or indirectly out of the London funds of the banks. Such transactions result in a fall in deposits or an increase in advances in New Zealand, and a corresponding fall in the London balances of the banks.

Thus these London balances are being constantly fed by a stream of funds from the sale of exports and depleted by another stream of funds to pay for imports, the increases or decreases in the volume of either being reflected in the incidence of deposits and advances in New Zealand. The inward stream is also increased by the amount of loans raised abroad, and the outward stream by the payment of interest on such loans. In fact, all items that enter into the balance of international payments affect the position.

Governing Factors.

As is demonstrated later in this statement, the volume of deposits is affected by advances and in other ways. The point to be noted in the meantime is that a credit or favourable balance in our overseas transactions widens the gap between the amount of deposits and advances. Deposits increase and advances are repaid by the credits to customers in New Zealand on account of the increase in the London funds of the banks arising out of New Zealand business. In so far as deposits are thereby increased, the community has more purchasing-power, while, on the other hand, the lowering of advances encourages the banks to grant further advances, thereby still further increasing purchasing-power. This additional purchasing-power unless utilized to pay off debts abroad will lead normally to an increase in imports which will tend to restore the balance in international payments.

Conversely, a debit or unfavourable balance in our overseas transactions (usually brought about by a fall in export prices or excess imports) leads to less deposits and a greater volume of advances—*i.e.*, the margin between them is narrowed. When this happens the banks are more conservative in granting advances to importers and generally take steps by pressure and perhaps by raising overdraft-rates to bring down advances, thus further decreasing the volume of credit in New Zealand. With less credit available, there is less scope for the purchase of imports and less spent on imports, which means less drain on the London balances of the banks.



In fact, the pressure on the London balances of the banks is what limits the amount of credit that can be created in New Zealand. As already pointed out, there is ample scope for expansion in so far as cash resources in New Zealand are concerned. If, however, the credit structure is enlarged, apart from any corresponding increase in local production, the additional resources will be used to buy additional imports, and thereby impose a drain on London funds. Failing internal action to lower the volume of credit, such a situation can be met only by raising the exchange-rate, which, in effect, means that more must be paid in New Zealand currency to obtain a given quantity of imports. Thus the additional credit created is neutralized by a depreciation in the purchasing-power of the monetary unit.

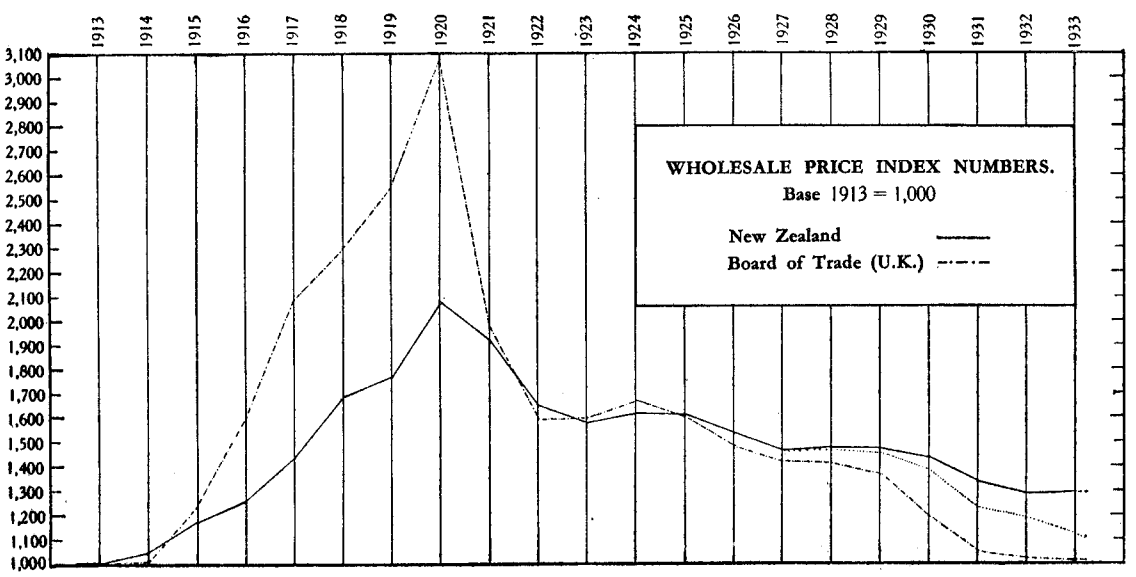
It may be pointed out that, while the banks can and do assist in maintaining equilibrium by variations of policy in respect of advances, there are other corrective forces always at work. For the most part purchasing-power reaches the hands of consumers in payment for services in production, using the word in its broadest sense. If, then, increases in the credit structure allow importers to bring in more goods from abroad than can be paid for with exports, having regard to other calls on the latter, the excess quantity of goods will generally be a drug on the market, unless prices are reduced to an unpayable level. Thus importers and merchants generally, although they act independently, are constantly endeavouring to equate supply to effective demand. Naturally they would not accept from the banking system credit for the purchase of more goods than they considered they could sell at a profit. Collectively they do make errors of judgment, for each one is endeavouring to get ahead of his competitors, but it is nevertheless true that to a large extent the initiative rests with the trading community.

The most enterprising banker cannot force advances upon people nor coerce them to make greater use of their deposits. Thus, if the psychological factor in the trading community is adverse, the banks would find it difficult to increase substantially the amount of credit used however much they desired to do so. Central banks can increase the credit available by buying up securities, but that does not put the extra credit to work. During the past year in most countries there has been an abundance of cheap credit available, but with the possible exception of Great Britain in recent months relatively little effective demand for it. In fact, increases in the credit structure involving currency depreciation are usually brought about by Governments borrowing from the banks and spending more than is collected by way of revenue.

Under the sterling exchange system in operation the London funds of the banks must obviously rise and fall by the balance of our international payments from year to year, and, as already explained, such rise and fall is reflected in the incidence of deposits and advances in New Zealand. Deposits, however, can be drawn in the form of notes, and are also affected by the purchase and sale of securities by the banks, so these factors must be taken into consideration in making comparisons to demonstrate the effect of external transactions.

The fluctuations in the aggregate amount of the London funds arising out of New Zealand business are not disclosed, and for past years are not generally known by the banks themselves, the reason being that separate records were not kept of the effect of Australian and New Zealand transactions respectively. The trade figures, together with the amount of interest payments and debt operations of the Government and local bodies abroad are known, while estimates more or less accurate can be made for other items involved in the balance of international payments. The movement of

NET BANK RESOURCES.—BALANCE OF INTERNATIONAL PAYMENTS.



private capital in and out of the Dominion is the most important item in respect to which little or no data is available.

Using all the available data, estimates have been compiled by the Government Statistician of the balance of international payments back to 1918, and the graph above shows how closely fluctuations in the net balance have been reflected in the margin between deposits and notes on one hand and advances and securities on the other.

The degree of correlation illustrated by the graph shows unmistakably how the banking figures are affected by receipts and payments overseas. Such difference as there is will be due largely to the fact that the aforesaid receipts and payments are based to some extent on estimates. Furthermore, the banking figures used are the averages for the March quarter, and these obviously will not coincide accurately with the trade for the financial year. To illustrate the same point Professor Tocker, of Canterbury College, in an article published in the *Economic Journal* of December, 1924, demonstrated the close correlation over a period of twenty years between the visible trade balance and the excess of deposits over advances and securities.

On account of our economic circumstances, this domination of our monetary system by our transactions with London would, probably, be practically inevitable in any case, but, in fact, it has been rendered definite and complete by the exchange policy adopted by the banks. Although at the present time there is a marked departure therefrom, this exchange policy consisted of maintaining stable rates of exchange, unaffected by any but very exceptional trade disturbances. For instance, the rates of exchange for telegraphic transfers New Zealand on London stood at 17s. 6d. per cent. for at least ten years prior to 1914, despite marked variation in the trade balance between 1907 and 1911. This exchange policy was the real regulative factor in controlling the volume of credit, and, through credit, the issue of currency in New Zealand. The result was to keep the New Zealand pound at approximate parity with sterling, and in the broad trend our prices fluctuating round about a definite ratio to British prices which, of course, were regulated by gold.

When British prices are down, goods can be purchased more cheaply in Britain and sold more cheaply in New Zealand. Thus New Zealand prices, while not so sensitive as British prices generally, move in sympathy with those of Great Britain. This approximate correlation in the movement of the respective price-levels is best seen at a time of violent fluctuation such as has occurred since 1913. The following graph shows the movements since 1913 in the British Board of Trade index and the New Zealand Government Statistician's wholesale-price index respectively.

WHOLESALE-PRICE INDEX NUMBERS (BASE 1913 = 1000).

The range of commodities used in compiling these two indices is not altogether the same, the main difference being the greater predominance of raw materials in the Board of Trade index.

Even so, it will be seen that, with a slight lag which one would expect under the circumstances, there is a fairly close correlation between the rise and fall in the two price indices. The violent upward swing which occurred between 1918 and 1920 is not so violent in the case of the New Zealand prices, but the peak was probably smoothed out somewhat in the lag, in addition to which it is well known that our internal prices are relatively slow to move. The lines came together again in 1923, and do not diverge very much thereafter. It will be noted, however, that the fall in New Zealand prices since 1929 is not as great as in the case of British prices. The reason for this is the progressive increase in the rate of exchange on London, and the fact that during this period the proportion of Customs duties to value of imports has risen. The effect of these factors upon the New Zealand index has been approximately calculated, and the dotted line also shown in the graph indicates the level to which New Zealand wholesale prices would have fallen but for the factors mentioned. This uniformity in the movement of the price-levels over a period of violent fluctuation, when for the most part both countries were admittedly off the gold standard, is another indication of the monetary system being definitely linked with sterling.

In fact, all the evidence clearly demonstrates that the volume of credit in New Zealand has not been governed through the currency on a gold basis, as was apparently originally intended, but is automatically governed by an exchange fund held by the banks in London, which fund, so long as Great Britain was on the gold standard, was in effect equivalent to a stock of gold held in London. When Great Britain departed from the gold standard, however, we followed automatically, and our exchanges were not directly affected—that is to say, this country possesses a sterling exchange standard.

A stock of gold coin and bullion has certainly been held by the banks in New Zealand for monetary purposes, but in fact—even in pre-war days—this gold was used only to support a gold circulation and provide for the legal requirements, previously referred to in connection with the note-issue. The export of gold for exchange purposes has been absolutely negligible, and imports of gold have been confined to sovereigns for internal circulation, there being no mint in New Zealand.

Prior to 1914, however, as already pointed out, the amount of gold held was relatively so large that a very large expansion of the currency was legally possible, but never occurred. Scope to expand the currency under the operation of the normal gold standard meant scope to expand credit proportionately. But then, as has been demonstrated, the normal gold standard did not, and does not, operate in this country. In fact, credit is not controlled through the currency, but, on the contrary, the currency is controlled through the credit, which in turn is controlled through the operation of the exchanges with London. Further, the banking habit is well developed in this country, and with the extensive use of cheques, notes and coin are definitely subsidiary, being required for little beyond payment of wages and till-money in the retail trade.

This being the position, it must be realized that under the normal operation of the *de facto* system, as distinct from the legal system, our gold coins played no greater part than our bronze coins. It is true that the gold coins carried within themselves the guarantee of ultimate redemption in value, but as part of our money mechanism they played the part of a token coinage; work that could have been carried out with equal efficiency with much cheaper material.

To sum up this examination of the monetary system, the only conclusions to be drawn from an examination of the facts are as follows:—

1. That the *de facto* system is and always has been a sterling-exchange standard.
2. That it has centred round an approximate fixed par of exchange between the British and the New Zealand pound.
3. That our external trade is cleared through London, and the London balances of the banks are the chief factor in regulating the volume of credit in New Zealand.
4. That the banking habit is strongly developed in New Zealand and notes and coin are very subsidiary, being used for little beyond payment of wages, petty disbursements, and till-money.
5. That the legislative restrictions on the note-issue have been quite inoperative, as the demand has always been considerably less than the maximum amount the banks were in a position to issue.
6. That the volume of credit has regulated the note-issue, and not *vice versa*.

How our Banking System Operates.

As an adjunct to the review of the factors governing the volume of credit in New Zealand, it may be useful to explain how deposits are created and extinguished, and generally how the banking machinery operates.

An understanding of this can best be obtained from simple illustrations of the effect of various transactions on the balance-sheet of a bank in skeleton form.

When the first bank extended its operations to the Dominion the first transactions were probably the purchase of suitable premises to be followed by purchase of gold, it being assumed in both cases that bank-notes were given in payment. A balance-sheet of the New Zealand business prepared at this stage would read as follows:—

Liabilities.	£	*Assets.*	£
Notes and coin	101,000	Premises	1,000
		Gold	100,000
	£101,000		£101,000

Then assume that transactions as set out below took place, the changes in the balance-sheet being given for each one.

(*a*) Bank accounts opened and £50,000 notes deposited:—

	£		£
Notes, &c.	51,000	Premises	1,000
Deposits	50,000	Gold	100,000
	£101,000		£101,000

(*b*) £100,000 advances granted and drawn, £90,000 by cheque and £10,000 in notes, both for payments in New Zealand, it being assumed that all cheques are lodged for collection immediately:—

	£		£
Notes, &c.	61,000	Premises	1,000
Deposits	140,000	Gold	100,000
		Advances	100,000
	£201,000		£201,000

It will be observed that the advances have created an equal amount of deposits and notes.

(*c*) Holders of advances lodge to their accounts £30,000 in notes, together with £40,000 in cheques, of which £20,000 is from depositors and £20,000 from other holders of advances:—

Liabilities.	£	*Assets.*	£
Notes, &c.	31,000	Premises	1,000
Deposits	120,000	Gold	100,000
		Advances	50,000
	£151,000		£151,000

The cheques obtained from other holders of advances had no effect on the total balance-sheet figures, being merely a transfer from one holder to another, but otherwise the total assets and liabilities have decreased by £50,000—*i.e.*, the net decrease in advances has brought about a fall of an equivalent amount in notes and deposits.

(*d*) The Government collects £25,000 in taxation, of which £5,000 paid in notes and balance by cheque £10,000 from deposits and £10,000 by holders of advances, the whole being lodged to Public Account:—

	£		£
Notes, &c.	26,000	Premises	1,000
Deposits	110,000	Gold	100,000
Government deposits	25,000	Advances	60,000
	£161,000		£161,000

The increase of £10,000 in advances has put up total assets by £10,000, the remaining £15,000 representing a transfer from notes and deposits to Government deposits.

(*e*) The Government floats loan of £30,000, of which £10,000 taken up by depositors and £20,000 by bank.

	£		£
Notes, &c.	26,000	Premises	1,000
Deposits	100,000	Gold	100,000
Government deposits	55,000	Advances	60,000
		Government securities	20,000
	£181,000		£181,000

It will be observed that the purchase of securities by the bank has created deposits to the amount involved, while the balance of the loan has resulted in a transfer of £10,000 from deposits to Government deposits.

(*f*) The Government spends loan and revenue collected, paying out £10,000 in notes and £45,000 by cheque, of which £10,000 received by holders of advances and £35,000 by depositors, it being assumed that cheques immediately lodged for collection.

	£		£
Notes, &c.	36,000	Premises	1,000
Deposits	135,000	Gold	100,000
		Advances	50,000
		Government securities	20,000
	£171,000		£171,000

As a result, Government deposits have disappeared, notes and deposits have increased by the respective amounts involved, while advances and the totals have decreased by £10,000.

(*g*) £100,000 worth of produce sold abroad and depositors' accounts credited in New Zealand, £5,000 being added for exchange.

	£		£
Notes, &c.	36,000	Premises	1,000
Deposits	240,000	Gold	100,000
		Sterling	100,000
		Advances	50,000
		Government securities	20,000
		Profit and Loss Account (loss) ..	5,000
	£276,000		£276,000

It should be noted that deposits and the totals have risen by £105,000, the corresponding items in the assets side being sterling and the loss in Profit and Loss Account. The margin between deposits and advances has also increased by £105,000.

(*h*) £90,000 worth of goods imported, £5,000 being charged for exchange, the total being paid for by cheque £50,000 from depositors and £45,000 from holders of advances.

Liabilities.	£	*Assets.*	£
Notes, &c.	36,000	Premises	1,000
Deposits	190,000	Gold	100,000
		Sterling	10,000
		Advances	95,000
		Government securities	20,000
	£226,000		£226,000

It will be observed that the aggregate figures have decreased by the amount of deposits used and that otherwise the decrease in sterling is balanced by increase in advances, the exchange charged wiping out the loss in Profit and Loss Account. Further, the margin between deposits and advances has decreased by the value of the imports plus exchange.

(*i*) £5,000 interest charged on advances and £1,000 paid in notes for wages and expenses:—

	£		£
Notes, &c.	37,000	Premises	1,000
Deposits	190,000	Gold	100,000
Profit and Loss Account	4,000	Sterling	10,000
		Advances	100,000
		Government securities	20,000
	£231,000		£231,000

(*j*) £90,000 further advances made, being drawn wholly by cheques which are lodged for collection:—

	£		£
Notes, &c.	37,000	Premises	1,000
Deposits	280,000	Gold	100,000
Profit and Loss Account	4,000	Sterling	10,000
		Advances	190,000
		Government securities	20,000
	£321,000		£321,000

The figures for both deposits and advances have altered accordingly, but the difference between them remains the same.

(*k*) Holders of advances dispose of sufficient of their assets to liquidate all advances, payments being received, £20,000 in notes and £170,000 in cheques, the whole being lodged to their accounts for collection.

	£		£
Notes, &c.	17,000	Premises	1,000
Deposits	110,000	Gold	100,000
Profit and Loss Account	4,000	Sterling	10,000
		Government securities	20,000
	£131,000		£131,000

It will be observed that deposits and notes combined have gone down by the amount of the advances repaid, the reason being that if all holders of advances are selling out their assets could be purchased only by note-holders or depositors.

Purchasing-power.

The monetary purchasing-power available to the community at any given time consists of—

(*a*) Notes and coin held by the public.
(*b*) Amount of free deposits.
(*c*) Unexercised advances for which authority has been granted.

Under present banking methods in New Zealand the last item is not disclosed in bank balance-sheets or returns. Concerning changes in the volume of the other two items, it should be noted—

(1) That the purchase of gold bullion or Government securities or any additional assets by the bank on its own behalf increases available purchasing-power. (See examples (*a*) and (*e*).)
(2) That advances expended in New Zealand increase deposits and/or notes by an equal amount. (See example (*b*).)

(3) That to the extent that advances are used for foreign payments deposits or notes are not affected. (See example (*h*).)
(4) That internal transactions can vary the volume of notes, deposits, and advances, but, apart from purchase of additional assets by the bank itself, not the difference between notes and deposits on the one hand and advances on the other. (See examples (*b*) to (*f*).)
(5) That export trade increases sterling balances and either increases deposits or decreases advances and in any case increases the margin between deposits and notes on the one hand and advances on the other hand by the value of the exports, plus exchange allowed. (See example (*g*).)
(6) That import trade decreases the margin between deposits and notes on the one hand and advances on the other hand by the value of imports, plus exchange charged. (See example (*h*).)
(7) That repayment of advances, except as a result of exports, automatically cancels out an equivalent amount of notes and deposits. (See example (*k*).)

It will thus be seen that the volume of purchasing-power is directly affected by our external trade and internally is dependent upon the volume of advances granted by the banks and used by customers.

It may be added that the taking of deposits and the granting of advances is of course not confined to the banks. About £3,250,000 of deposits are held by building and investment societies, and £6,500,000 by stock and station agents and other trading companies. The stock and station agents as part of their business regularly make advances to farmers. The firms concerned all have accounts with the banks, and if John Brown transfers £1,000 of his deposit at the bank to a stock and station agent the net effect on the aggregate figures of the banks is nil. If, however, the firm has an overdraft at one of the banks (and most trading companies taking deposits do so to keep their overdraft down) the transfer of John Brown's deposit to the firm means a reduction in both the deposits and advances in the banks' books. As to whether it involves a decrease in available purchasing-power depends on whether John Brown can draw on his deposit with the firm. If the transaction was a transfer from a free deposit at the bank to a fixed deposit with the firm, it has involved a fall in purchasing-power to the same extent as a transfer from a free to a fixed deposit with the bank. Thus appreciable changes in the volume and/or nature of deposits held by other concerns will affect comparisons of bank figures over a period.

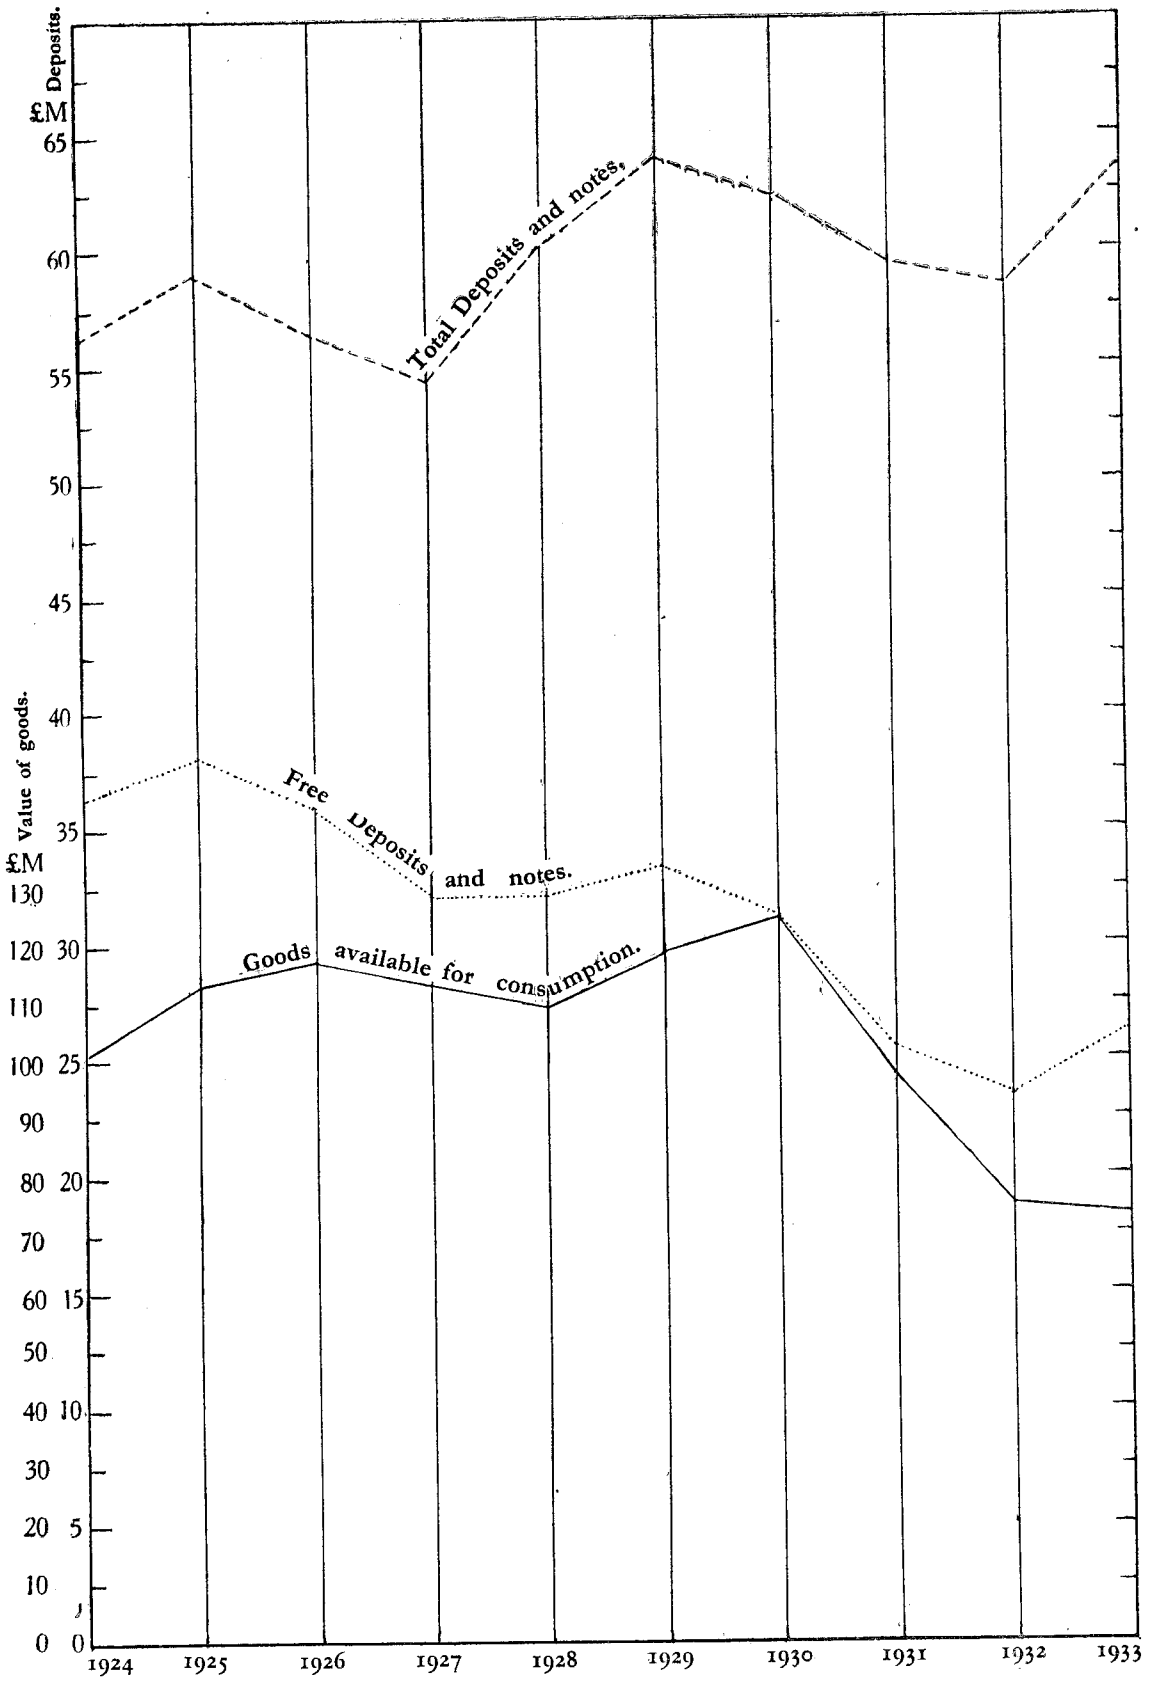
Many of the representations made are based on an assumption that insufficient monetary purchasing-power is available, but little or no evidence has been offered in support of that assumption. In so far as the quantity of available purchasing-power is concerned, the statistics are fairly complete, except that there is no information in respect of advances authorized but not used, nor of the extent to which deposits held by trading companies can be operated upon by cheque.

Concerning the extent to which the available purchasing-power is used, or what is commonly referred to as the velocity of circulation, we have since 1928 statistics of bank debits. These debits are charges against bank accounts including deposits and overdrafts. It is not uncommon for firms to work on overdraft the amount involved being constantly turned over as receipts and banked against drawings. Such rate of turnover will probably be much the same as in the case of firms working on deposits for the receipts in question will be largely drawn from deposits. Advances outstanding, however, do not constitute available purchasing-power, and in difficult times many advances are apt to become more or less frozen. The situation is thus best judged on the basis of free deposits. An analysis of the figures on the assumption that all debits represent charges against current accounts including Government deposits, gives the following turnover per £1 on current account:—

1929	.. 42 times.	1931	.. 41 times.	1933	.. 40 times.
1930	.. 42 times.	1932	.. 42 times.		

As the debits include those to overdraft accounts the figures do not correctly represent the actual turnover of deposits for any particular year, but it is considered that, as an index, the figures are approximately comparable from year to year.

It will be observed that the rate of turnover indicated has remained very steady over the period.



There are no records of the turnover of notes and coin, but the Government Statistician has made an estimated analysis of the class of payments for which notes and coin are generally used for the year 1931–32. Based on these estimates, the average turnover of each £1 of notes and coin was forty-one times, a result that coincides remarkably with the more definite calculation of the turnover of deposits. In bad times the turnover of notes in circulation probably increases for, on the average, wage-earners will keep less in their pockets.

On the other side of the equation, statistics of production are available, but there is little definite information as to the amount that should be added to cover personal services not included in the production figures. In so far as the value of production is an index to the need for purchasing-power, the graph below illustrates the position over the period of ten years—1924 to 1933 inclusive.

In order to arrive at more accurate figures of the volume of goods involved in internal trade, the production figures have been adjusted by deducting exports and adding imports for each year concerned.

Bearing in mind that the velocity of circulation of money does not appear to have altered appreciably during the period, it will be observed that the purchasing-power immediately available, represented by the free deposits and notes, has declined more or less in accord with the fall in the

value of the goods to be dealt with in internal trade. In other words, depositors have left on current account only sufficient resources to cope with current requirements and the balance has been placed on fixed deposit, the increasing volume of which is represented by the difference between the two lines on the graph concerning deposits. Fixed deposits are for relatively short terms,

PURCHASING POWER AND GOODS AVAILABLE FOR CONSUMPTION.

which are maturing daily, so that depositors can at any time rapidly increase the volume of free deposits. This being so, the analysis of the position made does not lend any support to the suggestions that our troubles are due to a lack of purchasing-power in New Zealand. The aggregate of possible purchasing-power represented by all deposits and notes is as great now as at any time since 1924.

As an indication of the fundamental source of the present stringency, the following indices, prepared by the Government Statistician, are of interest:—

Year.	Volume of Production apart from Buildings.	Volume of Exports.	Volume of Imports.	Volume of Goods available for Consumption.
1926	100	100	100	100
1927	108	108	96	102
1928	117	112	100	111
1929	122	116	114	121
1930	124	119	106	118
1931	117	120	69	92
1932	114	132	66	83
1933	122	151	66*	82

* Figure not available but assumed that it is the same as for 1932.

The periods for the volume of production figures are slightly different from those for the other two indices, but goods must be produced before they can be exported or consumed and the difference is not sufficient to invalidate comparisons.

Building and construction is more in the nature of capital expenditure, and therefore has been eliminated in considering the volume of consumable goods. It will be observed that between 1928 and 1932 production in the aggregate was fairly well maintained, the figures indicating a decline of 2½ per cent. only.

In 1928, 51 per cent., or approximately half of the total production (apart from buildings, &c.), was exported. Between 1928 and 1932 the index figures indicate that the volume of exports increased by 18 per cent. In exchange for the greater quantity of exports, after making provision for payment of interest and other fixed claims, we received in return for 1932 34 per cent. less quantity of imports compared with the position in 1928. The net effect of this was that for 1932 the quantity of goods available for consumption in the Dominion was 25 per cent. lower than in 1928. On the same basis the shortage for 1933 was 26 per cent. This was a real loss due principally to—

(*a*) Having to set aside a larger quantity of produce to meet fixed obligations overseas; and

(*b*) The fact that the terms of barter in Great Britain have gone against us, with the result that in exchange for a given quantity of primary products we now receive less manufactured goods than formerly — that is to say, the price of primary products has fallen more than the price of manufactured goods.

The upset in the balance of economic factors internally, resulting from the heavy fall in prices, has undoubtedly had far-reaching reactions, but it seems that our present economic troubles and shortage of real purchasing-power are largely explained by these factors, which are quite outside the scope of banking methods and entirely distinct from our internal monetary system. Accordingly it does not appear possible for this real loss in goods—amounting to one-quarter of our aggregate production—to be overcome by any monetary changes in the Dominion. Furthermore, the analysis of these figures disproves, or at any rate heavily discounts, the popular idea that there are ample goods in the Dominion to meet requirements, and all that is lacking is the money with which to buy them. It may be, of course, that in some directions, owing to psychological factors and disorganization of trade, our productive capacity is not being fully utilized. If so, there is scope for improvement through increasing and widening the production in the Dominion of goods needed for local consumption. But whatever action is necessary to do this lies outside the monetary system, for the additional production will automatically draw forth the additional purchasing-power required to buy those goods.

Changes arising out of the War.

Following the outbreak of the Great War the law relating to banking underwent considerable change, but several of the temporary provisions made proved entirely unnecessary, and presumably were made under the anxiety of war conditions, with the idea of placing the banks in a position to meet practically any contingency that might arise. Accordingly, the pre-war restrictions, inoperative though they had been up to that time, were largely removed.

On the outbreak of war bank-notes were declared legal tender by Proclamation issued under the provisions of the Banking Amendment Act, 1914. Successive Proclamations have maintained the position ever since, and under the last Proclamation issued the notes of the trading banks, unless they are replaced by Reserve Bank notes, continue to be legal tender until the 10th January, 1935. During the period limited by these Proclamations the export of gold is prohibited, except with the approval of the Minister of Finance.

War regulations made under section 44 of the Finance Act, 1916, were issued from time to time from August, 1916, to December, 1920. The first regulations authorized the issue of 10s. notes, and provided for an alteration in the form of the statutory bank returns consequent upon the

notes being declared legal tender. Others issued during the same month practically suspended the legislative restrictions on the note-issue and credit-expansion. Briefly, these regulations provide in effect—

(*a*) That the note-issue is to be limited only to the total amount of coin, bullion, and public securities held in New Zealand, with a proviso that the Minister of Finance may by Warrant authorize the inclusion of public securities held in the United Kingdom, provided the securities are hypothecated to the Crown. This regulation means that no gold at all need be held :

(*b*) That the sections in the several private banking Acts limiting the debts and engagements to three times the coin, bullion, and public securities held in New Zealand are extended to include public securities held in the United Kingdom. These are the sections intended to control credit-expansion, previously referred to as being unintelligible under the existing banking practice :

(*c*) That the definition of " public securities " in the several banking Acts previously restricted to New Zealand Government securities is extended to include public securities of the United Kingdom or of the Commonwealth of Australia or any State of the Commonwealth.

By additional regulations made in 1917 and 1920 the limit of the note-issue was extended by adding to the total of coin, bullion, and public securities the amount of the advances to customers to enable them to invest in war loans or discharged-soldiers-settlement loans, and also the amount of the advances against wool held in store at that time. Special returns of these advances had to be made to the Treasury.

In 1919 a section in the Finance Act removed the ban on the exportation of uncoined gold. This, of course, occurred after the cessation of hostilities, and probably was a recognition of the fact that mined gold is one of the normal trade exports of this Dominion. In the following year, 1920, it was deemed necessary to pass a further section in the Finance Act making it an offence to melt down or use gold or silver coin except as currency. The reason for this last piece of legislation probably lay in the fact that at that time gold was at a considerable premium—that is to say, gold bullion was worth in notes considerably more than the mint par as fixed by the gold content of the sovereign.

Since 1920 no further changes have been made in these Acts and regulations, and insofar as they are not overridden by the recent Reserve Bank of New Zealand Act they are still in force to-day. Now, what was the economic result of all these changes in the law ?

Declaring notes legal tender led to an ostensible change in the withdrawal of gold from circulation, but this in itself was of no real economic significance, as a pound-note does the work just as efficiently as a sovereign. In fact, in many respects the note is much more convenient than gold, and now that we have got used to paper, we would probably find that gold was a nuisance if it were again put into circulation.

On the face of things, a much more fundamental change was made when by regulation the legal restriction limiting the note-issue to three times the amount of coin held was removed. With a self-contained banking system this alteration, coupled with the ban on the export of gold, would have opened the way to unlimited credit-expansion. As already explained, however, the volume of credit was definitely dependent on credit conditions in Great Britain, and the relaxation of the restrictions on the note-issue in no way contributed to such credit-expansion as did occur in New Zealand during and immediately after the war. In fact, throughout the whole period of inflation right down to the present time the note-issue was practically covered pound for pound by the gold held by the banks. Removing the restrictions on the note-issue thus meant little or nothing in the economic affairs of the country. The additional provisions extending the issue of notes up to the amount of the wool and war-loan advances were never used.

The widening of the definition of public securities, and the further provision allowing securities held in Great Britain to be included in reckoning the ratio of securities to liabilities, may at times have been useful to the banks under such interpretations of the section in question as they may have adopted, but, for reasons already fully explained, the volume of credit was not really affected thereby.

In fact, none of the changes in the law referred to had any real economic significance, for the very good reason that the original permanent provisions which were subject to amendment or were suspended by the war regulations had always been quite ineffective. To amend a law that is practically a " dead letter " is obviously not going to make much difference to anybody. The only difference is that whereas prior to the war the law simply did not apply, now it is legally suspended or rendered inoperative. The essential point to which attention is drawn is that throughout the war period, and since, the pre-war *de facto* sterling-exchange system was maintained without any fundamental change.

Recent Changes.

Until recently economic facts and the traditional exchange policy of the banks were the only real regulative factors of our banking system. The position, however, has been changed by the passing of the Reserve Bank of New Zealand Act, 1933. This Act overrides the pre-war legislation and gives legal recognition to the sterling-exchange standard. The formal provision is contained in section 16 of the Act, which makes it mandatory for the Bank, after it commences operations, to supply on demand sterling in exchange for its own notes and gold and, *vice versa*, notes in exchange for sterling, both at rates of exchange to be fixed by the Board of the Bank. The unlimited authority thus granted to the Bank is unusual, and is due to the abnormal conditions prevailing both in Great Britain and here. It is normally the duty of Parliament to fix the basis of the currency by Act which in our case would mean fixing the par of exchange ; after which it would be the duty of the Bank to maintain

the value of the currency by holding the exchange-rates within a swing of approximately 30s. per cent. either way, that being the approximate cost of shipping gold from London to New Zealand and *vice versa*. When the time comes to stabilize the currency—which will normally accrue when sterling is again stabilized on some definite basis—it will be necessary to amend the Act accordingly. Hitherto, parity has been pound for pound, but a sterling-exchange standard could function at any other ratio, provided the chosen ratio was in accord with the relative price-levels in the two countries.

In recognition of the fact that notes are subsidiary to credit, no separate limitation is placed upon the note-issue, but the Bank is required to maintain a reserve of liquid sterling assets or gold of not less than 25 per cent. of its demand liabilities, including notes. It may be added that in the long-run, if not in the early stages of its operations, the reserve will probably consist mostly of sterling assets, which will mean that the volume of London funds will still be the governing factor of our credit structure.

The trading banks are to be deprived of their rights of note-issue on 1st August next, and are required to retire their own notes in circulation. When this operation is completed, we will have a single note-issue as a liability of the Reserve Bank and the trading banks will have to buy all the notes that they require from the Reserve Bank. Thus in future, in their internal operations, the trading banks must have regard to their ability to acquire Reserve Bank notes, and this fact, coupled with the necessity of maintaining a minimum balance with the Reserve Bank, will give the latter effective control over the credit structure. Provided there is the necessary margin in the reserve, it is, of course, open to the Reserve Bank to increase cash resources generally by buying securities. Power to control the internal credit structure, especially if combined with a substantial balance of London funds, will give the Reserve Bank control over exchange-rates. Furthermore, the statutory returns which the trading banks have to make monthly to the Reserve Bank will supply the latter with all essential information in regard to the position of the trading banks.

One of the items to be disclosed by each bank in such monthly return is the overseas assets in respect of its New Zealand business held in London and elsewhere respectively. This should be the means of overcoming a weakness in the banking system that has hitherto existed. This weakness arose out of the fact that four of the six banks carrying on business in New Zealand, from the point of view of their operations, are primarily Australian institutions. Australia is operating on a sterling-exchange system very similar to that of New Zealand, and the London balances to finance the trade of both countries, so far as these four banks were concerned, really formed one fund. In fact, some of the banks themselves did not know how much of their London funds had accrued from New Zealand business and how much from Australian business. As a result, the two countries have practically been regarded as one for the purposes of exchange on London, and the approximate uniformity of rates of exchange for both Australia and New Zealand fixed in the past by the six banks in association was presumably based on the average economic conditions and outlook of the two countries combined. Now, Australia is a much larger economic unit than New Zealand, and accordingly this country is much more affected by Australian conditions than Australia is by New Zealand conditions. Thus the rates of exchange New Zealand on London and *vice versa* were governed to a preponderating extent by Australian conditions. The implication was that the London balances built up by the banks from the good trading years of New Zealand were used to support the Australian exchange when Australian external conditions were adverse. At times the operations were no doubt the other way round, but as Australia is so much larger than New Zealand and liable to greater ups and downs from climatic conditions, the net result on balance worked out unfairly to the people of this Dominion.

The Reserve Bank, in their actions generally, including the fixing of exchange-rates, will have regard to the trading position and economic outlook of New Zealand only, and to be able to operate successfully at those rates the trading banks will generally find it necessary to reserve the proper proportion of their London funds for their New Zealand business and deal with Australian business separately.

The severance from Australia will be made more complete owing to the fact that, when the Reserve Bank takes charge, we will have a New Zealand board of directors exercising a deliberate and conscious control of our monetary system in the best interests of the Dominion as a whole. Hitherto all matters pertaining to our currency and credit have been largely in the hands of the six trading banks, of which only one has a New Zealand board of directors and four of the remaining five have much larger interests in the Commonwealth than in the Dominion. In the circumstances narrated it is obvious that the trading banks could not have any defined or conscious policy relating to the volume of money and credit as a whole or take into consideration the effect of their united transactions on the price-level of commodities in general. Although they act in association in fixing rates there is strong competition for business among the trading banks, and, as a result, the tendency has been in the direction of over-advancing in prosperous times and too drastic curtailment when conditions became adverse.

At present our exchange-rate is pegged at 25 per cent. off sterling under an indemnity arrangement with the banks whereby the Government purchases all surplus London credits at the pegged rate. A considerable amount of surplus credits have been taken over to date, and the banks have received payment in New Zealand in the form of Treasury Bills. Now, as previously demonstrated, if a Treasury Bill is sold to a bank in exchange for credit in New Zealand, the expenditure of that additional money increases purchasing-power, and thus has an inflationary effect. This is not the case with the Bills given in exchange for London funds, as no additional expenditure in New Zealand is involved.

The accumulation of sterling in the hands of the Government can, however, be used to place the Reserve Bank in a strong position from the outset. This can be accomplished by handing over the surplus sterling assets to the Reserve Bank, which under its statutory provisions must give notes for the same in New Zealand. These New Zealand resources can then be applied in paying off the Treasury Bills issued to the trading banks in payment for the sterling. These operations will lighten the interest burden of the Government, and so increase the sterling reserve of the Reserve

Bank that, if necessary or desirable, it will be in a position to permit, or itself bring about, a considerable increase in the volume of credit in New Zealand. Finally, it may be added that the large amount of London funds will in no way be a burden on the Reserve Bank, however long it may hold them, for it will have given its own notes in payment for the funds, and these notes, of course, will not bear interest. In fact, the Bank will derive some revenue from the investment of the funds in London. This, however, is only incidental to the use of the funds as a basis for the control of currency and credit in New Zealand. The Bank has little interest in the question of profits, the great bulk of which will go to the Government.

Finally, it may be added the establishment of the Reserve Bank will increase the flexibility of the whole banking system and be the means of providing on a sound basis ample credit resources to meet all legitimate requirements of trade and industry.

The Treasury, Wellington, 20th March, 1934.

A. D. Park,
Secretary to the Treasury.

B. C. Ashwin,
Second Assistant Secretary to the Treasury.

Witness: Mr. B. C. Ashwin, representing the Treasury.

Wellington, 17th April, 1934.

The Chairman: I would just like to say to the Committee that the matter that is under discussion is the statement bearing on banking and currency in New Zealand.

Captain Rushworth.] You do not agree that the banks lend their deposits?—Actually, no.

I would like to ask your opinion as to why it is the banks seek deposits?—How do you mean "seek deposits"?

They seek deposits by offering a rate of interest. I will suggest a possible reason, it is the only reason I can think of. It is to attract to themselves the money that otherwise might be available for competitors?—No. I think it is the other way round, in so far as they offer rates of interest for fixed deposits and from that aspect of the matter alone they do it not so much with the idea of attracting them as keeping them.

Then the putting of money on fixed deposit is really a detriment to industry?—In general, yes. It withdraws it from active circulation, and that may be a reason in certain cases for offering a rate of interest; for the purpose of pulling down the volume of active deposits.

Returning to the statement—there are several places in the statement where an interesting train of thought is set up. First of all, on page 1, the paragraph last but one, the wording is: "The explanation, of course, is that our banking system, &c." Could I understand from that—monetary system. Would that be synonymous?—Yes. In the general sense of the term, unless you have any specialized meaning for monetary system.

Strictly speaking, our banking system here, controlled by the local directors of the banks, is a self-contained system, but that really the monetary system is not self-contained?—Yes. The explanation of the paragraph is that the whole business is not centred in the Dominion. They operate in London as well as here. The active part of the business is done at this end.

That paragraph, read in conjunction with other paragraphs, leads me to think that what you intended was not so much the banking systems, as such not being self-contained, but that the monetary system which they administer should be self-contained?—Yes.

On page 2, about the middle, the paragraph starting,—

> In fact, the pressure on the London balances of the banks is what limits the amount of credit that can be created in New Zealand. As already pointed out, there is ample scope for expansion in so far as cash resources in New Zealand are concerned. If, however, the credit structure is enlarged, apart from any corresponding increase in local production, the additional resources will be used to buy additional imports, and thereby impose a drain on London funds. Failing internal action to lower the volume of credit, such a situation can be met only by raising the exchange-rate, which, in effect, means that more must be paid in New Zealand currency to obtain a given quantity of imports. Thus the additional credit created is neutralized by depreciation in the purchasing-power of the monetary unit.

Then on page 4, the bottom paragraph,—

> In fact, all the evidence clearly demonstrates that the volume of credit in New Zealand has not been governed through the currency on a gold basis, as was apparently originally intended, but is automatically governed by an exchange fund held by the banks in London, which fund, so long as Great Britain was on the gold standard, was in effect equivalent to a stock of gold held in London. When Great Britain departed from the gold standard, however, we followed automatically, and our exchanges were not directly affected—that is to say, this country possesses a sterling exchange standard.

And on page 5,—

> To sum up this examination of the monetary system, the only conclusions to be drawn from an examination of the facts are as follows:—
>
> 1. That the *de facto* system is and always has been a sterling exchange standard. . . .

Now, all those paragraphs, taken together, indicate quite clearly that New Zealand has never been a self-governing country so far as its monetary system is concerned. Is that correct?—No. I mean that the sterling-exchange system was adopted voluntarily, and it may be involuntarily, in that it grew up and was not part of a financial policy determined in advance. But it does not mean that this country is not self-governing.

That is to say, so far as the monetary policy is concerned, it had the power to become self-governing, but it was not so in fact?—Yes, even in fact, in that the system evolved was just as self-governing in working on the volume of London balances as the Bank of England was in the English system in working on a stock of gold.

Your wording here that the *de facto* system is and has always been a sterling exchange standard?—Yes, and by that I mean that the basis of our credit in New Zealand is and has always been the balance of sterling kept in London.

So that it is sterling that has been the sheet anchor?—Yes. Even so, that balance is only the reflection of our own trading position. That balance is built up by the sale of our exports and is depleted by payments for imports and by debt payments. The controlling factor has been our external trade and debt operations abroad.

Excepting those, this sterling balance depends entirely upon sterling policy?—Yes, in so far only as it affects the prices we receive for our exports. The sterling policy may lead to a given average price-level in Britain. If that price-level goes down, that automatically decreases the proceeds from the sale of our exports, and therefore the inflow into the basis of our monetary system.

But the prices of our exports in sterling rose rapidly when the sterling policy indicated that that course be taken. During the war for instance ?—Yes.

Lately the sterling policy has been deflationary and, as a result, our price-level has fallen ?—Yes.

So that what has controlled the prices of our commodities has been the sterling policy ?—Yes, through the trade ; but not by any conscious control over our banking operations. I consider we could not have avoided that effect no matter what monetary system we had had.

Who or what is it that controls sterling policy ?—You mean the monetary policy ?

Yes ?—Largely the Bank of England within the limits of their statutes.

Largely the Bank of England ?—Yes. The British Government prescribe the monetary standard.

In 1925 Mr. Winston Churchill, as Chancellor of the Exchequer, reverted to the gold standard ?—Yes.

And operating on that the Bank of England adopted the gold-base policy for sterling ?—Because they had no option. They were placed on that basis by law, and it became their duty to hold the currency to that basis.

Subsequently in 1931 Mr. Winston Churchill stood up in the House of Commons and said what I thought was a particularly brave thing, he confessed openly that that was the mistake of his life ?—Yes.

And he explained that he had acted on the advice of his experts. Who would be the experts ?—That I do not know.

It was stated at the time that it was the Treasury officials ?—A step of that kind, I should say, would call for a field of consultation wider than the Treasury officials.

About that same time the Governor of the Bank of England said that the difference between the Bank of England and the Treasury was the difference between Tweedledum and Tweedledee, so we get back to this same idea that, although the British Parliament ordained the return to the gold base in 1925, the presumption is that that was done on the advice of the Bank of England ?—It is a natural presumption, yes.

We therefore come back to this idea : That our destiny here is being controlled and has been controlled by the Bank of England through its control of sterling policy since 1931, when it was ordained that the gold base should be departed from, and there was no other base substituted for it ?—No.

The policy of the Bank of England is to lift sterling to some undisclosed point above gold ?—That is the declared policy of both the Government and the bank, as I understand it.

But there is no limit. There are no legal limits at all now, apparently ?—No.

They can go up or down ?—Yes.

And whether they go up or down really decides the general price-level ?—Yes, in so far as it is possible for monetary action in the short-run to lift prices. That is a matter upon which there is a good deal of diversity of opinion. It seems to me that a central bank is much more effective in stopping a rise than in starting a rise.

The Bank of England being a central bank ?—Any bank can stop a rise by cutting off supplies of credit, but a bank, when a depression has run its course, with all its attendant psychological reactions, is largely impotent to start the forward movement again. They have far less power for positive action. Stopping a rise is done by positive action of the bank, but the bank's action can only be negative when it comes to starting things.

You know there has been some very severe criticisms of the Bank of England and its policy in recent years ?—Yes.

Lord Beaverbrook launched a campaign and is still fighting it and insisting that the Bank of England must be brought back to its position as a servant, and not the master of the nation. Mr. McKenna has also drawn attention to the matter not once, but in almost all his annual speeches to the Midland Bank. I have here a copy of what he said in January of this year in connection with the matter, dated 26th January, 1934 :—

> Our daily operations are directly influenced by the policy of the central bank, and the whole trade of the country is deeply affected by it.

Then he refers to the shares of the trading banks. He goes on,—

> It is entirely beyond their power to vary the sum total, which is controlled by the Bank of England. The influence of the quantity of cash reserves on banking operations can hardly be overstated, for not only are these reserves the active element in a bank's daily business, but in their totality they govern the aggregate volume of bank deposits. The primary effects of central-bank policy on the joint-stock banks are, however, of less importance than the secondary effects, which result from its influence upon the trade and industry of the country. It is now well recognized that an adequate supply of money is essential to sustained business activity. Nothing in monetary practice is more certain than that contraction of the volume of money, or even failure to secure an adequate increase, tends both directly and indirectly to put a brake upon business of every kind, and to produce the very troubles—unemployment, unremunerative commodity prices, unbalanced budgets, and general depression—which have been apparent in almost every country in the world in the past four years. With expanding population and production, we need some expansion in the supply of money, or it will inevitably follow that consumption will not keep pace with production. There may in any circumstances be temporary maladjustment between production and consumption of individual commodities ; but if the supply of money is adequate the price-level of all commodities taken together will be kept approximately stable, and general consumption will be maintained. It follows, then, that the policy of the Bank of England is of the utmost concern to every one, for no one escapes the effects of general depression, and not one of us fails to benefit from sustained prosperity.

The main point to be considered at this stage is the question of control. You will agree that the Bank of England is a private corporation, privately controlled ?—Yes, except that it has evolved to a stage where it might rightly be considered a national institution in that I think the question of profits has become very subsidiary indeed.

I am not talking of profits ; control is far more important than profits. It would be possible for the controllers of an institution like the Bank of England to take no profits from the banking operations,

but by causing periodical trade booms and slumps make enormous fortunes by buying and selling ?—That is possible theoretically. I understand your point. That possibility would still be there if your directorate was appointed by the State.

Yes ?—When a man has much power to vary the price of commodities there is always the possibility of his exploiting that power for his private benefit.

There is this difference ; you might have venal officials but they do it with a rope round their necks. A private corporation can get away with it ?—You mean they are not there for the public benefit ?

Yes ?—Personally, my view is that as far as the Bank of England is concerned, I think they have very little regard for their shareholders ; they regard themselves as generally acting in a national capacity, although they are not actually so legally. Such action as exploiting their powers would amount to the venal action you mentioned.

You know that the shareholders do not appoint the directors ; they are appointed, as you know, by the merchant bankers of London City. Those merchant bankers never appear in public ; they figure as agents sometimes ; I believe the agent for the New Zealand Government in negotiating loans is one of these merchant bankers ?—It is an underwriting house.

It has come down through the centuries ?—I do not think the firm with which we deal does any banking at all. Their business is simply underwriting.

It is a euphonious term. These merchant bankers appoint the Court, or the directors, of the Bank of England ; they could take considerable advantage of trade cycles if they knew they were coming beforehand ?—Theoretically, yes.

So that, generally speaking, would it not be a good thing to have the controllers of such a mighty engine as controllers of the monetary system responsible to public opinion ?—Theoretically, yes, although there may be practical dangers in that.

I will not pursue it ; it is not fair to do so. Have you read Hawtrey's "Art of Central Banking" ?—I have glanced through it, but have not read it *in toto*.

He has been advanced as the authority on central banking at the present time ?—His book is not a technical book. It is really just a series of articles.

It is for popular consumption ?—He apparently gave this series of talks at various times, and then put them in the form of a book ; it is not a comprehensive treatise.

He is a very able man ?—Yes.

He has a high position in the British Treasury. In his "Art of Central Banking," he says, "Governments make money out of silver, copper, and paper. Banks create it out of nothing. But other lenders have not this mystical power of creating the means of payment out of nothing. What they lend must be money that they have acquired through their economic activities." That throws a flood-light on some of our misconceptions. Going back to your statement, page 2, paragraph last but one, "Thus, if the psychological factor in the trading community is adverse" : In reading that, it occurred to me that it would be more accurate, perhaps, to change the words "psychological factor" into "selling-ability." That is really the case, is it not ?—Yes, though it may be wider than that. The selling-quality of an article is always a problematical matter. If a man decides to manufacture anything at all, the question as to whether he will be successful is always problematical, but the question of whether he will start or not depends upon his psychological reactions. If he thinks the outlook is pessimistic, as is generally characteristic of a depression at a certain stage, he will not do anything. In other words, traders are not active when the outlook is bad ; when they think the outlook is good, it is a considerable factor in making it good.

If a man's liver is out of order, he will take a pessimistic outlook, but that would not apply to the whole of the trading community ?—It is a question of mass psychology.

If the whole of the trading community were able to sell their goods, there would not have been that pessimistic outlook ?—No. You mean you would not expect to find a pessimistic outlook in a time of boom ?

It is a question of cause and effect. Pessimism is very real but does not that arise from the continued inability to sell ?—Yes, it does ; but industries act and re-act on one another to such an extent that, when from any cause one man shortens sail, he affects the market of the next man.

But only within a certain small area ?—There are many ramifications and the effects go right through the economic system. You take one large manufacturer : If he for any reason at all decides to cut down by 50 per cent. and cuts down his staff, another manufacturer finds his sales affected and it runs right through.

I suggest it is something like a fishing-net. If you hang a fishing-net with a hole in it on the wall ; on the top of that hole is the pessimistic gentleman. He starts shortening sail and it has its effect. Later on, the hole will close of itself. Other people will come in, competitors and so forth. We have the case where the fishing-net is cut off altogether ?—The reverse effect will come when the tide turns and bolder spirits think there is money to be made. They will start, and it is equally cumulative.

Would you raise any objection if I write in here "selling-ability" ? Do you think that would be altering your sentiments ?—I regard the selling-ability as only one part of what I mean by the phrase "psychological factor."

You do not regard them as synonymous ?—No. I think mine is wider.

Yes, I think it might be in certain circumstances. On page 4, the paragraph before the graph—that is an interesting paragraph and meets several points. It deals with the exchange of goods on a barter basis ?—Yes.

"Goods can be purchased more cheaply in Britain and sold more cheaply in New Zealand" ; that depends on Customs tariff ?—Yes.

Generally speaking, that would apply, but the main point is that the subject of debts is left out ?—You mean as far as price is concerned ?

I mean to the wage-earner, to the man who lives on dividends; it is not so much what money they receive as what that money will buy when they get it; but that has to be read in connection with their commitments to fixed charges?—Of course. You are speaking now of fixed charges on the country, but the graph is a comparison of the whole prices of goods in Britain and New Zealand.

Quite. The point I am suggesting is really not relevant to this particular paragraph, but I wanted to draw attention to it to indicate that that paragraph taken by itself is not sufficient. Regard must be paid to individual and national debts in fixed terms of money?—Undoubtedly yes, in dealing with changing price-levels.

Page 5, first paragraph: "The export of gold for exchange purposes has been absolutely negligible"?—Yes.

You put in those words "for exchange purposes" in order to exclude the gold that has been exported, the product of Waihi and Reefton?—Those are trade exports.

And yet there is no difference in the commodity?—They no more affect our banking system than the exports of butter.

They were not used for exchange purposes, although they could have been if required?—Yes.

If so, the gold would have to be purchased by the Government?—I mean by that: To balance the exchanges the banks did not export a portion of their gold reserves held in the country.

The next paragraph, "Prior to 1914, however, as already pointed out, the amount of gold held was relatively so large that a very large expansion of the currency was legally possible, but never occurred." Why? During that period I find we were borrowing overseas?—The reason why it never occurred is, as explained here, that the currency or banking system was not operating on the basis of the quantity of gold held in the bank vaults in New Zealand, but on the volume of their London funds. It is difficult to explain in a few words.

But for the purpose of record, it may be as well to put it down?—You want to know exactly why the currency was not expanded?

Why, during that period, so much borrowing was indulged in when the currency could have been expanded proportionately?—But if the currency had been expanded in lieu of borrowing, you would have driven up your rates of exchange and therefore departed from the existing monetary system.

That brings the question back again: quite apart from the question of control of the Bank of England, the policy, whether it was international or otherwise, has been of working on what has been called an exchange level rather than the internal price-level?—Yes.

It has been stated categorically here by witnesses that they are mutually destructive terms, the exchange-level basis and the internal price-level basis?—Not necessarily.

I quite agree. Attempts are being made in some countries to reconcile those two, to have the internal price-level and at the same time to utilize the foreign exchange-rate. Sweden, Malaya, and Egypt have made the attempt, all by different methods. Would it not be possible for something of that sort to be devised for New Zealand?—I do not think so; it is not possible, except in a very short-run, to raise our price-level while the British price-level remains stationary and yet have the same rates of exchange.

Why?—Because to raise our price-level you would increase the volume of credit in the country by one method or another. That would put greater purchasing-power in the hands of the community which would lead to a greater volume of imports than the exports could sustain on the existing exchange basis, and the exchange-rate would be forced up.

Supposing you ration your imports by governmental action to prevent that?—That is tantamount to giving people the money and stopping them from using it.

That is if you imported everything, but not if you did not import everything. Would that not provide a tremendous stimulus to internal trade here?—Yes, if you put a ban on imports.

I do not suggest a ban, I suggest rationing?—To the extent that your rationing is effective, you undoubtedly give a greater field to local enterprise.

You could not only ration the imports, you could set the price for them. You could have a variable price; certain things below par, other things above par, if your national policy so required?—To do that, of course, the State has got to, as it were, do the whole external trade for the country, otherwise you would have to take over the exports and sell them, and then buy the imports and sell them in the country. You could fix the price that way and average it out. You could sell one-half 10 per cent. below and the other half 10 per cent. above cost, and you would come out square.

Something of that sort is being done in Egypt. It is not necessary for the Government to do the actual selling?—I did not mean the Government selling retail. It would only be possible if the Government handled the transactions until they were landed on the wharf.

Our production, butter, meat, cheese, wool, honey, &c., would have to be sold in the world's market on Government action?—Yes.

And the goods received in exchange, after debt charges had been paid, would have to be bought on license from the Government?—If you are still pursuing your idea of averaging your prices, if you give a man a license to import a certain class of goods and you desire him to sell below cost, you would have to adjust it by subsidizing.

It could be worked that way; there are several ways. I am rather suggesting that to the mind of man that has evolved the atomic theory, a matter of that sort should not pass his wit. It is worth investigation, is it not?—Yes, undoubtedly, it is vital to all of us.

Lower down on page 5 you give a very valuable illustration of how the banking system operates. You start off with notes and coin on one side, and assets on the other side. Your second stage then assumed the transactions below took place and the changes in the balance-sheets. "(*a*) Bank accounts opened," you do not say how. I suggest the interpolation of "by advance of £50,000"?—No. All that happened there was that the people who were holding £50,000 of notes and coin simply

came along and said they wanted to put it on deposit. The bank took the notes and gave them credit in its books.

You start off from the beginning, but you do not show any issue of £50,000 ?—For the purchase of gold the bank handed out £100,000. That was probably what, in the normal course of things, happened when the first bank came over here to New Zealand from Australia. The man who was sent over to start operations brought a stock of gold and silver coin and notes and he went out to the goldfields and simply bought gold. Having handed out £100,000 of notes, I assumed that £50,000, or the holders of that amount, came and said "Here are your notes, give us a credit for them."

There is a gap. You agree that there are two methods by means of which that £50,000 could come into existence: one by purchase of gold by the bank, and the other by creation by advances ?—That is shown in (*b*). (*b*) is where £100,000 advances are granted. In that case deposits and notes have jumped by the £100,000.

The particular point that seems still controversial in some quarters will not be settled by that illustration—that is the unfortunate part ?—What point is that ?

The suggestion will be inferred from this that the banks have lent the deposit ?—No. That illustration is intended to show that the additional deposits and notes have resulted from making the advances, but the depositors in one sense have created the deposit. The depositors handed over value for the bank deposits.

You notice that your description of the monetary system differs very materially from that given to us by the banks ?—I do not think so; only in minor aspects.

I think that yours is much more accurate ?—It may be due to the fact that I set out to show the operations; the banks were only dealing with them as they exist, and they are so complicated that you cannot see these effects.

They could not see the wood for the trees ? I think there is something in that. Page 8, second paragraph, "It will thus be seen that the volume of purchasing-power is directly affected by our external trade and internally is dependent upon the volume of advances granted by the banks and used by customers": There is, of course, the converse—that is, the calling-in of overdrafts ?—That cancels out deposits.

Yes. You know there has been a very considerable calling-in of overdrafts ?—No. You are referring to the fact now that the volume of overdrafts has gone down in the last year or two.

I was not referring to the banks' statistics at all, but to things I hear ?—In individual cases, yes, undoubtedly there has been; but, as far as internal action is concerned, taking the advances *in toto*, I do not think the drop in the bank advances is due to that fact at all, but to the reaction from external trade.

One of the greatest difficulties that I have found in understanding the banking figures is that both for advances and deposits the Government business is excluded ?—It is shown separately, that is all.

I have not been able to get hold of it ?—The bank figures show the Government deposits in the statutory returns.

What one wants really at the same moment is the Government advances on bonds and Treasury bills, the Governmant deposits, and then the private deposits and advances, and it is very difficult to get that over the same period ?—That is shown in the statutory quarterly returns as far as the banks are concerned.

I have not been able to find it. Maybe I have not looked in the right quarters, but I have searched very hard, and I have even gone so far as to ask a very prominent officer of the banks, and he was not very communicative. Perhaps he does not know. But perhaps later on I could have a chat with you, and you might be able to indicate where I can get the information. A little further on, on the same page. "Stock and Station agents. It is part of their business to make regular advances to farmers." Where do they get the money from ?—Partly from bank overdraft and to some extent from deposits.

The money really originates from the banks. They are in a secondary capacity are they not ?—Yes.

They are in the same position as a pawnbroker or any other kind of money-lender. They have not the power to create ?—No.

The next paragraph is the one I drew attention to as controversial. "Many of the representations made are based on an assumption that insufficient monetary purchasing-power is available." There is a fairly important school of thought in the world that holds a contrary view to that. McKenna, I have just mentioned, is one ?—But that extract of McKenna's you read was chiefly concerned with the question of having sufficient purchasing-power.

We are faced with this situation throughout the world: We have a growing destitution and growing poverty: people in the direct need of the bare necessities of life in many cases, and we have at the same time such a plenitude of those things that they require that fairly expensive methods of destruction are being adopted, all suggesting, in the absence of any evidence to the contrary, that it is due to a lack of purchasing-power, lack of money. Is there any way of getting away from that ?—Yes. Take a man in England. He may be destitute and want our butter and not have the purchasing-power to buy it. It is true in that sense.

In picturing it myself I have pointed out that there are some thirty to forty millions of registered unemployed in Western civilization. They are destitute, and behind them is a great mountain of stuff that they require, stuff that they themselves in some cases have helped to produce. Now, the curious thing is that they cannot purchase that great mountain of surplus goods until they get their jobs back, and, getting their jobs back, involves making more of those same goods ?—Or making some other goods.

Well, what goods are we short of ?—We are short of a great many things. There are cases in the world to-day, where we have relatively an overproduction in certain lines, particularly in foodstuffs and things like that.

That is true. That is obvious and patent to all of us. Primary products generally. But at the same time we know, by looking further, that the tremendous increase that has taken place in the

production of primary products is not a circumstance to the frightening increase that has taken place in manufactured goods. The mass production factories of the United States can supply all the needs of the world ?—They can supply, but they are not doing so at the moment.

They are only working two days a week ?—Yes. The capacity is there, but the whole thing has got many sides to it, and it seems to me fundamentally that, all said and done, we all live by taking in one another's washing, but it is a question of organization and balance in the factors.

Has that not always been the case ?—Yes. But we have never had the whole system disorganized or broken down to the extent it is now.

What has happened ? Is it sunspots as somebody suggested ? There must be some explanation ?—As to the cause of the depression, innumerable causes have been put forward. Scores and scores of factors come into the picture. They react on one another, but it seems to me that that is the basic factor, because theoretically, as we all know, trade both external and internal is only, after all, an exchange of goods and services. If we had a self-contained community, small or large, in which all the required goods were being produced in their right balance—that is to say, that if you had one man producing sufficient bread for the whole community and another man sufficient meat and so on, theoretically every man would be fully employed and there would be no surplus and no unemployment.

If that were done, with the latest applications of the discoveries of science and the harnessing of power, there would not be a job for the great majority of people ?—If you had perfect co-ordination and balance you could have either one of two things, either a higher standard of living or much more leisure.

I agree. Human requirements are dynamic. They are not static. Production is terrifically dynamic. In fact, it looks as though the powers of production have become much greater than our powers of absorption ?—I do not think that is correct. The thing still falls back on the question of preserving the balance in the different productive capacities. As long as you could keep perfect balance in your productive side of the picture, which involves many things, including tariffs and quotas and all that type of thing and not only the potential capacity of factories in different countries—if you could keep all that, the consumption would flow evenly and automatically.

The net result is that we are having leisure forced on us ?—Yes. A section of the community is.

We call it unemployment. Leisure, you would agree with me, is the greatest boon humanity can crave for ?—Yes.

So that there is no unemployment problem and it is wrong to call it a problem if that is the case ?—I do not agree with that, but it would be true if the leisure were properly distributed.

Mr. Langstone.] Leisure with income ?—That is so.

Captain Rushworth.] If we regard unemployment as a problem, within the framework of the existing monetary system, there is only one solution, and that is to take our scientists and engineers and put them in prison. Is that right ?—No.

I suggest that we should not regard it from that angle at all. At the bottom of page 9 you draw attention to the deposits in 1924. How do the deposits at that date compare with the deposits at the present time ?—You mean total deposits ?

Yes ?—It is illustrated on the graph. You will say that they are somewhere about £56,000,000 or £57,000,000, and now of course they have risen to somewhere about £64,000,000. That includes the notes as well.

You have got total deposits and free deposits, but you have not got fixed deposits ?—It is the difference between the two. The top line shows the total deposits and notes, and the other the free deposits and notes. The difference between the two is the volume of fixed deposits.

The paragraph that begins "Furthermore" half-way down page 10: "The analysis of these figures disproves, or at any rate discounts, the popular idea that there are ample goods in the Dominion to meet requirements and all that is lacking is the money with which to acquire them." That leaves out the potential production does it not ?—That is not only a statement of fact. It implies this, that if there were only sufficient goods to meet current needs of the community in 1928, and that supply is now reduced by 25 per cent., then there is an actual shortage on the goods side—that is, goods actually produced. I am not referring there to potential capacity.

But we have 70,000-odd registered unemployed, including men of almost every trade and profession ?—But that is covered here in the same paragraph, where reference is made to the fact that for various reasons our productive capacity has not been fully utilized.

That mitigates the effect of the previous sentence, but the trouble is that people reading this hurriedly may only get the one side of it without the qualification. I draw attention to it because that will correct it perhaps. Then the last sentence in the same paragraph: "But whatever action is necessary to do this lies outside the monetary system, for the additional production will automatically draw forth the additional purchasing-power required to buy those goods." Is that true ?—Broadly, I think it is.

Can it possibly operate that way ?—Yes.

Here is a point that may be new: It is suggested that no industry distributes as much in purchasing-power as is included in the cost of the goods that it produces ?—I think that is a fallacy.

May I give you an illustration to indicate what I have in mind. Before constructing any capital works we must of necessity first save up food, clothing, and shelter and suchlike things for the men engaged on that work. In order to distribute that food, clothing, and shelter we have to use money. We borrow money for the purpose. We distribute the money as wages. The wages are used to purchase the food, clothing, and shelter that we have saved up, and the money is paid back to the issuing authority, and at the end the whole thing is complete. The factory or other capital works are completed, the goods that have been saved up have been consumed, and the factory is free of debt. Now, we start the illustration, and to make it as simple as possible I assume that we get our raw materials

for nothing. We make no profit. We pay no rates and taxes. We deposit the title deeds of the factory with the bank as collateral security for an overdraft of, say, £1,000. Now, we start operating and we distribute the whole of that £1,000 as wages during the financial period of one year. At the end of the year, what is the minimum charge, The minimum financial cost of the product of that bank ?—What are you hitting at, bank interest ?

No. I will exclude interest altogether. Let me put it this way : The minimum charge must include the total wages that are paid out, £1,000, but the bank says this is a wasting asset, they insist upon the business being carried on on business principles, and they insist on a depreciation fund of 10 per cent.—that is to say, that £100 has to be paid back to the bank, so that the minimum charge that can be made is £1,100 and you have only distributed £1,000 ?—But the depreciation itself gets distributed. Depreciation is a fact which is going on all the time, and factories are wearing out and being replaced all the time, and, except in an odd case where you have a sudden increase in capital expenditure so that the amount being set aside for depreciation is for the time being less than is being spent in replacement of assets, the thing balances all right.

I am not saying it is wrong, but that is the procedure. If that is true, and I cannot see any fallacy in it myself (I have been thinking over it for some four years)—if that is true, then it is also true that that kind of thing applies to every industry, and no industry is apparently able to purchase the whole of its own output, that it only succeeds in doing so by a variety of circumstances which are more or less incidental. For instance, the flotation of a loan by a Government and the construction of a road or a railway or a bridge. That distributes purchasing-power and the purchasing-power is able to purchase the surplus product of that factory. In turn that loan-money has to be recovered *in toto* by means of taxation to form a sinking fund, and so on. The suggestion is that industries and nations can only carry on under the present system by getting deeper and deeper into debt ?—There has been a considerable increase in debts, but I do not think it is a case of cause and effect at all. Fundamentally, it is not necessary.

At the present time there has been a tapering-off of national debts in particular, and private debts for that matter too, and the result of that cessation, or, as McKenna says, " the failure to inject increasingly large sums of money into the community, has caused the whole of our fabric to start falling in like a house of cards." That is the theory ?—In regard to this point that you mention here, I think the analysis of that made in that book of Cole's on " Money " is sound.

There was a most interesting controversy between Cole and Douglas on this very subject. It ran for some months in *Time and Tide* and one or two other London papers. I followed that controversy with a great deal of interest, and Cole shut up in the end ?—I went through that analysis very carefully and it seeemed to me to be quite sound.

I draw attention to it purely because you take it as a particular question here, that the additional production does automatically follow. I suggest that that cannot be regarded as certain by any means. It is worthy of further investigation anyhow ?—That is a matter of opinion. I am satisfied on the point, and hence the statement.

We have had such a painful experience here. Mr. Massey can tell you that our production of butter has gone up tremendously, but it has not called forth the extra purchasing-power, has it ?—No. But that is due to an external cause.

It is not automatic then ?—I am speaking there of local production.

But does it do it in local production. I think it is open to question even there. You have goods here being produced in the country that cannot be sold ?—You are referring to the case where, to meet the market, we have to sell goods below cost. That is practically what the farmers are being compelled to do at the moment in many cases. They are being compelled to sell butter below cost.

That is not because the people have all the butter they require. It is because they cannot afford to buy more ?—And the reason they cannot afford to buy more is due to a great many causes.

Page 12, the fourth paragraph : " We will have a New Zealand board of directors exercising a deliberate and conscious control of our monetary system in the best interests of the Dominion as a whole." The fact that that control is on sterling balances and sterling policy is controlled by the Bank of England, is that quite justified ?—I do not get the point of your question.

We decided some little time ago that the monetary policy of this country is tied up with—linked—to sterling policy, and that sterling policy is controlled by the Bank of England ?—Yes ; in its reactions to prices.

Under those circumstances I suggest that it is not clear that it is quite justifiable to insert that sentence ?—The point of that statement is this : That up till now we have not had any deliberate or conscious policy in our monetary affairs at all. In future we are going to have it, and the Board has been so constituted—as far as it can be—that we have removed all other incentives from them as far as possible in order to leave them to base their decisions solely on the welfare of the country in general.

But the proof of the pudding will be in the eating ?—Yes ; the human element is there, of course.

A bit more than the human element. You have the legal restrictions that the Reserve Bank must operate on ?—Yes. Though at the present moment it is quite open. They are not tied at the present time at all.

That is true, of course, and you have the further point that that Act can be amended or repealed. I call attention to the fact that I think those words are not quite justified. The same thing applies to the last paragraph of the whole thing. That is really, as I read it, a condemnation of the existing banking system. It is a negative condemnation, in that this is reckoned to be an improvement. It means that the existing banking system is not flexible enough—that it did not provide, on a sound basis, ample credit resources ?—Yes and no. That is true in this aspect, that while they had the

power to do it, as they did not have any deliberate or long-range policy at all, the banks did not always make the best use of their powers. That is the sense in which I mean it.

Could it be put this way: That the trading banks are left to pursue their ordinary proper bank functions ?—Yes.

But that some power has been removed from them that will now be operated by the Reserve Bank ?—Yes.

And may I suggest that it is a little misleading to describe that institution—the Reserve Bank—as a bank. Is it not rather the modern equivalent of the Royal Mint ?—No. I do not think so. The work of a mint is purely putting a State certificate on metal is it not ?

Is it not putting the sole fount of the manufacture and issue of coin with the Reserve Bank ?—No it does not directly bring the coin into use, it only regulates the other banks in doing so. The increase and decrease of credit will still be carried out by the commercial banks in making advances as they do now; except this, that there has been a method of control over their operations devised whereby the Reserve Bank will exercise an overriding power to make them pursue a given line of policy.

But the words are in this Act somewhere "manufacture and issue." Do you remember them ?—Of bank-notes ?

Yes ?—Yes.

It is section 23, subsection (3) (*h*). I will read it: The form, denomination, design, and material of bank-notes, and also their manufacture, custody, issue, redemption, retirement, and cancellation ?—That is true.

If we applied that term to coins that would be in effect what the Royal Mint does ?—Yes. But the Reserve Bank does a lot more than that. The point is, that those bank-notes, as pointed out in this article, are purely subsidiary to the credit structure.

The Reserve Bank does do more than that, it keeps the Bank accounts ?—The Reserve Bank can do this, if they think an expansion of credit is desirable, they have various means of bringing it about.

They can force people to borrow ?—No, but they can tempt them.

Meaning that the present banks do not tempt the people to borrow ?—No, not to the extent that they might. The whole thing comes back to banking policy. It might be pointed out that our commercial banks are primarily profit-earning institutions, and they are after profits in business. When times are good they may fall over one another in their competition for business, and thus tend to carry things too far. When times are bad and they are all trying to avoid losses they will probably tend to go too far in the other direction from the point of view of being too sudden and drastic in restricting credit. Now our Reserve Bank, being freed from pressure in chasing profits, should avoid these pitfalls.

Is the Reserve Bank free from that ?—Yes. It has no interest in profits at all. That is the whole object underlying the provision whereby the State takes all the profits apart from the fixed dividend on the share capital.

Why was it considered necessary in these circumstances to have private shareholders at all ?—That is one of the means devised as an additional measure of stability, with the idea of keeping the controlling factor of monetary policy to some extent outside burning political questions of the day. It is only a means of giving an extra broad basis to the Reserve Bank.

On page 2 of your statement you say, "but it is nevertheless true that to a large extent the initiative rests with the trading community" as to whether they are going to have credit or not. Is that correct ?—Yes.

So that the banks do not control the situation ?—No. Their action is largely passive.

They are not a positive element in bringing prosperity necessarily ?—No. They can tempt people, but they cannot force them into taking action.

Mr. Langstone.] What is the position when there is a sudden calling-in of overdrafts like there was in 1921 ?—That comes back to the point that I made earlier, their power of positive action is greater in stopping a boom than in starting a forward movement following a depression.

If it is nevertheless true that to a large extent the initiative rests with the trading community, if the banks call in the overdrafts how can a community come into it. It has been initiated by the banks ?—That is restriction. I am speaking here, of course, of moving the other way.

Dr. Sutch.] On page 5 you say, "The export of gold for exchange purposes has been absolutely negligible." After the Exchange Pool was there not £1,000,000 went out to assist sterling balances ?—Yes.

That definitely was to help the sterling funds overseas ?—Yes.

On page 6, at the bottom, you have an item "sterling" in your account there, and you have a Profit and Loss Account of £5,000. Are you not adding New Zealand currency and sterling together ?—Yes. That is so. Normally the basis upon which sterling should be included depends upon the relative position of the two currencies.

It would be included in New Zealand currency, I suppose ?—Yes, if we had a different money of account than sterling. In other words, if you assume that our parity of exchange is no longer pound for pound.

Is not the assumption that the exchange was £105 ?—Yes. That is true, but still that is presumably only a fluctuation.

I was inferring that it should be brought into the balance-sheet at its New Zealand value at the moment ?—That would not be sound. Supposing the exchange was fluctuating widely and went to 50 per cent., you would then have a large increase in your sterling assets, whereas later on you might have to sell that sterling for 10 per cent. or for par.

On page 8 you have "The firms concerned all have accounts with the banks, and if John Brown transfers £1,000 of his deposit at the bank to a stock and station agent the net effect on the aggregate

figures of the bank is nil." Are there not some of these stock and station agents who do not have accounts with the banks ?—No. I should not think so. The banking machinery is such a convenient facility that I could not imagine such a firm carrying on without it.

Mr. Fussell suggested there were some who worked outside the system ?—No, only in relation to exchange business.

If there is a fall in the British price-level and our imports fall in value as much as our exports do, that is not an advantage to New Zealand, is it ? If we have fixed external debt payments what we would want would be higher prices in England ?—Yes. If the fall in the import prices was equal to the fall in export prices so far we would be no better or no worse off, except in so far as we would suffer from our fixed charges.

If both sets of prices fall equally we are still worse off ?—Yes.

Why have you fixed the exchange-rate with a swing of £1 10s. per cent. on either side of what it is stabilized at ?—It is only a theoretical point worked on the approximate cost of shipping the gold from New Zealand.

But we would not be on the gold standard ?—But we may use the same theoretical gold points as though we were.

But you do not need to ?—We could allow more latitude if desirable and allow a swing of say 5 per cent., but the wider it is fixed the less definite is your basis.

Do you think the advances that have been given to the Government on the Banks Indemnity Act have tightened credit to the rest of the community ?—No. Not the actual advances to the Government, but what has tightened up the position is really the rate itself. The point is this : That we give the banks Treasury bills and they give us the sterling which they do not want on the present basis of operations, but it does not tighten credit up. If they had any use for the sterling as a basis for credit here they would not give it to us.

Do you think an additional amount of deposits with the banks enabled them to give more sterling ?—Additional deposits with the banks normally come from two sources. One is from the sale of exports abroad, and the other from the issue of advances in the country.

But with a single bank, if it sees its deposits going up will it tend to make advances ?—Yes.

So that it bases its advances to some extent on the amount of its deposits ?—Yes.

Captain Rushworth.] But it does not lend its deposits ?—Actually when the margin is widening it is an indication that London funds are piling up and to that extent the banks can afford to expand credit in the country.

Is it not an indication that more money is being drawn out of industry ?—No.

Dr. Sutch.] Does the sterling-exchange standard mean that we have no control over our internal monetary situation ?—No.

So we can control our monetary system here despite the fact that we have sterling balances ?—Yes.

I was wondering whether sterling balances are determined on sterling policy. At present sterling policy is inflationary—the price of butter has not been helped, the price of wool has gone up quite apart from the sterling policy. Here we have our sterling balances increased in one direction and decreased in another, but both those things have happened quite apart from sterling policy. We are not controlled as much by the Bank of England policy as one might think ?—No, we are not ; particularly in the short-run, but in the long-run the level of prices is the governing factor and in the long-run its banking policy must affect prices.

It is the demand for our products in various parts of the world rather than sterling policy ?—Yes ; that is implied. The monetary policy in Great Britain is not the sole determinate. The action taken in other countries must vitally affect the British situation, because, no matter how they tried in Britain to work to a given price-level it could be seriously upset by the action taken in other countries.

So that, even if the State wholly controlled the Bank of England, it would not necessarily mean that we were going to be better off in New Zealand ?—No ; it could work out otherwise.

Does the British Government have a controlling influence in the Bank of England ?—Legally, no.

But in fact ?—I should say that they would be a powerful influence.

So that the decisions of the Bank of England are really the decisions of the British Government ?—Some people put it the other way round, and say that the decisions of the Government are really the decisions of the Bank of England. I should say there was very close co-operation between the two, and at one time it might be the opinion of the one and at another time the opinion of the other.

The Chairman.] There have been times when the British Government have been able to compel the Bank of England to do things for them ?—Yes, and in a time of crisis the opinion of the Government would go.

Dr. Sutch.] Do you think that a stable price-level is necessarily a good thing ?—No. Not altogether.

In the United States we had a Federal Reserve policy which accentuated the present depression very much. They kept prices stable instead of allowing them to fall. The cost of production was falling and there was a profit inflation instead of falling prices ?—The price-level should fall with the fall in costs, so that the consumer may get the benefit.

A stable price-level is not necessarily always to be aimed at ?—No.

Do you think that expansion of the currency here is just as good in operation as borrowing abroad and expanding that way ?—That is a difficult question to answer. It depends on the circumstances ruling at the time as to whether borrowing abroad is advisable or not.

Borrowing abroad when expanding the currency here. If we had a fixed policy we could either borrow on Treasury bills or borrow abroad. Do you think they are exactly the same process ?—No.

What is the difference ?—When you borrow abroad you borrow goods—that is to say, you bring in an additional volume of goods and services and apply them to the purpose for which you are raising the loan.

When you are borrowing abroad you are borrowing wealth, when you are issuing Treasury bills here you are not necessarily adding to the sum total wealth against which those Treasury bills will be spent ?—No.

Mr. Langstone.] What is the difference ? Suppose you fetch in extra wealth and never use any more of your New Zealand wealth and by note-issue or raising a loan utilize the wealth already in existence it is purely a matter of bringing goods into consumption is it not ?—Yes, but the question as to how far you can deflect the purchase of goods from current consumption or rather the labour of your people into capital works depends on how much you can afford to save.

Dr. Sutch.] Do you think it is advisable, say, to control the importing situation so that imports would have to be rationed over a price fixed ?—Generally, no.

Mr. Langstone.] I suppose that if we want to keep assets and securities stable we must have a stable price ?—More or less, yes.

And yet you do not believe in a stable price ?—But that is not to say that I believe in wide swings in price.

In reply to Dr. Sutch when he asked if you were in favour of a stabilized price you said it was not desirable ?—Not to this extent : That I say the price-level ought to fall with the fall in the cost of production in order that the consumers might get the benefit of the technical improvement.

If we want to have some standard basis of security it seems to me that the price factor is the central determining factor of all of your assets and securities, and you cannot have stability of securities and assets unless you fix your price factor ?—Yes, but you can have a great deal of fluctuation in individual prices which will not disturb your general price-level.

Hon. Mr. Downie Stewart.] I understood that you thought it was desirable, but very difficult ?—Yes.

Mr. Langstone.] In the beginning of your paper you point out that the gold standard does not apply, and you are evidently trying to set out that in an endeavour to keep the external exchange stable ?—No, it was not. The origin of the whole thing is that it is evident from the existing bank laws, apart from the Reserve Bank legislation altogether, that it was the original intention that we should work on a stock of gold in the country. It did not work out that way.

Inherently that is false. It is false for two reasons, if you take gold out of the country to settle exchange you constrict the base of your own currency ?—Yes.

You put up the bank-rate and also there is a fall in prices ?—Yes.

You have the bank-rate rising and the prices falling ?—Yes.

So you get a double disadvantage at the one time ?—Yes, that is inherent in the whole operation.

That assumes, then, that the question of the gold standard is a fallacy ?—No. The gold standard works to that extent automatically. One of the reasons why the gold standard did not work in the post-war time was that it was not allowed to have those effects.

You point out also that in 1914 we had £1,700,000 in notes, but on the gold held, provided there was sufficient Government securities purchased, the notes could have been £16,000,000 ?—Yes.

So really the amount of coin in circulation depends upon the action of the Government ?—No ; because the point you come back to is that the quantity of notes that go into circulation depend upon the habits of the community in relation to the volume of credit.

There seems to be some relationship between the bill money of the nation and the credit money ?—As the system operates in Great Britain that is the position. The controlling factor is the cash resources and they have the credit expanded almost to the limit. Our system really works the other way round.

Do we not in this country—if there are more advances is there not therefore a greater demand for cash ?—Yes.

And even if it is given to the Government and other people and there is an expansion in business there is a bigger payment in wages ?—But then the ratio on which cash goes out depends on the extent payments are made by cash and cheque respectively.

Our habits have not changed entirely. In 1921 there were about £8,000,000 of notes out. To-day with our greater increase in wealth, you have about £6,000,000 of notes out. We have greater wealth to-day, there are better roads and more factories, and everything ?—But those are not factors that directly bear on the quantity of money at all. The note-circulation and the circulation of volume of credit are dependent upon the current supply of goods that are up for sale. Factories and lands generally are not in the market for sale.

People are wanting things, but very few working-people have banking accounts, or for some reason or other they are not able to get them ?—In other words they have not got work, which in the majority of cases means they have not a job.

The basis of income in New Zealand to the working-people is work ?—Yes. It is the basis of income of every one, more or less.

But through something remiss in our monetary system these people are denied the right to work not because they are not willing to work, but because they cannot get work ?—But I do not think you can lay all that at the door of the monetary system. There are a great many other factors such as the question of disorganization.

How is the disorganization brought about ?—As far as New Zealand is concerned it is through the violent fall in sterling prices.

Why did prices fall ?—You mean in Britain ?

Yes ?—Through the interaction of a great many causes.

We have it from Dr. Walter Leaf in his little book on banking that the Government definitely decided on a policy of deflation, and they paid off securities of £500,000,000 ?—No, they funded their Treasury bills.

No, they did not fund their Treasury bills. They collected taxation and they redeemed the debt to that amount ?—What they did in effect was they collected money from the taxpayers in general, and handed it over to some of the taxpayers who were bondholders.

When they took that £500,000,000 from the taxpayers and paid it back to the bank it destroyed that amount of credit. Therefore while you had the same amount of money required you had £500,000,000 less ?—You imply that the Government should never pay off debt ?

I say it is not advisable for them to pay off debt. In fact, I say the Government should never get into debt. Again, on page 46 of his treatise on banking he says,—

> On the outbreak of the war a new fiduciary currency was established by the issue of notes through a department of the Treasury. The amount and manner of the issue was left to the absolute discretion of the Treasury. This was essentially a war loan free of interest, for an unlimited period, and as such was a highly profitable expedient from the point of view of the Government.

That was free money ?—That boils down to this, that it was practically a forced loan on the part of the community.

Is it not a forced loan if it is issued from the banks—it is a forced loan over the community. Only there is this : That the Government did not have to pay that back ?—Actually they did issue Government securities to the Note Redemption Fund, and those securities are still outstanding.

But they were non-interest bearing ?—No.

The first lot of the John Bradburys had no interest attached to them ?—No, but the Government established a Note Redemption Fund, and every note issued was covered by Government securities. The Redemption Fund, I think, was established with the establishment of the issue.

But that would only be a matter of book-keeping anyhow ?—Yes.

You could not owe money to yourself ?—No.

And the State could not owe money to itself ?—Broadly, no.

The fundamental principle behind the issue of money is no different between what the banks are doing to-day and the Government of Great Britain did in 1914 ?—To what banks are you referring now.

If the Government wants a loan to-day the banks accept Treasury bills. They advance against those Treasury bills by way of discount ?—They buy securities.

With what ?—They create a deposit.

But that creates its own deposit. When it is circulated in the community it goes back into the bank again. So the banks have not used anything belonging to themselves ?—No ; but a liability to other depositors is created.

They get 5 per cent for using the people's credit. Their share for doing that job would be £50,000 a year. If the State did that for themselves they would do it without paying £50,000. They would not be owing a debt, whereas now they pay this £50,000 every year and still owe the debt ?—Yes, that is true up to a point too ; but they can pay the debt off.

The State cannot pay a debt off to themselves ?—They can to the bank, though.

Yes, if they issue it through the bank, but if they issue it through the Treasury the Government will not be recalling that much of your issue. Assuming you had a State issue of notes and their purpose being effected you wanted to bring the volume of money back to what it was, you would have to recall your issue ? You come to Captain Rushworth's point immediately you do that. If £1,000,000 is necessary to do a certain job, when it is done the amount for all the labour and industry to do the job is demobilized and that £1,000,000 is taken out of circulation. You have still got the counterpart of a hundred men ?—You contend then that there should be no reverse gear at all.

If a Government collects taxation, which is an evidence or a contribution by the citizens to the Government itself, if the Government are spending that amount, the citizens get the benefit ?—Taxation is an entirely different matter to the question of issuing additional currency.

But the Government goes to get financial accommodation because they are short of income—that is, the proceeds of taxation are not sufficient, otherwise they would not discount Treasury bills ?—No. But the point on which I disagree with you is that deficit financing on Treasury bills should be a temporary phase, and the position should later be made good. If there is to be no reverse gear you are going to steadily, over a period, depreciate the value of money.

If we take the year's trade about 1921 onward where we gave back, I think, £4,000,000 per annum (some years much greater) in remission of taxation—the income-tax, you will remember, was reduced from 8s. 9d. to 4s. 6d.—at that same period when we were giving away our revenue, we were borrowing millions abroad to make up for it ?—No, not to make up for it. The two things might still be quite consistent. The fact that you are reducing taxation means that you are leaving a larger share of the current production available to residents of the country in their private capacity. That might still be consistent with the fact that you have insufficient to save enough to carry out the loan project.

We will say you gave back in taxation £4,000,000 and borrowed £6,000,000 ; you would possibly have needed £2,000,000 ?—The point is this, when you are remitting taxation and as it were cutting down the surplus, you are giving to the community. It is only a question whether the community gets better service when it is carried out by the State instead of by themselves. Otherwise you might say you could collect the whole income of the community and do everything for them.

There is no further obligation attached to the money they receive from taxation ?—Because they are making demands on people to hand over a share of their income in payment for services they have received from the State.

But if you borrow money, there is a continuous liability attached to it. That is the difference between the two forms, money raised purely from revenue and money raised from loans ?—I grant that. There is this vital difference that the limit of borrowing is the limit of what people can afford to set aside out of their current consumption.

You remember the Auditor-General pointing out a case where in 1879 we raised a loan of so-much. We transferred it into stock at 4 per cent. giving them a big discount. Then gradually it went through another process and latterly we had to reconvert it at a higher rate of interest. All the work done fifty years ago has gone out of existence, but the debt charge remains and is increased by 28 per cent.?—I do not know whether the work has gone out of existence or not; I assume it was used for railway construction or similar work.

Yes, for railways and for bridges washed away. Therefore you have got no asset, but a liability. Wherever you had any money through revenue purposes, even if you have got no asset, you have still got no liability ?—That comes down to this: whether you will make the community save the cost of that asset in one bite or spread it over a period.

The question of an internal price-level: We will assume that we gave a farmer £3,000 for a quantity of butter in New Zealand currency. We took that Home and it was sold for £1,000. £1,000 worth of goods was brought into New Zealand, and by way of bringing them up to an internal price-level we added an exchange-rate or a Customs duty or something of the sort. There was only £1,000 worth of goods, and we had £2,000 making the balance of £3,000 we had given for them. Would it affect your exchange-rate ?—Yes, that would be the exchange-rate.

It still leaves you £1,000 in England to buy £1,000 worth of goods, but still leaves you £3,000 in New Zealand. Do you not see that that is totally different from what you are doing to-day ? The fellow to-day is getting £1,000 for the goods, but owing to all the internal charges, no external charges, they are at least £2,000 in New Zealand. He has only got £1,000 worth of income to buy them with ?—Apart from the exchange, the cost of imports is put up by taxation, but then that only boils down to this: That that farmer, or whoever it is, having received the £3,000, has to hand a share of it over to the State who in turn spends it for him.

The reason they gave him the £2,000 bonus in the first place was to monetize his wealth to meet monetary commitments ?—But his taxation is part of his commitments.

Taxation is only difficult when you have not an income. He has still the same taxation on £3,000 as he had on £1,000 ?—Why ?

For the reason that he has still the same rates and insurances to pay, and the same cost of living ?—You mean he has got fixed charges. That is taxation on him. Some of his taxes are fixed, his land-tax and rates are fixed. His income-tax is not, and to some extent his Customs tax is not.

It is not so much value; it is a question of monetization of it, or the demonetization of it. In New Zealand the people are short of income, not of wealth ?—Our income is a question of cost on the one side and returns on the other.

Our income is determined by real things, goods and services, but we leave it to some other country to fix what that monetization point will be ?—We cannot do otherwise.

Why can we not ? Why did the Government inaugurate an exchange-rate ?—To increase the return to the primary producers.

There was no need to have kept it to 25 per cent.?—The higher it went up, the greater would be the difficulty of maintaining it.

The difficulty in maintaining the exchange-rate was this: That they stopped the price from falling as low as it would have fallen, but they never put the extra money in to sustain that price. If they had put 25 per cent. more currency into circulation, we would not have felt the exchange in this country at all ?—By that you mean that the rate was fixed without relation to our internal conditions to the extent that the rate was artificial ?

I say the whole thing is artificial ?—What you were advocating was an extension of the same thing.

With this fundamental difference: That we give the farmer the income first; when the charges come afterwards he is in a position to pay them; he is solvent ?—In other words, you say that the exchange-rate should have been left to look after itself and the additional money paid out in New Zealand.

I say that has a two-fold effect—one, you give the farmer here the price for his product, the exchange overseas belong to the Government. Seeing that they have paid for them here, then they know the quantity of them overseas. It is quite a simple thing, then, for the Government to determine what quantity of goods is to come into New Zealand ?—Whatever you add on the one side you have to add on the other, and also have regard to whether the community in their present state of incomes can buy those goods.

The void is with the bank to-day. The banks say they cannot put money into the pockets of people unless they have assets and securities, but the Government could, if it wished ?—The Government could ? How ?

By starting public works, pensions, superannuation, &c. ?—Or increasing salaries ?

Yes. It seems to me desirable that if they fix an internal price-level for goods they would have to fix an internal wage-level ?—That is implied, you would have to control it right through.

Replies to Questionnaire submitted to the Associated Banks, 7th March, 1934.

Question 1. What determines the rate of interest charged and paid by the banks ?

Answer: Broadly speaking, it may be said that the law of supply and demand determines interest-rates charged and paid by the banks.

A considerable portion of a bank's profit-earning capacity rests on the margin between their deposit and their overdraft and discount rates. The necessity for maintaining an adequate margin has, therefore, a bearing on advance and deposit rates.

There is no fixed figure which can be quoted as the actual margin, which varies as between deposits of different terms, and as between overdrafts yielding different rates of interest; it may be mentioned however, that the margin between the minimum overdraft rate and the twenty-four months' fixed-deposit rate is at present 2 per cent., though the margin is only 1½ per cent. and even ½ per cent. in respect of may fixed deposits still current. From the margin between the deposit and overdraft rates the banks have to make provision for a considerable portion of organization and running-expenses, reserves, depreciation, bad debts, and income-taxation; after making these provisions the margin left for net profit is extremely narrow.

For taxation purposes it is arbitrarily assumed by the Taxation Department that the income earned by each bank is constantly 30s. on each £100 of the total average assets and liabilities of the bank for the four quarters of the year, less bad debts actually written off and the income on tax-free securities.

On the fictitious income computed on this arbitrary basis the banks are required to pay income-tax at the maximum rate.

No allowance is made for the fact that in lean years bank profits represent a much smaller proportion of total assets and liabilities than in good years.

The margin between overdraft and deposit rates is required to furnish income-taxation to the extent of 17s. 6d. for each £100 of overdrafts plus each £100 of deposits, and this fact, of course, must be taken into account when fixing the minimum overdraft rates.

The necessity of having a margin between overdraft and deposit rates indicates the fact that bank overdraft and discount rates depend to a large extent on the rates paid for fixed deposits. What then, it may be asked, determines the rates paid by the banks for fixed deposits? The answer is, that these rates depend on the interaction of supply and demand for deposits. It is clear that, to preserve what the banks consider a proper volume of deposits, it is necessary for them to offer rates which will enable them to compete effectively with the rates offered by the competitive institutions, such as Government Departments, including the Post Office Savings-bank and Public Trust Department, also many trading concerns. In this connection the following official statement by the chairman of the associated banks was published on 27th February, 1933:—

> Were overdraft rates to be reduced without adequate adjustments being made in the method of taxing bank incomes, the inevitable and inescapable result would be to curtail the banks' means of assisting their customers and the community in general. The banks are willing to provide additional relief to the present situation by way of further reduction in interest rates if, to enable them to do so, some reasonable and fair alterations are made in respect of their income taxation, and if the Government rates for deposits are suitably reduced.

Further reductions in deposit and advance rates were subsequently made as indicated in the reply to question 2.

Question 2. To what extent has interest on overdrafts and other advances been reduced, and what proportion of accounts has benefited?

Answer: During the past four years the minimum rates for overdrafts and discounts have been decreased as under: On 1st November, 1931—Reduced from 7 per cent. to 6½ per cent. On 1st September, 1932—Reduced from 6½ per cent. to 6 per cent. On 1st May, 1933—Reduced from 6 per cent. to 5 per cent. The present minimum rate is 5 per cent. All accounts have benefited.

During the same period fixed-deposit rates were reduced as under (reductions applied to fresh deposits of all terms from three months to twenty-four months, but only the twenty-four months' rates are quoted here to illustrate the degree of reduction): On 1st August, 1931—Reduced from 5 per cent. to 4½ per cent. On 1st June, 1932—Reduced from 4½ per cent. to 4 per cent. On 2nd December, 1932—Reduced from 4 per cent. to 3¼ per cent. On 11th July, 1933—Reduced from 3¼ per cent. to 3 per cent. The present rate for twenty-four months' deposits is 3 per cent.

It should be mentioned that these reductions apply only to deposits taken subsequently to the dates mentioned, and that the customers whose deposits were already current on those dates continued to receive the benefit of those higher rates until their deposits matured—for example, though the twenty-four months' rate was reduced from 4 per cent. to 3¼ per cent. on 2nd December, 1932, a considerable volume of fixed deposits are still receiving the 4 per cent. rate, and some even 4½ per cent., though the present rate quoted is only 3 per cent., so that, in view of the reductions in overdraft rates during the past few years, it is clear that a material proportion of the banks' overdraft deposit business has been unremunerative to the banks during that period. This can be illustrated by taking the case of fixed deposits receiving 4½ per cent. concurrently with the existence of the minimum overdraft rate of 5 per cent.

The margin between the two rates is 10s., which margin is obviously inadequate to provide the expenses in respect of such business—*i.e.*, 17s. 6d. income-taxation in respect of each £100 of such overdrafts plus each £100 of such fixed deposits and, in addition, a proportion of other overhead charges and trading expenses.

Question 3. To what extent are variations in interest-rates reflected in the number and volume of applications for advances?

Answer: It is a well-known economic fact that the *tendency* of higher rates is towards lessening the number and volume of applications for advances, and that the *tendency* of lower rates is to increase the number and volume of applications. However, the variations in the minimum rates during the past twelve years have not exceeded a range of 2 per cent., and with the exception of the recent reduction from 6 per cent. to 5 per cent., the alterations have been only in ½ per cent. steps.

Other economic factors affecting trading conditions, then, have also come into operation, and the comparative trends of overdraft and discount rates on the one hand, and the volume of advances on the other, can be seen from the following table :—

Minimum Rate for Advances.	Per Cent.	Advances (excluding Government).	£
June, 1920	6	June quarter, 1920 ..	34,790,000
January, 1921	6½	December quarter, 1920 ..	47,118,000
March, 1921	7	March quarter, 1921 ..	52,446,000
January, 1923	6½	March quarter, 1923 ..	42,522,000
May, 1927	7	June quarter, 1927 ..	50,753,000
July, 1928	6½	September quarter, 1928 ..	45,119,000
February, 1930	7	March quarter, 1930 ..	53,677,000
November, 1931	6½	December quarter, 1931 ..	51,017,000
September, 1932 ..	6	September quarter, 1932 ..	49,975,000
May, 1933	5	June quarter, 1933 ..	46,757,000

From this table it will be seen that sometimes, contrary to the economic *tendency*, the volume of overdrafts has increased after overdraft rates have been increased, and has decreased after overdraft rates had been decreased.

Question 4. What are the limiting factors at present time in respect to—

A. Further lowering of interest-rates?

B. Further advances for business?

C. Is there any unsatisfied demand for the latter?

D. Does the amount of advances depend on the amount of legal tender held by the banks?

Answer : A. The answer to the query as to the limiting factors in respect to further lowering of interest-rates is to a large extent contained in the answer to question 1 of the questionnaire ; it may be said briefly by way of recapitulation, however, that at the present time the limiting factors are :—

(*a*) The obstacles to reduction of fixed deposit rates—namely, outside competition, which hinders further appreciable reduction in the fixed deposit rates.

(*b*) The fact that there are still fixed deposits receiving interest at the rate of 4½ and 4 per cent., though the twenty-four months' rate now quoted is only 3 per cent.

B. The limiting factor in respect to further advances for business is as under :—

As a result of the heavy fall in overseas prices for our exports on which this country very largely depends, and the consequent impact of the depression on New Zealand, there are fewer avenues of profitable employment of money. The effect of this is—

(*a*) That those who possess liquid funds refrain from employing them :

(*b*) That those who could obtain advances, or who could increase their advances, refrain from doing so.

C. As to whether there is any unsatisfied demand for advances for business, it is a simple fact that there is no bank limitation. In fact, the banks are very willing to extend their advance business, and the reduction of total overdrafts is not in accordance with their own wishes. The factors a banker takes into consideration in granting such advances are those set out in the answer to question 9 ; to advance money on inadequate security or unsound propositions would have the inevitable effect of freezing bank resources and aggravating the existing conditions.

D. The query as to whether the amount of advances depends on the amount of legal tender held by the banks is not clear. Taking legal tender to mean legal tender notes, the amount of these *held* by the banks has no bearing whatever on the amount of advances.

If the question refers to legal tender in circulation, the answer is No.

If the question refers to gold coins held, the answer is also No.

Question 5. Has there been any appreciable change over a period of years in New Zealand in the cheque-using habits of the people? Would it be an advantage to encourage the general practice of using cheques in everyday transactions?

Answer : As in Britain and other English-speaking countries, the cheque-using habit is highly developed in New Zealand, and the proportion of cheque currency to note and token currency is in accordance with the convenience of the users. Statistics show that the ratio of cheque clearings to notes in circulation in 1932 was less than in 1928, which would be due not so much to the habits of the people as to the fact that cheques are more used for larger transactions and notes for lesser, and the decline in cheque clearings is merely a reflection of trading conditions. As to whether it would be an advantage to encourage the use of cheques in everyday transactions, it may be mentioned that cheques are already so used widely, and the Government stamp duty of 2d. per cheque, coupled with the convenience of legal tender for pocket and till money, would probably militate against a much more general use of cheques.

Question 6. Do stock and station agents come into active competition with trading banks?

Answer : To the extent that stock and station agents perform banking functions they may be said to be active competitors. This is involved by the very nature of stock and station agency business ; but, as against this, there are certain functions performed by stock and station agents which are

outside the scope of ordinary banking practice. To some extent some stock and station agents obtain financial accommodation from the banks, but they also get their funds from—

(1) Their own shareholders;
(2) By debenture stock;
(3) By deposits from customers.

There are examples in New Zealand of large stock firms which do not require financial accommodation from their bankers.

Question 7. What proportion of the exchange business of New Zealand is conducted by the trading banks—(a) in normal times; (b) at present?

Answer: These particulars are not available to us. Possibly 80 per cent. or more is done by the banks, but this is merely conjectural. Under present exchange conditions there is more inducement for importers to endeavour to deal outside the banks.

Question 8. In normal times what is the procedure and what are the determining factors in settling the exchange-rate?

Answer: Broadly speaking, the exchange-rates in normal times depend on the supply of and demand for London funds, and these exchange-rates may be said to represent the market price at which London funds are bought and sold.

If an unbalanced external trading position results in a shortage or overaccumulation of London funds, it is, of course, necessary to make adjustments to correct the position, because it is obvious that the perpetuation and aggravation of such a position would be to the detriment both of the banking organization and of the country in general. In the last analysis goods pay for goods, and the goods we import must be paid for by the goods we export. Government borrowing overseas would have the effect of relieving a shortage of London funds which might otherwise necessitate an increase in the exchange-rates. An unfavourable trading position might be coupled with conditions of demand for bank accommodation necessitating an increase in overdraft rates.

Subject to the above remarks, it may be said that in normal times an increase in the exchange-rates is an indication that the supply of London funds is less than the demand, and that a decrease in the exchange-rates is an indication that there has been an accumulation of London funds which cannot be disposed of at the current exchange-rate.

Question 9. What are the factors a banker takes into consideration in granting an overdraft?

Answer: These considerations are—

(*a*) The purpose for which the advance is required—*i.e.*, whether the money will be used in such a way as will enable the debtor to provide for interest and repayment, and so enable the bank to avoid becoming involved in frozen assets.

(*b*) The length of time for which the advance is required, it being borne in mind that bank advances are normally repayable on demand; this principle also being necessary to avoid tying up assets.

(*c*) Whether the present and prospective value of the security affords a sound and safe cover for the advance. The character and commercial morality of the customer is also largely taken into account, particularly where an advance or part of it is made on the "personal security" of the borrower.

(*d*) The banks of this country, recognizing that this country is predominantly a primary producing country, render financial assistance to a very large extent to primary producers; the proportion that advances to primary producing interests bears to total advances in New Zealand on the books of one of the banks, excluding Government accounts (which may be taken as a typical example) is—

	Per Cent.
Primary producers	53
Co-operative dairy companies	4
Mercantile concerns (which include stock and station agents)	22
	79
Industrial concerns	7
Other parties	14
	100

Question 10. Advances vary from year to year: What are the specific causes of this?

Answer: Broadly speaking, variations in the output and in the range of prices of produce and in imports may be said to be the root causes of advances varying from year to year. When seasons and prices are good, and the farmers' incomes increase, business activity is promoted, imports increase, new ventures are embarked on, and the demand for overdrafts is stimulated. Low prices, on the other hand, limit the farmers' spending-power, and the community has therefore to pass through the period of adjustment necessary to the altered conditions. During that period advances for new ventures are not so generally sought by borrowers.

Question 11. In declaring a dividend are reserves drawn upon?

Answer: It is not usual, even if permissible under bank's charter, to draw upon reserves to pay dividends; the general practice is to provide for dividends out of the years' profits. However, in special circumstances reserves might be temporarily drawn upon to contribute towards payment of the dividend; it may be taken as being contrary to banking practice to deplete reserves permanently for the purpose of paying dividends. Nevertheless, reserves form part of shareholders' funds, and the investment of such reserve funds, or the employment of them in banking business, has the effect of contributing towards the earning of dividends.

Question 12. If dividends are sometimes paid from reserves, are securities sold to provide for these?

Answer: Not necessarily, and we are not aware of that ever having been done in New Zealand.

Question 13. What are the uses of reserves?

Answer: Reserves are set by from undistributed profits and/or from shareholders' contributions for the following purposes:—

(*a*) To strengthen the bank's general position;
(*b*) To assist in maintaining the bank's position liquid—a necessity of the first magnitude;
(*c*) To provide for losses or other contingencies.

A primary essential for the effective conduct of sound banking business is that there should be entire confidence in the bank on the part of depositors, the business community, and the public generally; sound reserves provide a tangible basis for such confidence.

The banks, as trading concerns, adopt the practice of all prudent commercial organizations in building up adequate reserves to enable them to cope with adverse economic conditions. It is to their reserves, combined with prudent trading, that the banks of this country owe their success in withstanding the impact of the depression with unimpaired soundness and without losing one penny of their depositors' funds. Furthermore, banks, as repositories of the funds of depositors, have wisely and traditionally adopted the precaution of building up ample reserves which, apart from their direct utility in the ways just mentioned, afford a tangible assurance to depositors that their interests are being properly safeguarded; in this connection it should be pointed out that all sound banking concerns regard their first duties as being to safeguard the funds of note-holders and depositors. This is in itself a duty of national importance.

It may further be mentioned that the general practice with these reserves is to specially invest portions in readily realizable securities, preferably Government stocks, in balances with central banks and to employ the balance in the banks' own business.

Question 14. What were the amounts of sterling funds held on New Zealand account by the banks since 1920 to 1932 (quarterly or monthly figures)?

Answer: These particulars are not available, as it has not been the practice to segregate the figures.

Question 15. To what extent is there evidence that importers may be withholding external payments in anticipation of a return of New Zealand currency to its former parities?

Answer: There is evidence that external payments are being retained in New Zealand meanwhile, but so far as the banks are aware not to any considerable extent.

Question 16. Is there evidence of the withholding or the accelerating of capital movements from or to New Zealand by reason of current economic conditions or of the rate of exchange?

Answer: To assist the Government, and at the request of the Government, the banks decline to facilitate the transfer of capital funds from England to New Zealand. As to capital transfers from New Zealand, it is clear that the present exchange-rate acts as a deterrent.

Question 17. What other agencies in New Zealand, apart from the trading banks, extend credit to business men or farmers?

Answer: Other such agencies include—

(*a*) Stock and station agents:
(*b*) State Advances, including Advances to Settlers, Rural Advances, Rural Intermediate Credit, Advances to Workers, Repatriation Advances, Fruit Preserving Industry Advances, &c.:
(*c*) Government Life Insurance Department:
(*d*) Other insurance companies:
(*e*) Building and investment societies:
(*f*) Savings-banks other than Post Office Savings-bank:
(*g*) Wholesale houses and retailers:
(*h*) Dairy companies:
(*i*) Private lenders and trustees:
(*j*) Public Trustee.

Question 18. Would it be advisable to have greater co-operation between and, if possible, co-ordinated control over these outside agencies?

Answer: It is felt that it would not be competent for the banks to express an opinion on the principle of co-ordination or control of the outside organizations referred to.

Question 19. Are securities ever sold in order to obtain a greater cash holding?

Answer: Yes. Every bank carries easily realizable securities which are available should it be necessary to add to its cash holding.

Question 20. Are there any specific improvements in New Zealand's monetary policy that can be suggested by the banks as desirable from the viewpoint of restoring and maintaining general prosperity?

Answer: The present conditions in New Zealand are due to world conditions outside the control of this country; specifically—a fall in prices for our produce in the market where that produce is sold—and the banks emphatically consider that prosperity cannot be achieved by monetary manipulation.

As already mentioned, it is not the present banking policy to restrict financial accommodation, and, moreover, the amount of demand deposits in the trading banks and savings-banks alone aggregated over £70,000,000 at the end of 1933. The fact that money is available for good investments is evidenced by the response to the Reserve Bank issue, and by the premium already attaching to Reserve Bank shares.

The remarks of the Chairman of Barclay's Bank in the course of his address at the recent annual meeting of that bank should be of interest in this connection. He said:—

> It is a matter for congratulation that we are upon a sound financial basis, and that, largely owing to the wisdom of the Chancellor of the Exchequer, the wild and unsound schemes proposed for currency and credit manipulations, designed to secure a quick return to prosperity, have been disposed of. We should realize that only by constant, patient, and faithful adherence to sound principles can the credit of the country be maintained at its present high level in the eyes of the world, and that by these means alone can we hope to lead the world to eventual recovery.

Question 21. It is requested by a member of the Committee that a brief explanation of the working of the present monetary system be given, with particular reference to the following points:—

(*a*) A definition is required of money in its various forms:
(*b*) How money comes into existence:
(*c*) How it is put into circulation:
(*d*) How it is cancelled out of existence.

Answer: There is no universal monetary system, and a brief general explanation of "the working of the present monetary system" or systems does not seem practicable; moreover, the Parliamentary Committee has at its disposal expert economic advice on such matters. However, some comments on the monetary system affecting New Zealand may be of assistance to the Committee, and are given hereunder:—

Prior to the World War, and subsequently from 1925 to 1928 Britain was on the gold standard, and New Zealand was also prior to the war. From April, 1928, to September, 1931, Britain was on the gold exchange standard, or the gold bullion exchange standard, as it has sometimes been called. During the latter period New Zealand might be said to be on the gold exchange standard in the sense that gold bullion could, if necessary, have been obtained in London in exchange for the banks' London funds held there, but, in effect, the standard was and still is a sterling-exchange standard. In view, however, of existing conditions it would probably be more technically correct to describe the present standard in New Zealand as an exchange standard of inconvertible bank paper money depreciated below par with sterling, but bearing a definite ratio to sterling, which, in turn, is depreciated below par with gold.

Since the wealth and prosperity of New Zealand is founded principally on primary production for overseas markets, a fundamental service of the banks of this country is the financing of our external trade, which is, *per capita*, one of the largest in the world.

The broad basis of the operation of the working of this system of financing our external trade is well known, and only brief mention need be made.

To the extent that external trade transactions are made through the banks, the London offices of the banks receive the proceeds of our exports, and disburse the cost of our imports; these transactions are preceded or followed by corresponding entries in the bank accounts of the exporters and importers of this country; it is evident that the London balances are continually being augmented by funds received from the marketing of our exports and overseas borrowing and depleted by withdrawals to pay for our imports and Government and local-body interest.

Within the country the banks provide the standard banking services efficiently and as cheaply as possible. Financial accommodation is readily available for productive purposes under proper safeguards. The banking institutions of this country are established on sound principles, and their business is prudently conducted, with the result that they thoroughly merit the confidence reposed in them by depositors and note-holders, whose interests the banks regard as the primary banking duty.

(*a*) Definition of money in its various forms: Money has been defined as "that which passes freely from hand to hand throughout the community, in final discharge of debts and full payment for goods, being accepted equally without reference to the character or credit of the person who offers it and without the intention of the person who uses it to consume it, or enjoy, it, or apply it to any other use than, in turn, to tender it to others in discharge of debts or payment for commodities."—*Walker.*

Money has been more simply defined as "anything which is widely accepted in exchange for goods, or in discharge of other kinds of business obligations."—*Robertson.*

The conception of money consistent with these definitions includes—(1) Gold, silver and copper coins, (2) convertible or inconvertible bank-notes, (3) Government Treasury notes.

"Currency" is a more generic term, and is referred to by Sykes as follows: "The term 'currency' is generally used to denote the whole of the circulating medium by means of which debts are paid and prices are measured. It is synonymous with money in its broader sense, and contains the two subdivisions of the coinage and the paper circulation—that is, bills, notes, cheques, postal orders, and similar forms of money."

(*b*) How money comes into existence: (1) Metallic money comes into existence by being dug from the earth and minted.

(2) Bank-notes come into existence by being issued by banks, in accordance with the law of the land and under proper safeguards, and on a basis representing tangible value.

(3) Cheque currency comes into existence by being drawn by the spender on a bank or other firm which accepts deposits or makes advances that may be operated on by means of cheques.

(4) Government money (*e.g.*, Bradbury's) comes into existence by being issued by a Government Treasury Department.

Bank-notes in circulation are almost invariably backed to the full extent of their issue by gold and/or securities.

In English-speaking countries cheque currency forms the bulk of the circulating medium; cheque currency arises out of claims on banks or other firms by the drawers of the cheques. Claims on a bank entitling customers to draw cheques may arise from the following sources:—

(1) The deposit of gold, or token coins on current account.
(2) The deposit of notes of that bank or of another bank or banks on current account.
(3) The paying of cheques or other negotiable instruments into current account.
(4) The obtaining of a loan from the bank on current account. Such loans are usually backed by security lodged by the borrower over tangible evidences of real wealth—*e.g.*, land, buildings, or marketable goods or securities. Such cheque currency thus has the dual backing of—
    (1) The security against which the loan is granted;
    (2) Banking resources.

(*c*) How it is put into circulation: This question is partly answered under (*b*) above. Bank-notes are put into circulation—

(1) On the initiation:
(2) At the option—

of those having claims on banks, and to the extent that money in that form is effectively required for circulation in the community.

The expression "effectively required" is used because a person who had no goods or services exchangeable for money would not be able to effect any increase in the note-circulation on his own initiation or option.

Cheque currency comes into circulation at the option and to the extent required by those having claims on, and the right to draw cheques on, banks or other firms.

The modes in which bank-notes come into circulation are as under:—

(1) By the encashment of cheques or other negotiable instruments at a bank.
(2) As the result of those having gold bullion or coins, or token coins, exchanging them for bank-notes.
(3) By the payment of wages or salaries to bank employees.

The mode in which cheque currency comes into circulation is by customers of banks or other firms exercising their right to draw cheques, and by their exchanging such cheques for goods or services.

The mode in which coins may come into circulation are—

(*a*) By those having claims on banks exchanging other forms of currency for such coins:
(*b*) By the minting of coins.

(*d*) How it is cancelled out of existence:—

(1) Bank-notes: While in circulation bank-notes represent bank liabilities. When in the hands of the *issuing bank* the notes are neither bank assets nor bank liabilities. Bank-notes cease to be money in circulation when they are returned to the issuing bank, and are "cancelled out of existence" when they are no longer eligible or required for reissue. Cancelled notes are replaced by new notes to the extent effectively required by the community. Note issues are increased to the extent effectively required by the community, subject to statutory provisions.

(2) Cheque currency and other negotiable instruments are cancelled when they are presented for payment at the bank or firm on which they are drawn. The purchasing-power which they represent, however, is not thereby cancelled out of existence by banks; if they are paid into a credit account, they increase the balance of that account by an equivalent amount.

The expression "cancellation of money by banks" refers to the repayment of loans to banks. Such cancellation, while it may have the effect of decreasing the balances of some credit account or accounts (and so decrease the amount of immediately "spendable" money available) at the same time normally frees from liability to the same extent the property or other tangible form of wealth which had been the basis or security for the loan.

Unless such property or wealth has deteriorated in value, it can, if economic conditions warrant, be re-employed as the basis of fresh loans. The "cancellation of money out of existence" is normally at the option of the user or users of the money, and not on the initiation of banks.

WELLINGTON, WEDNESDAY, 7TH MARCH, 1934.

Witnesses: Messrs. T. G. A. HARLE, E. C. FUSSELL, and J. SHAW, representing the ASSOCIATED BANKS OF NEW ZEALAND.

The Chairman: Gentlemen, we have this morning Mr. Harle, Mr. Fussell, and Mr. Shaw, representing the associated banks. Now, the Committee first of all decided to send in one or two questions, and these have been replied to and the answers distributed last evening. The banks, on the other hand, have prepared a statement as from the associated banks, and this, of course, will be incorporated in the evidence as they have prepared it, I take it, to assist the Committee in their deliberations. I have not read it through, as it has only just arrived; of course it will be for the Committee to raise any questions that they care to put in regard to that statement itself. We have not arranged for any other witnesses, realizing that the banks' requests will take up a great deal of time, and no doubt we will be carrying on with them this afternoon.

I would like to ask you, Mr. Harle, if you would first of all read this statement, as we have not had time to look at it, and then possibly you may care to make a statement—it would be quite optional. Mr. Fussell and Mr. Shaw may also care to make a statement—you take the matter as you think fit. If it is not your desire to make a statement or to amplify what you have put in, then the Committee will take up the matter by way of question.

Mr. Harle: I thank you for your suggestions. We have prepared a reply to your questionnaire, as you will observe, very fully, so that your Committee will have the matter fully before you. We have prepared this minor statement with the object of placing before you a general outline of the banking schemes in New Zealand. I do not think there will be any need to amplify it, but we will be very pleased to endeavour to answer on all these matters whatever questions the Committee put. We may ask your indulgence to speak on another matter also.

Mr. Harle read the first statement. This was included as evidence:—

We have thought it desirable, with a view to saving your Committee's time in the ensuing discussions, to place before you a résumé of the incorporation of the trading banks doing business in New Zealand, showing how they obtain the franchise they hold, their functions, and some of the statutory restrictions imposed upon them.

1. There are six trading banks operating in New Zealand, and we deal with them in order of age in New Zealand:—

The Union Bank of Australia, Ltd.—A British bank with registered headquarters in London. Branches throughout New Zealand and Australia. Commenced operations in New Zealand in 1840. Received its statutory powers originally under Ordinance (Session III, No. 1) of the Legislative Council of New Zealand. This was repealed by a fresh Act (Private, No. 1) of 1882, which laid down the basis of the bank's right of note-issue in New Zealand.

Bank of New South Wales.—An Australian bank with headquarters in Sydney. Established 1817. Has branches throughout Australia, New Zealand, Fiji, and New Guinea. Commenced business in New Zealand in 1861. There is a special Act of the New Zealand Legislature in existence (Bank of New South Wales Act, 1861) dealing with its operations and right of note-issue in New Zealand.

Bank of New Zealand.—An institution with headquarters in New Zealand. Formed 1861. Branches throughout New Zealand, also in Melbourne, Sydney, Fiji, and Samoa. Various enactments of the New Zealand Legislature give the Bank of New Zealand its legal franchise. Its right of note-issue is governed by the New Zealand Bank Act, 1861, as amended by the Bank of New Zealand Act, 1920. The State is a shareholder to the extent of one-third in the Bank of New Zealand. In addition to the ordinary functions of banking, the Bank of New Zealand has a special long-term-mortgage department.

Bank of Australasia.—A British company with headquarters in London. Branches throughout Australia and New Zealand. Former under Royal Charter dated 1835. Commenced operations in New Zealand in 1864. Its rights of note-issue are granted under its charter. The charter would, of course, be subservient to such special legislation as is contained in the New Zealand Banking Act, 1908.

The National Bank of New Zealand, Ltd.—A British company registered in 1872 under the Imperial Companies Act. By special Act of 1873 the New Zealand Legislature granted it powers of note-issue. Branches of this institution are confined to New Zealand.

The Commercial Bank of Australia, Ltd.—Founded in Australia in 1866. Has branches throughout Australia and New Zealand. Commenced operations in New Zealand in 1912, when the New Zealand Legislature passed the Commercial Bank of Australia, Limited, Act, 1913, under which this bank obtained its right of note-issue in New Zealand.

All the foregoing institutions conduct general banking business, and, in addition to their various branches, have agents throughout the world.

2. New Zealand banking operations come under the following main heads:—

(*a*) The resources of the trading banks come (1) From shareholders' capital, (2) shareholders' reserves, (3) funds deposited (i) on time deposit at interest, and (ii) on current account (*i.e.*, demand) deposits from the public and/or Government.
(*b*) The banks, under their existing franchise, issue the bank-note currency of New Zealand.
(*c*) They accept deposits as set out above.
(*d*) They make advances on overdraft to borrowers and also discount bills.
(*e*) They purchase bills (including produce bills) on places outside New Zealand—that is, our "export" bills—and, on the other hand, they sell bills to pay for imports into New Zealand.
(*f*) They act as the medium through which overseas' loans are arranged for municipalities.
(*g*) They act as repositories for the safe-keeping of their clients' documents and valuables.
(*h*) They conduct a "clearing system" throughout the country for the collection of the cheque currency.
(*i*) They act as bookkeepers for their customers.
(*j*) They are a source of large revenue to the Government.

3. *Shareholding in Trading Banks.*—As has been pointed out in the press in Australia, a commonly entertained but utterly erroneous belief is held by some people that the banks are owned by a limited number of wealthy people. There are nine trading banks in Australia and their shares are owned by some 71,000 people. The average capital holding is £528. The shareholders are drawn from every class in the community, except only the improvident; and

their holdings for the most part represent savings invested after careful thought, with the double motive of avoiding risk and ensuring a constant if low return. The average return on these investments, which was 7·4 per cent. in 1929, was only 2·47 per cent. in 1932.

The shareholders, as in other businesses, exercise complete control of the banks. They elect, reappoint, and remove directors, according to the degree of efficiency with which these are deemed to be discharging their trust, and, through the directorates, they control the management and staffs of the institutions. It is inconceivable that the shareholders would permit their servants to take a course of action which was inimical to their interests. That the officers of the bank would themselves initiate such a policy is incredible. Like the shareholders, they have all their own stake in the country. The trading banks in Australia alone employ about twenty thousand men and women.

There are 756,000 people in Australia who have deposits in trading banks. One person in every nine in the Commonwealth is a depositor.

Similar general principles apply to New Zealand conditions, where the trading banks employ some 3,300 men and women in their services. The shareholders in New Zealand holding shares in the trading banks in New Zealand number approximately 11,130, representing an average capital holding of £487.

4. *Statistical Information furnished.*—New Zealand bank figures are averaged and "quarterly" returns of Assets and Liabilities furnished the Treasury each quarter. In addition to this, weekly figures, including "clearings," are furnished by the Government Statistician.

5. *Note-issue.*—The Banking Act, 1908, provides that all bank-notes issued in New Zealand shall be a first charge on the assets of such bank.

At the outbreak of war in 1914 the Government enacted legislation (Banking Amendment Act, 1914) giving the Governor in Council authority to make, by Proclamation, bank-notes "legal tender" throughout New Zealand. By section 44 of the Finance Act, 1916, uniform regulations were enacted for use whilst the legal-tender position was continued. This enacted that the legal limit of note-issue of each issuing bank is made up by adding together:—

(1) The amount of all coin held:
(2) The amount of all bullion held:
(3) The amount of all public securities held:
(4) The amount of all war-loan advances made on special accounts:
(5) The amount of all soldier-settlement loan advances made on special account:
(6) The amount of all advances made on wool account.

NOTE.—Items 4, 5, and 6 are non-existent now, and therefore do not apply.

The assets enumerated above must be held in New Zealand.

"Public securities" are defined as "the public securities of the Government of New Zealand, or of the United Kingdom, or of the Commonwealth of Australia, or of any State of that Commonwealth.'

There are certain other provisions and extensions of the foregoing which the Government have power to bring into operation, but they have not been invoked.

Originally bank-notes were taxed by the Government at the rate of 7s. 6d. per cent. per annum, payable quarterly. From time to time Parliament has increased it by steps up to the present figure of £4 10s. per cent.

Further, as bank income-tax is based on an arbitrary basis, as explained later, the note-circulation also bears income-tax in addition of 8s. 9d. in the £100.

Now that the Reserve Bank of New Zealand has been created, the functions of note-issue will be taken over by that bank.

6. *Income-tax.*—Banks in New Zealand are not taxed on profits like ordinary trading companies, but on an arbitrary basis. This basis is the average for the year of their assets plus liabilities. On this total they are assumed to earn an income of £1 10s. per £100. This is the "assumed" income for taxation purposes. From this can be deducted bad debts and contributions made to staff pension funds. The net result is known as the "taxable balance," and income-tax is charged on this balance at the maximum rates.

It will thus be seen that the tax bears no relation to income, and that a bank operating in New Zealand may be working at a loss or making small profits only, yet it pays a heavy so-called "income" tax.

7. The system of banking in New Zealand is the "branch bank" one, which is the general system throughout British countries. This is in contradistinction to, say, the American system of thousands of separate banks, many with small capital resources only. The branch bank method gives greater strength to the system and better facilities to the community.

The method of making advances in New Zealand is the "overdraft" system, by which interest is charged half-yearly based on the fluctuating day-to-day balance of the debt.

8. As will be gathered from the foregoing brief review, the trading banks in New Zealand, from the time of the arrival of the Union Bank of Australia, Ltd., here in 1840, have been inseparably bound up in the progress of New Zealand, financing the old Provincial Governments, the General Government, the primary producers, and the industrialist alike, without fear or favour, realizing, as all banks should, that their interests and the prosperity of the Dominion coincide.

Mr. Harle: We have listened to various schemes and proposals put before your Committee, and we are particularly interested in those of Major Douglas, and we would ask permission to put forward a brief criticism of his proposals which we have prepared.

Chairman: Undoubtedly.

Mr. Harle: That is, dealing with his proposals; we have condensed it as much as possible. I shall read this statement—

Among the suggestions which have been submitted to the Parliamentary Committee are some by Major Douglas, which suggestions we feel we should briefly comment on, as they directly concern the banks.

So far as those suggestions concern the banks of this country, they are briefly outlined as under:—

(*a*) A limitation of bank dividends in respect of operations carried on within New Zealand to 6 per cent. per annum on the subscribed capital—the amount represented by the surplus above that figure to be applied (in the manner described by him) to reducing interest-rates.

(*b*) That the banks be deprived of the difference between the balance-sheet value and the estimated market value of bank assets, and that the amounts represented by such difference be transferred by way of gift (in the manner described by him) to the accounts of customers having overdrafts.

Both these suggestions are inherently unsound, and are in effect an unjustifiable raid on assets and reserves essential to the efficient conduct of banking business.

(*a*) The suggestion that dividends be limited to 6 per cent. per annum on the subscribed capital ignores the fact that in the case of some banks the subscribed capital represents several times the paid-up capital, while in the case of other banks subscribed capital is no greater than paid-up capital. Apart from this anomaly, which betrays a lack of knowledge by Major Douglas of the subject under discussion, the suggestion entirely fails to take into account the fact that dividends arise from the earnings of a much larger sum than the capital of banks—namely, the capital and reserve funds, which are the investment and the property of shareholders, and the reserve funds are often built up very largely from direct contributions by the shareholders in the way of premiums on new subscriptions of capital, as well as from undistributed profits. Thus, though the dividend is quoted as being at a certain rate on paid-up capital, that dividend represents the earnings of a much larger investment of shareholders' funds.

Furthermore, there is an important point, which has already been stressed by the Chairman of the Parliamentary Committee—namely, that the *market* value of bank shares is greater than the *nominal* value, so that if Major Douglas's suggestion were adopted, a shareholder who had paid a market value of £4 for a share with a nominal value of £1, would find the maximum return on his investment reduced to 1½ per cent. This would have the effect of inequitably reducing the incomes of members of the community.

In his evidence before your Committee Major Douglas referred to the Bank of England dividends as being 6 per cent., and mentioned that as a well-known precedent for the 6 per cent. maximum dividend he proposed in respect of the banks in New Zealand.

We would point out to the Committee that the Bank of England dividend rate is 12 per cent. per annum, a fact which again indicates Major Douglas's inaccurate knowledge of the matter under discussion.

(*b*) Major Douglas's suggestion that the banks be deprived of their inner reserves is inequitable in the extreme. It is a sound principle of banking to build up reserves to enable banks to cope with difficult economic conditions with unimpaired stability and to maintain and retain confidence. The effect of such wise trading can be seen by comparing the splendid record of the banks of British countries with the fate of banks of other countries which have not paid sufficient attention to making proper provision for such conditions. Major Douglas proposes to try the experiment of depleting bank reserves at the very time when the policy of maintaining adequate reserves has been abundantly justified.

On his own showing Major Douglas links part of his fantastic suggestion with his entirely unfounded and unwarranted assumption that "As things are going on at present there is no possibility whatever of the present banking system continuing for any considerable length of time—even three, four, or five years—without a complete catastrophe—complete breakdown of the present system." So he would deprive banks of an important part of their resources and bank shareholders of an important part of their income, and would make a present of the proceeds of his suggested confiscation to customers with overdrafts—many of whom are much more wealthy than many bank shareholders.

As to his assumption of a breakdown of the present system at an early date, on the way things are going at present, we would point out that there is at the present time encouraging evidence that Britain is making a decisive recovery from the effects of the depression.

In conclusion, we feel bound to say that we are convinced that the carrying-out of Major Douglas's suggestions in New Zealand would retard improvement here and do the country real damage.

[Whilst reading paragraph 4 on page 7 in connection with Major Douglas's statement that the Bank of England dividends were 6 per cent. whereas the rate was 12 per cent., the Chairman said, "12 per cent.?" and the witness replied, "Yes." Later, Mr. Harle produced a copy of the *Bankers' Almanac and Year-book, 1933–34*, and showed the Chairman the reference on page 9 in regard to dividends. This read]:—

Dividends: 10 per cent. per annum for sixteen half-years to August, 1921; 12 per cent. per annum to February, 1922; 11 per cent. per annum to August, 1922; 12 per cent. per annum for twenty-two half-years to August, 1933 (subject to income-tax). Dividends are payable April and October.

Mr. Harle: We think you will accept our comments in that form; there are many other comments that one could make about Major Douglas's fantastic schemes, but we do not feel that it is necessary to labour the question. He does not understand what he is talking about in some of his statements.

The Chairman: I feel that the associated banks have given us a very full statement and very valuable documents.

Dr. Sutch.] Now, I am just going through these questions as you have them. You say, "Broadly speaking, it may be said that the law of supply and demand determines interest-rates charged and paid by the banks." Now, there is an ample supply of credit in New Zealand, that is correct?—Yes.

Would it not be advantageous if the price of this credit were lowered to accommodate itself to demand?

Mr. Fussell: It would most certainly, and the desires of the bank are in this direction.

Dr. Sutch.] These deposit rates which you have mentioned here—they are obstacles in the way of reduction of rates at present. It could be possible to reduce interest-rates to zero and could there still be no demand for credit?—I would not say rates could be reduced to zero, but they could be reduced to a very low figure. If there was no possibility of obtaining credit the whole economic system would break down.

I have struck a situation where credit overseas was reduced to 1 per cent. and still no borrowing?—I can imagine such a situation. If the rate were at zero and the price-level were to fall more than 5 per cent. during the year, a person who had borrowed would still have to pay back more purchasing power than he had borrowed.

You mention a margin between deposit rates and advances rates—that is one way a bank makes profits, what are the other ways?—In the discounting of bills and the buying and selling of exchange and different agency business.

Do they make profits on investments?—They make profits on investments and securities.

And on the internal exchange of cheques?—Yes, broadly speaking, the internal charges cover working-expenses.

Two shillings and sixpence per £100 would be to cover working-expenses?—There is almost as much work involved in transferring the small amount as in transferring the large one.

Do advances exceed deposits?—Not at the present time.

Generally?—I should say that the policy of the banks is to have a certain ratio between advances and deposits. And I think normally the policy in New Zealand has been to have deposits slightly in excess of advances.

Dr. Sutch.] Is the income of banks not an average of 30s. per £100 per annum of the total average assets and liabilities of the bank? Does it ever average that?—I could not say exactly as to the real average, but everything points to the fact that it does not.

Why do you use the term "fictitious" income?—"Fictitious" means that it is not actual income; it is based on the assumption that the income is earned on that basis, whereas it is not, because we pay income-tax on our assets and liabilities. You do not earn income on your liabilities.

Do the banks suffer because of this taxation?—They certainly suffer at the present time.

How?—Because, for instance, they are not earning as much income as that 30s. per annum.

Who suffers ?—I should say that the banks' shareholders suffer because the dividends payable to them are not so great as they otherwise would be. The figures show that the average return on the investment at market price is quite low now; for the six banks the last dividends were equivalent to: 1927—£2 16s. 4d. per cent., £2 17s. 1d. per cent., £3 2s. per cent., £2 9s. per cent., £4 4s. 7d. per cent., and £2 11s. 3d. per cent.

So in New Zealand in good years you are taxed in the same proportion as in bad years ?—Yes.

So these poor rates are not necessarily due to taxation, they may be due to the depressed conditions of industry ?—It would be partly due to taxation, because the fact that we are paying on a greater income than actually earned absorbs part of that income. If we were an ordinary trading company we would pay a graduated scale of tax according to our business. We would get relief in a bad year.

How much tax is paid on Treasury bills borrowed by the Government to purchase sterling funds held overseas ?—The tax paid on that would be, roughly speaking, 8s. 9d. per £100 on the average assets.

Not liabilities ?—Yes.

So 17s. 6d. per £100 is what is paid in taxation. Are the Treasury bills referred to classed as overdrafts ?—They are not classed as overdrafts; they are classed as advances, but they are not included in the total advances; they are incorporated in Government securities.

And there are not corresponding deposits for these Treasury bills held against sterling funds ?—I would not say there are not corresponding deposits for these Treasury bills.

And yet the ratio between advances—including Treasury bills—and deposits has not been so greatly disturbed as one would imagine. Can you give us those figures ?

Mr. Fussell: Total overdrafts and advances, including Treasury bills, £59,000,000; and the deposits, £62,000,000.

Dr. Sutch.] What rates have the Government paid for Treasury bills over the last few years ?—I could not say, but that has been published recently—£5 8s. 9d., and later at £5 per cent.

Was there nothing higher than that previously ?—Not to my knowledge, I do not think there was anything higher than £5 8s. 9d. The Treasury could give it to you; I would have to look into it.

Is 8s. 9d. the tax on these Treasury bills ?—Yes.

Was that 5 per cent. apart from administration costs as clear profit ?—I would not say it was clear profit, because, as mentioned before, we are paying interest on deposits to the extent of 4½ per cent.

What is the objection to issuing Treasury bills against revenue with no interest charges at all ?—The paying of interest charges is caused by the stringent conditions operating at the present time.

Assuming the stringent conditions, is the issue of the Treasury bills holding up advances to industry ?—No, they are not. Any person who can provide security and show the bank that he will not lose the money—if he can prove that to the bank the money is available for him.

Dr. Sutch.] You use the expression "to preserve what the banks consider a proper volume of deposits." How is this "proper volume" determined ?

Mr. Fussell: There is no rule about the matter. If a bank had let its deposits fall very low it is obvious the difference between deposits and advances would have resulted from cheques being drawn and claims being made on the bank, and these claims have to be settled somehow.

Dr. Sutch.] At the moment, would a concerted move to reduce deposit-rates have any effect on the volume of deposits ?—I do not think so, because at the present time there are no avenues for investments.

If the deposit rates were put up would it reduce lending ?—To a certain extent, because then the banks would be unable to quote such low overdraft rates as they would otherwise.

You quote the Chairman of the associated banks, "Were overdraft-rates to be reduced without adequate adjustments in the method of taxing bank incomes, the inevitable and inescapable result would be to curtail the banks' means of assisting their customers and the community" ?—Unless we get adjustments in taxation the community are going to suffer because they cannot borrow on such attractive terms.

But you yourself said there was plenty of credit available ?—Yes. The credit is available if it were only usable by the people who might use it.

But it is not the rate of interest that worries them ?—That goes into the account because during unprofitable times if the person could hardly trade profitably with no interest at all or if it would just pay him to operate and trade with the money at no interest at all, obviously the charge of 5 per cent. interest would be just that deterrent which should prevent him from operating.

Would your extra taxation put up the overdraft-rate and discourage borrowers ?—I should say that it keeps up the overdraft-rate. That means if we were put on the same basis as other trading companies—and I speak to you entirely without prejudice, because I cannot say what the bank would do—I should say that it would be possible to reduce the interest-rate by ½ per cent. I say that entirely on my own responsibility, but it seems to me that that would enable the banks to reduce the rate by ½ per cent.

In the answer to question 2 you say that all accounts have benefited by the reduction in overdraft-rates. I took that to mean the best accounts. What about the accounts that are charged more than the minimum rate of 5 per cent.?—When that last reduction from 6 per cent. to 5 per cent. was made I understand that it was an all-round reduction. That means advances which were getting a less favourable rate than the best rate for various reasons also were reduced by that amount, 1 per cent. all round.

I notice here that the banks seem to reduce deposit-rates some months before reducing the overdraft-rates. Why is that ?—That has not always happened. It has happened sometimes, and the reason for that is this: When overdraft-rates are reduced the banks immediately stop collecting

the more favourable rate, but when fixed-deposit rates are reduced the banks go on paying to the depositors who have deposits with them at the old rate.

I understand that. I was just wondering whether overdrafts ran on similarly to deposits?—No, they do not. They come down from the day advertised.

That would explain it, of course. And when you speak of a 10s. margin between deposit and overdraft rates, does this mean that the banks, taking all charges into consideration, are losing money on this type of business?—They are losing money on that type of business, but that is in respect of the fixed deposits at 4½ per cent. that are still current.

On that type of business. Only on the fixed deposits at 4½ per cent. that are current. But on the fixed deposits at 3 per cent., and 2¾ per cent., and 2½ per cent., they are not losing business?—No.

So that on the whole the banks are profiting from this type of business?—They make a slender margin of profit on that type of business.

But there are also current accounts in which no interest is paid?—Put it this way, that if the banks fix their various charges, interest charges, bank charges, various other charges, all this is taken into account and you can rely on the competition among the banks forcing the charges down, and if we had to pay interest on all current accounts as well, you can be quite sure that the banks would not be able to have the interest-rates that they have now and pay any profits.

One other question in regard to your question 2. When the tax on the note-issue was increased the banks increased their bank charges for keeping customers' accounts?—That is so.

When the Reserve Bank takes over you will be freed from note-tax. Will you reduce similarly the charge for keeping customers' accounts?—That is a policy matter which might be *sub judice* at a later date.

Mr. Harle: While you are on that, do you consider that £1 a year is an unreasonable charge for book-keeping?

Dr Sutch: I do not know because I am not familiar with the administrative side of banking. I do realize this, that if the banks were to charge for every petty little service they do the public would be inconvenienced to a much greater extent than they are now. But that is only my private opinion.

Mr. Fussell: While on this point, Dr. Sutch, I would like to explain that so far as English banking is concerned there is no fixed charge, but every six months the various accounts are perused and if the operations have been very considerable a bank would say, "I think it is worth £3 a year or £4 or £5 5s. for keeping this account," and the charge is made according to the estimation of the quantity of work that they have done for that account. So that it might be quite possible to charge £15 15s. for keeping an account at Home.

Dr. Sutch.] Is that the reason why internal exchange is not charged between the banks in England?—I cannot answer that question. I do not know. It is possible that the competition between the banks forces that down. The banks must get a reasonable margin of profit in some way. If they do not get it in one way they are compelled to get it in another. They are trading with shareholders' funds and so forth and they are providing service to the community, and they do not make a greater margin of profit than well-run business concerns.

Mr. Ashwin.] Do the banks at Home allow interest on current accounts?—Some do and some do not. Is it the country banks, Mr. Shaw?

Mr. Shaw: Yes. Some of them do and some of them do not. It all depends on the circumstances.

Mr. Fussell: Another aspect there is that in England the usual way of granting advances is to grant a deposit account and debit a loan account. That means that if a person came to you for a loan account and placed that amount at your disposal, I think it is a sort of tradition that you would leave something in the account. You would not draw out the last penny.

Dr. Sutch.] Debit the loan account. But Major Douglas says you credit the loan account?—As far as the customer is concerned it is a debit to him. It is a debit to loan account and a credit to the customer's account.

To get back to the questionnaire again, you mention in question 3 other economic factors affecting trade conditions. What other factors have operated on the volume of advances?—I should say that briefly is the fall in the price of overseas produce.

You mentioned that before. You are talking about the tendency of interest-rates to be reflected in the volume of applications for advances?—Other things being equal, the higher the interest-rate the less tendency to increase in advances.

What are these other things?—What I mean is this, that the falling prices of overseas produce, in reducing our income here makes trade unprofitable here; and although the rate of interest on advances has fallen lower, yet advances have fallen lower also, because although it is cheaper on paper to borrow it is not cheaper on paper to trade, since you cannot say as to the result, even at the cheaper rate.

Are these high overdraft rates an indication that borrowers are willing to let the banks join in their prosperity?—Yes. It is an indication that they can borrow at that higher rate and their demand for the money is such that that higher rate can be charged and the money will be used and used at a profit.

That 7 per cent. is for a minimum overdraft rate. Does that mean that the shakier accounts would be charged 9 per cent. or 10 per cent.?—No. It is very hard to say offhand what the margin is, but I should say between 1 per cent. and 1½ per cent. above the minimum rate.

That is 8 per cent. to 8½ per cent. And stock and station agents; are they charging even higher rates?—I could not say that. I should say that the stock and station rates are about the same as the bank rates.

Even when they get their funds from the bank ?—Well, stock and station agents do not always, but in some cases they do.

The Chairman.] Are not they usually 1 per cent. more ?—Yes, I think that is probably the case.

Dr. Sutch.] So that your advance rate of 7 per cent. really fixes the advancing rate for other credit-making institutions ?—It has a bearing on it.

It does not fix it ?—It all depends on the type of business, because if the type of business were such that a bank would invest in it, the borrower has the option of going to the bank and getting it, so that there again the type of business and the other aspects affecting the borrower come into account.

And the banks compete with one another ?

Mr. Harle: Yes, intensively, within the minimum rates.

Dr. Sutch: And are the overdraft rates in New Zealand ever raised with the specific purpose of decreasing the amount of credit made available ?

Mr. Fussell: It is very hard to say whether that is the case, but looking over things it seems to me that if a certain amount of credit has been issued, on the face of it, that is profitable to the bank. But if, at the same time, it is found that the total of deposits is insufficient, it is necessary to put up the deposit rate. The necessity to put up the deposit rates to increase the deposits in relation to advances compels the banks to put up the advance rate. One rate pushes the other up.

Dr. Sutch: So that the rate is not ever put up to choke off people who want to borrow ?

Mr. Shaw: I think that that might be so if it is considered in the interests of the country that borrowing should be restricted.

Dr. Sutch.] I think so. But seeing that the individual banks are competing against one another for business they would not be inclined to take that point of view ?—I do not know. In a matter like that they would take the country's viewpoint, because the banks generally are looking a good deal further ahead than the ordinary man who comes for an overdraft.

Mr. Fussell: And then I should say for the sake of competition no individual bank would risk getting itself into an involved position.

Dr. Sutch.] That is true. But some stock and station agents have got into involved positions through competing for business ?—Yes. But that is because they have not got bankers in charge of them.

Mr. Harle: May I suggest that their difficulties have been because they have been trying to carry out a banking business without banking resources.

Dr. Sutch.] Quite probably. That is just what I wanted to get at—Question 4. Why are deposit rates raised other than to attract deposits ?

Mr. Fussell: I cannot think of any reason why they should be raised other than to attract deposits, except, of course, to retain deposits we have if the rates outside rise.

Dr. Sutch.] And if there were no competition, would the deposit rates be forced up ?—They would not be forced up if we could have the volume of deposits by paying a lesser rate. There is no reason why we should offer a greater inducement than we feel is necessary.

In question 4 you say the only limiting factor in the reduction of deposit rates is the competition of other rates ?—Yes. That is because we cannot have the volume of deposits if we do not meet that competition. If we lowered our rates, as you can see, our deposits would dwindle away.

But you have introduced another factor. You might require more deposits quite apart from competition ?—Then our rates would have to be the winning competitive rates.

So we would have to include that in the limiting factors in the answer to this question 4 ?—Do you mean the possibility that it might be necessary to increase deposits ?

Yes. Would it be a limiting factor ?—If it were necessary to increase deposits, yes, it certainly would. But that would be an indication that already the advancing had proceeded to such a degree that there were more advances than deposits, so that you would see it was about time some limitation were devised.

Mr. Harle: For instance, on the occasion that deposit rates reached 5 per cent. that was primarily caused by Government over the counter sales of stock at 5½ per cent.

Dr. Sutch.] I recognize the competitive force, but I was looking for some other force than competition. If there were no competition, would deposit rates fall to zero in any conceivable situation ?

Mr. Fussell: It seems quite conceivable that people would lodge all the deposits that the banks wanted without any inducement whatever. There would be no deposit rates. But, on the other hand, we have the competitive factor. A bank might want to compete with its neighbours. It would think to itself, "Now if I can increase my deposits by £2,000,000 I can increase my advance business."

Dr. Sutch.] Yes, but without competition, I meant ?—I should put it this way: No competition, no inducement necessary.

And in the same question 4, you talk about people possessing liquid funds but refraining from employing them. How are those liquid funds held ?—They are held to the extent of about £22,000,000 by way of deposits on current account, to the extent of about £39,000,000 by way of fixed deposits, and to the extent of about £60,000,000 or £70,000,000 by way of deposits in trading concerns, Post Office Savings-banks, and trustee savings-banks.

And what do they do with these liquid funds ?—At the present time, as you know, the total advances, including advances on Treasury bills, do not show much disparity between the total deposits.

So that they are not even lending these deposits out ?—That is another question, and I would not like to say anything about it unless that question is being dealt with.

Is the amount of legal tender issued by a bank determined by the amount of advances ?—It is not necessarily determined by the amount of advances, although there is some connection. For instance, you might say that in a country where the total advances were £40,000,000, the notes in circulation would

be rather bigger than in a smaller country with advances of only £2,000,000. The real factor is the amount of pocket-money that people are in the habit of carrying around with them, and the proportion of business that they do by way of notes in proportion to what they do by way of cheques.

So that if advances went up the note-issue would go up too?—Not necessarily. Sometimes advances have gone up and note-issue has gone down, and *vice versa*. Again, it all depends not only on the habits of the people, but on the velocity of circulation of the notes.

That is a very interesting point. Could the bank force more bank-notes into circulation?—A bank could not force more bank-notes into circulation because, for instance, take this case: If a bank gave you £1,000 in bank-notes, I am willing to guess that those would be back in some bank before the day was over.

Question 5, about the cheque-using habits of the people. If the Government stamp duty on cheques were removed, would the extension of the cheque-using habit be a benefit to the community?—I should hardly say so, because the using of notes is no trouble at all to the community and the writing-out of small cheques, of 10s. and 5s. and so forth would be just as useful to them, but they would have the trouble of writing the cheque out.

I was interested in that because in some other countries they have no stamp duty on cheques and people carry cheque-books round with them and make out a cheque for quite small amounts?—Yes. But in some other countries you might have no stamp duty and they would not use them, much as in Germany and France.

Are there any stock and station firms in New Zealand that have as large a banking business as the smallest of the trading banks?—It is impossible for me to say that, but I should think not.

Mr. Harle: In answering that question you have got to appreciate the fact that Dalgety and Co. are a very large institution in Australia as well as in New Zealand. You could tell from the balance-sheets more or less, but we have not got them here.

Mr. Fussell: I suggest that anything you would like us to look up and answer later, things that require reference, if you could give instructions for the notes to be taken we will be pleased to do that.

Dr. Sutch.] Yes, I would like that question answered. Thank you very much for your offer. Now, if the Reserve Bank is to take over the issue of notes, there will be less to distinguish these stock firms from trading banks?—No essential further distinction. Because, as you know, the issue of notes is not an essential or a fundamental banking function, so that the transfer of notes from the bank does not relieve them of the fundamental banking function.

But they will seem more similar to a stock firm now that they do not issue notes?—Yes. That is so.

Do the stock firms do a different type of banking business?—They go further than the banks do.

How so?—I should say in inspecting private properties and stock and so forth and dealing with the stock.

That is on a different part of their business. Under the Reserve Bank Act the trading banks must keep a proportion of their deposits with the Reserve Bank. Will this give a differential advantage to the stock and station agents who would not have to do it?—My own personal opinion is that it will certainly give them a differential advantage, because the banks will be operating with some of their assets which will not be interest-earning, and the stock and station agents, to the extent that they allow their deposits to be drawn by cheque can carry out that part of their business more cheaply than the banks can.

So that the system would be strengthened if you included the stock firms?—Personally, I would rather not say that, because it is a matter rather too broad, and I am speaking on behalf of the banks and, as a matter of fact, I do not know whether it has been considered.

I quite realize it is a delicate position?—I will give you my private opinion, which is that the reason why the banks are required to put this deposit with the Reserve Banks is in the direction of strengthening and consolidating the position, and I should say that what would strengthen a bank doing banking business would strengthen the position of another firm doing banking business.

So that you are going to be strengthened by having assets at the Reserve Bank?—Not the individual bank necessarily, but the whole banking structure would be strengthened.

But you will require to hold less reserve funds with the Reserve Bank than if you were an individual bank working in competition with other banks?—Not necessarily. I do not think that is the case, because, whether they have to or not, the banks hold what they consider is wise.

But surely, when the Reserve Bank gets going they will hold fewer reserves because they will be pooled in the Reserve Bank, so that it would be an advantage to a bank, if the structure is consolidated, to be in the position of having to put some of its assets in the Reserve Bank.

Mr. Harle: The difficulty in answering a question like that is that New Zealand is not a water-tight compartment so far as the banks are concerned. We have Australian interests and London interests and reserves are held in London as well as in Australia. Some banks keep a portion of reserves with the Commonwealth Bank in Australia. Under the New Zealand arrangements they also have to keep reserves here. It is a very difficult question to answer.

I quite realize that.

Mr. Fussell: Another factor occurs here, and that is that the banks might use their reserves when they are looking after them—that is, in their own business, or they might employ them in some way, and the deposits with the Reserve Bank would return them with no interest at all.

Dr. Sutch.] The right of note-issue was not any advantage to the banks was it?—I would not go so far as to say that, but at the present time we might say that the note-issues of the banks are practically, if not entirely, unprofitable.

Question 7: This is a question about the exchange business in New Zealand. Would it be beneficial to New Zealand if the banking institutions only conducted all the exchange business?—

You are asking me to answer a question which concerns the restraint of freedom of trade. My own personal view is that there is no objection to outside people operating—that there should be no compulsion to put business through a bank.

What is the procedure if a borrower wishes to deal outside the banks?—An importer?

Yes?—An importer might arrange with an exporting firm to pay over the money in England. An exporting firm might have funds in England.

That is, a New Zealand exporting firm?—A New Zealand exporting firm might have funds in England, and it might export say £1,000 worth of butter, and then an importing firm might want that £1,000 in London. It could either go to the bank and get it or go to the exporting firm and ask for it there.

Why should it go to the exporting firm rather than to the bank?—Well, the other firm might cut the rate a bit, but then there may be other matters of reciprocity of business. I do not know about that.

Is there any evidence of importers not remitting payments to England regularly in the last year?—That is answered in one of these questions.

Yes, it is; but from the point of view of your banks I wanted to know. In the banks themselves have you any evidence of that? It is question 8?—I will put it this way, that I have not examined the books myself, but I believe that there is an inducement there for importers or for the exporting firm at Home to tell the importer not to remit yet awhile.

So that it is possible that banks in New Zealand are helping importers to carry on rather than remit their payments Home?—How do you mean, helping them to carry on?

Giving them advances here?—No. I should say that would not be in accord with banking policy, to have people speculating on the exchanges.

Mr. Harle: Where the importer is working on a credit basis he can do what he likes with his own funds. The bank has no control there. It would only occur where he was owing advances to the banks.

Dr. Sutch.] So that the banks are not financing importers to avoid the payment of remittances to England?—No.

It is admitted by some competent authorities, is it not, that a lowering of the exchange-rate by even five points would create a far greater set of injustices than were alleged to have been caused by the raising of it?

Mr. Fussell: Would you say that again. I would like to think it over.

Dr. Sutch.] It is admitted by some competent authorities that a lowering of the exchange-rate by even five points would create a far greater set of injustices than were alleged to have been caused by the raising of it?—I do not think so. To agree to that you would have to agree that an upward movement in the exchange is less than 33⅓ per cent. as unjust as a downward movement, and I do not think there is any economic soundness in a view like that.

I am not talking necessarily of the economics of it?—Or the ethics?

Injustice generally.

Mr. Harle: Would it not depend on the quantity of stocks in New Zealand when the rate went up—stocks bought at the old rates?

Mr. Fussell: That is what it depends on.

Mr. Harle: Then if the importer has been living from hand to mouth, will he suffer from the reduction in the rate?

Dr. Sutch: That is only from the point of view of the importers. I was talking generally.

Would it be unwise and prejudicial to the normal trade and industry of New Zealand to give advance information of an alteration in the exchange-rate either up or down?—I consider that it would be most undesirable and contrary to banking practice; the reason being, of course, that there is always the tendency to speculate on the matter, and if people knew that the exchange-rate was going down by such and such an amount on such and such a date, importers would hold up business and refrain from importing, and exporters would tend to rush their stuff away.

So that these people who are agitating for the Government to announce what they are going to do with the exchange-rate are really trying to get the Government to do something that is harmful?—I definitely believe that it would be harmful to give advance information.

But the associated banks announce the exchange-rate in normal times?—Yes. That is announced by the associated banks.

There is an agreement between them?—Yes, that matter is always done in agreement with the banks.

Might there not be a minority of disagreement among the six banks?—There might possibly be, but I do not know of any case where that has ever happened.

It has not happened?—No. You are not referring to anything happening during any exchange controversy are you?

I was out of New Zealand when the exchange controversy went on?—But in normal times I do not know if there has been any disagreement, because the reasons would be pretty general.

If you do not segregate your figures for sterling funds held on New Zealand's account, how is it possible to say that the demand and supply of these funds fixes the rates?—Each bank would have sterling resources in London, not so far as that bank's whole business is concerned.

That includes Australian business?—Yes.

So that the Australian situation might influence the New Zealand situation and so affect our exchange-rate?—It might be possible to the extent that it might save the rate going down below par here and result in the farmer getting less than £1 sterling for his butter.

Leaving the question of the farmers aside for the moment, I am talking about whether Australian conditions affect the New Zealand exchange-rate. It is admitted that they do ?—Yes, I should say it would be impossible for New Zealand any more than any other country to adopt a policy of "splendid isolation."

You say that the exchange-rate in New Zealand is fixed in normal times by the demand for the supply of sterling funds. That is rather academic in view of the fact that we do not know what those sterling funds are and the fact that such sterling funds are influenced by Australian demands ?—With regard to this question, Australasia was one economic unit and with the exchange-rate between New Zealand and Australia at par it does not seem unreasonable that it should be so.

I was regarding New Zealand as an economic unit, of course ?—At the present time we are far more separate in that direction than we would be if the exchange-rates were the same in both countries.

So that we have not been separate in regard to exchange, Australian conditions do influence the matter ?—Speaking from memory, the exchange-rates are affected. A change in the New Zealand rates follows a change in the Australian rates.

I think I can remember an example where New Zealand went below 100 and it was influenced by Australia, and it had nothing to do with New Zealand. That could be so ?—Possibly. Generally speaking, the conditions are similar; they have been in the past, I think.

Mr. Ashwin.] When the rates started to climb to 110, before the indemnity rates came into being, would you say then that the rising of the rate in the case of New Zealand was influenced by the Australian trading position ?—My view is that the rates here were influenced.

That is my impression too.

Mr. Langstone.] If that is so, there is a further question. Why did it not follow that up when Australia went to 125 and we went to 110 ?—There are one or two conditions for that. In the first place, there was a very strong tendency in Australia for a flight of capital; in the second place, the outside rate in Australia already went up to that rate and the banks recognized that as the rate.

In Australia ?—Yes.

But not in New Zealand. We did not follow them up to 125 ?—No. The conditions in both countries were normal, and the conditions here did not follow the conditions in Australia.

To follow Dr. Sutch's question: The tendency would have been for demand to raise the rate—there was a surplus of funds; there was an overplus of New Zealand funds. Would that not be an incentive for them to get New Zealand funds for Australian purposes ?—I would not say we had an overplus of funds.

When it was 110 there was no shortage of funds in London; we were carrying good balances there ?—That is a matter that requires the dissection of the banks' books, but, speaking generally, to what extent do you think sterling funds would be available when New Zealand had to put the exchange-rate up 10 per cent ?

The balance in London according to the statistical returns with the exchange-rate of 110, before it went to 125, was £10,000,000. There would be a demand for £8,000,000 for local-body and Government needs; there would be an overplus of £2,000,000. Would there not have been a big incentive for the Australians to have used New Zealand exchanges for their own purpose ?—Their rate was already up.

I know it was ?—At that time.

That would be all the more reason why they should want New Zealand funds to keep their rate down ?—Now you are dealing with the Australian banking policy.

Dr. Sutch.] I have noticed fluctuations of sterling funds from quarter to quarter and year to year, and I have noticed no corresponding changes in the exchange-rate. Would that be due to these Australian conditions perhaps ?—The way I look at it is this: If the funds in London are such that all the funds purchased by the banks and held in their London Office can be sold at the same exchange-rate at which they were purchased there is no need to lower the exchange-rate, but if they cannot be sold at that rate there is a tendency to lower the rates because you would have funds you cannot dispose of.

Sterling funds include overseas borrowing on the part of New Zealand ?—Yes.

You say, "If an unbalanced external trading position results in a shortage or overaccumulation of London funds, it is, of course, necessary to make adjustments to correct the position." What are those adjustments ?—The adjustments are affected by conditions on both sides. For instance, if the condition of a shortage of London funds was the result of over-importing here and consequently on an increase of overdrafts above deposit-rates, it might be necessary to increase the advances rates, increase the deposit rates to restore the equilibrium here, and that might automatically have the effect of restoring the equilibrium overseas.

So that you might have to adjust the exchange-rate as well ?—You might and you might not.

I notice you say, "In normal times an increase in the exchange-rates is an indication that the supply of London funds is less than the demand." You admit, then, that the exchange-rate could fluctuate in normal times ?—Oh, yes; but not to a great extent, as the history of the case has shown. For many years past neither Australian, New Zealand, nor intercolonial exchange-rates have varied by more than a few points.

In talking of the shortage of London funds up to 1931. In December, 1931, the exchange pool was instituted. England needed short-term funds urgently for foreign withdrawals. The New Zealand Government owed England money on short-term and undertook to supply £1,000,000 a month during the period of stringency. Before the banks would agree to provide this from sterling funds, they asked the Government to give them a monopoly of the handling of sterling exchange. This was agreed to, and the banks received their monopoly, pooled the London funds, made so much available for the Government account and rationed the remainder. Is that a correct picture ?—What do you mean by rationing ?

There was a demand for credit from the importers and it was rationed out among them by the banks. Is that a correct picture?—To my knowledge there was no necessity to ration those funds.

In the beginning there might have been?—There might have been to start with. In the beginning the banks had to be prepared for any contingency in the matter, and they had to give an assurance, and in order to give that assurance they had to be safeguarded.

Mr. Harle: That would be interesting to know five years hence, because under the banks indemnity business operating at the present time it has become necessary to alter the records so that these things can be segregated, so that we will know that in a few years' time.

Dr Sutch.] It will be extremely interesting to know that?—But that information will not be available until a few years from now.

Is it a usual financial practice to ration credit?—No.

There was a possibility of all this having to be done: they did not know what the result was going to be?—No, and no one can say whether it was a possibility or not.

So that when the stringency took place, according to the orthodox canons of exchange theory, the exchange-rate should have been much higher at the end of 1931. That would have coped with the situation?—Yes, possibly, but what would the Government have said? They might not have been satisfied if the banks said when the Government asked for an assurance that the funds required should be available, "You want an assurance from us, but instead of that we suggest that you try and experiment with the exchange."

You put it all on to the Government?—I am not doing that at all. The Government constituted the regulations, because they wanted an assurance which the banks gave them under the protection of those regulations.

We will leave the exchange-rate now. In question 9, talking about the factors a banker takes into consideration in granting an overdraft: Is the tendency of the price-level to change taken into account when deciding the amount of credit that is to be granted?—Do you mean the general price-level?

The price-level of commodities in which New Zealand is interested?—I should say that no bank would be blind to the fact that the price-levels all over the world were varying, and if a person wanted to borrow money and repay the money from commodities to be sold next year the bank would be aware of the varying prices and take that into consideration in granting the overdraft.

Then since 1929 the advances in New Zealand should have gone off, fallen somewhat?—Not necessarily, because there are very many other aspects coming into the picture, such as security and so forth.

In regard to question 13, talking of the uses of reserves: Are reserves ever held or are they merely book entries?—They cannot be merely book entries because if there is a debit and the reserve is on the debit side there must be something on the credit side.

Would it be something tangible?—Yes, it is definite evidence of value.

So that if you made a profit at the end of the year and decide to put so much to reserves is that not just merely a transfer in the books?—No, that is represented in the debts due to you, cash, or in other assets. It increases those assets.

Liquid reserves. Are they held in Government stocks?—To some extent.

In realizing reserves what is the procedure?—Realizing reserves for what purpose, banks usually have a policy of maintaining their reserves, not depleting them.

Mr. Harle: Mr. Shaw has had experience of that in London he would probably be able to answer that question.

Mr. Shaw: The banks reserves are largely held in London because of the better means of investment and also the better market and the better nature of the security which is obtained, liquid security, for instance, Treasury bills, money lent to the money-market or British Government stocks.

Dr. Sutch.] New Zealand banks deal in all those does it not?—Oh, yes. A bank holds its reserves. Speaking for ourselves, our reserves in London are in what we would call gilt-edged securities which can be sold in London at a minute's notice.

So that they would be sold if you wanted cash?—Yes. If you started to sell Government securities in New Zealand to any extent it would have an immediate effect on the market, and if you wanted to call in your overdrafts it could not be done.

I am sorry if these questions appear simple, but I want to get clarity. Is it possible that the banks in New Zealand have been too cautious in accumulating reserves?

Mr. Fussell: I think that is quite impossible.

Dr. Sutch.] Quite impossible to be too cautious?—It is quite impossible that the banks have been too cautious.

New Zealand seems to have hoarded almost as much proportionately as France or the United States. What is the use of this great amount of "dead" gold New Zealand had?—Has or had?

Had from 1914 onwards, and also prior to that time?—You recognize that there is a provision that gold cannot be exported without the permission of the Minister of Finance?

But some gold was exported with his permission?—Yes.

Why have that huge amount of gold, because it was a huge amount compared with other countries?—The currency was covered pound for pound by gold.

That was the reason?—It was actually covered.

But was that the reason, that they wanted the currency covered?—I should not say so. In my opinion there would not be any real need for that, but there is this aspect that a country is never so sure of itself as when it has its notes backed by gold. Its gold reserves are its mainstay. It is an asset of value no matter what happens to other things or other values.

You have not the figures for sterling funds held by the banks in the last decade ? Are they included in the Australian operations ?—I would not like to say.

For taxation purposes must they not be segregated ?—For taxation purposes I should say that London figures would not be combined with New Zealand.

The Bank of New South Wales in a recent bulletin compared sterling funds held on two different dates. Could that be done in New Zealand ?—No, because the figures have not been segregated.

It is obvious from some of the answers to questions that there is no monopoly of credit in New Zealand ?—That is quite true. Mr. Ashwin mentioned the other day that the total mortgages in the country amounted to £200,000,000 and the total of all bank advances including mortgages is only one-fifth of that amount.

Could you tell the Committee, in regard to question 19, why it is necessary to sell securities to add to the cash holding rather than issue more notes ?—You mean print more notes and hold them in the till ?

If you want money for cash purposes ?—If you printed more notes, they would not be cash.

You would want cash ?—Yes.

You sell securities to get cash, why not print notes ?—Well, that would not give us sterling.

You would not sell securities in New Zealand to get cash in New Zealand ?—I do not know of any case where that has been necessary.

I thought it might be so in New Zealand. Why do you say, when you admit that New Zealand is on a sterling standard, that your bank paper money is inconvertible ?—I mentioned that not as a definition but as a description.

It is not a very important point and you say it is just a description of existing inconvertible bank paper money ?—Inconvertible into gold, but convertible into——

It is convertible into sterling exchange ?—It is convertible at a proportion, not pound for pound.

So it is not inconvertible ?—No, but so far as economics is concerned it is not convertible, because it is paper money which is not regarded as convertible into gold.

But you are using a sterling-exchange system ?—It would not apply there. However, that was just a description.

You are speaking of convertibility with a gold-standard country. I am speaking of convertibility with a sterling-exchange system, which is the New Zealand position. One other point. Do coins come into circulation by minting ?—As a result of the minting of coins it could be described more accurately, as the person who has the bullion would take it to the Mint and the Mint would issue the coins back to him.

Does that happen ?—Not at the present time.

They have stopped minting coins now, gold coins ?

Mr. Harle : They only issue gold to the value of 400 oz.

Dr. Sutch.] I meant gold coins.

Mr. Ashwin.] I have not many questions to ask, as Dr. Sutch has brought out some of the points I was going to mention. I was interested in the statement you made when you said you were taxed on income unearned. Is that correct at present ?—I do not know that I would put it in that form, but we are taxed on the assumption of a certain income.

What I mean to say is, do you suggest that the income on which you are taxed is greater than that which you are earning ?—Yes.

Would you say that that applied generally over a period averaging good times and bad ?—No ; as a matter of fact, I do not think it would, but the position is that the banks would rather be in the position of paying a fair rate of income-tax when they are making good profits and being relieved, just like trading firms, when there are times of stringency.

I appreciate that. Would you say that the nature of a banking business is suitable for taxation on a company basis ?—That is another matter. That is a matter of machinery. The banks are of the view that it can be done ; that is why they ask for it, and it is done in other countries. I do not know of any other country where the banks are taxed precisely on the basis they are in New Zealand.

Are you aware that the banks were originally taxed on the company basis ?—Yes.

Are you also aware that some of the banks' returns disclosed no income or very little ?—When was that ?

Somewhere about 1898 ?—I would be very much surprised to hear that they disclosed anything much at that time.

Are you also aware that the present basis of taxation was actually suggested by one of the banks in operation at that time ?—I would say that the banking conditions of to-day are not such as would make that system so equitable as the taxation on income.

I do not want to embarrass you, but I wanted to bring out the point that the bank is not the only class of business where it is necessary to have a more or less arbitrary basis of taxation ?—I understand that, but I wanted to mention that the banks felt it would be more equitable if they were taxed on the basis of their income ; that would mean that in good times they would pay more and in bad times they would pay less.

You would agree that that must be contingent on the Tax Department being able to devise a system whereby they could ensure that you do pay on the income earned in a year ?—I should say, speaking without prejudice, that it is for the Tax Department to devise an equitable system of taxation, because they are getting the benefit.

You will also admit that there is considerable difficulty in the case of tracing the domicile of the profits earned by a bank which is trading partly in the country and partly overseas ?—There are certainly some difficulties, but I do not think they are insurmountable.

You probably are aware that the matter has been considered ?—Yes, I realize that the matter has probably been under consideration before.

It has been considered on numerous occasions ?—Yes.

Hon. Mr. Downie Stewart: Last time it was taken out by the Statistician it was found that it would not make much difference one way or the other whether the banks were taxed on the normal method or on their present artificial method, because it fluctuated some years one way and in other years the other way.

Mr. Fussell: What year was that ?

Hon Mr. Downie Stewart.] 1926 or 1927 ?—It is quite possible it would be so then.

Mr. Ashwin.] The real difficulty is the Tax Department. In a banking business, so often it is almost impossible to check up on the statements. Unless they go to the extent of keeping a man at the banks they could not do it ?—I put it to you that it should not be necessary to check up on the banks' statements in this country. They have been accepted always by the Tax Department and the Government, and they have no reason to do otherwise; such is the reputation of the banks in this country.

Similar statements are accepted from private individuals, too, and companies, but behind it all the Tax Department has the means of checking up an entirely private company or individual by going to their books, and they do that periodically, so that the power they have over the companies and individuals would be lacking to some extent in the case of the banks ?—The Commissioner of Taxes can go to the banks.

Mr. Ashwin: He has the power to go, but not the means whereby to check up on the banks. I will not follow that.

Mr. Fussell: Do you mind my interrupting. Would it be possible for your Department to consider that, when times are bad, the amount that the banks were assumed to earn be taken on their assets and liabilities. Where they earned two-thirds of the previous year, they might be taxed on two-thirds of the average assets and liabilities. It would relieve banks in difficult times and enable them to pay more tax when profits were good.

Mr. Ashwin: Yes, we could quite easily do that; alter your rate of assumed income per cent., provided we could agree upon the rates ?—We could have it on the present rate on the basis of incomes earned in a certain year, and fluctuating as income fluctuates.

Hon. Mr. Downie Stewart.] Does it matter much so long as you pass it on ?—The necessity for passing it on means higher rates than the banks desire to charge.

Mr. Ashwin: Mr. Harle, I think, mentioned that in Britain they follow a different banking procedure in regard to advances than in New Zealand—that is to say, they keep two accounts, a current account and a loan account, and when a man applied for an overdraft, say, of £1,000 they debited his loan account and credited the £1,000 to his current account ?

Mr. Harle: That is called the cash credit system.

Mr. Ashwin.] Well, that of course would reflect in the bank's total figures; the total aggregate volume of purchasing-power available ?—If they were taxed on a liability basis such as we are, it would hit them very hard.

I am speaking not from the point of view of taxation, but from the point of view of information disclosed by bank returns. Their returns disclose the total of deposits that can be borrowed upon at any time; that is not the case in New Zealand ?—You would require to know the limit. In granting an overdraft in New Zealand the borrower is granted a limit up to which he may overdraw. It is conceivable, and it is a fact, that he does not draw all at one time. He draws his daily requirements, so that the margin between that limit and his drawings is his undrawn drawing-power.

That is the point I wish to make. It comes down to this, that the total purchasing-power available to the community in New Zealand in good times is the amount of free deposits as disclosed by the bank in their returns plus the undrawn portion of the overdraft up to the limits fixed ?—That is put very well.

Another statement arising out of your discussion with Dr. Sutch: You said if people took their money away outside the banks, the banks would lose deposits ?

Mr. Fussell: Yes.

Mr. Ashwin.] How would that come about ?—For instance, say a bank had £1,000,000 advances and another £1,000,000 deposits, and the money derived from that was spent in such a way that it eventually found its way by being deposited in one of the other savings-banks or in another bank.

Are you speaking from the point of view of individual banks ?—I meant that if the person who had a claim on the bank did not want a deposit but wanted its value, the bank could not provide it for him unless it gave him gold in a gold-standard country, or gave him notes, but he certainly would not want to hold that form of value. That extra advance, if it were not in conformity with the amount of his deposits, would mean that the bank had that debt somewhere. When a cheque is drawn, that cheque is a claim on the bank. The negotiation passes that claim, but it does not extinguish that claim.

That is not my point. You mention here that it is necessary for the banks to offer deposit rates to compete effectively with the Post Office Savings-bank and the Public Trust. First of all, I will suggest to you that the class of money in the Post Office Savings-bank is different from that normally in a trading bank ?—What do you mean by "the class of money" ?

I mean that the class of money that goes into the Savings-bank is not commercial funds ?—No, I quite agree with you there. It is usually funds that people wish to put by and do not intend to use as a circulating medium at the present time.

Then you see, does not that itself discount any competition between the Post Office Savings-bank and the banks ?—No, I should say that the fixed deposits, the deposits on which the banks pay

interest, come into the same particular class as the deposits in the Savings-bank—namely, money that people do not wish to use at the present time.

They are a different type of funds. Would you suggest that the clerk or the working-man wanting to save money would go to a trading bank ?

Mr. Harle: We have numerous deposits of varying sums, down to the sum of £5 each.

Mr. Fussell: When putting the rate up, the bank does not necessarily want to attract deposits from a savings-bank; more often than not it is to stop deposits drifting away from the bank. I should say that a person getting 2 per cent. on fixed deposit in the bank, if he found he could get 3 per cent. outside, would go outside the banks.

Mr. Ashwin.] I would like to follow through the transaction of deposits drifting away from the banks. If £100,000 on free deposits are transferred to the Savings-bank, what happens ? Is it not that your ordinary deposits will go down by £100,000 and your Government deposits would go up by £100,000 ?—That is the case, but take the case of one bank. It would not help one bank to know that Government deposits in another bank went up.

I am speaking from the banks' point of view collectively; I realize your difficulty in treating the banks individually. The total volume of your deposits is the same, but a portion is Government deposits instead of ordinary deposits. If that £100,000 which has gone into the Savings-bank is invested in Government securities, and we will say the amount is used to make a progress payment on the Wellington Railway-station, and the contractor lodges the cheque for collection, is not the net effect then that the Government deposit of £100,000 is extinguished, but the ordinary deposit has gone back to the original figure ?—Not necessarily, that contractor would probably be paying for materials at home.

I do not wish to introduce a complication. I am referring more to the internal position.

Mr. Harle: On an isolated transaction that would be the position.

Mr. Ashwin: Then your volume of ordinary deposits is left intact by that money going to the Savings-bank ?

Mr. Fussell: I am not sure that that is the case; it would undoubtedly be possible for the total Savings-bank deposits to be greater than the bank deposits.

Mr. Ashwin.] Oh, yes, that could come about ?—You mean that the sum could be paid out a dozen times.

The notes could. The point I wish to bring out is that a deposit in the Savings-bank is not part of the currency. It is called a deposit, but it is a different class of deposit and actually when there is a transfer from a bank deposit to the Savings-bank and it has gone through the channel I have referred to, your volume of deposits is not affected, assuming that the amount is spent internally ?—Assuming also that the transactions go back through the banks.

Well, they must ?—You consider that all of them must go back ?

Yes, one way or another. If they go back as a deposit or as a partial or whole liquidation of an advance ?—Even although there are outside firms who may not have deposits with the bank who accept deposits ?

There is a cheque drawn to pay that £100,000; that cheque is put here against that deposit ?—Yes, and it wipes that deposit out.

In doing so, it either increases some one else's deposit or wipes out an overdraft to that extent ?—Yes.

So that actually, though there has been this transfer of deposit, when the transaction is completed, your situation is really not affected, and the net position is that there is a certain asset over here as a backing for Government securities which are held against Post Office Savings-bank deposits ?—I look at it from the actual practical way; when deposits are in fact lower in proportion to advances, banks feel it is unsafe; they raise the rate and that restores that balance. Whatever the cause is, the effect of adjusting rates is that of bringing up deposits to the required level. It has the effect of restoring the balance. Sometimes you notice in the past advances have exceeded deposits. Deposit rates have gone up and the result is the swing has been round the other way, and the way the banks want it. The actual effect is that, if you increase the rate, you restore the required balance.

But where do these deposits come from ?—It is very difficult to say offhand where all these deposits——

Come back to this: How can the volume of your deposits be increased ? I suggest in only two ways; either as a result of external trade when the exports exceed the imports ?—And of course that is just part of our business.

Secondly, by an increase in advances ?—Yes, but it would not apply in the present case to the extent that it would be increasing advances; that would increase both sides *pari passu*, and would not restore the balance between the two. If advances are more than £5,000,000 more than deposits and the banks increase the deposit rate, you will find that the ratio between the two is restored.

That goes further back; what brings your advances to the position in excess of your deposits ?—Apparently it may be the reduction in advances rates, but then you notice that deposits go up also.

I suggest that your advances normally get ahead of your deposits only as a reflection of adverse trade conditions ?—Yes, and the Government's payments overseas and various other payments overseas.

I am including that, as the result of adverse commitments overseas ?—I would not say "only," but they have their effect; internal things have their effect too.

The only other way would be for the bank to go out and sell securities. If you go out and sell Government securities, that would decrease your deposits, would it not ?—Yes, it certainly would have that effect, and it would increase advances of people with overdrawn accounts.

That is not a normal transaction, but normally it seems to me that the only way in which you could arrive at a situation where you have an excess of advances over deposits is the reflection of an unbalanced external position ?—I will agree that this is the major factor, but would not say that this is the only one.

Apropos of that, you mentioned that at the present time the ratio of advances to deposits has fallen ; is not that due to the fact that we have a large surplus on our external position ?—Taking all advances ; you are including the Government ?

Well, not necessarily ?—I would not go so far as to say the ratio has fallen if we include the Government. Including Treasury bills, the ratio is not far from normal at the present time. Treasury bills have made up the extra that otherwise would exist between overdrafts and deposits.

Only when you are counting Treasury bills as advances ; I was assuming Treasury bills as securities ?—That is just the way you look at it. The bankers look upon discounts as part of their advances, and Treasury bills are discounts, as well as securities. Treasury bills are homogeneous ; they are advances and security.

Taking that view, of course, the amount is equal ; I suppose you have the security on one side and the advance on the other ?—No, because we do not put the security into the balance-sheet. For instance, if you had a farm valued at £20,000, and borrowed £100, giving the farm as security we would not own the security and would not put that on the balance-sheet. We will leave the Government out of it. Where the position overseas affected that difference, the conditions that cause a surplus of funds in England are the same set of conditions that cause the maladjustment here ; both are effects and not causes.

Would it not be that the condition which led to us having a large balance externally would be the condition that brought about the other condition. As the result of the trade position, you have got disparity between advances ?—Yes, both are effects from certain causes.

With regard to fixed-deposit rates ; you say that advances business is not remunerative ; of course you have also your free deposits ; what is your average deposit-rate ?—That would be a very difficult matter to work out and I have not the information here. We would have to take into account the expiry dates of all individual deposits and the volume of deposits at different periods, and different unexpired currencies.

But at any given date, it would be possible to assess the average rate ?—Yes, it would be possible. It is mathematically possible to do so. The majority of the deposits are for twenty-four months, so that the average rate would be far nearer the maximum rate than it would be the minimum.

Are not the banks at the present time somewhat embarrassed by the amount of fixed deposits ?—You are asking me to tell you what they feel about it ?

After all, you are a business concern ; when your fixed deposits rise at the expense of your free deposits, the banks have to pay more interest. Would you not prefer to have more free deposits ?—To put it on a human basis, we would far rather have the free deposits for nothing than have to pay for them.

That is really the point of my question ?—It is quite true that the tendency has been for a greater proportion to be held on fixed deposit than on free deposit at the present time.

To what do you attribute this abnormal rise in fixed deposits ?—I should say to a very large extent it is due to lack of avenues of satisfactory investments or profitable investments, and people regard it more important to have their money on a gilt-edged basis, definitely safe and secure and to have a very moderate interest on that, even to the extent of moving over from the free deposits to a fixed deposit. People who would not have bothered to do so in prosperous times, do so now to catch that extra 2½ per cent. or 3 per cent.

Do not you think it would be a benefit to the country to lower your fixed-deposit rates with the idea of driving the people to make a more active use of their money ?—Personally, I do not believe that could be done. We have to see that we get our share of deposits to keep the ratio of deposits. I think it is desirable to lower the rates, or to enable interest-rates to be lowered. If the outside competitors, including the Government Departments, would be willing to reduce the rate, I think you would find that there would be no difficulty in the banks doing so.

I do not see that they can in the ordinary course take the deposits away from you ?—From the actual facts of the case, you will see that the deposits do go away from us at times, otherwise the ratio would not alter. You have mentioned that the cause is overseas, but the fact is there whatever the cause, and we have to adapt ourselves to the effect. I quite agree with your working-basis of the thing.

I think it is indicated in one of your replies to Dr. Sutch that in the past it has been the traditional policy of the banks to keep stable rates of exchange, year in, year out, and to bring about any necessary adjustments to the trading position by other means ?—I would not put it quite in that way. The *de facto* position was that England, Australia, and New Zealand had a paper currency represented by parity with gold and internationally by approximate parity which would be represented round about the gold points, and charging that rate of exchange did not cause any such maladjustment in the London funds position as would prevent the banks from selling the exchange bought at par at a rate on the same basis. The forces which would call for an alteration in the exchange-rate did not arise.

To take a concrete example : I think your telegraph rate on London stood at about 17s. 6d. for about ten years prior to 1914. In that period there were some quite considerable fluctuations in our external trading position. You did not find it necessary to alter the rate to adjust that ?—No ; I should say that to the extent that there is a fluctuation in external conditions, it would result from forces emanating internally, and the maladjustment emanating internally, if there was such maladjustment, would be corrected internally.

If the banks thought there was going to be an excess of imports, would not your line of action then be to cancel the unexhausted overdrafts on imports?—Oh, no; the banks have not adopted the policy of calling in advances that are on good security.

I was not referring to that at the moment. If you thought any time there was going to be too many imports, instead of first making an alteration in the exchange-rate, would you not set about it by first of all cancelling the unexhausted overdraft authorities of imports?—Do you mean to the extent that a man may have an overdraft arranged but had not drawn to the full amount?

Yes?—No; if the security is satisfactory the arrangement stands; they do not depart from the arrangement, though of course that is subject to the general principle that bank advances are repayable on demand. It is a safeguard, but you do not find in practice that this is exercised.

Then your answer is to the effect that it is not the practice of the banks to be, shall we say, liberal on the one hand and somewhat stringent on the other in the matter of advances as a factor to adjust any swing of the trade situation they can see?—I should say not. The position usually has been that the people who cause the maladjustment can be induced to stop by fixing interest-rates in accordance with the demand. If the interest-rate goes up, those who have an effective demand can still have their advances; the others will cease causing a situation of maladjustment which is not an advantage to any country.

The overplus of imports must be pressure on your London funds; if you do not interfere with the exchange-rate for long periods, how do you direct those funds?

Mr. Shaw: The fluctuation, if it is only a matter of a couple of pounds, is not enough to regulate anything, either to increase or restrict. It is rather different when you come to the question of 125 per cent.; that is quite definitely a deterrent, but not when the old exchange-rate used to be something under £1. If there was a change—it might be 10s.—that was not sufficient to act as a deterrent, though it possibly may have reflected a certain amount of strain on London funds. I think that the banks would of necessity (and have in the past to my knowledge) restrict, say, credits with the view of preventing too many imports. It is more or less done in connection with a man's own position, as Mr. Fussell said. It is the proper banking practice to put pressure on in those particular cases, otherwise you might run right out of London funds.

Mr. Ashwin.] Exactly; that is the point. I was trying to get at the method.

Mr. Fussell: You mentioned a shortage of London funds arising from increase in imports. The practice for many years in New Zealand has been for an almost constant stream of London borrowing on account of this country to cause a stream of London funds to be made available, so that increases in imports would not be the strain on London funds that they would otherwise be. This was a young and developing country and there was plenty of scope for using borrowed money, and that enabled us to import more than we otherwise would have done without pressure or interference with the exchange-rate.

Mr. Ashwin.] Quite so, but apart from that, this is going to put the total amount of imports up by the amount of the loan, but apart from that the system is likely to get out of balance. It did in 1920 or 1921, and I was endeavouring to ascertain what method the bank used to check any actual overimportation or any threatened importation. Preferably they should act when the excess is threatened?—In 1921 the advances were greater than the deposits. Also in 1921, the deposits being lower, deposit rates were put up, and on the same date, to preserve a balance, the advance rates were put up. The result was that shortly afterwards—two years afterwards—the deposits were in excess of the advances.

The effect of that must have been that putting up your advance rate must have discouraged your imports?—To the extent that it was so, if it was so. The main thing we had in view was to restore that balance in New Zealand, because we considered it bad to have that maladjustment. In correcting that, the very people who were causing it were deterred. If the banks had said, instead of correcting the position gradually by operating the supply of and demand for credit, we will do it indirectly by altering the exchange-rate, the effect would be that it would not necessarily fall on the people causing the maladjustment. It would be a transfer of wealth from one section of the community to another section, and would be inequitable. To the extent that any maladjustment would cause a lowering of the exchange-rate at a time when we are on a par with sterling it would mean some sort of adjustment by way of gold movements or other such movements.

Mr. Lye.] I am not going to criticize the administration of the banks or go into technical sides of banking or currency, because I am not an expert, but I wish to elicit a certain amount of information on questions of public interest. First, I would like to ask Mr. Fussell if he considers the banking and monetary system of to-day fairly satisfactory, sound, or is there room for appreciable improvement in the methods employed?—To what extent do you mean "methods employed"? I consider improvements on the lines I have mentioned such as reduction of the cost of credit might be made, but I do not see there is any lack of credit available for sound purposes. I would like to see that credit cheaper.

The statement is being freely made throughout the country that to-day there is a great shortage of credit and currency.

Mr. Fussell: No shortage of credit is suggested, but if a person has nothing to give, nothing in demand in any shape or form he cannot get credit; if you have no goods to express in money you cannot get the money.

Mr. Lye.] If the banking system is the cause of our troubles, bringing about a lack of purchasing-power, will you agree that it becomes a first public duty of a person, if he has a solution to advance, to advance it for the purpose of examination?—That is undoubtedly so, but you are arguing on the assumption that our troubles are caused by the banking system.

And the banks would welcome any suggestions ?—How do you mean ?

In a section of the public mind there is a suspicion that the banks are the enemy of the people in this country and therefore if there is any doubt the banks would naturally welcome an examination into some of the proposed remedies ?—I should say so, providing those with unsound remedies did not sway others into accepting them.

I would like to clear up another matter : Is there not need to have at any time or all of the time credit or currency in circulation equal to the value of the goods produced ?—Decidedly not ; it is decidedly wrong because it ignores the velocity of circulation.

In asking Major Douglas to explain the importance of the velocity of circulation of credit and currency, he attached no importance to it : could you briefly give us your viewpoints of the part played by the velocity of circulation ?—It is well known that 1s. can purchase £1 worth of goods if it circulates twenty times. Major Douglas's idea is a decided fallacy.

Can you give an explanation of the frequently made statement in public—it also appears in the press—that banks create and destroy credit at no cost. I would like a definition if I can get it of what this costless credit is ?—Credit is the use of wealth that is made available to one person by another, and the banks do not create credit, in the sense that they make something out of nothing. Credit is on a tangible basis. For instance, if a man goes to a bank and gets an overdraft, that credit is the basis of the value that he has.

Does the ratio of deposits really influence the position as to the amount of credit available ? I am just asking a simple question and trying to get a simple answer which any one would understand ?—The *de facto* position is that when deposits are not in sufficient volume the balance is restored by increasing interest-rates all round. That has always had the effect of restoring the balance.

Has it the tendency to restrict credit ?—It has that tendency.

It is frequently stated that every bank loan creates a deposit. Accordingly, is it true that it at the same time creates a debt against some asset the borrower has ?—I understand that is true. A classical example is that of the Hon. Reginald McKenna who said that every bank loan creates a deposit, but my own view is that when a loan is granted the customer's account is credited with the amount of that loan.

What is the ordinary practice ?—In New Zealand we grant accommodation by way of overdraft that enables a man to pay interest only on the amount of indebtedness from day to day ; it is not correct in New Zealand to say that an overdraft creates a deposit, but it does create a debit—it always does that. It is not a deposit for this reason : if a man gets an overdraft and draws a cheque for £100 and pays it into an account that is not in credit it does not affect the deposit at all.

Do you know of any method by which purchasing-power could be made available to people who have no security ?—I know of no way at all—there is no way of getting something for nothing. The printing of credit notes would not meet the position. That would not be possible unless there was security or assets. The mere printing of the notes would be no good unless the people had assets which would be expressed in the form of goods—unless there were goods or services to be offered in exchange for these notes it would not meet the position.

I presume you will agree that there is to-day a lack of purchasing-power ?—I would not say that. The real difficulty is the lack of confidence. In New Zealand at the present time there are free deposits of £70,000,000, but the people who have this money cannot be induced to purchase things with it.

That answers in part only the question I have asked. Are there not really a number of factors which have been responsible for the falling-off of the purchasing-power not only in New Zealand, but in other parts of the world ? This falling-off in purchasing-power : do you consider it has been due in part to any failure of the banking system ?—No, I do not consider it so. I wish to say that the troubles at the present time are not monetary and cannot be restored by monetary measures. Various economic forces are responsible ; personally, I do not think the monetary system has anything to do with it ; and if these things which cause the trouble were righted the monetary system would reflect that improvement.

Would you say that the burden of war debts, Britain reverting to the gold standard, and the hoarding of gold are a number of factors responsible for this fall in prices—the setting-up of a process of deflation—and the consequent fall in prices ?—I consider that the war debts in conjunction with the attempt to restore the gold standard were part of the cause, but the main part is the fact of the impossibility of satisfying the huge commitments with security which did not exist.

I presume that you are aware of the fact that this Committee of Inquiry to go into monetary matters was set up as the outcome of a general demand for an inquiry into the monetary system ?

Mr. Fussell : I am aware of that.

Mr. Lye.] Would you say that the only real proposals for monetary reform that appear to have caught on to the public imagination are the Douglas proposals ?—I would not say that the Douglas proposals are the only ones.

To any great extent I mean ?—I should say that the Douglas proposals have more discussion than anything else.

Would you say that there appear to be two schools of thought in connection with banking and currency—say the " Douglas " school and that of the present banking system—which may be described as the orthodox and unorthodox methods of currency ?—What I should call the orthodox and unorthodox.

You would say that is a fair statement ?—In my opinion.

Now, I presume that behind any system of banking and currency the idea is really to promote and facilitate the exchange of goods and services, is that right ?—That is right.

And that money is only required to a limited extent. Really the thing that we want to bring about is the free exchange of goods and services, and the question of greater volume of money ?—That is limited to a certain extent in the exchange of goods and services.

That is so, that is really money either in the form of metallic money or paper currency in circulation ?—That is correct, goods pay for goods.

There has been a demand for the establishment of a National Credit Board or National Credit Authority. I put it to you, would it be possible if the State actually controlled the banking and currency of the Dominion—that would not in any way enable the National Credit Board or authority to issue credits except on the usual established sound practice of advances against securities ?—I would not go so far as to say that. Even when the Government issues credit, they are in the position of compelling people to accept the evidence of that credit in payments for debts and so forth, as happened in France, and the banks have not that ability; Governments can force loans (but that money must pass on a certain charge), and they can impose fines and so forth where people refuse to do so; but to the extent that credit is soundly issued by a Credit Board it would not enable more credit to be issued than there was a real basis for.

Witness: Behind the issue of any credit there must be more funds, and the establishment of a National Credit Authority or Board would not permit of the indiscriminate issue of credit unless there was adequate security or assets behind the issue of that credit.

Mr. Lye.] You would say the establishment of a National Credit Board should not permit, and it would not be likely to permit this? The question that has arisen and been discussed in New Zealand from time to time is the question that there must be a reform in our banking methods in this country which would allow the payment of interest on current accounts of credit on a daily balance, which I understand is the practice in Great Britain ?

Mr. Fussell: Yes, that could be done; it is not unworkable to do so; it would add to the running-costs and overhead expenses and to preserve that margin that is necessary the banks would be compelled to increase those charges. In Britain, on the other hand, the banks have very large operations and they have the advantage of their short term money-market, and the bank could pay a small rate of interest on a balance deposit account and would have the advantage on the other hand of using any surplus cash they might have—even for one night—on the London market. The banks in New Zealand have not that facility; if they had surplus cash for one day they would not be able to employ it.

Mr. Lye.] It is argued that if a person has a credit on a current account in a bank in New Zealand the bank has the use of that money; immediately that same person gets an overdraft he has got to start paying interest on all he has overdrawn. Is not the difference between the banking practice in New Zealand and that in operation in Great Britain this: If we wanted an overdraft for £1,000 in Great Britain I get that credit placed in my account and whether I use it or otherwise, the bank having established that credit, I have to pay for it ?—Pay the interest on the full amount of overdraft. If you have a balance in your credit account of £1,000 or £500 or £200 you still pay the interest on the £1,000. In New Zealand the position is that you are only charged the bank-overdraft rate on the amount actually overdrawn.

Mr. Fussell: If you reduce the amount of overdraft by £100 one day you would be relieved of that interest on that £100 for that day.

Mr. Lye.] Did you say definitely to a member of the Committee that the banks in Great Britain did charge an annual fee for the keeping of current accounts ?—That is the case.

Mr. Fussell: I have a memo. here, which has been written after conversation with an English banker:—

> "Regarding charges: These are also made up by means of arrangement with the customer where, for example, the account is a heavy one the charges are consequently considerable. Ordinarily, however, there is no negotiation between the banker and the customer unless the latter complains of the charges which are debited automatically."

Mr. Lye.] Following up the line of thought that I have been pursuing, do you say that the volume of business for the banks in New Zealand is not sufficient to warrant the issue of current accounts free of cost and the abolition of the internal exchange-rate that is charged on cheques—what is the reason—for instance, I may have a bank account in London and go to Edinburgh and draw on the bank in London and pay no exchange ?—Yes, you could do so; that is the result of the large scale of operations which I mentioned before. It is also due to the fact that the banks may distribute their running costs in different ways and if we gave cheques free of exchange within New Zealand then we would have to collect that amount in some other way.

It has been stated from time to time that it is quite possible—and some people go so far as to say it is a desirable way—to have a banking, credit, and currency system entirely independent of Great Britain and our currency and credit independent of sterling: have you any comments to make on that claim which has been made frequently ?—You may have a different coin from sterling, but it would have some basis or relation to sterling; that has been explained before. What we do in our trade with Britain is to send so many bales of wool, pounds of butter, and so on, and we ask in return for so many tons of pig iron or anything else, and were we to have a different self-contained system here we would still have to provide goods to enable us to buy goods from England.

Would you say that, seeing New Zealand is an exporting country, our economic welfare must always be largely determined by conditions governing Great Britain and the rest of the world ?—I should certainly say so. There is another theory that has been advanced—and it is quite possible—to base our financial system on production, and not on any metallic basis at all.

Mr. Fussell: Do you mean in that case it would have no relation to any metallic standard ?

Mr. Lye: Yes, that is the claim made.

Mr. Lye.] How would you arrive at any stability ?—I am not in a position to say.

I am asking you for your comments on the claim made ?—I do not consider it would make for stability if you did base it on production. It is the demand for production that is the deciding factor—the effect of demand for our production.

Captain Rushworth.] Can you give us your definition of inflation and deflation ?—Not necessarily in technical terms. My own view is that inflation takes place when the volume of money is, in relation to its velocity of circulation, is increased in proportion to the volume of goods and their velocity of circulation. That means that there is more money to do the work than there was before. I would say that that would result, other things being equal, in prices rising, and that it would be entirely a monetary effect, purely from increasing the volume of money. And deflation is just conversely. If we decrease the money in circulation without decreasing the volume in relation to the velocity of circulation of goods, although you can decrease the money in circulation and increase the velocity of circulation and that would enable the same amount of money, by travelling faster, to do the same amount of work, and the tendency would be not to affect prices, and therefore to avoid deflation.

Could you, by increasing velocity of money, pay off debts to the bank ?—I do not think that would depend entirely on the velocity of circulation, because the payment of debts to the bank is just one movement.

This question of inflation and deflation, could it be expressed that a state of inflation exists when you have a general rise in the price-level and a state of deflation exists when you have a general fall in the price-level ?—Not necessarily.

Then I did not quite understand your definition of the terms inflation and deflation ?—In what way do you mean ?

What is a state of inflation ?—What I mean is this, that if there is an increase in the price-level it might be due to an increased demand in certain directions.

But a general increase in the price-level ; an increase in the general price-level—that is, over all commodities ?—It is very difficult to make a general statement about it because in New Zealand if prices increased here and at the same time the prices we received for overseas goods increased it would not necessarily be a state of inflation at all.

Then how would you decide whether a country had adopted a policy of inflation or not ?—Normally speaking, for a very long time currencies have been related to gold, and an indication of the extent to which a currency has been depreciated, which is the converse of inflation, is the extent to which the currency is depreciated in terms of gold.

Then if we found a mountain of solid gold in this country, that would not result in a state of inflation ?—It would not result in a state of inflation, but it would decrease the value of gold in proportion to the demand for it.

In proportion to the goods ?—In proportion to the goods.

Involving an increase in the price-level ?—Yes.

So that a state of inflation is an increase in the general price-level ?—Not necessarily. An increase in the general price-level can be a state of inflation.

Yes. But can you have a state of inflation without a general increase in the price-level ?—Yes, you can.

Could you give me an illustration ?—If the volume of goods decreases.

Well, if the volume of goods decreased and the volume of money remained constant, surely you would have an increase in the price-level would you not ?—Would you say that again.

If the volume of money remains constant and the velocity and the quantum of goods diminishes you would have a state of inflation ?—It all depends to what extent the volume of money was in circulation.

We give that in. We will put it this way : If the volume of money in circulation remains constant and the quantum of goods in circulation falls you have a state of inflation. Is that right ?—It might be considered so.

Would you consider it so ?—That is a question that wants thinking out.

It seems simple enough ?—What I mean is, I am looking upon gold as having an intrinsic commodity value, and the way I was approaching inflation and deflation was as regards the paper currency issuing the titles to purchasing-power without increasing the work it was to do.

Yes. You see why it is so necessary to have a clear understanding as to what we mean by the word inflation, because otherwise we shall be stumbling over it later on ?—Yes, that is right.

Is it not a fact that the term inflation is applicable to a general rise in the price-level ?—No. As I mentioned before I do not consider so. You might consider so.

I want your opinion ?—I would not regard it as inflation if the supply of gold increased in relation to the supply of goods, and the currency based on the gold increased to that same amount, because all that it means then is that the volume of money to do the same amount of work is more and the money has an intrinsic value. But what I mean by inflation is that if the quantity of paper money is increased and the work it has to do is not increased, I look upon that as inflation because the reason why that sort of thing is done usually is for some other authority or some one to get the difference—get the margin, and reduce the real burden of debts payable.

May I put it, then, that you personally make no equation between money and goods, but only between various forms of money and gold ?—No. As regards inflation, it is a term I understand as referring to depreciation of the paper money in respect of gold and a rise in prices on account of a greater increase of the gold supply available. I would not consider that inflation at all, although it might be considered so.

There has been no increase in the general price-level, I am told, in Egypt and Sweden, but in neither cases are the moneys of those countries related to gold. Would you say that there is a definite state

of inflation there ?—No. I cannot see how you would say that they are not related to gold, because of their purchasing-power in comparison with the purchasing-power of gold, there would be a relation there.

So that the meaning you attach to the term " inflation " really is the relationship of money in its various forms to gold. Is that it ?—That is the way I am understanding it in this particular case.

No relationship to the price-level ?—I do not say it has no relation to the price-level. What I am saying is that a change in the price-level could take place without its being inflation.

That is to say, inflation might or might not take place irrespective of the price-level ?—No. I would not say that. What I say is that all increases in price-level are not necessarily inflation.

Then how would you decide that a state of inflation has arisen ?—In gold countries, in countries whose currencies are linked to gold, by the relation of the paper currency to the gold.

And in other countries, countries not linked to gold, how would you arrive at it ?—You mean in countries like Egypt and so forth ?

Never mind ; any country not linked to gold. How would you arrive at the state of inflation ?—Well, considering between two points of time, if, at a certain time, the price-level was at such-and-such an amount and the volume of goods and so forth were such-and-such a quantity, and then there was just the monetary change without the relation of the goods changing, a state of inflation or reflation might exist between them. Why I use " reflation " is that we may be merely returning to a previous basis which was considered as normal.

Of course, the terms " inflation " or " deflation " or " reflation," if there is such a word, are relative ?—Yes. That is why I mentioned gold, because I regard it as being relative to something or some commodity.

So that you personally would be quite satisfied that if there were a general rise in the price-level a state of inflation might not exist ?—It may not exist.

Here in New Zealand ?—For instance, if we return to the price-levels and the incomes and the volume of goods and services that we had before, when both Britain and New Zealand were on the gold standard, we would be very much more prosperous than we are to-day, and we would be paying higher prices than we are to-day, but I would not say that a state of inflation existed then.

So that if we as a Committee here had any proposals put before us which involved a general rise in the price-level, it would be quite wrong for us to suggest that that necessarily meant going into a state of inflation ?—In my view, a sound basis of returning to the price-levels that have existed before would not necessarily be inflation as compared with the parities and standards that existed before the depression.

We are taking the position as it is now ?—Well, you must compare it with something. You must relate it to something.

We are relating it to the present situation. Supposing a proposal were put before us involving a general rise in the price-level as from now, would the Committee be wrong in suggesting that that would necessarily involve a state of inflation from now ?—Yes. I consider there is a distinction between inflation and reflation.

What is the difference ?—I consider that reflation is returning to a basis that was formerly considered as normal, and that inflation would be, as I have described, the depreciation of the currency in respect of its original purchasing-power.

But supposing your previous state was abnormal and that you are back to normal now. If you go from the normal to the abnormal would you call that inflation and not reflation ?—Not necessarily, because " re " means back again, and if you are not returning to anything it would not be inflation.

It would be back to the abnormal in the case suggested ?—Well, that would be re-inflation.

Well, it would be justifiable, would it ?—Not necessarily.

Well, I will let that go for the moment. I am satisfied with the answers so far. Do the banks operating here in New Zealand act as trading concerns for profits ?—They do.

For the benefit of the shareholders ?—It is for the benefit of the shareholders and also for the benefit of the community, because banks are what may be called quasi-public bodies.

Yes. That has been mentioned once or twice this morning, that the banks, on occasion, operate in the interests of the community as a whole. What I want to ask you is, what happens when the interests of the community as a whole and the interests of the shareholders are in conflict ?—I do not consider that they would come into conflict.

No. But what would happen if they did ?—Well, the community interests would have sway. For instance, it would be to the interests of the shareholders at the present time to increase the overdraft rate.

Yes. But that is not my point. My point is, when the interests of the shareholders and the interests of the community as a whole are in conflict ?—I am wanting to understand you, and if you will explain how the interests of the community as a whole can conflict with the interests of a very large body of them drawn from all classes of society and from all grades of wealth, I might be able to do something. But the thing is that I cannot see that they do conflict.

Is there any way in which, in the event of such a conflict, the interests of the community could be made paramount ?—In cases of national emergency the policy of banks is directly concerned with national interests, but still, at the same time, those interests, I affirm, are the shareholders' interests also. The shareholders are a part of the community and not of any section of the community or any party in the community, so I consider that the body of shareholders are a representative body of the community.

Well, surely they are a section of the community. They must of necessity be ?—Yes. But I mean that no party or divided section. For instance, you would not say that their interests were exporting as distinct from importing, or that they had any political colour at all or any religious colour.

You remember what my question was. It was, in the event of the interests of the community as a whole and the shareholders' interests being in conflict, is there any means by which the interests of the community can be made paramount?—Well, until I can consider that the interests of the community are different from the interests of the shareholders, I do not see how I can answer you. The interests of the shareholders are the same as the interests of the community and they are both paramount.

I will let it go at that. Do the banks actually lend the money that is deposited with them?—The exact answer to that, in my opinion, is that in respect of a large part of their deposits they may lend some of their deposits. The actual money paid in may be lent out again. For instance, if you paid in some coins to the credit of your account those very coins might be lent out, but if you paid a cheque into your account, that very cheque would not be lent out, and I would like to refer to the fact that according to law money deposited with a banker ceases to be the money of the depositor and becomes the money of the banker, who is under an obligation to repay the depositor a similar sum. Now, the bank lends money to those who borrow from them. The net position is this, that they borrow money and they lend money, and that they cannot lend money unless they borrow money except under certain limitations.

What do the banks do with the money that is deposited with them. Will you trace out the actual process?—If sums are deposited with bankers they record that they have an obligation to the person who deposited that money to the extent of that amount.

What obligation?—They become liable to repay to the depositor the same sum that he paid to them. That means that if a depositor deposited a cheque for £100 that depositor has the right to draw a cheque for £100 on the bank.

What does it cost the bank to do that?—That goes into the question of overhead expenses, to provide the facilities for doing that, a roof over their head and so forth. I could not give you the exact figures or anything like that, but they go into the running-expenses of the concern.

I am satisfied of that. Following this question of deposits again, if the money is paid into the bank on a twenty-four months' fixed deposit, what does the bank do with that money?—That money becomes part of the bank's money resources and it is against these money resources that the bank advances money on loan.

Do you suggest that the bank's power to make advances is limited by the amount of the deposits?—Generally speaking, that is the case. The Right Hon. Reginald McKenna said what has often been quoted, that the banks can create money and so forth. He was referring to the fact that they could advance money and later on in the same book he said traders often assume that the banks can issue loans to as great an extent as they like, but this is not so. The banks can only lend to the extent of their cash resources. That is a statement made by the Right Hon. Reginald McKenna.

There is a little confusion still on the subject of these deposits. Do you say definitely that the bank's power here in New Zealand to lend money is limited by the amount of money that is deposited with them?—Not necessarily limited by the exact amount of deposits, because banks have other resources.

Do they lend any of the deposits?—As I said before, my view of the case is that the banks lend against their deposits, and I mentioned that they may lend part of the actual material paid in, but they do not in the case of cheques, of course.

Will you trace it through. A man pays in a cheque for £2,000 on fixed deposit. That is entered up in the ledger somewhere, is not it?—That is so.

Is there any corresponding entry on the other side that that £2,000 is lent to John Smith, or anybody else?—As far as the bank is concerned that is a debit from the bank to the depositor, and as far as the depositor is concerned it is a credit that is owed to him by the bank.

You have no corresponding entry in any book to show that that £2,000 is lent out to anybody else. Is that right?—In book-keeping the debit is "To cash received."

But the point I want is this: Is there any book kept by the bank in which that entry of £2,000 is shown as being lent out to somebody else?—That particular £2,000?

Yes.—There is no entry to show that that particular £2,000 has been lent to any one else, but the amount of that entry is covered by entries on the other side by way of loans.

You do not suggest that the banks do really lend their deposits?—My own personal view is that they lend against their deposits. They lend from the bank's funds and those funds are built up by the deposits.

You give the impression of fencing with the question. Can you answer it definitely. I want to make this quite clear?—I quite understand that.

The witness is giving me the impression that he is fencing with the question. Do the banks, or do they not, limit their powers to make advances by the amount of the deposits?—Yes, they do.

So that this statement that you have submitted to the Committee is not quite correct?—It is correct. What I mean is that the banks desire to preserve a certain ratio of deposits to advances.

Why?—It is ordinary banking prudence.

But why? Why do they desire to maintain that ratio?—Because if they overlent or overtraded and they did not have what they considered a sound and safe ratio of deposits to advances, their position would not be secure.

Why would their position not be secure?—Because there would be claims against them which would be required to be satisfied in some way, and if the way in which those claims were required to be satisfied were not acceptable to the persons having those claims by way of having a deposit with the bank, the bank would have to find other means of doing so.

You do not agree with the authorities that state that advances create deposits?—I have not said anything one way or the other, but I will say this, that some of the money drawn from the

bank by way of loan finds its way into banks by way of deposit, and no sound system can be devised whereby a person who drew a cheque on an overdrawn account was prohibited from paying it in to a credit account.

What proportion of advances finds its way into the bank as deposits ?—I could not give those figures.

You know that before that Commission held in London it was given in evidence that of the money transactions recorded by the banks in one year 0·7 of 1 per cent. was represented by currency, the remainder being by credit instruments of various kinds. Would that be something like the proportion here ?—I am not in a position to say that.

You say that the proportion of currency—— ?—Currency to banking transactions ?

Notes and coin—— ?—Notes and coin to banking transactions ?

Yes ?—Well, it is not possible to say what the proportion is here, but the thing is that the banking transactions by way of cheque is the volume and the velocity. That means that the note can circulate a thousand times and yet it only appears as one note-issue, but a cheque is recorded each time it passes.

We will deal with the question of velocity a little later. The point at issue at the moment is still this same question of deposits. Can you tell me how money comes into existence in the first instance ?—That has already been replied to.

In part. Would you mind elaborating a little. So far as metallic money is concerned, we know that comes into existence through the operation of the Royal Mint. When money was entirely metallic, all the money in existence originated at the Royal Mint. Is that right ?—Or at some mint. By minting, yes.

So far as Great Britain is concerned it is the Royal Mint ?—Yes.

There is only one mint, the Royal Mint ?—That is so.

With the development of the monetary system the metallic money has become a very small proportion of our total money ?—That is the case.

Our total money, in Professor Walker's definition, the one you have adopted, consists very largely, almost entirely, of credit instruments of one form or another. Is that right ?—That is the case.

Those credit instruments we commonly corrupt into the word "credit." We talk of the credit structure and so forth. Now, the amount of credit that is issued by the banks and takes the form of credit instruments of various kinds is based in some way upon the currency, that is the cash reserves of the bank. Can you give me any idea as to the proportion ?—Are you referring to banking in New Zealand ?

Yes ?—I should say in New Zealand it is round about 20 per cent.

In Great Britain they found it quite safe to assume from ten to twelve times of credit to the English reserves they held; do you think it would be more like five or six ?—What do I think would be more like five or six ?

The amount of credit; the total volume of credit instruments that the bank can issue that has a relationship to their cash reserves. Is that right ?—Yes.

Because that may be used to draw on cash. About what proportion ?—In New Zealand ? I have said I think it is round about 20 per cent. in New Zealand, but the system is not quite the same.

I know that. The banks here can quite safely issue credit beyond the limits of their cash reserves. They do in fact do so ?—What do you mean by "the limits of their cash reserves" ?

You have a total volume of currency, notes, and coin; you can issue credit beyond the limit of that currency ?—You say we have currency, notes, and coins; do you refer to the notes in the tills of the bank as being coin ?

No, legal tender ?—Legal tender in the banks ?

I am using the term "cash" in the same sense that it was used in the Act passed by the British Parliament in 1819 when the Bank of England was authorized to use cash payments; cash in the ordinary accepted sense of the term covering all forms of currency. The banks here operate on a certain volume of currency; that currency is limited by certain other things which I will touch upon presently, but they are able to issue credit over and above the limits of their cash reserves ?—Do you include notes that are not in circulation which are held in the banks as cash reserves ?

Yes. You consider them as cash reserves ?—That is not correct, because notes held in a bank are merely pieces of paper and not entered on the bank's books at all. They are not assets or liabilities; they are only liabilities of the bank while they are in circulation; and when they are in the bank's hands, if they are all destroyed, it would not make any difference beyond the necessity of printing more.

What is the limit of the credit that the banks here may go ?—I cannot say anything as being the limit to the credit that the banks may go. It would be in accordance with their views of what may be soundly and safely given on the security which is the basis for that credit and the bank' cash resources or funds.

What is that "cash resources" you are talking about ?—The actual metallic money and the reserves.

What reserves ?—General banking reserves.

What reserves—coin ?—Including coin and securities.

But the securities are not legal tender; you do not call those cash ?—There seems to be some confusion here in regard to legal tender, but the banks do not hold legal tender.

You said cash; I am trying to get a definition of cash ?—Cash resources are the funds representing amounts deposited by cash depositors.

What are they—are they notes?—No, they are obligations on the part of the bank; a debt on the part of the bank and a credit on the part of the customer.

When you talk of obligations, do you mean us to understand cash?—Not necessarily. From the point of view of the depositor, the depositor regards his deposit as cash.

You are the banker; you talk as if you can issue credit against your cash reserves?—No, I said resources. What I mean is against such resources as the deposits. They can issue advances against the deposits.

The amount of credit you can issue has no relationship to your note-issue?—In New Zealand there is no definite relation, but there is a connection between the amount of notes issued (and it is not a rigid one) and the amount of credit, but Sir Otto Niemeyer said that currency depends on credit. You may or may not increase the amount of notes in circulation but it depends, as I said this morning, on the habits of the people. If they wish to have more notes in circulation than they have at present, they can do so without necessarily increasing the amount of credit.

When you make an advance on overdraft to an individual, just exactly what do you do?—First, you enable the man to turn the value he has such as land——

No, what do you do? I mean the mechanism?—First, see whether the security is adequate, whether the present and prospective value is adequate, whether the manner of using that money is likely to be such that the money will be repaid. That is necessary. Then we give the person who is arranging to borrow the money from us a claim on the bank to that extent.

Yes, what do you do?—In the case of books we record that that man may draw on the bank to the extent of the amount of the loan.

What do you do? Do you do any more than write up a credit entry for him in your books?—We do not write up a credit entry in the books, but we give him the right to draw upon us.

You must make some note of it. In your system you must keep books?—You do not rely on memory; it is recorded in some way.

You make a note of the fact that he may draw up to a certain figure?—Yes.

Now that is written in the books; when he draws on that, he draws a cheque, and that may be in one of two forms, either to pay to the order of some one or to pay bearer. If it is to pay bearer, you as a banker have to be prepared to meet that in cash?—That is the case.

So that, when you write up an overdraft, you must have at the bank cash reserves because there may be a draw on cash. What would happen if you granted an overdraft for an amount, the man drew a cheque for cash, and you could not meet it?—That position does not arise where banks are constituted like they are at present, because, in the first place, it is not convenient for people to do all these large transactions by way of notes. If it were convenient and necessary for them to do so, we would have a slightly different banking system, as, for instance, in Germany and France, where the cheque system is not nearly so current as in New Zealand, and therefore we find there that notes in circulation represent a far greater proportion to cheques in circulation. Each country's banking system is in accordance with the habits of the country to that extent.

But at the same time whenever an overdraft is arranged for, there is always the possibility of some portion of it being a draw on cash, is that right?—There is always a possibility of some proportion of it being asked for in the form of cash, that is paper money or bank-notes?

You must be prepared to meet that in notes, if the necessity should arise?—Yes.

On the other hand, the cheque that is not a bearer cheque but is payable to order; what happens to that? That is eventually paid into the banking system and it becomes a deposit?—It may become a deposit or it may reduce an overdraft.

Yes, when it is so paid in, what exactly happens?—The customer by drawing a cheque exercises a claim he has on the bank. By paying it into a credit account, he transfers its claim on the bank.

What has the bank done so far?—The bank has enabled the person to use his own credit and has given that person a claim on the bank which the person has transferred to some one else or the bank, and so the person who drew the cheque forfeits his claim on the bank and transfers it to some one else, so the bank on the one hand has a claim on this person, and on the other hand has a claim against itself. There is a debit and a credit in the bank's books.

So that what the bank has done is some clerical work, some book-keeping?—That is the clerical procedure.

That is all right. There are one or two other points. The question of velocity. You indicated that the question of velocity is a very important one, and you illustrated it by certain articles you had on the table there?—That is so.

Whilst you were doing so a similar illustration occurred to me. Perhaps you would tell me whether it follows your line of reasoning. Two men together have 13s.; one has 6s. and the other 7s. They go into partnership, and with 12s. they buy a dozen bottles of beer. They then go out in a boat. One has 1s. left. After a while out in this boat they decide it is a pretty warm day, and the man with the 1s. says, "I will buy a bottle of this beer," and hands over the 1s. to the other man. He drinks the bottle of beer. The other man says, "I will have a go, too," and hands the 1s. back again, and so on until the whole twelve bottles of beer are consumed. That is the maximum velocity of money in that case. Trade is booming, but the net result is only 1s.?—The net result is that 12s. of business has been done by that 1s. changing hands.

Are you satisfied with that illustration as the working of velocity?—It is an illustration that 1s. can do the work of 12s. by changing hands twelve times instead of 12s. only changing hands once. Instead of having just the 1s. they each had 6s.; each would take his own bottles; both would finish up with six bottles and 6s. That is velocity of circulation.

Talking of the way money comes into existence and into circulation: under the existing monetary system coin still comes into existence through the operations of the Royal Mint?—That is so; you mean token coins, do you not?

I mean the ordinary silver and copper coins ?—Quite right.

Notes come into existence in a different way altogether. I put it to you that the banks are licensed to issue notes ?—That is so ; they are empowered by statute to do so.

Yes, and they have a monopoly ?—Yes, they have a monopoly of actual note-issue, but not of credit issue.

I am talking about the notes. If they have a monopoly of the note-issue, the credit instruments that the banks issue are connected with the note-issue ; they are greater than but are connected with the note-issue ?—They bear a relation to the note-issue to the extent that some of these credit instruments may be transformed into notes at will.

Have not the banks the monopoly of the issue of these credit instruments based on the note-issue ?—I do not say that the issue of the credit instruments is based on the note-issue. The note-issue has a duty to perform and credit instruments have a duty to perform, and some other system regarding the issue of notes would be necessary if this was not in existence.

Could the banks under the present system issue those credit instruments if they did not have the right of note-issue ?—There would have to be some right of note-issue or some statutory provision. When the Reserve Bank is in operation the bank must continue to issue those credits, but will not have this right of note-issue.

There must be some right of note-issue to enable the banks to issue the credit ?—In the case of a country where such credit is convertible into notes there must naturally be the notes.

If there is a monopoly of the note-issue, it follows that you have a monopoly of the credit issue too ?—Not necessarily. I do not see that ; other outside firms do not have the monopoly of issuing notes, but they can demand notes and can get them.

You say outside firms have the power to give credit ?—That is so.

Can they do that in the first place ? Must they not in the first instance obtain credit from the banks ?—Not necessarily. The total credit issued by the banks is £42,000,000, and the total amount of credit is well over £200,000,000.

Under what circumstances could a firm or individual in New Zealand give a credit, issue credit instruments, legal instruments, unless he had a credit with the banking institutions ?—If I bought a piano from you and I gave you an I.O.U. or promissory note, you would be issuing credit for the amount. You would enable me to exercise purchasing-power by means of a piece of paper without actually having money. You have increased the amount of credit. You have used my credit and the purchase takes place, but the settlement of the debt takes place later.

But I, as the owner of the piano, must have had a credit with the bank to get the piano in the first instance ?—On, no. We will put it this way : One person in every nine is a depositor, and one person in every nine has an overdraft. One in every four and a half has a bank account. Would you say one in every four and a half would have a piano ?

No ; it is only something to build up this credit on, surely ?—Not necessarily, because a credit may be based on real assets. I think the direction of that is the assumption that the banks have a monopoly of the real assets in the country, but that is not the case at all.

I think you misunderstand me ; I am still operating on Professor Walker's definition of money ?— Are you not talking about credit instruments ?

Yes.—Do you consider that Walker's definition of money includes instruments ? Would you mind reading it ?

Yes ; it is your own wording. I take it as being correct : " That which passes freely from hand to hand throughout the community, in final discharge of debts and full payment for goods, being accepted equally without reference to the character or credit of the person who offers it, and without the intention of the person who uses it to consume it, or enjoy it, or apply it to any other use than, in turn, to tender it to others in discharge of debts or payment of commodities " ?

Mr. Fussell : That means universal acceptability. " Without reference to the credit of the holder " ; I do not think you would accept a cheque without reference to the person issuing it.

Captain Rushworth.] A time payment agreement does not come within that definition ?—Cheques and credit instruments would not come within that definition. Unless guaranteed cheques, I take it ? Guaranteed cheques would. A guaranteed cheque would be a piece of money in the same way to all intents and purposes as a bank-note, but the proportion of that to the total amount of cheque currency would be negligible.

The great majority of credit instruments would be bills of various kinds ?—Sykes' definition of currency, " synonymous with money in its broader sense, and contains the two subdivisions of the coinage and the paper circulation—that is, bills, notes, cheques, postal orders, and similar forms of money ; they are regarded as not being money but currency."

They are not money in Walker's definition, quite obviously, but keeping within Walker's definition, do you not agree that the only parties licensed to issue money in New Zealand are the banks ?—Certainly not, because in accordance with Walker's definition, Treasury notes, Bradbury's, are money, and I should say that the banks have not the monopoly of issuing Bradbury's.

Mr. Fussell : Excluding Bradbury's, you are still including gold coins ?

Captain Rushworth.] No, I am satisfied with that. So far as Treasury is concerned, of course, the Treasury has not the legal right to issue notes in New Zealand, and we have no Royal Mint here to manufacture gold coins. In fact, they do not circulate. So that we come down to the practical result that, in the situation to-day, the banks operating in New Zealand have the monopoly of the issue of money ?—No, because the banks do not issue the coinage.

No ; I am sorry. I gave you that loophole ; excluding silver and copper coinage, the banks have the monopoly ?—The banks have a monopoly of issuing money to the extent that money includes only bank-notes at the present time.

Those credit instruments are based on bank-notes ?—No, I do not say that. I say that the circulation of bank-notes bears a relation to, but not a fixed relation to, the amount of credit, but there is no very fixed relation because the supply of bank-notes all depends on the needs of the community. They can go up when credit comes down, and they can come down when credit goes up. At a given day, say, a race day, the circulation would be very much higher and next day it is lower again.

Excluding gold coins, which do not circulate in the country, excluding silver and copper which do circulate, excluding any powers of issuing Treasury notes which may be issued, but are not, is there no power or authority in New Zealand which has the authority to issue money in Professor Walker's definition other than the banks ?—No.

It is right to say that they have a monopoly ?—The banks have a monopoly of the issue of money to the extent limited by you.

Limits are established by Parliament in that notes can be issued against security of coin in gold and bullion and public securities ?—That is so.

Public securities being defined as Government securities held either here or in London or Australia. Will you tell me what happens when a loan is floated in London ?—You mean a national loan borrowed by the country ?

We will say a loan of £10,000,000 for the purpose of providing hydro-electric machinery in New Zealand ?—My conception of the normal happening is for the amount to be added to London funds and money does not pass between the two countries, but goods pass, and if it is for the purpose of purchasing hydro-electric machinery, those funds in London would be used to pay for that machinery, and the machinery would come out. The amount would have been paid into the funds and taken out by the shipment of goods, so the net result is we have borrowed that hydro-electric machinery, and must pay for it by the shipment of goods.

Let us trace it a little more carefully ; go backward and then go forwards. When a £10,000,000 loan is applied for in London, that £10,000,000 is money, it is monetized, and it is spent in Great Britain ?—That is so.

Directly or indirectly, that is spent in wages, is it not ?—Do you mean the full amount ?

Yes, directly or indirectly ?—I do not say so. I do not say that the only cost in purchasing goods is wages.

I said directly or indirectly. It is not quite clear perhaps. A professional man receiving part of that £10,000,000 would spend it, would he not ?—Yes, I should say so.

If you trace it right back, you will find that wages are in it somewhere ; ultimately the whole £10,000,000 goes in wages ?—No, I would not say that.

Shall we say for the payment of services ?—For the payment of goods or services.

Right ; what are those goods and services in the ultimate ? They are such things as food, clothing, and shelter ?—Suchlike things.

In fact, even the service. If you take a stage further back, you will come to the same thing. The point I want to make is that that food, clothing, and shelter that are purchased with that loan-money have already been brought into existence. They must have been. So that, if the loan had not been floated, those goods (food, clothing, shelter, &c.) would not have been purchased. There would have been no money for them, would there ?—I cannot quite see that.

If the £10,000,000 is spent in providing food, clothing, and shelter in Great Britain, the food, clothing, and shelter having already been provided the failure to float that loan would have rendered those goods unsaleable ?—No, because the demand would have existed elsewhere. I should say that in connection with hydro-electricity the order goes in and the machinery is made ; no one goes and puts a tremendous amount of hydro-electric machinery on the market in the hope of selling it.

I do not think you have got my point. What I am trying to get at is that £10,000,000 is spent in Great Britain ; it is spent there and is utilized by the recipients to provide food, clothing, and shelter and suchlike things. If the £10,000,000 had not been floated that money would not have been in existence ; those things would have been already produced, they would have been surplus to requirements ?—But you say that they have already been produced ; you say the food, clothing, shelter, and so forth has already been paid for.

It is already brought into existence ; it is there. It is there waiting to be purchased and the £10,000,000 loan to New Zealand enables them to be purchased. Is that actually what happens ?—The way I look at it is that the amount of production is increased to the extent that our demand is an increased demand.

Possibly. Quite obviously the men engaged upon the work of manufacturing that hydro-electric machinery must have had food, clothing, and shelter while they were working on it ?—Yes.

The food, clothing, and shelter must have been produced first ; it must be there ?—Yes, I quite agree with you there.

So that the £10,000,000 loan is spent in the consumption of food, clothing, and shelter, which had been already produced ?—In the direct result I consider that it reimburses those who have provided that food, clothing, and shelter.

It reimburses the people ?—They would not get reimbursed if they could not sell the goods.

Having got that far, the people were reimbursed with that money for providing food, clothing, and shelter, and they very properly received payment for it. What do they do with that ?—The thing is that it depends on their financial arrangements. It might be that we are getting a little involved, but we will take the case of a man manufacturing machinery where he borrowed money, created a debt, to enable him to pay for these services ; when he sells his services he can repay that debt.

Yes, that is the point I wanted, that money then goes into the liquidation of the debt and is cancelled out of existence ?—We will put it this way, the money came into existence and the net amount of money was nil because the debt was minus the £10,000,000 and the cash was plus the £10,000,000.

And when the money had done its duty it cancelled out of existence?—Yes, and relieved the securities of debt; they were free of debt.

Now to go forward; the hydro-electric machinery comes out here and in due course interest and sinking fund on that sum, £10,000,000 has to be paid by New Zealand. New Zealand sends to London butter, meat, cheese, wool, honey, and fruit, in order to obtain sterling money with which to liquidate that debt. Is that right?—Yes.

But the money that came into existence with the debt has been cancelled. Would you agree with this: That New Zealand can only possibly pay that debt—could only obtain the sterling—if a loan to somebody else was floated?—New Zealand could obtain the sterling.

Only if money was created for the purpose of a loan to some one else?—Not necessarily. It seems very simple to me. I am looking at it from the goods side. We get the machinery out and we sent the goods over and the goods are sold.

Yes, how are they sold, where is the money, where does it come from?—The money is the purchasing-power in Great Britain, the demand.

We are talking of money, where does it come from?—It is not necessarily purchased by money.

It must be purchased by money if we are going to get money to pay that debt?—We might not have money to pay that. We must keep to the definition we were referring to and I am not ruling out of my conception that the staff may be paid for by credit instruments which are not money.

But surely credit instruments fall within Professor Walker's definition?—I consider they do not.

Do you exclude sterling from this definition?—Not sterling funds.

We are talking of sterling now. The money is borrowed as sterling whereby to repay that debt in sterling. Do you exclude sterling from this definition?—I do not exclude sterling funds, but I do exclude sterling expressed in the form of a cheque drawn for a certain amount of sterling.

However, that is immaterial?—I do not think it is.

You cannot draw a cheque against money that does not exist, can you?—You cannot draw a cheque against anything that does not exist.

Look at this thing further, when this £10,000,000, as far as the banks funds are concerned, is cancelled out there is still a debit to the New Zealand Government by way of debts on the London market. Although the funds, as far as the banks are concerned, have been used, still that debt is on the London market and when the goods finally go over to pay for that machinery what they do is to liquidate that debt which was against the New Zealand Government?—Yes.

But how do they liquidate it?—They can only liquidate it by obtaining sterling.

And that sterling is paid over to liquidate the debt?—Yes.

Where does the sterling come from?—Sterling comes from the price paid for the exports.

Where does it come from; where does the factory come from?—From the real resources of Britain.

But the real resources of Britain are not money?—They are not money.

We are talking of money; where does money come from?—We are back again to the same trouble; I am not talking about money in the sense of bank-notes.

My question is in relation to money to the extent that money, distinct from credit instruments, is used to pay that debt, and that cannot be until money goes over. We will come back to this in a moment. I will now ask you to tell me what happens in regard to floating a loan in New Zealand. The Government floats a bond issue here in New Zealand and it is taken up by the banks, how does the bank pay for it?—Do you mean that the banks buy that bond issue?

Yes?—It comes to this, that the banks hold the Government security and the Government owes the banks the amount of money involved. The banks enable the Government to draw cheques for that amount, and the net result is pretty much the same in effect as the present Treasury bill issue. The banks hold Government securities and the Government has the use of the spending-power.

How do the banks pay for the bond issue?—Again that comes from the banks. Lending-power is based upon the national credit—that is, the credit of the Government. It must have a basis and then, on the other hand, it is the banks funds.

What is to prevent the banks manufacturing the money themselves at no cost to themselves, drawing a cheque on themselves and paying the Government that way for the bond issue?—The thing is that by paying the Government a cheque they give the Government claims on the bank so there is a debit as well as a credit.

There is nothing to prevent them doing that, is there?—You mean to say there is nothing to prevent the bank merely giving the Government a cheque?

Not necessarily a cheque, it need not even be that?—They would have to give them some evidence of the claim.

The bank may write to the Government and say "we have written up a credit of £400,000 for the State Advances Office and we have taken over this bond issue"?—I do not think so. You mean to say that the Government would hand over the bonds before it received payment and say we may want to draw up to that amount?

It could not be done?—No, because if the Government wanted that they would say, "Here are Government securities; they are ours; we do not forfeit the title to them, but you can have them as security; and if we want to draw against them we will." And they would make arrangements with the bank to that effect, and those bonds would rank as a mortgage, not rank as the banks assets at all.

I think you had better let your colleague, Mr. Shaw, answer this question. I am dealing with an actual case that happened. The Bank of New Zealand took up the whole issue of rural bonds of £400,000. How did the Bank of New Zealand pay for that £400,000?

Mr. Shaw: Credited the Government Account.

Captain Rushworth.] They credited the Government Account. They may have written to the Superintendent of the State Advances Office saying he could write cheques on it, something of that sort ?—Nothing like that.

Just writing up a credit entry in the books ?—Really it seems we are making a terrible big song over a very small transaction, because as far as we are concerned when we purchased the rural-advances bonds we simply credited the Government's Account which gave them the right to draw on that account.

Yes, and you thereby created £400,000 of money—that is right, obviously ? I want to go further with this. Having created that £400,000 of additional money——

Hon. Mr. Downie Stewart: You are taking it for granted that it was created; they may have used their own resources.

Captain Rushworth.] I am inviting the question. Do you wish to add anything to what you have said ?—I simply said it had been credited to the Government's Account and the bank took the rural bonds into its securities.

Was that money in existence before ?—Well, really, I must say I do not understand you. As far as we are concerned in the practical way the Government Account was credited by that amount and we got the rural advances bonds and we held them as security.

In the books of your bank when you credited the Government with £400,000 did you debit any other account ?—We took it into the investments.

Did you debit any other account ?—Yes, certainly, we took it into investments. If we credited Government Account we must have a contra.

From what account did you transfer that £400,000 ?—It was merely a book entry to investments.

Did you transfer it ?—Certainly.

What account did you transfer it from ?—If we credit the Government Account we get certain securities and we put them into Investments Account. Is that not all there is to it ?

No, because I suggest, and I am giving you every opportunity to contest it, that that was a creation of new money. Do you say that that was not a creation of new money ?—From the Government's standpoint ?

No, from the bank's standpoint ?—Well, it is just in the same category. The Government issue a loan, instead of issuing it to the public they issue it to the bank.

But the Government have not taken power to make money—to monetize the bonds ?—I do not understand you at all.

The bank has the power to monetize these bonds. Did they transfer existing money to the credit of the Government or did they manufacture new money for the credit of the Government ?—I must say the question is too abstract. I cannot answer it.

I am dealing with an actual case ?—I am dealing with our actual business, and such a thing does not occur as far as we are concerned.

May I take it that you decline to answer ?—I decline to answer, it is too abstract for me.

I do not want to go off this leaving you in an awkward position. I give you another opportunity of saying, if you wish to say so, that the money in question was transferred from some other account, and I suggest that if that is the case that you might enable the Committee to have a look at the books to see what kind of transfer was made if it was a transfer of existing money ?

Mr. Fussell: Perhaps I could say something on the abstract side.

Captain Rushworth.] I am dealing with the £400,000 worth of bonds that were taken up by the Bank of New Zealand some years ago ?—We will put it this way: that the banks are legally enabled to issue money or currency or, we will say, money and notes against, amongst other things, Government securities. When they have Government securities they have the legal backing for the issue of that money.

That is quite right. What I was doing was trying to get at the facts of the case, as to what happened ?—I quite understand.

Because in my opinion, and I think you will agree, that was an addition of £400,000 to the money in this Dominion, and what I suggest to you is that to a very microscopical extent that was a kind of inflation—an addition to the money circulating in the Dominion, and at the moment there was no corresponding increase in goods ?—I am not *au fait* with that transaction, as it was in another bank. I would prefer not to say, seeing that it was in connection with another bank.

There are all sorts of things that could arise in connection with that ?—I do not know the nature or purpose of the bond issue, so I am only speaking generally.

I am satisfied with the answers so far as I have gone. While I am on this question, are you familiar with the Guernsey Market Hall ?—I have a little knowledge on the subject. I have read some particulars about it and I heard what was said here the other day, but I would not like to say anything definite about it.

We had it mentioned here and it is a matter of interest and I would like your opinion. The Governor, De Lisle Brock, at that time manufactured and issued £5,500 of new money in order to pay the wages and purchase the material for this Market Hall. There is no evidence as to what the effect of that was on the price-level. We can assume that either the general price-level rose because of the increase in money and no increase in consumable goods, or we can assume that there was increased effort on the part of the people resulting in an increased volume of consumable goods equating the new additional money. The Market Hall was built and the first suggestion is that the people had paid for it. They had paid for it either by increased prices for goods generally or by increased effort. Is anything wrong so far ?—That seems reasonable to me.

Then subsequently the authorities let out stalls in the Market Hall for which they charged a rental and that rent had to be payable in this particular scrip that Brock had issued. The stall-holders charged the rent into the price of the goods they sold and so recovered from the public. That

means the public paid a second time for the Hall, do you agree with that?—It might be correct to say they paid twice over because they might have paid the amount expressed in those notes twice over, but the second time they paid it over in those notes the purchasing-power of the number of notes would be less, so the real amount they paid would not be double, but it is quite possible that they paid more for the Hall than it was worth. What I mean by that is that probably the sacrifices of the people, if they sacrificed—we are talking about a nebulous thing now—would have been less if a loan had been borrowed outside and goods generally sent to the other country in exchange for the goods and services that came in.

Supposing they had been satisfied with the first operation. They put the £5,500 into general circulation, erected the Market Hall and left it at that, let the stall-holders have the stalls free of charge. What would have been the result, would it have been good, bad, or indifferent?—It would have been good, bad, or indifferent according to the circumstances. I am not very anxious to talk about the thing concerning which experts seem to be in some doubt and under some speculation, but if the amount of money in circulation was sufficient at the time, before this extra was issued, and if there was no return to the former amount of currency and circulation, no alteration in the velocity of circulation, no increase in the quantity of goods or services or satisfactions, I should say that the extra amount of money would be redundant and the people would be paying for the Hall, especially people with debts owing to them and so forth. They would be getting back less purchasing-power than that which they had borrowed and to that extent they would be paying for the Hall.

So far as the value of your opinion is concerned, I can assure you that as the accredited representative of the six banks operating in New Zealand your words carry a great deal of weight?—It was for that reason that I would rather not say much about a thing concerning which very few people seem to have an accurate opinion.

It is of particular value, because the next point I wish to suggest to you is that the banks, having a monopoly of the creation of money here in New Zealand—I want to ask you how the banks put that money into circulation?—In the first place I do not consider that the banks create money. I look upon creating as to make something out of nothing. For instance, if banks issue money and that money is in circulation that money is a liability of the banks.

Yes, we will say then that the banks issue money?—Yes, that will do.

If the banks issue money where do they obtain it to issue?—There, again, we are back to the bank's resources. A bank with no assets at all would, I consider, not be in a position to issue money, although if it had Government fiat or authority it might be able to express by way of issuing notes the purchasing-power that exists in the security, the exchange value of the security.

But security is not money you see, is it?—No, nor are cheques.

I know, we all know, that a great deal of money is intangible and in the correct technical sense it cannot be manufactured; it cannot be made. An intangible thing cannot be made, and yet, for the purposes of clarity, it is a convenient word to use, to manufacture or to make money. We understand that, but if you prefer some other word we will try and think of one. Originators, shall we say the originators of money?—Issuers of currency.

It is more than currency?—Currency is the wider term, the more generic term.

Currency usually means legal tender?—No.

Dr. Sutch: Not at all.

Captain Rushworth.] I am not talking in expert terms; I am talking in the terms of the circles in which I move?—All right, it means whatever you understand by it, but in accordance with this definition currency is the wider term and includes the whole issue, bills, postal orders, and cheques, and so forth, so would you mind using the word "currency."

That would be rather complicated because I have never heard bills called currency before?—If they are current.

However, that is immaterial for the moment. We will stick to the general term "money" still using Walker's definition?—That means we leave out of account cheque currency?

If you like. We will still stick to Professor Walker's definition and previously you agreed that the banks have a monopoly of the issuing of that money. Now, will you tell me how the banks put that money into circulation?—And we are using Walker's definition, therefore we do not include the drawing of cheques on banks. I am not trying to make it difficult, but I must clarify my terms.

You have it before you; it is on page 13 of your own statement. How do the banks put that money into circulation?—First, I will explain what I mean by that. Money, as defined by Walker, is coins, token coins, and bank-notes; we will not include Treasury notes because there are none, just bank-notes and coinage.

And credit?—No. Only legal tender and coinage is money, otherwise it is not in accordance with this definition that it is being accepted without reference to the character or credit of the person who offers it and without reference to the intention of the person who uses it. The credit of the person who draws a cheque is a vital factor.

Keeping your own definition in mind, can you tell me how the banks put money into circulation. May I assist you by saying that, excluding the comparatively small amount that they spent in wages, salaries, purchase of furniture, and suchlike things, the only way in which a bank can put money into circulation is by a loan. Is that right?—I want to clarify that. You are referring to bank-notes now, legal tender?

Bank money?—That is legal-tender notes—legal-tender notes in accordance with this definition. I am doing this to enable me to help you. If I tell you something I am not clear about, it will not be helping you.

Can the banks put their own bank money into circulation in any way other than by loan?—They can allow a person to withdraw a cheque from a deposit account, and he can cash a cheque drawn on a deposit account.

Yes, we already have it that the deposits are the results of loans ?—To some extent.

We are only getting a stage further back. In the olden days a bank did not put money into circulation as a loan. In other words, do you know of any case where the banks have given money away ?—No, except of course by way of donations.

So it is only done as a loan ?—By meeting a claim on the bank.

But the claim originates in a loan ?—No. I will say a great deal of the claims originate in loans.

Those that do not originate in loans, how do they originate ?—A person may have metallic money, such as gold and so forth, and he may deposit that with his banker.

Metal, such as gold. Do you mean minted or otherwise ?—Minted.

Not otherwise ?—I am not referring to otherwise.

I am referring to the time when bullion could be used. We are talking of to-day here in New Zealand. May I put it this way: Is there any money in circulation in New Zealand that did not originate from the banks as a loan ?—I consider so.

Tell me cases ?—Looking on the circulation of notes as a fund, there has been in circulation in New Zealand a continuous supply of notes. Part of that proportion of note-issue was issued against gold. Gold may have been paid into the bank prior to the war. Gold and notes have constantly been in circulation since.

You mean the banks purchased the gold with the notes ?—In the sense that money deposited with a bank becomes the bank's money, notes may have been issued against gold.

You are referring to the bullion gold that was purchased by the banks, as described by Mr. Falconer Larkworthy. He was the one to start it. Is that what you are referring to ?—When a bank either gives notes or credit in exchange for bullion it gives the person who sold the bullion a claim on the bank.

For what ?—To the extent of the value of that bullion at that time, except of course that we would have to explain the usual way by which it is done. Bullion is shipped home to England and the banks would pay a proportion out at the time it was lodged and the balance later, depending on the market price realized.

So that you put that forward as an issue of money by the banks, and I think it is quite legitimate. That money is issued by the banks in the purchase of gold bullion which is not in the shape of a loan ?—Money may be, but not necessarily.

I think that is quite correct. I should have included that in my exceptions, but it did not occur to me. So that the banks by the purchase of bullion ——?—Give other people claims on the banks.

That is not the point, I know that; but the banks—by the purchase of bullion, by the payment of wages and salaries, and so forth, and by the payment for furniture—put money into permanent circulation ?—I would not say permanent circulation.

Is it not ?—No, not necessarily.

We exclude taxation for the moment. So far as the banks are concerned they have no further lien on that money ?—How do you mean they have no further lien on that money ? The holders of the money have a lien on the bank.

They have a lien on the general community, surely ?—The holders of the money have a claim on the bank.

Money has been defined as that which passes from hand to hand through the community, but the money that is handed to the individual for the bullion is a claim upon the rest of the community, surely ?—It is a claim upon the bank.

But what can a bank give me if I sell bullion to the bank and obtain pound-notes in exchange and I go along to the bank with a pound-note, what can the bank give me for the pound-note ?—Under the present law the bank can give you either a credit on its books, or sterling in London, or it can give you notes.

What is sterling in London, another note ?—Yes, we will put it that way.

So that my claim against the bank if I hold a note is for another note, is that right ?—Your claim against the bank is for purchasing-power.

But surely my claim against the bank is for another note, nothing more ?—It is for what the note represents.

When I accept a note I do so because I want my teeth seen to or some bread, food, clothing, and shelter; can the banks supply that ?—Yes, the claim you have against the bank can give you food, clothing, and shelter.

It is the community that render services, not the bank ?

Mr. Fussell: No, the bank renders the service enabling the people to turn the service and the property into a form in which it passes from hand to hand.

Captain Rushworth.] So if this good sound bank were not in existence we would all die ?—Not necessarily.

Excluding the money that is issued by the banks in the purchase of bullion and in the purchase of furniure, payment of wages, salary, and suchlike the great bulk of the money issued goes into circulation as a loan ?—I should prefer to say a large proportion.

A very large proportion ?—I prefer to say a large proportion. It is a matter of going into books in dealing with such a large organization, and speaking for several banks we cannot say too much verbally; it means looking up records.

Can you suggest any other exceptions ? I will make a note of these: the payment for bullion, the payment for furniture, payments in the case of salaries and wages for staff, payments for rates, taxes, and payments for buildings I presume—are there any other exceptions you can think of where banks put money into circulation other than by loan—for instance, they pay dividends ? Dividends too ?—I think that is right.

Any other ?—I cannot think of any.

If you do think of any we could add them. It is really a very important matter. You admit a large proportion of the money goes into circulation as a loan, that is right, is it not ?—As loans which are claims on banks.

Immediately ?—Without qualification the figures might give the impression that I did not wish to convey.

You wish to make qualifications ?—The point is that the large bulk of that money goes into circulation as a loan and as a liability it has to be repaid.

Mr. Fussell: That is correct.

Captain Rushworth.] The loan has to be repaid, but whenever the loan is repaid it cancels out a debt ?—That is true.

The money that is issued from the bank with the exceptions we have enumerated goes out as a loan and has to be repaid ?

Mr. Fussell: By the banks as well as to the banks ?

Captain Rushworth: By the banks is true enough.

The banks are issuing authorities and cancelling authorities ?

Mr. Fussell: Yes. The loans have to be repaid by the banks as well as to them.

Captain Rushworth.] Of course, if the banks do not repay the loans made to them by the depositors, the debtors to the bank could not repay the money advanced to them, could they ?—I would not say that those who pay the banks always get the funds from the bank deposits.

In what way ?—There are other deposits.

If a man is called up to reduce or repay his overdraft, is there a source from which he can get any money ?—He might get it from selling his produce. He might ship it overseas.

A depositor has to buy it ?—Not necessarily, a person with an overdraft might buy it.

An overdraft becomes a deposit does it not ?—An overdraft *may* become a deposit.

In the last hundred years a change has come over the situation in that the bulk of our money system has become a debt system, whereas previously it was not so; when the money was entirely metallic the possessors of the bullion took that to the Royal Mint. It was minted free of charge and handed to them, and they put that money into circulation; as the coins became worn they were sent back to the Royal Mint, reminted free of charge, and again put into circulation. That metallic money was in permanent circulation, is that right ?

Mr. Fussell: When would you consider the debt system came into existence ?

Captain Rushworth: With the change from the metallic system.

Mr. Fussell: You mean over five hundred years ago ?

Captain Rushworth: Anything from then, it really originated from 1844.

Dr. Sutch: The Phœnicians had debts and paper money.

Captain Rushworth: I know that.

Captain Rushworth.] The money that was existing when the money was entirely metallic was in permanent circulation, is that right ?—That is so.

It was not repayable to the issuing authority ?—What do you mean by the issuing authority.

The issuing authority is the Royal Mint ?—The Royal Mint does not give value, the Mint changes the form of the gold.

Can you tell us why should the Mint be repaid for that ? Had the gold the value before it was minted ?—It had the value before it was minted.

The intrinsic value and the extrinsic value ?—What do you mean by that ?

The additional value given it by minting. Was there any additional value given to it ?—The additional utility is that it is more easily passed from hand to hand and ranks as a certain quantity of gold.

The fact remains that that token was in permanent circulation though ?—Not necessarily, I have heard a tremendous amount about fireplaces and socks.

Temporarily suspended ?—Yes.

It is not taken out of circulation ?—Yes.

Cancelled ?—Yes, taken out of circulation, not cancelled.

There is a difference between the operation of that metallic money and the operation of the present system, where moneys are issued by the banks as loans and are called in and cancelled. I submit it to you that cases where proper safeguards were not made to enable claims on banks to be met have resulted in tremendous calamities in some countries ?

Mr. Fussell: Would you allow me to ask you whether you consider it is an undesirable thing that the currency of money should be cancelled ?

Captain Rushworth.] If I was an expert witness I would probably hedge on that question. The fact that I want to get quite clearly is, if it is so, does the bulk of our monetary system come into existence as a loan and become a debt—a money debt. It is true that those debts can create good assets. The point I wish to ask you, Is it not a fact that the money that is created against the value of those assets may be cancelled prematurely, it may be cancelled before the assets are worn out ?—Yes, the thing is, when they are cancelled before the assets are worn they relieve those assets of any debt.

Yes, that may be, but the money is withdrawn from circulation ?—And liberates a security which may be used as a basis of fresh currency.

If everybody in New Zealand could get out of debt it would be a good thing, would it; if we were to free all assets in New Zealand from debt it would be a good thing from your point of view ?—It would be a good thing.

If everybody paid off debts would there be any money left ?—That is hard to say ; you would have to collect the amount of debts with the amount of money in circulation and the amount of deposits in various forms.

If all the loans were paid off, the great bulk of our money would cease to exist ?—Yes.

And that money would have been applied in freeing properties in debt or persons indebted ; there would be no money ?—How, but there would, there would still be left the money that the bank possessed to buy bullion with, that is about all. What I should say, roughly speaking, the amount of money still in circulation would probably remain in circulation and those people who owed money to banks would not have to pay the banks.

Why ?—Because you say debts are paid when they owed money.

You are visualizing a case of debts repaid ?—If this did happen, those who had owed money to the banks would not have to pay it and the banks would have no claims owing to them for that reason. On the other hand, since the financial obligations to their depositors are debts, necessarily your visualization includes the elimination of all deposits.

If we were all free of debt the banks would have no loans out, would they ?—No. They would have no loans out ; all the money would be remaining in circulation.

Only for this situation New Zealand would be practically devoid of all money. Do you think that money can exist freely without debt ?—Would you mind if I read a portion from a summary by McLeod which would make the subject of money and debt clearer. That gives the view by that economist that there must be debt money. Even in the old times when there was only coin in circulation there must still have been debts, because the coin must have been borrowed from some one else.

Quite so.

Mr. Fussell : So that you do not eliminate debt by having an entirely metallic currency.

Captain Rushworth.] We talk about debt between the community and the issuing authority ; in this case it is a debt between the community and the banking system. You said this morning that in your opinion the monetary causes were not at the root of the world depression or the trouble here in New Zealand, was that so ?—I consider that is so.

You suggested that it was lack of confidence that was the real trouble ; do you really think that it is lack of confidence ?—It is lack of confidence on the part of potential spenders who could spend and do not spend.

Who are they ? Are they here in New Zealand ?—In New Zealand there are £70,000,000 on demand deposit ; those who could spend this do not ; if they do not the result is that the total amount of deposits is larger than the total amount of advances—this would be on account of lack of confidence largely—lack of demand as a result of lack of confidence that the money is not actually spent.

Do you think that there is still the amount of money that there was, say, four years ago ?—I would have to compare figures to see if there is the same volume of money ; at the present time there is a very large volume of money.

The Minister of Finance told us in the House the taxable returns show that the national income has dropped from £150,000,000 to £90,000,000 a year, a difference of £60,000,000 a year ?—That is the total income, not the volume of money.

I know that, which rather suggests that lack of confidence is hardly the explanation ?—Lack of confidence is largely the explanation ; people who can spend do not, the conditions at present overseas and the fall in prices for our products that we export and the fact that more bales of wool and more pounds of butter are necessary to pay for a given quantity of goods from overseas are reasons for our decreased prosperity in New Zealand.

Who are these wicked people who have caused such a lot of trouble through their losing confidence here in New Zealand ; are they the ones that have put their money on deposits ?—I would not call any people wicked who have put their money on deposit and thereby caused the trouble.

If the depression is caused by lack of confidence, surely those who are suffering from that lack of confidence have caused the depression ?—I should say that persons or sets of individuals who cause lack of confidence would be responsible. The lack of confidence is the effect, not the cause.

That is better ; I agree. I thought that you said the cause of depression was the lack of confidence. It was the effect of the depression ?—Yes, the effect. [Mr. Fussell illustrated how an immediate cause might at the same time be an effect of a prior cause.]

You do not suggest then that lack of confidence is the cause of the trouble ; it is one of the instruments ?—Lack of confidence immediately causes the trouble, but the lack of confidence is caused by something else.

Lack of confidence has had the effect of encouraging people to place on fixed deposit in the banks moneys that they would otherwise have made available for investment in industry ?—I should say the fact that people in general feel that by investing their moneys in production or other activities they would not make a profit—they would make losses.

You said, I understand, that there are no avenues for investments ?—Did I say " no " avenues ; few are satisfactory avenues, there are some.

I know what you mean ; I fully agree there are no avenues for investment just now ?—I would not go so far as to say that ; the investment in the Reserve Bank shares was a very welcome one.

When you talk of lack of confidence you mean really lack of confidence of people to put their money into industry, but they have confidence in the banks absolutely ?—I should say that the people have confidence in the banks, which is well merited by the banks.

They have confidence in the banks because it is the only safe investment at the present time ?—I would not say the only safe investment. They have confidence in the banks because the banks are confidence-worthy, and they are trustworthy, and they conduct their business on sound lines ; they make provision for bad years as well as good years.

I do not know much about horse-racing, but you know it is said if you are going to back a horse the best way is through the stable ?—I really could not say ; I have never put a bet through a stable.

Would not the same suggestion apply here ; people who are nervously seeking an investment are inclined to put their money into shares in the bank or deposits in the bank rather than risk it in any industry ?—It is not a question of the distinction between bank and industry ; the person who puts his money into bank shares feels he will not lose his money.

Do you think that is a bad thing for the community or for industry ?—I think that the circumstances which drive people not to employ their money are part of the cause of the present depression and to that extent they are undesirable.

Putting money on fixed deposit the money is not available for industry ?—The fixed deposits enable the banks to grant claims to assist industry. The net result is that, instead of people who do not want to use the money keeping it in their pockets they put it in the bank and the bank makes the money available to people who do want to use it.

What happens to the money these people put on fixed deposit ; do the banks lend that money out to invest it in industry ?—The banks do not so much invest in industry ; they advance money for the enabling of the conduct of industry ; they have clients, and these people lodge deposits with the banks. The money represented by these deposits becomes the bankers' money, then the bankers lend the money out to people who require it on private security, and that money is used to conduct industry.

Your statement is that this money put on deposit is directly or indirectly used from the banks in industry ?—Indirectly it is the basis of the money advanced.

Well, if that is the case—I am not accepting it—if that is the case, then where is the harm in any people putting their money on fixed deposit—it ultimately finds its way to industry ?—The trouble is there is not the effective demand for the money for industry.

You mean the money is not being used ?—Money is not being used for industry at the present time.

What is it being used for ?—Advances have fallen to £30,000,000 ; deposits are up to £50,000,000. The difference is made up in Treasury bills, so that, instead of being used in industry, it is being used as a loan to the Government.

So that the money that the people would normally invest in industry is being put on fixed deposit thereby handicapping industry ?—No. They have money on fixed deposit and instead of the money being used for industry for which it is available it is being used in other ways.

What other ways ?—Treasury bills and loans to the Government.

What does the Government do with Treasury bills ; do not they pay the Public Service ?—I am referring largely to the Treasury bills in connection with existing indemnities, purchase of sterling.

In any event the Treasury bills are negotiated with the bank to meet urgent claims in industry—that is the case is it not ?—Not necessarily.

That money comes into circulation, surely ?—No.

Mr. Ashwin: I may say that the money advanced to the Government by way of Treasury bills—the Government owes the banks for the Treasury bills here, and the Government has balances in London for the amount.

Captain Rushworth.] We are talking about people with fixed deposits on the banks here in New Zealand. You said that these fixed deposits are used to finance the Government on Treasury bills and that the Government has got that money in London, is that the suggestion ?—No.

Mr. Ashwin.] Perhaps I could explain that ; there are two classes of transactions for which the Treasury bills are issued. One of them Captain Rushworth referred to. One might probably be described as deficiency bills or bills in anticipation of revenue. The corresponding credit derived from this is spent in New Zealand. The other class of bill is abnormal, and is caused where Treasury bills are handed over in New Zealand in exchange for the surplus credits in London ?—That is so.

The position in regard to those bills is simply that the banks hold the bills in New Zealand and we hold the money in London ?—That is as far as it has gone.

Captain Rushworth.] The point that I was dealing with was the use of the depositors' money, either that the depositors' money is used for the purpose of industry or it must be lying in the bank—that is what I was wanting to get at. The suggestion that depositors' money is used for the purpose of financing Treasury bills surely cannot be seriously advanced ?—The banks' discounting of Treasury bills to the Government.

They do not use depositors' money for that purpose surely ?—The discounting of the bills is a part of the total advance ; total advances are made against deposits.

Do you tell me, before you can grant an advance you have to go and look at your deposit account and see whether you have enough ?—I would not say that ; I say the banks ultimately require a certain relation between the total advances and the total deposits.

You are not able to tell us why ?—It is immaterial at the moment.

You are not suggesting that before the banks can make an advance to the Government they have to consider their deposits to see if there is enough there ?—When the banks make advances to the Government the Treasury bills rank as Government securities.

Mr. Fussell: These Treasury bills arise indirectly out of money the banks have already had paid to them.

Captain Rushworth.] Yes. But is there any physical difficulty to the banks creating and lending to the Government £100,000,000 if the Government were prepared to give them public securities for that amount ?—No. They could do that.

They could do that. They do not have to consider their deposits before considering the question ?—On Government securities they could issue to the Government.

So that they do not lend their depositors' money to the Government ?—They lend against it.

Do they lend their depositors' money to the Government ?—I have mentioned before that I do not consider that the banks actually lend what the depositors paid in.

And so we are coming back to the money that these depositors, through lack of confidence, have put on deposit. Now what happens to that ?—On fixed deposit ?

Yes, on fixed deposit. I have driven you off the suggestion that that money has been invested in Government bonds or Treasury bills. Now one of two things remains ?—I was never on the suggestion that that money was invested in Treasury bills.

There remains the possibility that that money lies dormant in the bank, or is used by the bank directly or indirectly in investments in industry. Which is it ?—The money is not lying dormant in the banks. The thing is that the deposits on the one hand, including those fixed deposits, are claims that the banks owe.

But what do the banks do with them ? Will they hold them ?—They represent banking resources.

But what do the banks do with them. I am not talking about what they represent. What do the banks do with them ?—The banks use them as a basis for trading.

Yes, but what do they do with them ?—What do you mean ?

Do those pounds sterling or pounds New Zealand lie dormant in the bank ?—No. They do not lie dormant because they perform a service.

You suggested that those funds are withdrawn from industry. That was your suggestion ?—No. What I mean is that, as far as the individuals are concerned who deposited the money, they are investing their money in deposits rather than investing it in industry.

Now those deposits, are they still invested in industry through the bank ?—Part of them are.

If they are not, they must be lying dormant. Is that so ?—No; the deposits do not lie dormant.

Well, if they are not dormant they must be used in industry ?—They form the basis of claims which the banks have on others.

But whilst they are forming the basis for claims on others, do you suggest they are lying dormant ?—No, I do not suggest that they are lying dormant.

Well, what are they doing ?—Forming the basis of trade claims.

They are book entries, are they not ?—The amount of the deposits is entered in the books.

Is there anything more tangible ?—Do you mean, are there any assets behind those deposits ?

No.—Do you mean, Can you go into a bank and take out a handful of them ?

No. If I sell shares in the Bank of New Zealand realizing £2,000, I come along and pay the cheque in to you, into your bank, and put it on fixed deposit. What happens to the £2,000 ?—That £2,000 represents a claim you have on the bank.

Yes, I know what it represents. I should know a photograph of it if I saw it, and all that sort of thing. But what happens to the £2,000 ? What does it do ? I have parted with the use of £2,000. I have handed it in to you. What are you going to do with it ?—It is credited to your account there, and the bank owes you a claim.

Yes, but what do you do with it ?—For instance, if you owed somebody something, what would you do with it ?

Yes, but what do you do with that £2,000 ? Do you put it in the vault ? Do you keep it dormant in the bank ready to pay me, or do you use it in industry directly or indirectly ?—It is used for the bank's business as a basis for the other side of the balance-sheet.

Very well, we will not pursue that any further. I cannot get any further with it anyhow. You said this morning that the cause of the depression is largely non-monetary. Do you really suggest that ?—Yes. It does not originate in monetary causes, because if conditions of trade returned to what they were before, the monetary position would not retard, but would reflect it.

Would you go so far as to say that there is no monetary cause to the depression ?—To the extent that economic conditions are reflected in the monetary matters, there is some monetary reflex. For instance, no one will deny that the war debts have some basis, but that was not a monetary cause in the first place. It was a political cause.

Would you go so far as to say that there is no monetary cause to the world-wide depression ?—What do you mean by that, because if you mean whether it is due to banks and money, I should say there is no cause there at all.

May I make a distinction here. I think there should be a very clear distinction between banks and banking functions and between the manufacture and issue of money. In my opinion the difference in function is clear and distinct. I have nothing but admiration for the way in which the banking companies of this Dominion carry out their purely banking functions. That is not my point. I have no criticism to offer in regard to the way in which the banks carry out their banking functions. My criticisms are all directed towards the monetary sytem. In old times the control of the monetary system was the prime function of the Government. It is the very essence of sovereignty to control the monetary system, to manufacture, to issue, and to cancel money. That is not a banking function, and my questions are directed towards showing the difference between the two functions. Now, the question of the monetary system as such is: Do you think the world depression is caused by circumstances other than monetary ?—Yes, I consider so.

Such as ?—For instance, anybody having goods or services which other people effectively desired would not find that there would be any obstacle to his having the money for them if he wishes to exchange them for money.

You think that it is due to the inherent wickedness of human nature or some cause non-monetary that is behind the depression ?—I consider so.

You disagree with the authorities on the subject?—Not necessarily. Do all authorities consider otherwise?

Here is a matter I would like to put before you. This is Professor Keynes in his "Essays in Persuasion," page 364. "In quite a few years, in our own lifetimes, I mean, we may be able to perform all the operations of agriculture, mining, and manufacture with a quarter of the human effort to which we have been accustomed." Do you not think that opens up a vista of possibilities?—It may open up a vista of possibilities, and it may throw some light as to the causes of the unemployment and so forth. I should not say that this change in the economic organization was a monetary one.

Would you consider this suggestion that, owing to the discoveries of science and the harnessing of power, gradually industries are generating less and less purchasing-power?—No. I should not say that.

You think that the discoveries of science and the harnessing of power do not act as labour-saving devices?—Yes. They require less and less man-power. That means that a man's services are not required.

If less man-power is required there would be less wages, would there not?—Yes, and these are economic and industrial causes that you are referring to, and probably they are the result of the dislocation at the present time and the fact that very many people are not needed.

If we could devise a machine to perform all the operations of a certain industry without the intervention of human aid at all, that machine would generate no purchasing-power at all, obviously? No, I would not say that; because the thing is that people must have a claim on the goods that they produce.

No; I am talking about the industry generating the purchasing-power. If you had a machine to perform all the operations of an industry, quite obviously it would generate no purchasing-power, because there would be no wages. Is that right?—No. I do not agree with that.

Well, what purchasing-power would be generated simultaneously by such a machine?—The exchange value of commodities for commodities produced by that machine.

That is relying upon the purchasing-power generated by some other industries. That industry itself would not generate the purchasing-power, would it?—It would. It generates the purchasing-power for the goods that are produced by that machine. They have purchasing-power for the goods that are produced by other machines.

Are not you confusing purchasing-power with exchange value? The product would have an exchange value. By purchasing-power we mean money within the definition of Professor Walker. I put it clearly that such a machine would not generate money sufficient to purchase the product of that industry?—That machine would not generate money because it is not the function of a machine to generate money, but I do not wish my remark to be associated with the statement that the machine does not generate purchasing-power. If it generates, we will say, boots, and then you have a pair of those boots and you wanted something produced by another machine, and those boots had that exchange value, you could pass the boots over and you could get something for them and the purchasing-power of those boots would be what enabled you to get the other, whether it was 5 lb. of butter or whatever it was.

Let us take it a step further, and just for the purpose of illustration exaggerate. Supposing we had a machine or a series of machines that performed all the activities of all industries, the only necessity being for one man to press a button to start the thing going, the rest of humanity would have to sit down apparently and die of starvation?—No. Because if this machine produced everything and demanded no payment for it and just put those goods forward, I do not think the machine would refuse to allow people to collect those goods.

How could it be distributed in such circumstances, with no purchasing-power available?—That is a matter of organization of a Utopia, and I cannot extemporize the organization of a Utopia. But I should say if the goods were there the people would get them.

I am trying to get you to say that they would have to be given away?—If you did not feel inclined to go to the machine and get the goods, you might say that you would perform some service. You are not imagining that the machine would perform all services?

Yes?—That means it would post letters for me?

Yes?—In that case, I would say to the machine, "If you can post the letters for me you can hand me over the goods."

The goods would have to be given away?—Yes. The machine would certainly give you the goods if it was so obliging as to post letters for you.

You know that the British Ambassador in Berlin has stated fairly recently that in his opinion the present crisis is a money crisis. You do not agree with that?—It is a crisis that has a relation to money. But did he say that it was money that caused the crisis?

Yes—He said that money caused the crisis?

Yes—I did not even understand him as saying so.

I merely put it to you, you do not agree with that?—No. The crisis is reflected in money matters, but it was not the money that started the crisis.

Professor Keynes, again, writing about Mr. Winston Churchill when he was Chancellor of the Exchequer in 1925. Acting on the advice of his experts, he caused the British monetary system to be returned to the gold base, and Professor Keynes says, "Why did he do such a silly thing? Partly perhaps because he has no instinctive judgment to prevent him from making mistakes, partly because, lacking this instinctive judgment, he was deafened by the clamourous voices of conventional finance, and most of all because he was greatly misled by his experts." Do you agree with that?—Well, he speculated on several causes that might have actuated a person in his actions. I have no comment whatever to make on that.

And since the public always understands particular causes better than general causes, the depression will be attributed to the industrial disputes which accompany it, to the Dawes Scheme, to China, to the inevitable consequences of the Great War, to tariffs, to high taxation, to anything in the world except the general monetary policy which has set the whole thing going. You do not agree with that?—That is his opinion.

You do not agree with it?—Not in its entirety.

In any part of it?—I consider that any changes in the monetary system or monetary policy arose out of other causes.

He does not refer to any change. He says anything will be put up, except the general monetary policy, which has set the whole thing going, whether it is a change or not. You do not agree with it. That is the point I wish to make?—I do not ally myself to the statement in its entirety. I do not mean to say that is an incorrect statement, because he has made no statement. He has said that anything else will be put up. But then he is going one step further back and implying, without saying, that it is monetary. But behind that monetary there are other causes which come into it.

In fact, you do what he suggests. You put up some other cause other than the monetary policy?—Yes. For instance, the war debts would have a very large effect on it.

You apparently come within his definition of one of those who will say those things?—I do not accept the comment. I would not say it was precisely accurate, because I have only mentioned the monetary. I think that what the economist Robertson said probably expresses my views: "No tinkering with counters will take us very far towards the discovery of an industrial system which shall supply both adequate incentives to those who venture and plan and peace of mind to those who sweat and endure."

Mr. McKenna has been referred to. I think you referred to him, the Right Hon. Reginald McKenna, Chairman of the Midland Bank. I am very interested in his speech that he delivered to the shareholders of the Midland Bank on the 24th September: "The average citizen will not like to be told that the banks do create and destroy money, and by these means direct the policy of Government and thereby hold in the hollow of their hands the destiny of the nation." You do not accept that?—No. Because he was using "create" in a sense in which I do not understand it. If he meant that the banks create money out of nothing he was simply wrong. But I do not think he meant that.

There are implications here far more serious. I put it to you that they are clearly far more serious than the mere making and destruction of money. He goes on to say, "and by this means direct the policy of the Government and thereby hold in the hollow of their hands the destiny of the nations." Pretty strong, you know. Do you agree with them?—I consider that that does not apply in New Zealand, and I interpret what he says as that a wise Government will accept wise financial advice.

Financial advice in the interests of the shareholders?—In the interests of the country. For instance, if a Government said, "Shall we do what Germany did?" the banker would say, "No; and if I can help it you will not get unlimited money with no provision at all for cancellation of the money and the debts against it."

I want to mention Keynes again, because he says that monetary policy is capable of determining our price-level and our destiny is in our own hands in regard to this question of price-level. Do you agree or do you think that monetary policy can determine price-levels?—Monetary policy, as influenced by Governments, has determined price-levels to the extent that in Germany, as a result of monetary policy—unwise monetary policy, that is as distinct from the policy of such banks as the Bank of New Zealand—the German mark became less in value than the original mark by a million times a million, and the present reich mark represents a thousand times a million marks.

That was a very substantial increase in the general price-level in Germany?—Yes.

How was that brought about, that increase in the price-level?—By the constant issue of money without corresponding increase in goods.

So we come to my definition of inflation, increase in the price-level?—Not necessarily. The price-level increased because the inflation was there.

The increase took place in the price-level you say because of the terrific increase in the volume of money that the German Government put into circulation without a corresponding increase in the volume of goods. Those are your words, or to that effect, I think?—Yes. Without supplying the increase in goods, the Government simply issued the money to pay its own debts.

If there had been a corresponding increase in the volume of goods, the price-level would not have gone up I suppose?—That depends upon the effective demand for the goods, because if the goods had been created—for instance, if there were pounds of butter to that extent—you can see that the price-level would not go up or it would not have been set where it was, because there would be a glut of goods.

And if the price-level can be raised by monetary policy I presume it can be lowered by monetary policy too, by the reverse process?—Yes.

Is there any other way in which the price-level can be raised other than by monetary policy?—Yes. The price-level can be raised by alterations in the supply of certain limited goods. For instance, the failure of wheat harvests in one country may increase the price of wheat, but that would not be a result of monetary policy.

If the money were reduced correspondingly, would that have any effect?—Not necessarily, because for some commodities the price does not bear an exact ratio to the amount of money.

Monetary policy will cause an increase in the price-level, as you stated in Germany it did?—It can. Unwise monetary policy can cause an unwise increase.

And monetary policy, I presume, by the reverse process, can also produce a fall in the price-level ?—Yes. Wise monetary policy could cause a wise fall in the price-level, if necessary, and an unwise monetary policy could cause an unwise fall.

We can leave the adjectives out. Whether it is wise or unwise, monetary policy can cause a rise in the price-level and it can also cause a fall in the price-level ?—That is so.

One of the characteristics of the world depression is a general fall in price-levels, it it not ?—That is so.

So much so that several countries have adopted as a national policy the ideal of bringing about a rise in the price-level ?—Yes, that is so.

They are seeking to do so by monetary policy ?—Yes, that is so.

The United States is a case in point. Now, would it not appear correct that there is a connection between the world depression and the fall in the price-level ?—There is a connection between the two.

Do you suggest that it is the depression that has caused the fall in the price-level, or the fall in the price-level that has caused the depression ?—I should say they were inter-related effects of the causes of the depression.

You do not think with those authorities who state that it is definitely the monetary policy that has been adopted that has caused first the fall in the price-level and thereby the world depression ?—I do not consider that any monetary policy was the cause of the world depression. Personally, I consider that to a large extent the present depression is a long-dated result of repercussions arising from war conditions and the reactions therefrom.

You do not agree with those authorities who ascribe the depression to monetary causes ?—Not entirely, because a great deal depends on the meaning, and if they mean that the monetary matter is the be-all and end-all and the initiation and the cause of it, I do not agree.

What is the originating cause of the world depression, and our depression here ?—So many theories and so forth have been produced about that that I do not feel inclined at present to extemporize an explanation of the matter.

You are satisfied that the monetary policy plays no part in the matter ?—I do not say that the monetary policy plays no part; I would say a small part. The difficulties at the present time are not monetary.

Has it played a small part in causing the world depression ?—No, I do not consider so.

Not even a small part ?—No.

No part at all ?—I do not think that any part at all originated just in monetary matters.

We are talking of the originating cause. In the originating cause, monetary policy, you say, played not even a small part ?—Not even a small part, so far as you look upon it as an originating cause.

You say definitely that is the opinion of the banks operating here in New Zealand ?—No; in my own private opinion.

I see; you are not speaking on behalf of the banks ?—No, that is my own private opinion.

Do you agree with the idea that there is definitely a shortage of purchasing-power ?—I have already mentioned that there is a large supply of purchasing-power which is not being used.

There is in circulation insufficient purchasing-power; may I put it that way ?—Insufficient for what cause ?

To purchase the output of industry ?—What do you mean by that "in circulation" ? You do not refer to money that is lodged with banks and savings-banks. Do you mean in current circulation. That depends a large amount on the velocity of circulation. Do you mean to say you ask me whether the amount of money in circulation represents a sum which is equal to the value or the price of all the goods produced ?

Enough to purchase the output of the industries ?—There is enough money to purchase the output of the industries if it changes hands frequently enough. One shilling could purchase all the things in the world if you gave it long enough, and it went fast enough.

Could it ?—One shilling changing hands a sufficient number of times could represent a sum which would represent the cost of the goods.

Could it be the cost of goods ? Could it purchase all farms and factories that are financed by loans ? Could 1s., however fast it circulated, purchase such projects ?—That would largely depend on where it circulated. It would have to circulate between people who had goods to sell to each other. If you had two sets of people on either side with a certain amount of goods to exchange for a certain amount of goods, it could be done by a system of barter or the passing backwards or forwards of a coin.

When you introduce the subject of debt into it, does not that alter the case, cause money to move in two dimensions ?—What do you mean "in two dimensions" ?

If I might suggest this, the first dimension being the course that the money takes from the time it is issued as a loan by the bank until the time it gets back to the bank as a repayment. That period, long or short, is a period in which the money sets up a second dimension. It moves in a second dimension. What operations are going on all the time ? Loans are being repaid all the time and deposits are being reduced and increased all the time, so the general funds of both sides may stay the same or greatly increase over a period of years. In particular, some money comes into circulation as a loan. Taking that into consideration this is a new factor that destroys the idea of barter.

Mr. Fussell: But do you mean to say the new idea destroys the idea of barter ? Do you say in the last resort goods are not exchanged for goods and services ?

Captain Rushworth.] No; goods are exchanged for money, and the issuing authority has a loan on the goods ?—How can you estimate they have a loan when the money is a claim ?

Because the issuing authority insists upon a repayment of the loan on a shorter or longer period ?—Not necessarily, if all the notes are in circulation.

Take all loans issued for financing farms and so forth. They come originally from the banks; it does not matter about the subsidiary channels. That being the case, the farms and factories producing products must of necessity sell for money, because they have to meet the demands of banks for money. That is so, is it not?—To a certain extent.

Can a farmer or a manufacturer, operating on loan-moneys, effect an exchange by barter?—It all depends on the arrangement made. If he had promised not to do so, he would not. In certain circumstances that may be possible. Supposing you had a farm and had an overdraft and yet you wanted to exchange a horse for a couple of cows. You could exchange them by the system of barter, but if you had already charged the horse, spent part of that horse by borrowing money on him, you could not expect to be able to do so. You cannot eat your cake and have it.

That is just the point I have put in. In the present circumstances it cannot be done. Any one operating on debt money cannot go in for barter because some part of his product must be used to obtain money to repay his debt?—I would not make that general statement, because the only circumstance I refer to is that he could not use or get something else for some part of his property for which he already had got something.

Do you agree, if a producer is operating on loan-moneys, he must of necessity sell part at least or his product for money, because the banks are not willing to accept wheat or chairs or boots in repayment for debts. That being the case—being under the necessity of selling part at least of his property for money—he cannot go in for barter?—The net result of it is barter. The net result is that he wants goods and things to live with, house, clothing, &c., and he produces goods.

The point I make is that he must use part of his product to obtain money with which to meet his obligations to the bank. The amount of goods, the volume of goods, he has to give to get a certain quantum of money depends very largely on the monetary policy of the issuing authority.

Mr. Fussell: What do you mean; as it changes the price-levels?

Captain Rushworth.] Yes; if the monetary policy of the issuing authority is to cause an increase in the price-level, quite obviously he has to give less product for a set sum of money. If the monetary policy of the issuing authority is in a contrary direction, he has to give a greater volume of goods for the same amount of money?—Yes.

So that the monetary policy of the issuing authority determines the volume of product that he must give to obtain the money with which to meet his obligations to the issuing authority?—Do you mean for the price-levels, taking from the time he got the loan until he repaid it?

Yes, when he got the loan?—We will say that if the monetary policy should have been such as to alter the price-level in the meantime, it would have the effect of benefiting some people.

Who would it benefit?—If the price-level rises, I should say it would benefit people who have obligations fixed in terms of money.

And if it fell?—It would be to the detriment of people who had obligations fixed in terms of money, because they had supplied a certain amount of money as purchasing-power.

A rise in the price-level benefits debtors, and a fall in the price-level benefits creditors?—That is an economic fact.

THURSDAY, 8TH MARCH, 1934.

Captain Rushworth.] Have you seen this cable from London which appears in the *Dominion* this morning—will you read that [paper passed to Mr. Fussell].

> "The *Daily Herald's* city editor says that, 'despite official denials, the city believes that, although it is possibly only temporary, a stabilization agreement between the pound and dollar has been reached after discussions between the Bank of England, the Bank of France, and the Federal Reserve Bank of New York.' There has been no direct participation by the Governments. It was suggested that the stabilization was made at a level entailing a heavy sacrifice by British industry and one completely unjustified by economic considerations."

Mr. Fussell: That report contains a conjecture as to the position.

Captain Rushworth: The statement is that this arrangement has been made—that is one statement, the next statement is that the Governments have not participated, and the third is "entailing a great sacrifice to British industry."

Mr. Fussell: Is your statement that the Government has not participated a complete statement of what is in the cable?

Captain Rushworth.] I am merely asking you to answer if you had seen the cable?—The Government has not participated directly.

Mr. Clinkard: Can we discuss the assumptions in Great Britain at the present time?

The Chairman: I think Captain Rushworth is entitled to put the question and get an answer.

Mr. Langstone: Yes, with a statement made in a reputable newspaper like the *Dominion*.

Mr. Fussell: All I can say in the first place is, it is a statement of what the *Daily Herald* says, "the city thinks"; in the second place what is reported by the *Daily Herald* is officially denied; and in the third place, although that report says that the Government does not participate directly, the implication is that the Governments are participating but indirectly, and it is not said that the agreement has been made. It is suggested that the stabilization was made at a level entailing heavy sacrifice to British industry, so at the present time this thing is too incomplete for me to make a statement thereon.

Captain Rushworth.] Your comments are useful; I was not inviting comments. History will decide, of course, what the result will be, if any result. I was merely asking whether you had seen the cable?—The answer is in the affirmative.

The reason I asked the question was because of the world-wide impression that the power of sovereignty has passed from Governments to banks. You do not admit that, I think?—I do not admit that in that form.

Yesterday you made some references to mortgages; there is a point that requires clearing up; you said that the total mortgages registered are valued at £200,000,000?—No, I did not mention registered; I referred to £200,000,000 quoted by the Treasury official.

£200,000,000—that is the total mortgages?—Yes.

Are not a number of these mortgages duplicated so far as money is concerned?—What do you mean by that?

One mortgage will be granted on property, then there would be a second mortgage and so forth on the same property?—You would not call it duplicating because the second mortgage would not be for the same amount as the first. It might be two different persons altogether. The first mortgage might be for £100, the second for £100—two separate mortgages on the same property.

It is the total we are dealing with, not the individual mortgages. We are dealing with the money represented by the mortgages?—We are dealing with the amount of the money.

The point I am dealing with is the money represented by those mortgages—that is the question I want to put to you—where the money originates?—The money originates in the value of the land. I would like to point out if you are referring to money in the sense indicated by Walker you exclude currency in the form of a cheque, and I do not see that the question has much application, because who can tell how money is used in respect of mortgages.

You used the expression yesterday to this effect that the banks only issue so-much money and there was so-much more used in mortgages suggests that there was money in existence that did not originate from the banks?—Not at all, I suggested debts in existence not due to the banks.

Do these debts in so far as they represent money—the money that causes the debts—originate from the bank?—I should not say that money causes debts.

Could you have debts without money?—Yes, certainly.

Expressed in terms of money?—Expressed in terms of currency. Currency not necessarily money.

Can you have a form of currency not money?—That has already been answered in the banks' statement. If you read those words of Walker's and that other statement by Sykes you will see the difference made between money and currency—their definitions.

You do not want to answer the question?—I have answered the question.

I will put it to you again. You say there are forms of currency that are not money, will you give me one?—According to the definitions that were given by us a cheque is not necessarily money.

Is it currency?—A cheque may be currency. That is in accordance with the standard definition.

So far as this money is concerned that is mentioned on the mortgage debts: Where does that money originate?—Are you referring to the purchasing-power?

The money referred to in the mortgage: Where does that come from?—On our definition it is not necessarily money.

Where does the debt originate? Each mortgage proclaims the fact that some money is due by the mortgagor to the mortgagee?—That is so.

Where does that money originate?—That money originates in a claim of the mortgagee on the mortgagor.

How does it come into existence?—It is lent by the mortgagor to the mortgagee.

Where does the mortgagor get it from?—Do you mean the mortgagee?

Where does the money originate?—The money is lent by the mortgagee to the mortgagor.

Where does the mortgagee get it from?—The mortgagee would get it from his savings.

Where does he get his savings?—As claims on the various resources.

He receives the money from somebody else?—Any one who receives money receives it from some one else.

I want to take it right back from where that money comes from—where does the mortgagee get his money from? I want you to answer that?—But I have given the answer in the questionnaire. I gave you various cases of origins of money.

Where does the mortgagee who lends to the mortgagor get his money from?—He gets it from his own resources.

Do you mean he makes it himself?—No, he might get it from various resources.

Cannot you tell me where he gets the money from?—He may get some of it from a bank if he has a deposit.

Supposing no deposit?—If he has no deposit in the bank he may have a deposit elsewhere.

Such as where?—He may have borrowed it from some one who has a deposit from some other firm.

Carry it back as long as you like, as far as you can take—I want to get to the root of the thing—how comes the money into existence in the first instance. Where does it come from; does the mortgagee make money himself?—No, he does not make the money.

Who does?—Money is not made as such at all; the money is an evidence of value possessed by somebody.

How is the money brought into existence, who by?—It all depends what you mean by money, whether you mean a cheque.

No, I mean the money—the money that the mortgagee lends to the mortgagor, whatever form, tangible or intangible, that money comes into existence at some time. Who brings it into existence?—It never becomes money at all, it merely remains currency. If the mortgagee gives the mortgagor the right to write a cheque on the bank, then he is the transferee to the mortgagor of a claim which he already had on the bank.

You mean that the money originated with the bank?—The bank is not the origination of the money, because the bank is the place where the claim already existed and it represents the transfer of the money.

Do you suggest that money can be in existence ?—Money can be in existence when it does not originate from the bank.

Give me an instance ?—Gold coins.

Do they not originate from the banks ?—No. You would not call money held by the Bank in New Zealand, imported here for consumption, as having originated in the Bank in New Zealand. Take gold coins, they originate from the Royal Mint.

Are there any other forms of money that originate from places other than the bank ?—If you want a list of the different forms of money——

No, I do not want a list. I want an illustration only, any money that originates from some source other than the banks—you gave me gold coin ; I accept that, is there any other ?—If you say money, you must mean bank-notes.

No. I am going on Walker's definition ?—That is not necessarily any connection at all with the total mortgages.

That may be, but I ask you if money originates from any source other than the banks—you have given me gold coins—are there any others ?—Money does not originate in a bank because you can always go further back. If you see that a bank is issuing money in the form of notes you can go further back.

Would you say that the money goes through the banks ?—To a large extent money goes through a bank, but it is not created by a bank out of nothing.

You say it does not originate with the bank, but goes through the bank ?—The originations go further back than the banks.

Let me get this right. You gave me gold coins ?—We have traversed all this before.

I know, but we are still at a loose end in regard to these mortgages. I am sorry, but I am determined to get there ?—I suggest that if you want the information, you want a considered reply. I suggest you put your question in writing and you will get a considered reply.

I am not satisfied with that, because I know by experience that endeavouring to get a reply by letter you can spend a whole year and still be fencing at the end of it ?—Are you suggesting that if you asked the banks a direct question that they would not give you a direct answer ?

Why do you not give me that answer now ?—You are asking me to put on behalf of all the banks a reply to your question without looking up or making any reference.

I did not realize that, I am sorry, you cannot answer it now ?—I am not prepared to answer it.

The Chairman : It is understood that you are prepared to answer that question if it is submitted in writing. I think that can be accepted. I think there was a similar arrangement in connection with a question by Dr. Sutch.

Captain Rushworth.] I accept that, Mr. Chairman. The question of income-tax has been raised ; the bank pays a peculiar form of tax : 1½ per cent. on the assets and liabilities of the bank as declared by the banks' auditor, is that right ?—Yes, that is correct, based on the average assets and liabilities for four quarters of the year, subject of course to the bad debts written off—income and tax-free securities.

You have left out the provision for the superannuation funds to staff ?—That is included also.

You suggest that it might be good for the banks, particularly at the present time, if they paid income-tax in the ordinary way ?—I say that the banks have suggested that.

If that were done they would have to submit returns and have their books inspected by the authorities just the same as other trading authorities ?—I understand that the tax authorities have the right to inspect them now.

The returns would have to disclose reserves would they not ?—I am not aware of the requirements of the Tax Department on the matter, but the suggestion of the banks is on a broad basis that they pay tax on the income earned.

To arrive at the income earned it naturally follows that the reserves would have to be declared, would they not ?—If income is taken to reserves they would have to pay tax.

The income would not be taken into reserves until after it became income ?—Quite so.

But the reserves would have to be declared ?—Do you mean the amount accruing towards the reserves ?

No, when the reserves have to be declared in the income-tax returns ?—If the Income-tax Department requires it ; you could ask the Treasury about that.

That would be the ordinary requirement in the usual form ?—I am not suggesting the banks would be on any other basis than that of an ordinary trading department. I cannot speak for the Income-tax Department.

If the Income-tax Department required it the information regarding reserves would have to be disclosed ?—I should say so.

At the present time that is not necessary ; there is no necessity to mention reserves in the income-tax return ?—The ordinary balance-sheet of the banks indicates that provision has been made for this, that, and the other reserves, the amount is not stated, is that right ?—That is correct.

Have you studied Sir Basil P. Blackett's book " Planned Money " ?—Yes.

[From cover-sheet—read by Captain Rushworth] :—

> " Sir Basil Blackett has had a distinguished career both as a public servant and in business. He rendered brilliant service in the Treasury during the war, and from 1917–19 was Treasury representative in the United States of America and Canada. From 1919–22 he was Controller of Finance at the Treasury and represented Great Britain on the Financial Committee of the League of Nations. For more than five years up to 1928 he was the Finance Member of the Government of India, the Indian Chancellor of the Exchequer. In that capacity he was responsible for six budgets and his work in India is widely recognized as an outstanding achievement. On his return to this country he became a director of the Bank of England."

You will accept Sir Basil Blackett as an eminent authority ?—He may be so.

Do you think so ?—I think so.

I only know of the enormous number of copies of his book that have been sold. I shall read you an extract from a paragraph on page 9 :—

[Captain Rushworth quoted from Sir Basil Blackett's book " Planned Money "] :—

> " . . . Yet to wait till effective steps can be taken by international action would result in mere futility. Action, whether political or economic, must be taken within the area within which political conditions permit of its being effective. This dilemma between the claims of nationalism and of internationalism is responsible for a considerable part of the feeling of frustrated effort in the modern world. . . ."

The argument there, Mr. Fussell, is that monetary systems must first be tackled inside the political area. Can you accept that ?—I should say that each country should keep its own house in order so that it is able to co-operate with other countries when necessary and to the extent necessary.

In that connection, Mr. Fussell, there are two rival policies so far as monetary systems are concerned. There is the national policy or the internal price-level policy, and there is the exchange policy which is the international policy. Which policy have the banks here been following ?—The banks' own policy regarding exchanges has already been pointed out in the questionnaire. I should prefer to give you a considered reply on that matter. You are asking me questions of bank policy, and I submit to you that when speaking on behalf of six banking organizations it is not possible for any one officer of whatever standing in the bank to speak on their behalf without discussion among the banks.

I am sorry I put it that way. I was not really asking you to discuss banking policy ?—It is a matter of policy. I suggest that you will get a reply from the banks if you submit the question to them.

The question is, Which policy has been followed ? Have the banks been following the exchange policy or the internal price-level policy ? I know what they have been doing—they have been following the exchange policy—but I wanted you to say which one. I shall be very glad to have it in writing after my question has been considered. To continue, some few years ago a man bought a farm for £6,000. He paid £4,000 down, the remainder being on mortgage. To-day at a conservative valuation that farm is only worth the amount of the mortgage—£2,000. Can you tell me where the £4,000 belonging to that man has gone ?—I should say at £6,000 the farm might not have been estimated at its true value. That might have been the value which the seller had induced the buyer to consider the farm worth. The value of the farm on an ordinary basis would be what the farm could earn, and what it would earn would depend on the prices it could obtain for its produce overseas.

Would it be correct to say that that £4,000 no longer exists ?—When that £4,000 was paid it was a claim by somebody on somebody else and whether that £4,000 exists depends on whether the claims were honoured.

If it exists it must have been transferred to somebody ?—That is so.

Can you suggest whether that somebody would be in this Dominion ?—It might not be so.

Would that be the case in other similar circumstances ?—It might have been, and it might not have been.

Would the fall in the value of the farm necessarily mean an increase in value of something else in this Dominion ?—Not necessarily.

Would it in any case ?—Not to my mind. The fall in the value of any individual farm would not necessarily mean the rise in value of anything else though it might be measured in the comparative value of something else. I submit that all farms have not fallen to that extent.

But all farms have fallen to some extent ?—I would not go so far as to say that. Some farms may have increased in value. It depends on how they have been improved.

Do you know of any property which has improved ?—Not any specific property.

Bank shares ?—Bank shares are now less than they were then.

Then bank shares have fallen in value ?—Yes, on the market.

Is it not a fact that every other security has fallen in value ?—I would not go so far as that.

It would be exceptional ?—I should say the general trend is downwards.

What has happened to the money that those securities represented ?—It is a question of values expressed in money.

That money had an existence in bank-books at one time. Where has the money gone ? Has it been cancelled out of existence ?—To the extent that money ceases to exist as money, that means evidence of purchasing-power ceases to exist as evidence of purchasing-power. That releases a debt, but does not destroy purchasing-power.

You think that the purchasing-power of the Dominion remains the same as before ?—Not necessarily, because the purchasing-power of the Dominion depends on the exchange value of the goods we can send away, and the exchange value has fallen.

But the amount of money is less ?—An increase or decrease in the amount of money does not necessarily bear any relation to the increase of purchasing-power. I will read a brief extract out of a statement made by the General Manager of the Commercial Bank of Australia.

On what occasion ?—It was a public statement made in Australia recently. " Most proposals for currency reform are based on the fallacy that money is wealth, a fallacy which leads to the erroneous conclusion that to increase the amount of money will proportionately increase the amount of wealth with consequent benefit to every one in the community."

That is your answer ?—I am referring to an authority who indicates that money as such is not wealth, but evidence of purchasing-power, and that a quantity of it is not necessarily an indication of the amount of wealth.

Nothing has happened to that particular farm I mentioned as an illustration. If anything it has improved in real value ?—What do you mean by "real value."

That it supports human life. It has increased in its capacity to support human life ?—Has it increased the exchange value of that output ?

You are now bringing money in ?—Is the product of that farm exchangeable for a greater quantity or a lesser quantity of goods from overseas ? I submit that the product of that farm is exchangeable for a lesser quantity of goods from overseas.

Why exchangeable for lesser quantity of goods from overseas ?—Because those who have goods overseas are not willing to exchange the same quantity of goods as previously for the same quantity of produce from the farm.

Has not the price of goods overseas fallen correspondingly ?—The price of goods has fallen to a considerable extent.

Is it not that they have fallen to at least as much ?—I would not say that.

Cotton has fallen much more than either butter or cheese or wool here. On the average you will find that the general fall in the price-level has been fairly even, so that if it were only a case of exchange you would be just about the same. If that is the case, there would be no difference ?—In that case how is it that although we are producing more we are getting less.

I suggest that a large increased volume is required to meet the debt charges. Is that not a material fact ?—The debt charges are a material fact.

Surely there is a fall in price because of the increased volume required to meet the debt charges ?—That is correct.

This is applicable not only to the nations, but to the individual farmers. The individual farmer has his debt charges to meet and he cannot exchange the whole of his products. He first of all has to set aside an increased volume of his products to meet his debt charges ?—That is so.

Leaving a less volume exchangeable for overseas products ?—Yes.

So that the money question comes in very largely ?—The money question certainly does come in.

There is a group of picture-shows here in New Zealand. The valuation a year or two ago was £1,500,000. They had an overdraft at the bank and the bank is now realizing. The bank is acting as mortgagees in possession. The sum advanced in overdraft by the bank was substantially less than the million and a half at which the properties were valued. Can you tell us what has happened to the money in that case ?—You are discussing the customers of some particular bank, are you not ?

Yes. For obvious reasons I cannot mention names. But I suggest, Mr. Fussell, that this is just another case where a large sum of money has been cancelled out of existence ?—When money is cancelled out of existence it releases a debt to the same extent.

True ?—You are not referring to any loss the banks might make ?

No. All I am thinking of are the poor fellows that have lost their money—the people who paid the cost of those picture-shows and now have nothing. Their money has been taken from them. Where has it gone to ? Is it not true that it has been cancelled out of existence ?—When the money was paid over by them they did not have the money, and the property for which they paid has decreased in value.

What have they lost ?—They have lost material.

They have lost the control of the property ?—If they paid money for certain materials or certain buildings and then that building ceased to have the value they paid for it, they lost the material or the building. Is that equitable and just do you think ?—It is a very difficult question to ask me. It is not due to monetary causes.

There are many cases throughout the Dominion like that, you will agree ?—Yes, quite likely.

People who have lost what they previously owned because of what is called the policy of deflation, which is operating all round the world ?—You are looking at this as from the monetary side.

Yes ?—Last night Mr. Harle read something which indicated that the conditions existing at the present time are not due to monetary causes, and to clarify the position I will read a little more.

First of all I want this point dealt with—that there are a large number of people in this Dominion who have lost through this policy of deflation—they have lost their homes, their farms, their properties ?—I may say that that is not the result of monetary matters, and therefore it is not a matter on which I can speak on behalf of the banks.

Is it not that they have lost those properties because they have no money ?—Certainly not. If you paid £100 for a building and that building lost its value, would you say you lost the value of that building because you had no money ? You cannot spend money and still have it.

Why did the bank, referring to this group of picture-shows, take over possession ?—As to the precise reason why the bank took over possession I cannot say. But if a bank takes possession it is a fact that the bank gave the people who borrowed money claims on the bank to a certain amount, and those claims must be met some time. Where claims are given and not met you have a most involved condition resulting in hardship.

The control of the whole premises and ownership are transferred from the original owner to the bank ?—In that particular case in settlement of a debt.

I suggest that that in essence has been operating all over the Dominion ?—No. I should say it has not been in operation to a great extent at all.

What about the indirect actions of the bank—the State Advances Office, the Public Trustee—who obtain their moneys from the banks, and who eject people from their houses because they cannot pay the mortgagee's interest ?—That is a matter for the Government Departments.

But the Government Departments obtain their money from the banks, do they not ?—Yes. They can obtain evidence of purchasing-power from the banks. But to indicate that the present

conditions are not due to monetary causes and therefore that the discussion does not impinge on the bank, I would read as follows :—

> " Section 208 of the Macmillan report says, ' It seems to us equally clear that the economic difficulties of the post-war decade are primarily due, not to any wanton misbehaviour on the part of the monetary factors themselves, but to unusually large and rapid changes on the part of what are rightly described as non-monetary phenomena, these non-monetary factors again themselves producing monetary changes. In particular, war and post war non-monetary causes led to the great and unwanted flow of gold to the United States from which such vital consequences have ensued. For example, in the foregoing summary of events we have attributed great importance (i) to the unusual instability in the demand for capital resulting from the losses and interruptions consequent on the war ; (ii) to the changes in the established relationships between debtor and creditor countries consequent on the war debts ; (iii) to the rapidity of technical changes in manufacture and agriculture ; (iv) to the shifting character of demand resulting in a want of balance between the demand and supply of services as against manufactured products, of new types of manufacture as against old, and of manufacture as a whole as against agriculture ; (v) to the rigidity of wage-rates ; (vi) to the growth of tariffs ; (vii) to the embarrassments of Budgets ; and (viii) to violent changes in speculative activity in New York and elsewhere."

In so far as I have studied the question I agree with those points, but believe them to be effects. If we start off by realizing the powerful part that money plays in our internal order, would it not be possible for all those things to eventuate through a defect in the monetary system ?—The point is, and I have nothing further to say, that the decision of the Macmillan report is that this confusion has not resulted from monetary causes but from non-monetary causes.

You accept the Macmillan report ?—I accept it as an indication that the present conditions do not arise out of monetary causes.

In the same report we find that by granting loans, allowing money to be drawn by an overdraft or on securities, the bank creates money. I am quoting this as an authority which you yourself quote. You cannot accept one part and not another. If you wish to make reservations here I will exercise the same right ?—I do not wish to make reservations. With regard to the point that the banks create money, I wish to say that the banks make nothing out of nothing.

The " Encyclopædia Brittanica " says the banks create credit out of nothing ?—I consider that that is a loose phrase.

Possibly. Do you know of that very interesting law case *The Bank of Portugal* v. *The Waterlow Company of London ?* The judgment was very interesting. There is a majority and minority decision in that appeal. Lord Justice Scrutton remarked that the bank was under no obligation to replace the forgeries by anything else than their own notes ?—Is not the Bank of Portugal a State bank ?

Yes ?—Then the State issue the money.

I mentioned this case as a matter of interest. I think you would get a lot of interest out of studying the judgment because it did occur to me at one time that the best way of investigating the monetary system would be to have a judicial inquiry presided over by Lord Justice Scrutton. In the event of such a judicial inquiry being asked for with evidence given on oath and so forth, would the associated banks, do you think, be likely to co-operate in advancing such a request ?—That could be easily ascertained by asking them.

Would you make a note of it and let me have a reply in writing ?—Yes.

During the war a man, whom we shall call Mr. A, in the Waikato had a freehold farm, unencumbered in any way. He was assessed by the Government and directed to take up £10,000 worth of war bonds. He had no money and arrangements were made for him to have an overdraft at the bank. We will assume that the bonds carried interest at the rate of 5 per cent. The overdraft rate of interest was also 5 per cent., and the bank accepted the bonds as collateral security against the overdraft. Did that farmer lose anything ? The bonds and the overdraft were conterminous ?—On the face of it, it does not seem that he lost anything. If the debt was equal to the credit and the interest paid out was equal to the interest received, on the face of it I should say he lost nothing.

Yet his frozen asset was his farm, free and unencumbered ?—In this case the bonds would have no relation to the farm, because the farm was not mortgaged.

But the farm was assessed at £10,000. That was its Government valuation for the bond purposes ?—The farm in that case might have been used as an indication of the measure of the quantity of bonds this man should take up. But I would like to ask Mr. Ashwin if it was in line with the procedure at that time.

Mr. Ashwin : There was an arrangement made with the banks whereby they would make advances to people to enable them to take up war bonds and collateral, with that was an arrangement whereby the banks were given the right to issue notes against an advance for that purpose.

Captain Rushworth.] Will you agree, Mr. Fussell, that the farmer lost nothing ?—It seems to me to point that way.

There was a frozen asset there in the farm and that was monetized in the interest of the nation ?—What instrument or security was taken over the farm ?

I did not mean that. I suggest that the frozen asset was monetized in the interest of the nation ?—No. The State may have monetized or got an advance against its own credit. In that case it seems to me that the State supplied the security, but did not hand over that particular farm. If the State gave a bond it was the bond as such to redeem that amount.

There was £10,000 more in the Dominion and a £10,000 debt against it ?—The owner of the property lost nothing. It would be the same as if the Government issued Treasury bills.

It would be possible by adopting similar means to monetize a great variety of frozen assets, would it not ?—The Government would be able to obtain credit, but of course not to an unlimited extent.

Surely the Government could do the same thing—and they did do the same thing—in regard to a great number of frozen assets—unmonetized assets ?—I should like to know what you mean by "frozen assets." If that farmer had a farm against which he could get an advance it would not be a frozen asset. It would be an asset. I would not call it a liquid asset, but money could be obtained against it. What I define as a frozen asset is something which cannot be realized on at the time for its value at that time.

What asset would you describe it as ?—As a farm I would say it is an asset of landed property.

It would be in the same category as any other asset upon which money could be raised or created ?—Taking my definition of "create"—that is, making something out of nothing—I would not admit that money could be created against it.

Take the Macmillan definition ?—The Macmillan definition to mean that the money was not issued against nothing, but against something ?

In the case in point the money was created, was it not ?—The money would not be made out of nothing at all.

When the banks received those bonds as collateral security did they not hand over anything in exchange for them ?—They would hand over the claim on them by way of entitling the person to draw a cheque on them.

They handed over money ?—That is a difficulty again. If they handed over a cheque they did not hand over money, but the title to the money.

They paid for those bonds by means of money in some form or other. Why dodge the question ?—I wanted to be sure that I am not asked to say anything about money as excluding cheques. That is why I said a considered reply would be best. If I were writing it down I would say that when money is used cheques are excluded, but when currency is used cheques are included.

You understood my question—that that £10,000 was additional money to what had been in existence before ?—It was evidence of the title to that money, but in the act of spending it, it was in the form of currency.

That is beside the point. £10,000 more money came into existence as the result of that transaction ?—If you are using money in the broad sense to include the issue of a cheque.

I am talking of the subsequent operations. The cheque was subsequent to the creation of the money ?—Not necessarily. You mean that if a bank grants a person an overdraft the money is created for it ?

Is that not so ?—No. If you went to the bank to arrange for an overdraft of £100 all the bank says is, "If you exercise a claim on us to the extent of £100 we will admit that claim."

We are not talking about that, but of a case where the Government has deposited £10,000 with the bank for this Mr. A. One of two things happen, either the bank pays or does not pay for those bonds ?—It all depends on whether the bank purchased them. They would hold them as security against a claim for £10,000. When that claim is exercised it is a claim on the bank by the person making it.

It is a claim on the bank for £10,000 of money ?—Yes, in the broad sense.

And that money had no previous existence, or comes into existence that way. That is all beside the point. The real point is that in this instance an asset that was termed frozen was lying there and was being monetized in the interests of the Dominion ?—I do not admit that to monetize all assets would be in the interests of the Dominion.

I am not suggesting that either. I am suggesting that in this particular case this asset was monetized in the interests of the Dominion ?—I do not admit that that particular farm had any instrument or security over it. I consider the farm was unencumbered.

I agree there was no instrument over it. That is quite correct. Yet there was a connection between the volume of the money and the farm, because the value of the farm measured the volume of the money ?—The farm is used as an indication of the economic standing of the person and the idea at the time was that persons who were comparatively well-to-do would take more by way of war bonds than those who had nothing.

So that if a bank had reserves—that is, assets in the same shape and form as this particular farm—it would be quite legitimate to monetize that asset in the interests of the nation without confiscating anything from the banks or their shareholders ?—You mean it would be quite sound for the Government to say, "How much are those reserves ? Therefore, will the bank purchase from us bonds to that amount ?" That is, if the Government said "those reserves of yours are worth £10,000," that would mean that the Government would be exerting its credit with the bank to the extent of that £10,000 in the same way as they do now when the banks discount Treasury bills for them. The same operation would be quite legitimate if made applicable to the banks. The point I wish to make clear is that—as was done during the war—it would be possible to monetize the banks' reserves without confiscating anything from the banks or their shareholders.

You have seen Major Douglas's proposals ?—Yes.

You know that what he suggested was the monetizing of the banks' reserves without confiscating anything from the banks. That was quite clearly demonstrated during the course of his examination ?—No. I consider that it would be a confiscation. The banks have given their reply to that. The banks would be forcibly placed in the position of having assets taken from them to such an extent that they would not have the capacity to earn the profits they were entitled to.

You are forgetting the case of Mr. A., of the Waikato, whose farm was monetized ?—In that case would the Government propose to give the bank bonds to the extent that they have reduced the overdraft ?

We have not got as far as that yet. We have just got as far as Major Douglas's proposals. The Government has not considered it. But the question arises as to whether Major Douglas did intend taking anything away from the banks or their shareholders, or whether he intended monetizing those reserves in any way without any confiscation ensuing ?—Has he not made that clear ? Then I suggest that he should do so, because on the face of it his suggestion appears to be confiscation of bank assets. I think Major Douglas should clarify the position.

Captain Rushworth : I had the advantage of hearing part of the evidence and it seemed clear to me that his proposals did not involve confiscation, but it is evident that the banks take the contrary view ?—That is the case.

Hon. Mr. Downie Stewart : The Major said he was going to rob the robbers.

Captain Rushworth : That was not in relation to this particular proposal ?

Hon. Mr. Downie Stewart : Yes.

Mr. Fussell : Major Douglas quoted an old Spanish proverb which stated that he who robbed the robbers gained a hundred years' remission.

Captain Rushworth.] The rejoinder that the banks have submitted to Major Douglas's proposals exhibit a considerable degree of annoyance apparently. I suppose that is the cause of it—I mean the suggestion of confiscation ?—I should say if they were annoyed they would be justified in being annoyed.

I suppose other people who had their assets confiscated would probably experience a similar kind of annoyance ?—I would not like to speak on their behalf.

Do you know that wherever Major Douglas has been addressing meetings both here and in Australia, immediately afterwards an expensive advertisement has appeared in the newspapers ?—I have seen it.

Can you tell me from your own knowledge that the banks are not responsible for that ?—I can tell you from my own knowledge that I know nothing whatever where those things come from or how they are put in. You can take that as a definite and honourable statement from me.

I put my question in that way in the hope that you would be able to answer clearly ?—Since I do not know I cannot say anything.

Do you know that when this Committee laid down its procedure it was decided that anybody who had anything to advance in the way of monetary reform would have to proceed as plaintiff *v.* defendant ?—Is that laid down ?

The Chairman : I do not think that that was laid down by the Committee. I think somebody did mention it.

Captain Rushworth : Very well. Major Douglas rightly or wrongly apparently formed the opinion that this Committee was not prepared to consider the present monetary situation——

The Chairman : I think it was all cleared up in the correspondence if you will refer to it. Major Douglas was told that the present monetary system would come under discussion and be considered.

Captain Rushworth.] Do you know anything of Major Douglas's famous theory ?—I know something of it.

You know that, generally speaking, he propounded some years ago a theory alleging certain defects in the monetary system ?—I understand that for a considerable number of years he has been engaged on a theory which has been named the Douglas theory.

Not a system ?—It is a suggestion of a system I should say.

You do not know what the theory is ?—I have a general idea of what its intention is.

There seems to be a design to accuse Douglas of having invented a "system." I suggest to you as a student that all he has propounded is a theory ?—It seems to me that that is the case, but he may have outlined a suggested system. I should not say that it would be any condemnation of him that he had propounded a theory.

You know he has had to leave the Dominion owing to fixed engagements ? Did you know the fixed engagements he had were with Governments and Legislatures in the United States and in Canada ?—No.

And that one of the most pressing reasons was that he had been urged to call on President Roosevelt as soon as possible at Washington ?—I note the information.

Do you know that the British Rotary has issued a booklet indicating that they are convinced of the truth of Douglas's theory ?—Is that so ?

And that the Southhampton Chamber of Commerce and the London Chamber of Commerce also ? I am merely putting these to you because I want to suggest to you that if that theory is right, and it seems to have been accepted by intelligent people in every civilized country, then anything that suggests that Douglas is either a lunatic or a knave is to be deprecated. Do you agree ?—I agree that if his system is right he is entitled to express his views, and I should say that in any British country he would be entitled to express his views even if they were wrong. Personally I would not label a fellow-man as a knave or a lunatic.

You would not suggest that in the case of Major Douglas ?—That is not a fair question. I have no reason to consider that his bona fides and his belief in his own system are simulated.

Have you seen suggestions in the press to the effect that he charged money for admission to his lectures ?—I have seen references to it.

Do you know it is quite untrue ?—No. I do not know that is untrue. I know that money was paid for admission. Whether he got it was another matter.

The Chairman : Surely, Captain Rushworth, this does not affect the Committee ? I think it is unfair to put these questions.

Captain Rushworth : If you rule them out——

The Chairman : I must rule them out. I think it has gone far enough.

Captain Rushworth: Very well, I accept your ruling. There is only one other question I have to ask: Now that the Reserve Bank is established, the function of creating, issuing, and cancelling money is transferred from the associated banks to the Reserve Bank?—The function of issuing notes will be transferred from the trading banks to the Reserve Bank in accordance with ordinary reserve-bank practice.

That is, the notes form the basis really of the other non-tangible money that the banks deal with?—You consider that the notes form the basis of the other non-tangible currency that is issued through the banks.

We will not argue that. I did not mean that the notes themselves are the basis. I was quoting Sir Otto Niemeyer. Very well, we will take it that the manufacture and issue of notes is now transferred from the associated banks to the Reserve Bank?—There again I must say what I mean. The manufacture of the notes is not the function of the Reserve Bank. The Reserve Bank issues the notes and they are manufactured elsewhere for issue by the Reserve Bank of New Zealand.

In that respect that function has been transferred now?—That note-issuing function is being transferred to the Reserve Bank.

And the Reserve Bank is a private corporation?—With Government representation on the Board—the three State Directors and the Governor will be appointed in the first instance by the Governor-General in Council and the Deputy Governor and the other representatives will then be appointed. The State, I should say, would have some connection with the establishment of the Reserve Bank.

That opens up another question. I had intended to leave it at that, but the State representation on the Reserve Bank is in the minority is it not?—It is as set down in the Act.

Yes, a minority, whereas before the State had a majority of the Directors on the directorate of the Bank of New Zealand?—That is so.

So that the change in that respect is from the Government having a majority on the directorate to the Government having a minority. I did not wish to pursue that but you opened up the subject by volunteering that information.

Mr. Ashwin: The position of the Bank of New Zealand is not affected by the Reserve Bank legislation.

Captain Rushworth: I think I can only say now that I compliment the witness on the dogged fight he has put up. I think it is only right to say that the banks have no need to be ashamed of their representatives?—We very much appreciate that remark.

Hon. Mr. Downie Stewart.] I have only one or two questions to ask, Mr. Fussell. Captain Rushworth referred to the world-wide, or widespread, belief that the power of sovereignty had passed from the Government to the banks. He asked a question in that connection?—Yes.

Would you consider it consistent with that belief—that is to say, that the power of sovereignty has passed to the banks—if the Government is able repeatedly to pass banking legislation controlling and effecting the banks?—I should consider it quite inconsistent. The banks in this country and in practically all, if not all, countries are circumscribed in their operations by banking statutes and banking laws.

Would it not be contrary to that belief when we know that the Government recently took over the gold from the banks at a price at parity against the wishes of the bank?—That is an indication that the sovereignty does not rest with the banks and the sovereigns do not rest with the banks.

And the fact that the Government put up the exchange-rate against the protest and express wishes of the banks, that would be further evidence that the sovereignty still rests with Parliament and the Government?—That it a further indication.

And the instance quoted by Captain Rushworth of a settler in the Waikato being compelled to subscribe to the war loan, would that also be evidence of Government sovereignty?—That is a further expression of that sovereignty.

If further evidence was wanted, the fact that the Government, without consulting the banks, increased taxation by a note-tax and otherwise would be clear evidence that the sovereignty still rests with Parliament?—That is so.

When you were asked whether the banks would co-operate in a judicial inquiry into the monetary system, it is a fact is it not that whether they agreed to co-operate or not Parliament has the power to enforce the inquiry on them?—Yes, I understand that is the case.

So that there would be no need to ask for their co-operation?—If *suaviter in modo* failed, the Government could be *fortiter in re.*

Broadly speaking, your contention is, as I read your statement, that the New Zealand banks have stood up to the depression as well as any banks in the world?—I should say so, certainly.

You will agree that experience has shown that one of the worst evils the country can suffer from is weak banks or banks that are liable to become insolvent?—That would be a major calamity.

It is a fact, too, that ever since the depression in the early "nineties" the New Zealand banks have realized the absolute necessity of having large reserves to meet any depression?—Yes, they have learnt that.

They have learned the necessity for keeping those reserves. They have got those reserves, and the present position is justification of that policy?—Yes.

A great deal of discussion has taken place as to whether the banks create money or only issue money and so on. Speaking as a practical banker, I understand your view to be that the banks cannot create or issue credit or money without reference to their resources?—That is the case; they cannot soundly do so.

And it is correct to say that they cannot effectively create money unless there is a demand for it?—That also is the case because if there was no demand for it they could not pass it on.

You have had various passages quoted to you. Do you know a recent book by Mr. Cole, the Labour economist at Home ?—I have read parts of it.

He says in the course of it, " Bankers cannot effectively create money unless there is a demand for it, and the business demand under capitalism might arise only from the expectation of being able to use it at a profit." That is in accordance with your view ?—Yes, quite in accordance with my view.

Now, I think you said that what regulates your power to expand credit, the central regulative factor, is the state of the London funds. As those expand so your power to expand or contract credit in New Zealand expands or contracts ?—It has a bearing on it. If we have a large supply of London funds it means that there are funds there available for purchasing goods to be obtained and sold in New Zealand. Those funds represent resources, and as part of the banks' resources they have their part to play in enabling the bank to issue credit or currency.

So that if the Government borrowed very freely from the banks here, would the course of events not be that, as more money went into circulation, the demand on your London funds would increase and thus affect the power of the importers to buy imports. That would be so ?—It would have a double effect. The increase in money in New Zealand for currency in New Zealand would stimulate the demand for London funds and the fact that there was an increased supply in New Zealand might result in the depreciation of that money, especially if there was an overissue, and in both cases the extra demand for the London funds and the depreciation in comparison with sterling would be an indication that the exchange-rates might go up.

I notice in an article written by Mr. Ashwin some time ago on the New Zealand currency he says that the deposits and advances which constitute the credit system of the Dominion are predominantly governed by the rise and fall in London balances. This domination of our monetary system by London would be, I think, practically inevitable in any case, but it has been rendered definite and complete by the exchange policy adopted by the banks. I am only asking this broad point, that the main features of our banking and monetary policy do depend upon economic circumstances leading us to trade so heavily with Britain and our banking system has to follow suit ?—Those economic circumstances have a very big bearing on the case when we sell a very large proportion of our goods overseas.

So that there are definite limits on the banks as to the amount to which they can create credit or expand it ?—That is so—that is, sound expansion of credit.

If it were possible to create credit or money without limitation, then no bank could ever close its doors ?—No, and every one would be wanting to be opening banks.

Mr. Langstone: They are not allowed.

Hon. Mr. Downie Stewart: Yes, they are.

Captain Rushworth: There is a special charter required.

Hon. Mr. Downie Stewart: Some one got it while I was in office.

Captain Rushworth: Did it ever start ?

Hon. Mr. Downie Stewart: No, but that was not our fault; it was provided for. No one is prevented from starting a bank if he puts forward reasonable security.

However, if it were a fact that the banks could issue credit without limit none of these thousands of banks that failed in America need have failed ?—That is the case.

So that though it has been put to you that the banks have an unlimited power to create and issue credit or money, that is not in accordance with your views ?—I should say that would be incorrect.

The point was put to you just now as to what was called monetizing frozen assets in regard to the farmer in the Waikato. I understood your answer to be that if that process went on and money was issued with respect to all assets that are regarded as frozen you would very quickly reach a stage of inflation ?—Most certainly.

You would really be repeating the experiment by the French Government ?—And that experiment arose out of what is known as " Lawism," and there is a small passage which I have here with me indicating the essence of it.

I should like to hear it. That would be a natural logical sequel ?—That would be the natural logical sequence.

If you pursued a policy of monetizing all these assets ?—That is the case. I mentioned to Captain Rushworth that I had here a book, McLeod, on Law's theory of paper money, but I did not read it out. It says Law's theory was, " Any goods that have the qualities necessary in money may be made money equal to their value. Five ounces of gold is equal in value to £20, and may be made money to that value; an acre of land, rented at two bolls of victual, the victual at £8, and land at twenty year's purchase, is equal to £20, and may be made money equal to that value, for it has all the qualities necessary in money." That is the end of the quotation, and then the book gives the economist McLeod's comment on that: " In this sentence is concentrated the whole essence of that eternal delusion, so specious and plausible, and so fatal, which we designate as 'Lawism.' It is, indeed, nothing but the stupendous fallacy that money represents commodities, and that paper currency may be based upon commodities. This delusion is deeply prevalent in the public mind at the present day, and probably there are few persons, except those who have studied the true philosophical principles of political economy, whose views are not deeply tainted with this infection. No man who does not thoroughly understand the great fundamental doctrine established by Turgot and others, that money does not represent commodities, can ever have sound ideas on this subject. Money does not represent commodities at all, but only debt, or services due, which have not yet received their equivalent in commodities. Now, the views of Law are much more extensively prevalent than is generally supposed. All those who think that there is any necessary connection between the quantity of money in a country and

the quantity of commodities in it are influenced by them. Take the case of a private individual. Is there any necessary relation between the quantity of money he retains and the quantity of commodities he purchases? The quantity of money he has is just the quantity of debt—of services due to him—which he has not yet parted with for something else."

In point of fact, as far as the resources are concerned, the banks in New Zealand have at all times had ample funds to finance any industry that could show it could earn a profit?—Yes, that is the case, and at the present time they are very willing to do so.

So there is no difficulty from a monetary point of view in industry being pushed forward if it can earn a profit?—Not the slightest difficulty.

I would like to know whether you agree with the view expressed by Cole in an article recently in the *New Statesman*. He says, "Despite the assertions of the monetary reformers, there is under capitalism no persistent shortage of purchasing-power in relation either to the volume of goods on the market or to the productive power of society." Would you agree with that?—I should say that is a sound and correct statement.

When it is said that Major Douglas put forward no plan, are you aware of the fact that book after book has been written to criticize the plans he has put forward?—Yes.

Here in this book of Cole's; it says, "As we should expect, Major Douglas's remedy for the economic situation involves some kind of compensation for the 'deficiency' of purchasing-power which he is at such pains to demonstrate. But the methods by which he proposes to achieve this object are both peculiar and complicated. He rejects two well-known methods of increasing purchasing-power—namely, an increase in bank credits and a direct increase in consumers' incomes—the first because it involves an increase in costs and so leaves the ratio between costs and consumers' purchasing-power unchanged, the second because it will lead to a rise in prices. As an alternative, which suffers from neither of these defects, he puts forward the following plan: On a certain day the Government shall decree that prices are to be reduced in a certain proportion." Now his plans have been put forward repeatedly as a remedy?—As suggested remedies.

So that—I am willing to be corrected by Captain Rushworth—I do not follow the statement that he has not put forward any plan—the whole point of the analysis of the existing defects as he sees them is in order to put forward a remedy?—That is as I understand it.

Captain Rushworth: Can it not be a variety of remedies?

Hon. Mr. Downie Stewart: He puts forward some out of that variety.

Captain Rushworth: As illustrations.

Mr. Fussell: He has obviously advocated them as a cure; at least I should think so.

Mr. Langstone: He put forward a plan for Scotland.

Hon. Mr. Downie Stewart.] Yes. Reference is made to a book by Sir Basil Blackett. I have not the book, but I would like to ask either yourself or Captain Rushworth: Does he not expressly state in the preface that no institution and no person other than himself is in any way committed by the views here expressed? So that probably it is not within your knowledge, but, in point of fact, dissent from his views was expressed by his colleagues; at least objection was taken to him publishing them?—I have not heard of that, but I realized that in mentioning him to Captain Rushworth I should use caution.

There is one feature in the statement put in by the banks I would like to ask a question about. You were asked whether any specific improvements in the New Zealand monetary policy could be suggested by the banks as desirable from the viewpoint of restoring and maintaining general prosperity. I know the answer that you made. Do you not think there is any need to regulate and control the institutions that are doing banking business in New Zealand in effect without being subject to the safeguards that the trading banks are subjected to?—Speaking on a sound basis as a banker, I should say that safeguards are always necessary and should always exist where banking business is done.

It is within your knowledge that there are large numbers of firms in New Zealand taking deposits and allowing clients to operate by cheque?—That is the case.

Did the banks consider the question of whether there is any danger to New Zealand's economic life by that unrestricted operation by outside organization?—Bankers have considered it in their own minds. My own view is that safeguards should exist which would ensure that people who deposit money, whether with these outside concerns or with the banks, should have their interests properly protected.

You have not dealt with that in your answer to the question?—No, the question was in regard to the New Zealand monetary system as a monetary policy, not as to the organization.

I thought it was perhaps a matter of public interest?—There is another thing I would like to say and that is that the banks have indicated elsewhere that they consider a change in the direction of cheaper credit would be an advantage and a desirability affecting the monetary policy.

If the banks' reserves were monetized in the way suggested by Major Douglas, what would be the effect in your view?—If, as we understand it, and Captain Rushworth has indicated, that probably what was expressed is not what Major Douglas has in his mind—and I wish to be fair—but taking it that the suggestion is that the amount of those reserves be applied partly in reducing overdrafts, cutting out the amount of overdrafts, and partly in reducing interest—it is a reduction of dividends that reduces interest—it would reduce the banks' resources.

Then in whatever way it was applied, would the fact not remain that they would not be available to you in times of storm?—That is quite the case. It goes back to the old saying, "We cannot eat our cake and have it."

Would you care to express any opinion on the broad question of public policy as to the advantages of our present banking system as against socialistic banking or direct political control of banks?—It

is a principle which is widely held and has received the test of generations of bankers and of banking in many countries, that the banks operate best and most satisfactorily in the interest of the people when they are not nationalized concerns.

Is the apprehension that if it were controlled otherwise than by the present method that public pressure and public clamour would always tend to demand inflationary measures ?—It seems to us that that is the tendency, and that, I think, was in Sir Otto Niemeyer's mind when he said, in recommending the Reserve Bank, " It must be free from the fact or fear of political interference, otherwise it will do more harm than good."

When that question was asked about the rural bonds, as to your financing the Government with those, does the same principle apply there whether it was £400,000 or £4,000,000 ? You would have to have regard to your resources before you decided to assist the Government in any way ?—Yes—that is, subject to the fact that the Government is sovereign. The Government might compel the banks to issue money against these bonds.

But is it a fact that you can issue unlimited credits to the Government ?—In effect the thing is that the Government borrows, and in the cases where Government, for their own expenses, have borrowed huge amounts, it has resulted in economic and financial dislocation.

There is another question that is quite often raised in New Zealand and has been raised in this Committee—that is, why is it that some banks in England allow interest on current account whereas in New Zealand it is not so. Am I correct in saying that the reason why that is done in England is that as an offset to that when an overdraft is granted immediately the account is debited with the limit of the overdraft and interest paid on that, irrespective of whether it is fully used or not ?—In those banks that operate on that system that would be an important factor.

That would enable them to compensate themselves for allowing interest ?—That is quite so.

Whereas in New Zealand, although I may have an overdraft limit of £1,000, I am only charged on the day-to-day balance ?

Mr. Harle: I think, subject to correction, that the London City banks do not allow interest on current account. That system is confined to the country banks.

Hon. Mr. Downie Stewart.] Am I right in saying that when the advances exceed the deposits the general policy of the banks is not to ration individual clients, but to make a general control either by raising the overdraft-rate or raising the exchange-rate when they have control of the exchange ?—Their policy is to do it generally, not to ration.

Rationing, of course, would always give rise to discriminations and controversy ?—Yes. It is subject to the fact that the banks always ensure that the money they lend is soundly lent.

You are aware, of course, that there are a great many authorities who agree with your view that non-monetary causes were the main factors in bringing about the depression ?—That is so.

There are two schools of thought on it are there not ?—Yes.

Mr. Langstone.] The question of the account-keeping side of the bank is a very correct and scientific method of recording the trade transactions and the transfers of credit from one person in the community to another person or to groups of persons ?—Those transactions are recorded, and I think very efficiently.

Very efficiently ; there is no doubt about that, I think. Have the banks within their staff or within the management of the banks, a kind of study circle where members and executive heads study the banking question in relationship to all other questions ?—We have not got what is known as a study-circle, but there is the Institute of the Banking Diploma, and bank officers are encouraged and also financed to study the various subjects affecting banking.

That is, from all angles of banking ; you study the whole lot and are not confined to any one particular form, say, the orthodox system of banking ? You can study any system ?—In the subject " currency and banking " are included financial systems and types of banking and so forth. You are aware of the subjects as set for the Bachelor of Commerce degree ?

Yes ?—The subjects for the Banking Diploma are similar ; there are not so many, but on the same standard, and if you pass for one degree they count for the other.

I thought that that would happen from the way in which the questions are being answered. The first gentleman who spoke, Mr. Harle, made a statement with regard to what Major Douglas had said, and stated that the question of his fantastic suggestions taking the reserves and limiting the dividends to 6 per cent. was not a fair proposition. That is right, is it not ?—That is the intention of the thing.

Now, is share capital absolutely necessary for banking ; can you carry on banking without share capital ?—No, not in my opinion.

How do they do it with the Commonwealth Bank of Australia ; there is no share capital there ?—In that case the Commonwealth State Bank is trading on the State credit through the right of note-issue.

If the Commonwealth Bank of Australia are trading on the credit of the nation, the banks in New Zealand must be trading on the same basis ; is that so ?—Is not a distinction made between the holding of share capital and the non-holding of it ?

I said it was not necessary ; I suggested that share capital was not necessary ?—Formal share capital might not be necessary in the case of a State bank.

Or in any other bank. In your banking operations, if the bank only had its share capital and its reserve funds, and if that was the maximum amount of trade they did and they could not go beyond that, how would the bank get on ?—They would be very much restricted. May I stress the necessity for share capital ; it provides resources for the banks to use and, in the second place, it is a basis of confidence. If I open a bank and have no capital at all, how can I induce people to lodge deposits with me ? I certainly could not start off as a lending agent.

There was no trouble in Australia when they started without any capital at all ?—Do you mean the Commonwealth Bank ?

Yes ?—That bank has the State as its backer and in addition to that the other banks are required to lodge deposits with that bank. That is a compulsory measure, and the trading banks trade on the voluntary confidence of the people. There is a distinction there. I should say it would be very hard for a trading bank to start operations if it had no share capital.

Of course, the other banks have got the State behind them. In 1894 when the Bank of New Zealand was in financial difficulties the State had to go to its assistance. It was compelled to do so ; it would not do for the country to allow the thing to crash ?—That is the case.

So that they have, in a sense, the State behind them. But that is not the point I am trying to get at. The fundamental principle of banking is this : that the customers to the bank supply the capital of the bank on which the bank operates. For arguments' sake, if I have an asset and a security and it is worth £2,000 or £3,000, and if I go along to a bank and I ask for a loan on that security, I will get it on my security ?—That is so.

All that they do is to monetize my security ?—Yes, that is right.

They make it liquid so that I can use it ?—They enable you to spend part of your property and fully release your property when they have got the money back.

The banks have the power to say, Yes or No, and if they say, No, it does not matter how much I want to trade and how much other people want to trade with me, no trade can take place ?—That is the case, but it is the life-blood of banking to do good business, and to refuse good business is the same as a man refusing food.

What has gone wrong, then ? Let us try and get at the root cause of things. New Zealand as a going concern in the physical sense is better to-day than ever it was ; our roads are better and our farms are better ; cows have gone up in butterfat-production, and our sheep and all of our means are improved ; but there must be something wrong with the financial side of it ?—I would not agree there. It has been said authoritatively that if money is wanted for sound purposes it is obtainable and the banks are anxious to lend for sound business purposes ; it means that something else is wrong.

You will admit that, at the Ottawa and World Monetary Conference in London a while ago, every economist, local and international, attributed the cause to a fall in prices. There has been a fall in prices ?—Yes, but, of course, it would be understood that in referring to a fall in prices there must be some other factor behind that.

What causes a fall in prices ? What is the other factor ?—These other factors are mentioned in the Macmillan report.

I do not think so. On page 93 of the report, it is stated that they could not go into those non-monetary matters according to their order of reference, but they suggested that there were causes other than monetary, although they did not go into them ?—I read out this morning eight points.

What are the eight points ?—Shall I read them again ?

No ; it is not necessary. Let me see if we can arrive at a basis. Let us start with No. 1 : the ability of any firm or individual or company to finance is based upon the possession of assets and securities ?—Yes, that is correct.

But the value of assets and securities is determined by price. Price is the regulating factor of the value of assets and securities ?—I should say the value is expressed in price—that is, the exchange value.

But price is determined by the amount of money in credit, in circulation and use, is it not ?—The money in circulation has a bearing on the question, but the volume of goods has also. For instance, more money would be available now if it were asked for, but that would not necessarily alter prices.

Do you mean to tell me that the unemployed workers—if the Government or some one else came along and said we will increase your wages to £3, £4, or £5 a week, they would refuse to take it ?—I do not suggest that.

If they got it, it would be effective ?—They would be able to spend it at once.

And that would possibly put up prices ?—It might do so, but the money would go straight out of circulation. You would be giving the unemployed a claim on some institution—on a bank or on the Government.

Let us get this claim on the bank : when a bank issues notes, you told us yesterday that when they had notes printed and not issued the notes were worthless paper, and of no value at all ?—Yes.

Can you tell us what accounting takes place when you tear some of these off and issue them in Wellington. Say you issue £1,000 in Wellington this morning ; that it is necessary ; there is a demand for them. I know that a bank will not keep notes back if there is a demand for them ?—The broad accounting basis is that the notes in circulation—the liability of the banks—is increased by £1,000. The bank owes £1,000 more.

To whom ?—To the holders of the notes.

But then, what have they got to pay the holders of the notes ? If I go back to the bank with a note and say, " Give me something for it," they will give me another note ?—That is due to the fact that the note is legal tender.

The note is worthless while it is not issued, but immediately it is issued it is a legal claim on goods and services to the value of the note, and it will buy from Jones, Smith, or Brown an equal amount of value mentioned in that same note ?—And it will transfer from the drawer of the note that claim. That claim still remains on the bank.

If it was nothing in the bank from the start, only a worthless piece of paper until it was issued, it gets its vitality outside the bank instead of in it ?—I would not say that. If I had an I.O.U. in my hand ; I have written it out, it is worthless, but if I hand it to you it represents a claim you have on me.

There is a difference here. With an I.O.U., I have the right to issue, but in regard to a note I have got to accept it in payment or I forfeit my right to claim. If I go into a shop, the shopkeeper can refuse to accept an I.O.U., but he cannot refuse a note ?—You cannot push any analogy too far.

That is actually a fact ?—I may tell you that the fact that you cannot get any other form of purchasing-power of a higher title than a note is due to measures put in force for the benefit of the community, and the community would have been in great hardship if those measures were not put into force.

An Act of Parliament is behind it ?—Yes, the note-issuing is governmentally circumscribed.

Take the Act of Parliament away and all your money would be cancelled. If the Government to-morrow said we are going to issue Treasury notes and recall all bank-notes, then those Treasury notes would be a claim on the goods and services of the people in the exchange of goods and services. They would not cost the Treasury Department any more than the printing. It would be a tax. I mean to say, that the State as a State would receive its services in the form of a tax through the issue of money, would they not ?—They might do so, certainly.

If the Treasury do it that way, then the banks do it that way ?—Not exactly, because the banks have ultimately to keep solvent and to redeem the notes.

What are they going to redeem with ? If I have a pound and go to the grocer and buy some bread, he is actually giving me something for it. I cannot buy bread from a bank ?—No, but it can enable you to buy the bread.

I can go to the baker and the grocer ; he gives me real wealth for it, but the banks do not give me anything ?—But the banks enable you to do it. They give you something that the baker will take.

Then the Treasury could do it ?—In some countries the Treasury does.

It is a costless creation ; the service that the bank people are rendering in keeping accounts and all that is a really valuable thing ?—I would not say it was a costless creation, because the bank in giving a person an advance or a note gives a claim on the bank, and that claim is passed on to some one else when he spends it. There is still the claim on the bank.

But what are the banks paying that claim in ? The bank is only trading in money, and we do not eat money or wear money. Money is that transferee, that method or medium by which we transfer goods or services from one person to the other. We consume goods but we do not consume money. The bank only handles money or figures ?—It accepts the liability on the one hand. It is debtor on the one hand and creditor on the other.

But not in money. If I go along with a note to the bank and say, "Redeem that," what will they redeem it in ? Will they give me a suit of clothes for it ?—No ; but if you had an obliging banker he might say, "You wait here, and I will buy you a suit of clothes with it." But why go to the bank for a suit of clothes when you can go to the tailor ?

Yes, and be charged a sales tax on it ? If you have not read this Portugal bank case, I would advise you to read it. In December, 1924, a gang of frauds interviewed Sir William Waterlow and Co., the printing firm, who print notes, &c., for the various banks, and who were printing money for the Bank of Portugal at the time. These people evidently got to find out what was going on, so they entered into an arrangement for an issue of notes. They are what are called "escudos." They were going to get 580,000. The first issue of 20,000 was given late in February, and between February and the following December—that would be ten months—about 200,000 (to be correct 209,718) of these notes, in Portugal ?—These frauds ?

Yes, these illicit notes. The bank did not know anything about it. Here is the most remarkable thing. The trade of Portugal, the internal price-level and the exchanges, were more stable at that time than any other time before or since. In December of 1925 it was discovered that there had been a fraud, and the Bank of Portugal paid out a new issue of notes and called in all the other issue, and then they summoned Waterlow and Co. to make good the loss, and in making good the loss there was judgment given against them, and I do not think it was a good judgment ?—Against Waterlow and Co. ?

Yes. This bank was called the Bank of Anglo e Metropole. When they wanted to circulate these notes inside Portugal they had to establish a bank to do it. They found it too difficult, so they got a charter and issued them through the bank. Naturally, when the fraud was found out, they confiscated the property of the bank, and this bank within a few months was able to acquire, through the issue of notes, real property and estate to the value of £450,860 ?—That means it paid out notes ?

Yes, illicit notes, which were accepted by the community. It would have gone on ?—Those notes would represent a liability of the bank.

No, it did not represent anything. The Bank of Portugal gained not only the amount of fine that was actually paid by Sir William Waterlow, but, in addition to that, they made £450,860 ?—By issuing those notes ?

No, because the other bank had to be confiscated. They sold up the property, it was declared a fraud, and the Bank of Portugal got twelve-thirteenths of the estate, and that was £488,430, in a few months, through the issue of money. If it is possible for money to be issued that way—that money while it was passing was transferring the same goods and services as the licit money—it was just the same ; there was no difference ?—It had the quality of money ; it had acceptability.

No ; if they had gone to the authorities and said, "Make our money legal tender," it would have been all right. They made a mistake in that way.

Hon. Mr. Downie Stewart : The reason why damages were given against Waterlow was that it was not possible to substitute good notes, but the policy of Portugal was to restrict the note-issue.

Mr. Langstone (to Hon. Mr. Downie Stewart) : Your statement is true. The mere fact that, while the Bank of Portugal was going in for a policy of deflation, these new people were putting in an inflation, kept the price-level, and conferred a benefit on the people of Portugal. That is what happened.

Hon. Mr. Downie Stewart : It was not the policy of the Government.

Mr. Langstone : What I want to get at is : the bank is complaining of taxation—the heavy taxation that it pays. Does the bank pay heavy taxation ? Are there some corresponding benefits that they have that set off any disadvantages they may be imposed upon them, do you think ?

Mr. Fussell: The banks have the advantage of trade here, but the complaint of the banks is not that they have to pay taxation. They do not complain that they have to pay taxation; it is the basis they complain of. It is a fair complaint for any trading concern to make. In years when profits were small they do not pay smaller taxation.

Mr. Langstone.] They are assessed on an average of their assets and liabilities for four quarterly periods. It is estimated that they make 30s. per cent. on every £100, and that they are charged the ordinary rate of taxation on that 30s. ?—Yes, the maximum rate.

Yes; if they made more than the £10,000, any one would pay the maximum. They pay the ordinary taxation, but on a different basis altogether. But they can write down their property can they not, their land and premises, as much as they like?—For depreciation and replacement purposes.

Anything they like; there is no limit to it?—That is quite correct.

They can make all the provision they like for bad and doubtful debts, can they not?—They can make what they consider——

There is no restriction on them; they can do whatever they like. The Tax Department must accept the returns that are put forward by the banks; that is the basis it is done on?—Yes, that is right.

And do you not think that that more than offsets any disadvantage that they may have in regard to taxation?—I should say those advantages would apply elsewhere, too. In the case of trading firms that make a bad debt, they do not pay a tax on that bad debt.

Let me show you something I have here. The 1900 returns. I notice that in the 1900 returns, the Landed Property Account of the Bank of New Zealand is £422,339, that is thirty-four years ago. Now, I find that the return the Bank of New Zealand put in for taxation purposes Landed Property Account in 1932 was £481,463, £60,000 more. I think that their branches have increased from about 100 to 220. Is that right?

Mr. Shaw: Are those New Zealand figures only, Mr. Langstone?

Mr. Langstone: These are the figures furnished.

Mr. Shaw: Those are only the New Zealand figures; they are the tax figures.

Mr. Langstone: That is all they pay on.

Mr. Shaw: As far as that is concerned.

Mr. Langstone.] I am taking their figures in the years 1900 and 1932, that is thirty-two years afterwards. Do you not see, then, if they are able to write down their assets, they are avoiding paying taxation?—Yes, that is quite true that they do not pay taxation on assets which do not appear in the balance-sheet.

I mean to say that, when they complain about their overburdening of taxation, on the figures I have quoted (and they are the correct figures) it seems that there is a good deal of humbug about the statement?—They would not go to the trouble of wanting to be put on the same basis as other companies unless they considered they were on a worse basis now.

There are other reasons. They got their graduated land-tax abolished altogether, did they not?—Yes, in common with other people.

They were instrumental in doing it, along with others?—Yes, that is quite fair and just.

Naturally no one likes paying taxation. Any one likes to get out of it?—That seems to be the idea.

Do the banks really pay a note-tax?—They do.

What do they pay?—We really pay for it. The bank issues £100 worth of notes and they have to pay £4 10s. to the Government as note-tax.

How do they do it?—In our own bank we pay the £4 10s. to the Government by cheque.

All that you do evidently is to get £100 worth of notes. You get £95 10s. worth for the bank and pay the Government tax by cheque. It is not a tax really; it is a division of the issue of the notes. Do you give them a cheque on the bank to come and draw out the money in notes?—If the banks issued in notes they would have to issue more notes and the extra issue would mean more liability.

They pay to the Treasury by way of cheque?—Yes. I should say they are not paid out in notes. They may eventually, but the Government would normally pay the amount into the Government Account.

If you paid it into the Government Account and the Government transferred it to wages it would not make any difference?—It increases the bank's liabilities in comparison with its assets—increases the claims of note-holders.

These notes are paid back again into the bank?—Yes, but they do not relieve the bank of the claim; it puts the claim in another form.

If somebody wants notes it does not stop them issuing more?—If they issue more it is increasing the claim. I am stressing this a little, because I think it is important. If the banks could issue notes and they did not form a claim on the banks, they could give them without loss.

Where is the claim?—It is a liability. With the banks constituted as at present, if a man came in and said, "Give me £1,000 worth of notes," would you, as a banker, say, "Yes" or "No." I think you would say "No," because it is increasing the liabilities of the bank—increasing the claims on the bank.

That is a book entry. I want the reality of the thing. Supposing every customer of the bank went in on the same day to draw out their deposits, would the bank have to meet them?—The bank would not be able to meet them without some change in the organization. That is why confidence is so important.

Can you have confidence in a bank that writes down its securities to avoid taxation?—It is not to avoid just taxation. It is not admitted that the taxation is the most just that could be devised.

To Captain Rushworth you said that notes came into circulation by buying land ?—Notes might buy land.

In your statements you say it is for paying wages, salaries. If the only authority that it is necessary for the banks to have in order to pay for services is the statute law, which gives them the right to issue money on the credit of the people of New Zealand, then it is really the people outside who are paying the tellers and clerks in the banks for the services they are doing ?—That is true of the banks in the same way as other members of the community. The whole basis of the economical organization of the community is that services are given in return for a *quid pro quo*.

The Hon. Mr. Downie Stewart spoke a while ago about other concerns accepting money on deposit, but if they accept money on deposit that is the total amount they can lend out again. You admitted yesterday that that was not the total amount a bank could lend. Before the Cunliffe Commission and the Macmillan Commission it was estimated that they could lend nine times the amount of cash deposits—that is, £1,000 of cash deposits could be turned into a loan of £10,000 ?—I do not think it said quite that. I think it was said it could be used as the basis of it.

£1,000 would be the basis of a £10,000 loan. It was said that 10 per cent. cash was sufficient to keep against the demands ?—I would like to explain that this is in accordance with the English banking system which is not quite the same as ours. In England the bank-notes in the till are money assets of the bank, but there the bank-notes issued are not the liability of the trading banks, and the banks have found that by keeping about one-tenth of their advances or deposits in the form of cash reserves, they have sufficient against demands.

McLeod, in his report, stated that if the banks found that their lending had outstepped their cash reserves they got their reserves back again by calling in their overdrafts ?—That does not happen in this country. I think by using the term " calling in overdrafts " they mean they increase the rate and make them less attractive.

They ask them to reduce them just the same as in this country. It is quite common for banks to say to their customers that they must reduce their overdraft by a certain date. The only way they can reduce them is by selling something ?—That is so.

If you have a lot of people in the same industry affected—farmers we will say—and they are all sellers because their credit has been restricted, then the prices must fall, must they not ?—It might have the effect of causing prices to fall.

If prices fall for sheep and cattle, then the land and the other securities must also fall ?—You would go further back and see what caused the banks to have the overdrafts reduced.

They find their cash reserve is less than it should be according to prudent banking. To get their cash back again they call in the overdrafts and thus get their cash back ?—What I mentioned about the cash in the till is not the same system as we have in New Zealand, although it will be the same when we have the Reserve Bank. In New Zealand other aspects come into it. Here the banks generally adopt the policy that advances must not exceed deposits by too great an amount. It is better to have a system that works in practice.

Talking about advances, naturally when there is a plentitude of money about and people are using it, there is a demand for labour and most labour is paid in cash. Therefore there is a bigger demand for cash ?—Yes. There would be more notes in circulation when there was more labour employed.

Most of our business is done by cheque, and that is a matter of cancelling and increasing book entries from one person to another. But currency does not do that. When there is a big demand for cash and the banks call in the overdrafts the only way people can reduce those overdrafts is by selling their goods, if they have them to sell. If there are no buyers and prices fall, then you find you create unemployment. Is that not exactly what takes place ?—I should not say that is the case.

I am going to quote Neville Chamberlain, Chancellor of the Exchequer, at London last June. He is dealing with the position there. He says, " After the termination of the war we in this country, taking as it proved too hopeful a view of world tendencies, set ourselves to restore the pre-war situation." (That meant go back to 1914.) The war-time created such a huge expansion of currency by thousands of millions that prices rose, and we created a new standard of values. If we had to pay £80 a ton for wire and also had to pay in ratio for all the things we wanted, going back to 1914 would cripple us ?—Any sudden change in the volume of money and in the prices affects people, as has been mentioned before. A fall in price is beneficial to one section of the community; a rise in price is beneficial to another section.

To continue: " We established our equilibrium by a long and severe process of deflation. We struggled to bring sterling back to its pre-war period. At the same time, we made every effort to establish peaceful relations in Europe and to restore the international gold standard in the countries whose currencies had broken down. In the early part of 1925 Great Britain, together with the British Empire and certain other countries, returned to the gold standard; and, although in fact this step entailed further heavy sacrifices for our people in the shape of unemployment and depression for our industries, there was no reason why the restoration of the gold standard should not have been a great success had world price-levels at the critical moment displayed a tendency to rise, or even remain stable " ?—What you are driving at is that the price-level is an important factor.

I am saying that the monetary factor is the cause of the price-level falling. Further quotation from above report: " In the opinion of the United Kingdom delegation an attempt to obtain equilibrium by further large reductions of costs would be attended by intolerable suffering, and holds out no hope of success. No doubt it would be possible to restore equilibrium between prices and costs by reducing costs if only prices would remain steady. Under present conditions that does not happen, but, on the contrary, an all-round reduction of costs produce further reduction of prices, and so costs and prices chase each other downwards without getting to equilibrium " ?—It is true that if costs are less the price is less.

Is the policy in this country not the same as that in Great Britain ?—I should not say so. If costs were reduced to a certain amount they only reduce a proportion of the total transactions. If they went down two points they might reduce the general price-level only one point.

Under dual control: Do you think the banks say it is a matter for the Government to act, and the Government says it is a matter for the banks to act, and because of that there is no action at all, and things are left to drift ?—No. That there is any failure to agree—that there is a tendency on the part of the banks to push on to the Government their responsibility, and *vice versa*—is not correct. It has not been the case in New Zealand.

In referring to Neville Chamberlain's statement, he says, "The control of monetary policy is largely in the hands of central banks, and practical steps to give effect to the requisite monetary policy have to be taken by them" ?—Steps are taken by them, and I agree with what you say. But, as has been referred to earlier, the State is sovereign and the central banks, I should say, would carry out the policy which would not traverse the interests of the State. In England, for instance, I do not know of any case where the Bank of England's policy is in direct opposition to the Government. They manage to work in co-operation. The banks have their own duties. The State, I should say, should not act as its own banker. That is my view of the matter. It is found in practice, generally, that banking services as such are efficiently carried out by private enterprise without political interference.

When you say "political interference" you do not mean parliamentary interference ?—I mean the use of the banks as instruments of party government.

Do you not think the boot is on the other foot—that the banks possibly use influence on the Government or the politics of the country ?—To the extent that it is the duty of the banks as advisors to advise the Government, I do not think that the influence of the banks on the Government would be subversive.

You think the interests of the banks and the rest of the community are mutual ?—I think that is so.

We will take the case of a man paying 7 per cent. interest on an overdraft. The shareholders are going to get the benefit of it. Do you mean to say that the interests of the person who is paying the 7 per cent. and the person who is going to get it are mutual ?—That is a different matter. In the community shareholders as a body have the same interests as members of the community as a body. But those of each individual member of a community may be at variance with those of anybody else.

If we are running New Zealand as a mutual concern on the basis of what you say under one definite control, would it be possible to make a profit ?—I should say it would be necessary for the services performed to be paid for.

They cannot make a profit ?—In the last resort I would say there is no profit. Profit is paid out by way of remuneration for some form of service.

If you are running any concern and at the end of the year you find out that after paying all of the charges you have a surplus, that is a profit ?—Yes.

That means that that is a tax on the rest of the community who are that much poorer ?—I would not say that is necessarily so. Suppose a company is run moderately well and has provided good service for the community, but makes no profit whatever. You say that company has not taxed the community at all. Another large company might produce the same service and give good value for the money and yet at the end of the year have something left over. I would say, "Well done, good and faithful servant."

That is good evidence. I mean to say there cannot be a profit without a loss. I heard you say there could not be a credit without a debit. There must be something to offset it ?—No. In the matter of profit, then the human and psychological aspects come into it.

I am not talking about that. I am talking of the actual physical things people are getting. If you and I went on to the racecourse and you invested a pound on a winner and I invested it on a loser, you can only win at my expense ?—Oh yes, in a case like that.

While I make a gain, somebody has got to lose ?—Yes.

Well, if we commercialize things and put them into a profit and loss account, is that not just the same as on the racecourse ?—Not quite the same. If I went down the road and bought a pound of butter for a shilling and brought it along here and you wanted it, and I sold it to you for 1s. 1d., I would be making a penny profit.

I should say that I would be losing it ?—You are paying the penny for having the pound of butter delivered and not having to go for it. You are getting the service.

If it cost you a penny to deliver the pound of butter and I pay you a penny for it you would not make a penny profit on it ?—Oh yes, I would. I would sell it at a profit for the results of my labour.

If you charged me 2d. on it and there was only a penny cost of your delivering it, you would be making a penny profit ?—But you would not be making a loss because it would be worth while you you paying me the extra 2d.

If I pay you 2d. for what has cost you a penny, I must be making a loss ?—You would not, because you would be receiving value.

If it was value for value, then who is going to make the profit ? If we are going to have an equivalent of values, a *quid pro quo*, and it is going to be mutual, who is going to make the profit ?—If the service is worth while for the person who purchases the service, I should say he does not make a loss. Take this simple case. If a person borrows money from a bank and the bank makes a profit thereby, but the person borrows the money and he makes a profit on that, the bank makes a profit out of him. Of course, I know that these things can be passed on and passed on, but you can see that if the service rendered is worth while for the person and the person can make a profit out of the service, you can hardly say that he is involved in loss. He would be making a smaller profit than if the bank gave him the service more cheaply, but the bank gives him service at a price which makes that service worth while.

With regard to the reserves in London, I think Mr. Shaw talked about the advisability of having the reserves in London. The earning-power of London reserves is very small, is it not ?

Mr. Shaw : Yes, at present.

Mr. Langstone.] Has been for years ?—Yes. That is correct generally. There have been fluctuations.

I noticed a statement some years ago when the overdraft rate was put up here, the Chairman of the Bank of New Zealand said that the reason why the overdraft rate had been put up here was because the bank rate had fallen in the Old Country, and because there had been a fall there their profits would be less and they had to put it on to the people here ?—I do not think he said that. I do not remember that.

That statement was made in 1927 ?—I do not remember that. I do not think that is a correct statement.

I can show you the report of it. Is there any way in which our balances in London may show really more than what they should be ? What I mean by that is this : Is it possible for a Japanese person, say, to send goods to London to sell them there ; and he is wanting to buy wool in New Zealand. He has got a London credit, a London exchange ; could he sell that London exchange to the banks in London for an exchange in New Zealand ?—Yes.

He could do that ?—Yes.

So that we have £1,000 or £10,000 or £500,000 there that do not belong to us, and they have the advantage by buying in New Zealand at 25 per cent. appreciation ?—Yes, but he will get it in any case. The Japanese will get it in any case. It eventually must go through London, whether the wool is shipped from here and the draft is negotiated here, in which case the bank gets the premium.

But what I was meaning was this, that we get a lot of credits in London. We give that person, say, £10,000 (it is £12,500 when it comes here). The banks or the Government have guaranteed it. They can only invest that possibly at 5s. per cent. or 6s. per cent. ?—Not very much, anyhow.

But we have got to pay 25 per cent. here, plus the £5 8s. 9d. Treasury bills, for discounting the accommodation to let the money go over there at 1½ per cent. ?—I am sorry to interrupt, but just to clear the matter up, this £5 8s. 9d., that is not the present rate of Treasury bills, is it ?

No, but it was. Well, say £5 ?—But even then it did not even work out at that, because by the process of rebating Treasury bills the effective rate was lowered.

Rebating them ?—Yes.

By how much ?—I do not exactly know what particular time it was, but a little while back it worked out over a certain period at an amount about 3½ per cent., but we will call it 4 per cent.

Well, that 4 per cent. added to 25 per cent. is 29 per cent. that we have got to make good because we have bought an exchange. I might agree with what Mr. Shaw says, that it is inevitable if those people have got an exchange and they want to trade with New Zealand ?—You will agree that that 25 per cent. is also paid to the primary producers in New Zealand ?

Part of it ?—The whole of it.

No, not all ?—It is through London, and if the price received in London was £1,000 he would receive £1,250 here approximately.

From whom ?—From the banks here.

Yes. And whom do the banks receive it from ?—The banks receive part of it from the Japanese in London, sterling, and to the extent that that sterling cannot be sold at the price at which is was bought, they receive it by discounting bills for the Government. That means that the Government purchases the funds from them and pays out the equivalent value at the present exchange-rate here. But the farmer really gets that.

Yes, I admit he gets it, but who pays it for them to get it ?—That goes into the question of the effects of high exchange-rate, but it is quite an orthodox thing.

You mean to say the people have got to pay it somehow ?—Yes. The people pay it and the people get it.

To make it simpler, it is a transfer from the importer to the exporter ?—Yes, on a simple basis that is the case.

But it is charged in the price of goods that are sold to the community. In the last analysis they pay ?—In that case we can leave the exchange part out of it. The net result is this, that £100 net has been paid into the funds in London and £100 net has been received in New Zealand in payment for it. But the 25 per cent. was merely transferred from one to the other.

That is so. It does not make any more or any less money in New Zealand. But it is a tax on the people of New Zealand ?—You mean the extra 25 per cent. ?

Yes ?—You are talking on the exchange now.

Yes. If I am an importer I have got to add that 25 per cent. to the price of my goods, have I not ?—Yes.

And I have got to charge the people more for the goods that I am selling to them ?—Yes. It is a fundamental thing ; the effect of the high exchange-rate is to transfer from importing interests to exporting interests, but of course we might agree with the policy or not. The reason for that is that it was considered that the case of the primary producer was such a parlous one, and such a desperate one (and it has been agreed in this Committee that this country's wealth in the last resort depends on primary production), and it was considered by the Government that some means of assisting them at the expense of the rest of the community was necessary. And I think it can be soundly agreed that those measures were necessary. The measure by which the transfer of wealth from one part of the community to another part of the community was the machinery of the matter, and that does not affect the general policy that the primary producer must be helped.

I want to come back to the monetary part of it now. We will assume that I am representing a Japanese firm with a letter of credit. There has not been time to transfer any goods out because

when the bank in England has purchased my Japanese exchange and I am here in New Zealand to buy wool, who finds the money for the wool that I am going to buy. I only come with a letter of credit. Who provides the money?—You come here with a letter of credit?

Yes. I come here from Japan with a letter from the bank certifying that my credit would be good here in New Zealand up to £12,500?—It is rather a technical matter, but it would be necessary for the Japanese firm to have some form of credit in London.

But they have done it. They have sent goods there and sold them. They have bought a New Zealand exchange in London. But that is in London. It is not here. And the money is in London. It comes out here in a ship. I come out here in a ship. I come out here in a ship to buy wool and I buy wool up to the credit that you have given me in London, but who supplies the money to pay the £12,500 for the wool?—The money is supplied by the Japanese person in London because he pays it into the bank.

That is not in New Zealand. The farmer is paid here in New Zealand. When he sells his wool he gets a cheque. The banks pay it, do they? They admit that his credit is good and they supply the money to back up that credit?—No. They do that because the money has been paid into the bank in London and the bank itself is the one unit on both sides. The bank has received £10,000 and can pay it out on the other side.

You paid £10,000, so you have got a credit in London?—Yes.

When you come to New Zealand you have got £10,000 in New Zealand plus 25 per cent. exchange which the Government say the importer has got to pay?—Yes. The net result is that £10,000 has been paid to one part of the bank and the bank has paid out a net £10,000.

The point I am trying to get at is this. I know ultimately that other goods would come out or something like that, but I want to know the immediate effect of it. The banks provide the necessary money to back up that credit, so that that person can buy the wool?—Yes.

So that really the wool is the basis of currency and the price is determined by a Japanese or a German or somebody else that comes here to buy it?—Of course, the price of wool is determined by the demand for it in the open market.

But if they like to say that it is worth 1s. 6d. a pound?—If they are willing to pay.

If they are willing to pay, then the price is 1s. 6d. a pound and they arrange the credit. Then the banks see that the necessary finance is there to meet those credits?—Putting it very simply, if the wool-buyer pays the bank £10,000 in London the bank will pay the person who is selling the wool £10,000 here.

You think it would be possible, then, allowing for these ups and downs, for the Government through stamp duty to definitely assess the value of wool in its various grades and say, "Well, that is the price that has got to be paid." Would the banks find the necessary credit for that?—It is a policy matter, but I rather doubt it, because I very much doubt the ability of a small economic unit like New Zealand attempting to fix the price in the world's market of a product because if we said the price of wool is going to be 2s. the wool-buyers would say, "Well, until the price comes down to 1s. we will do our buying in Australia." What are you going to do about it?

You fix the price for milk in Wellington, do you not?—You can do that here because nobody is going to go over to Australia and get his milk because the price is a penny dearer here. That is because there is not a world market for it.

Do you not think that is what happens? If butter to-day in London is a shade over 6d. plus the 25 per cent. exchange-rate, which is 1½d., that makes it 7½d. Now that is the farmer's income from butter. That is his income; that 7½d. will only buy that amount of goods in London because it is a sterling exchange?—It will buy 6d. worth of goods in London: 6d. expressed in sterling in London.

But when those goods come to New Zealand the Government have come into the picture. They say, "To run New Zealand, because prices have fallen, we have got to get more income." So they put on, say, a 30 per cent. Customs duty. The 25 per cent. exchange-rate has got to be added too. They put a sales tax on it. They have got the importer's charges and costs, and the retailer's distributing charges. Now you find that that sixpenny article in London, which the farmer has got 7½d. for in New Zealand, that article is 1s. 6d. when it lands here owing to those internal charges. They are not external charges?—For the sake of argument I would rather you used a smaller price than 1s. 6d., because I do not think that 300 per cent. is a fair thing to add on. You mentioned 6d. to start with.

We will make it a shilling then. But if the farmer has only got 7½d. as his income from his labour, his commodity that has been sold over in London, how can he buy back with the price at 1s.?—The thing is that under no system can you import without expenses at all.

Quite so. But the expenses of importing are not greater than the expenses of exporting. A customer who exports from this country is an importer at the other end, and *vice versa*?—Looking at it from the goods side, we will say that if butter is exported to England some of the butter is applied to pay for its freight. That means the farmer only gets paid for a certain portion of the butter because a certain proportion has got to be paid for the freight.

You advance it?—No. I mean that if the price of a pound of butter on the London market is such-and-such a figure and the farmer has to send it from here, he has got to pay the cost so that the farmer sacrifices part of the butter to pay the expenses.

Quite so?—I have said that when the farmer imports he sacrifices part of the quantity of imports that he might otherwise want.

But he does it both ways. Does not the other fellow on the other end pay anything?—No. But the man who sells the goods does so at his price, and if you want to pay that price you must pay the cartage also.

If we sell butter here in New Zealand, we will say f.o.b., that means that all of the other charges, freights, and insurance, and so on, is paid by the person who buys the butter here. He buys it f.o.b. ?—Yes.

If it is consigned then we pay all the expenses. That is deducted ?—It all comes to the same thing, that out of the selling-price you have got to take all expenses.

Yes, they allow for it in the price ?—I can understand what you are driving at, but I think that the net result is that the quantity of stuff that we can import depends on the amount of money that is realized in London on our exports, and the quantity of imports we get is the quantity that we can pay for.

You definitely think that we must link ourselves to overseas markets, particularly London, with regard to our price-level here in New Zealand ?—We cannot be entirely independent.

Not entirely ?—We must be linked up to some extent, no matter what the system should be.

But our internal price-level, then, is not an external price-level, is it ?—Oh, no; it is not the same.

No, totally different. This is the position you are in: Your income is fixed on a world-parity basis, but your expenses are based upon an internal price-level ?—The income expressed in money is not necessarily fixed by the external price. For instance, even if you buy this exchange on an increased internal price-level the income that you get from exports depends on the amount that you get from outside, naturally.

But the internal price-level must always be bigger in the main than the external price, owing to those extra charges ?—Yes, to the extent that, all other things being equal, if a certain quantity of goods could be sold in the country that produced them at a certain price, it would not be possible to sell them at that same price in another country, unless there were some arrangements about it, as for instance, if the price was fixed in the country that sold them, or the country that sold them made a deduction to pay for the costs of export, but always, in some way or other, the service of transferring the goods from one place to another place must be paid for either by sacrifice of part of the quantity of goods or by paying money.

You know that in Egypt and Sweden they are fixing their internal price-levels, and they are utilizing their foreign exchanges to buy goods to go back into those countries, and they appreciate their internal price-level, and they balance in that way. They are doing that in Egypt to-day, and they have been doing it for eighteen months in Sweden ?—You mean to say that they fix the internal price-level and let the exchange-rate fix itself.

No. The exchange-rate they have got to take what they can get on the world market ?—Well, that really comes to about the same thing.

No. It means to say that when those goods go back they approximate the internal price level and they balance it that way ?—Do you think that is really the case though, because I put it this way: That if they keep the internal price-level steady the amount of goods that they can get overseas for a given quantity of goods that they export depends on the price overseas. So it comes down to the same thing. One year they might find that for twenty bales of cotton they can get two motor-cars, and the next year they might find that they have got to send forty bales of cotton to get the same two motor-cars. So that causes internal dislocations.

But if the price-level in London was fixed down to such an extent, then we would not be able to buy anything from London, so that they lose a customer ?—Yes.

And they create an unemployed problem for themselves ?—I should say an unemployment problem would certainly be created, unless, of course, the other adjustments were made, because it is said by economists that the actual amount of money in circulation has very little significance if the other factors balance or allow for it, such as velocity of circulation and price-levels. So that I would not say it would necessarily be followed by unemployment, but it probably would.

We will take a bank handling dairy-produce going Home. The bank advances, and then they take control of their exchanges do they not? And you retrieve your amount that you have paid out out of the sale of the goods when they are in London, and that gives you a credit in London ?—Yes.

Therefore, you own the exchanges ?—What is that ?

The bank, by financing dairy companies and other exporters, practically own the exchanges ?—They own the exchanges, do you say ?

Yes. You own them ?—Oh, the London funds balance that.

Yes ?—The banks have paid for them, they buy them, and they sell them, but to this extent you would not say it is owning them in the ordinary sense. For instance, if the banks could not sell the funds that they get, if there was no demand for them at the present price and the Government would not take them from us, it would be money that would result in a loss to us.

But under the guarantee I mean ?—Oh yes.

But under the guarantee you do not care ?—I did not say we do not care, because we would be very much happier if all the exchange could be sold.

Yes. So would everybody, but what I am trying to drive at is that if it is competent, and it evidently is competent, for the Government to guarantee the banks on a basis like that, it is only one step further to guaranteeing an internal price-level, is it not ?—Yes. They could guarantee an internal price-level, but what I am submitting is that so far as the external business is concerned it would not help us at all.

It would not affect the external trade ?—No.

The Chairman: I would like to thank the bank representatives for placing yourselves at our disposal when required. We will notify you when we would like you to come along again.

Mr. Fussell: You can rely on our being very willing to do so.

THURSDAY, 12TH APRIL, 1934, AT 10.30 A.M.

Witnesses: MESSRS. T. G. A. HARLE, E. C. FUSSELL, and J. SHAW, representing the Associated Banks of New Zealand.

The Chairman.—We are pleased to see you gentlemen here again this morning to finish your evidence. Several members have questions they desire to put to you, and possibly other questions may arise as we proceed. Now, Mr. Fussell, what has been the average number of notes in circulation during the past three years?

Mr. Fussell: Around about the six million mark.

The Chairman.] Under the conditions existing at the present time, if you wanted to increase the number of notes, you would do so?—If they were required.

Are they not required?—They are not effectively required.

Every one at the present time is complaining of the shortage of money, as you know. To what reason do you attribute that?—In my opinion it is due to the lack of confidence or the lack of sufficient avenues for trading. The man who can obtain money from the banks either by overdraft or otherwise will not use that money unless he can use it effectively or profitably. There are not sufficient avenues for the employment of money at the moment.

You think that is through lack of confidence?—Lack of confidence in the prospect of profitable trading.

You think that that is what has brought about the present state of affairs?—That is the immediate effect. Conditions overseas caused by the depression is a major reason why money cannot be profitably employed to the extent it was before.

But trading has increased and improved in the Old Country?—Yes, it is most definitely on the upgrade, and more money is being used.

Could not that be made applicable to New Zealand?—To a certain extent yes, and that is also reflected here in the price of wool, for instance. So far as the banks are concerned, if more money is wanted it can be provided.

Do you think that the holding of gold in New Zealand, when public securities can be made use of instead, is advantageous to New Zealand?—In a broad way it may be considered advantageous, but merely to the extent that we have the gold here. It is definitely a universal asset, but there is no technical reason why it should not be held overseas, or that sterling balances be held instead of it. There is not the same sense of security with gold anywhere outside of the country as there is in our own vaults.

So that if we had no gold at all, notes and subsidiary silver and bronze coinage would answer all practical purposes would they not? It is not necessary under legislation to hold gold?—It is not necessary under legislation to hold any gold here for actual banking purposes, although legislation prohibits the export of gold at present without the permission of the Minister of Finance. There is no real banking reason why it is absolutely essential to hold gold in New Zealand.

Public securities would do instead?—They would do—I know the question of monetary gold is a vexed question with the banks at the present time.

Mr. Ashwin.] That question is settled. It is all over?—I do not know. The Minister of Finance said that he was quite prepared to reopen the question if anything further was proposed.

Mr. Ashwin: That is so.

The Chairman.] Now, Mr. Fussell, it is stated that to hold the gold means a loss of about £330,000 per annum to New Zealand. Do you think we should save that money or hold on to the gold?—My personal opinion is that there is really no necessity to hold it here. Of course, we would not get £330,000 per annum if we sent it away. We would get interest-rates at about 1 per cent., perhaps, in the market where we had the gold.

It would be held in London?—Yes, by way of sterling balances. They would not actually hold the gold.

Still, that does not alter the fact that holding gold here is a loss to the Dominion?—To a certain extent it is. It is a loss in actual cash to the extent that you might get a small rate of interest on it overseas, but there is more to it than that. The knowledge that the gold is held here in times of difficulty means that we have a definite basis of confidence.

One admits that; but that does not alter the fact that it is not compulsory to hold the gold, and public securities would do instead. There would be a big saving to New Zealand?—The gold, at the present time, is the property of the banks, so that it is their own profits that suffer to a small extent by holding the gold here. If the gold were sent to the Old Country this country would make a slight profit out of it, and if the gold were sold at the present market price the country would make a large profit.

On the present market price, that is true, but if the gold here were sent Home it would be an additional security in the Home-country, and that would bring in a certain amount of extra money to this country?—Yes.

One admits that the rate of interest might be low?—Yes. I am not saying anything against the policy of sending it out of the country. I am stating that holding it here does, in bad or difficult times, give an added sense of security. I am not saying anything against the policy of sending it out of the country and collecting interest on it.

What use would gold or anything else be if the security of the country were no good?—If Government security were no good, you could not do anything, but gold is a universal asset, although I will admit that £5,000,000 worth of gold would not be of much use in a time of world cataclysm. If securities became valueless you could not base much on that at all.

Would not the security of a country come before gold or anything else?—I do not think so, because national credit—that is, the security of a country—has fallen away almost to nothing in some cases, but the value of gold has not fallen away. It is always worth its market value.

Since this Committee has been set up you have heard a lot about costless credit, and the issue of money by a Credit Board. Do you think that this could be carried out with advantage to the country?—Do you mean credit under political control?

Certainly, it would have to be under political control.—There would be a danger in that, because there is always the danger of inflation, and other aspects; besides, the economic aspect comes into it. If the Credit Board took over the note-issue and operated in the same sound way as the banks are now operating, and issued notes to the extent that they were required——

And interest free?—But in that case the Government would be losing a tax on the notes.

If notes were printed and issued from time to time as suggested, they would have to be cancelled at some time or another?—Yes.

Supposing that process went on until £50,000,000 in notes were issued?—There would be tremendous difficulties in the way of redeeming them. It is hard to say how they could be cancelled.

Might such a policy not lead to promises of credit at election times, with one party offering to issue so much if returned, and another party offering to issue so much more, to go one better?—That is rather a political question, but I should say that a candidate for election would be rather foolish if he did not take a chance like that to promise something like that in return for support.

I suppose you have read of the Guernsey Market Hall scheme?—I cannot say that I know much about that, because I understand that the experts who write about that scheme seem to be in the dark as to the actual effect of the scheme and all the forces that came into play.

Notes were issued to finance the cost of erecting the Market Hall and shops, which were let when constructed, and the revenue enabled them to extinguish the debt by repaying the notes?—They repaid the notes, I understand.

Mr. Lye: They cancelled the notes issued.

The Chairman.] From the income received from the premises. That would be a totally different thing to the proposals placed before us, because the conditions in New Zealand would not be on all-fours with the Guernsey Market Hall scheme?—It appears that notes were issued against the cost of erecting the Market Hall, and that that debt was met from receipts from the letting of the premises. I am not very familiar with the facts of this case.

Supposing we do issue paper money in New Zealand through a Credit Board as suggested, how would that affect our relations with Great Britain? Would it affect our present monetary relations?—If you had created a Credit Board instead of a Reserve Bank? If a Credit Board issued credit soundly, with due regard to the payment of that credit, I do not think that that would, in itself, prejudicially affect our relations with Great Britain at all. Britain would probably consider that as a first step towards the creation of a central bank.

The money would not be used outside of New Zealand. It would be a local issue?—Do you mean that the Credit Board would issue notes along with the banks?

Yes?—But the banks are only too anxious to issue credit. Do you suggest that the Credit Board would issue credit for purposes for which the banks would not consider?

Yes?—Well, that would most prejudicially affect our relations, because Britain would see that money was being put into concerns that did not have a chance of showing a profit.

What are the primary causes of the bank rates in New Zealand rising and falling? Is that affected by the London balances?—To a certain extent. The way the practical banker looks at it is this: He watches the deposits and advances, and if he finds his advances are getting rather ahead of deposits and reaching a figure which he does not consider satisfactory he may raise the rate, but, on the other hand, he may raise the rate to meet competition from outside rates. Various factors come into consideration.

An accumulation of money in the Old Country would not affect the position?—I do not say that, because if money were accumulating in Britain in normal times it would mean that we were exporting more than we were importing, and that would mean that we would have a favourable balance of trade, and the banks might be anxious to stimulate the purchase of London funds by lowering the advance rates. It does not necessarily follow that if London funds reach more than a certain figure the advances rate would go down. The exchange-rate would go down. All these things are interlocked.

And that would really have no effect upon the dropping of the advances rates. I am speaking of overdraft rates?—No, I do not wish to convey the impression that that would not necessarily affect the position. The economic tendency of large balances in London is to lower the exchange and advances rates, but it does not follow that both of these things would take place.

Do you think that the present rate of exchange is in the interest of New Zealand? Would you care to give an expression of opinion on that?—I would not care to say that. I can say, however, that some method of assisting the primary producers was necessary; some measures had to be taken either by subsidies or in some other way. What the banks said about their function in this matter was that they could not quote any other than the economic rate. If, for political or State reasons, any other rate were required, it would be for the State to deal with the matter in that light.

I do not know that I should have asked you that question—I do not think, perhaps, that it is quite a fair one to ask you. Now, Turgot, one of the greatest French economists said, "It is the superabundance of capital which enlivens enterprise, and the low rate of interest is at the same time the effect and the mark of the superabundance of capital." Would you care to express an opinion as to whether or not it would be advantageous if the rates of interest were reduced to 3 or 3½ per cent., or even to 4 per cent., with a corresponding reduction in the rate of deposits. That would liberate a lot of money and would give cheap and abundant credit as in the Old Country, would it not?—All things being equal, and it would be done in a practical way, I should think if would be most advantageous. That is what the banks want. They desire the rates of credit to come down. But, as I have mentioned earlier, there are certain obstacles in the way.

But abundance of credit is the main thing needed in New Zealand at the present time?—But credit is abundant at the present time.

I mean cheap credit?—If it could be done it would mean that it would help the marginal enterprises that are just deterred from operating under present conditions.

We have to remember, of course, that most of the banks have large reserves, and what Major Douglas calls "concealed assets," and from these reserves they receive a fairly large income for the benefit of their shareholders in the way of dividends, &c., because the money is lent out again, is it not?—Yes. I would like to say that the incomes that are called large are not relative really. In view of the amount of money invested by the shareholder, and the amount of reserves, the rate of earning is quite low. It is under 3 per cent. on the money invested. That is really moderate.

Well, take the case of the building societies. The building societies go on increasing their reserves year after year, if they are able to do that, and that money is lent out to clients and brings in an additional profit to the societies which enables them to pay larger dividends?—That is so.

The banks are in much the same position. Whilst you may be getting only 3 per cent. on your money in some cases, I have no doubt that you are getting a great deal more than that in other cases?—I am talking about the earning-rates on the amount of capital invested—that is, the return to the shareholders on the shareholders' funds, or otherwise the dividend.

Where building society money is allowed out again to clients it brings in an additional return to that which it received for its ordinary money?—Yes.

Surely the banks are in a similar position in some respects?—Do you mean that if they lowered the rate they would by this action increase the application for advances?

Certainly?—That would be no use if for every £100 there was a slight loss entailed—there must be a margin between the rates.

You pay 3 per cent. for fixed deposits?—Up to 4½ per cent.

But that will be discontinued soon?—That is so.

There are not many 4½-per-cents. left now?—Not many.

We want to get all the information we can on the subject. You understand that?—Yes.

Supposing the banks say, "No one knows how soon we shall get out of this depression. It may be one year, it may be two years, or it may be longer." As some one interjects near me it may be for ever. But supposing the banks took up that view, do you think they would consider any proposals for a stated term to endeavour to meet the position?—I think they would be fairly limited in the amount they could do in that respect, because it would mean absorbing part of the reserves for the benefit of the country.

But take the main income. If the banks can pay up to 14 per cent.?—Which bank pays that?

One bank did not long ago?—There is a source of misunderstanding over the dividend rates. A dividend is declared on the nominal value of the shares. If 14 per cent. is paid as a dividend, that does not mean that the person investing got 14 per cent. on his money.

I understand that?—If you suggest that they should allocate the money that is paid in dividends to relieve business concerns, that would mean, perhaps, that the dividends would be reduced to ½ per cent. or perhaps nothing. In effect it would mean sacrificing the interests of one section of the community who lived on or received income from dividends to help another section of the community to get cheaper money.

Might that not be adjusted, as Major Douglas suggests?—If we adjusted it it would have to come out of some one else's pocket. Why not go straight to the pockets concerned?

Of course banking institutions differ from the ordinary mortgagees?—In many ways.

The ordinary mortgagee pays money out and takes his chance. The banks hold securities that are quite sufficient to meet advances made. The ordinary mortgagee at the present time is getting down to 1 per cent. return, and sometimes nothing?—That is so.

Do you think it is possible for the banks to endeavour to meet the position by supplying money at a lower rate of interest for a stated term?—They could do it but only to a small extent.

I am not talking about a reduction of 1 per cent. I am talking about a reasonable reduction?—A reduction of 1 per cent. would reduce the earnings of the overdrafts by £500,000 per year. That would mean taking money from the pockets of one section and giving it to another section.

Are you taking into consideration the reduction that would take place in deposits?—No. If the rate for deposits could be reduced further, without having outside competition to contend with to take the deposits away——

But you would not have outside competition. That is all round?—Well, in my opinion the banks would welcome it. I think I have spoken on these lines all through. The banks are anxious to see the overdraft rates come down.

Mr. Lye.] Would not it be possible to reach an agreement on the matter between all the financial institutions, or would that have to be governed compulsorily by statute?—My experience is that it is hardly likely that that could be done, other than by legislation.

The Chairman.] If that were done by legislation do you think it would help us in our present difficulties?—It is a matter requiring investigation. You ask, in effect, would it help the community to reduce the incomes of those people receiving interest?

It would reduce the incomes of these people certainly?—If that led to a corresponding benefit to those people who pay interest, in my opinion, it would probably be to the good.

If we examine the Mortgagors Relief Act we will realize that not only the mortgagors but the mortgagees are suffering?—That means that the receiver of interest is suffering, and you are going to make him suffer more if you lower the rate of interest he is entitled to. It is a matter for a round-table conference, so that the pros and cons can be weighed.

It has been stated repeatedly that the banks and the stock and station agents and other financial institutions are receiving the whole of the benefit from the high rate of exchange. Do you think that

that is so ?—I do not think so at all. Of course to the extent that the high rate of exchange is a deterrent to importing it means that less business is done. Do you mean that some people claim that the £25 in every £100 that people pay to get London funds is just pocketed by the banks ? That is not so.

The suggestion is that the farmer and the seller in New Zealand is indebted to the financial institutions to such an extent that all the advantage is absorbed by these institutions and does not reach the farmer who requires the immediate assistance ?—That may be so to a certain extent, but all the farmer is doing is paying off his just debts. He must pay his liabilities and this is helping him to do so.

One realizes that. I have some figures before me showing the value of the increased exchange to the producers, and whilst I admit at once that this advantage to the farmers has been given at the expense of the trading community and others who are suffering hardship in many cases, it is evident from these figures that the farmers have been helped. The dairy-farmers alone, on the increased 15 per cent. on the exchange from the 20th January, 1933, when it was instituted, until March 1934, netted an additional £2,612,115. That is additional.

Mr. Langstone: Where was this money brought from ?

The Chairman.] It was not actually brought in, but that is the increased total to the New Zealand dairy-farmers. The total benefit from the 25 per cent. exchange has reached £4,353,525. I would like to point out that I happen to be a chairman of a dairy company with five hundred suppliers—probably not a great number— but it is interesting to note that with the exception of two or three Government loans, the whole of the benefit goes to the dairy-farmers. We have not one order on the stock and station agents ?—That is evidence that so far as your company is concerned the advantages are passed on to the producers, and the claim that all the advantages are not passed on is not true.

It may be in some cases the advantage is held by the stock and station agents ?—It has not been the policy of the banks to reduce their overdrafts by the proceeds of farmers' sales in this way. The banks want to extend their overdrafts, provided the conditions of so doing are on sound lines.

So far as the London balances are concerned, we have four Australian banks operating in New Zealand ?—The banking business is predominantly Australian, but two Australian banks have their head office in London.

And the London balances are held separately are they not ?—They are now, but were not previously. They have to be now on account of the Banks Indemnity Exchange Act.

Getting back to overdraft rates, you have clients who run two or three accounts at the bank, have you not ?—Yes.

One account may be in debit and two accounts may be in credit. Do the banks allow the credit balances to be set off against the debit balance ?—Yes, under certain conditions. The condition is that the money is the customer's own money, and unattachable credit balances may be set off against debit balances. The banks are not obliged to do it.

Provided it is a genuine business that is allowed ?—Yes, and any private person is permitted to do so, as long as there is a legal right. Trust funds do not come into it.

Mr. Harle: For instance a solicitor could not have his trust account set off against it.

The Chairman: I realize that, otherwise we would have people sending their money to that solicitor——

Mr. Langstone.] If a local body had a credit balance in one account and a debit balance in another account, could the credit be set off against the debit ?—We could not set off unattachable credit balances. The right of transfer from one account to the other must be in the hands of the banks.

Mr. Harle: That principle is governed by the Municipal Corporations Act.

The Chairman.] Have stock and station agents been able to reduce their overdrafts with the banks ?—I have not looked into that aspect of the question. I would say that the dairy-farmers have been able to reduce their overdrafts.

Mr. Harle: Some stock and station agents do not work on overdrafts. They work on their own capital.

The Chairman.] But many do ?—Yes.

Mr. Fussell: I think the general attitude of the financial institutions is that they like to see their customers prosperous, for that makes them more prosperous, and if they can help their customers at all they do so.

The Chairman.] In reference to legislation enacted two or three years ago for long-term mortgages for the Bank of New Zealand, has there, generally speaking, been any great demand for that type of business ?—The figures are about £1,100,000—that is, the figures of a year ago, and I do not think they have altered very much.

Has that money gone out on broad acres or on city properties ?—The intention was for broad acres, but I think in some cases, owing to lack of demand in that branch, it has gone out to some extent on city properties.

Yes. I find it rather difficult to follow that in your balance-sheet ?—I do not think the balance-sheet sets it out.

It is difficult to follow it. The rate of interest was to be 6 per cent.; has that been automatically reduced or does it still stand ?—It is 5 per cent. now.

And the whole of the amount the bank really set out to lend has not been taken up ?—No; it may be said that the demand is disappointing.

In your lending policies you work upon deposits, do you not ?—Yes, the banks lend against their deposits.

Suppose all your deposits were called up and you could not equate your advances, what would you do ?—That is a thing I would like to look at fairly particularly. It is a different question if it happens to all the banks at once or just to one bank. Dealing with the matter happening to one bank: Apparently the reason is that the confidence of the customers has been lost. Knowing that notes are

a first charge on the assets, they want a first charge on the assets because they think the bank is going to fail, so they withdraw their deposits in the form of notes, and presently that bank reaches its limit. Then, I suppose, it would try and call in its advances, and of course could not get them in quickly. The bank has to be solvent on the day; it is no good to be solvent on paper, or a week or month hence; it must be solvent on the day. That bank would either have to close its doors, as banks have often done and have been forced to do in America, or it would have to get help. Either the other banks or the Government might come to its aid. If it happened to all the banks, you would have to look around for a motive, because there must be some cause. It would want people to hold the notes of all the banks if they thought all the banks were going to smash and wanted a first charge on the assets. They could do so; it would be possible, but it would not be in the national interests. When the notes reached their limit, a banking crisis would arise, and probably legislation would be altered to enable more notes to be held. In that case I think it much less likely that they would call in their overdrafts.

Captain Rushworth.] Would legislation be required to enable them to hold more notes?—Oh, yes.

Cannot the banks issue notes against public securities? The Government can issue public securities and they can issue notes against them?—Yes; the Government could buy the money from them, but what would happen? As does happen when the note-issue is limited, some legislation is passed to enable that to be exceeded. Where legislation does not already exist, they would give the conditions for which it might be exceeded, but I do not think advances would be recalled in such a case, because that would naturally aggravate the position engendered by the lack of confidence causing the money to be withdrawn.

On the last occasion you were asked a question about the exchange on cheques; it was considered by some of the members, I think, that the rate was excessive, and then, of course, reference was made to the Old Country where there was nothing charged for exchange, but there was a definite arrangement made in regard to overdrafts?—You mean the bank charges, but I read somewhere since that exchange is charged in some cases in England.

That was admitted here; it was not said to be general, but do you think that the rate of exchange could be reduced? Do you not think that is a big charge—a heavy tax upon the customers of the bank?—The charge is 2s. 6d. on £100, but it operates as a clearing system and any clearing system costs a fair amount of money, and in New Zealand the charge is considered to be a fair one, and it is one of the charges made for the banking service. They have whittled them down as far as they possibly can.

It is considered by the banks that the charge is a fair one?—It means that they have lowered it as far as possible; their overhead is a certain amount and they have to meet it.

But you did not hesitate to increase the charge for the customers' accounts from 10s. to £1?—And the Government did not hesitate to increase the note-tax.

They had to have money?—So did we! The banks have intimated that when the note-tax is reduced they will be pleased to lower the bank charge.

I am afraid that may be a long time?—It will not be a long time because the Reserve Bank is taking over the note-issue, and our own note-issues will gradually go off—I think, in two years. The matter would be immediately *sub judice* with the banks.

Dr. Sutch.] They are intending, then, to lower the charge?—That would be a matter crystallized at a meeting, but my own view is that, when the cause of the charge is removed—the note-tax which puts the rate on—the bank charge will come down.

The Chairman.] I asked that last time, but you were not then sure?—I said it would be *sub judice* and would have to be decided at a meeting.

The increase in the exchange-rate in normal times (leaving out the depression altogether): How is the question of the reduction or *vice versa* arrived at? Does it happen when you have an accumulation, or is it settled through a meeting of the associated banks, or directed from London?—It is settled out here through a meeting of the associated banks; London has no say in the matter.

No influence on it?—It would be impossible to say anything has no influence. The bankers have a meeting and a decision is made, here in New Zealand, and put into effect in New Zealand, by co-operation of the banks.

Mr. Langstone.] With regard to the reply that you gave to Mr. Nash in connection with the 3 per cent. dividends on the actual assets and capital involved in the bank?—Put it this way, that the return on the investment to the shareholder is under 3 per cent.

If the shares were sold on the Stock Exchange for £2 10s. or £3, that has nothing to do with the bank?—That has nothing to do with the bank, but from the point of view of the investment, the shareholder expects——

Does the dividend that the bank has paid determine the rate?—It certainly does. The dividend is declared on the actual capital paid up, but the earnings are a very much lower sum.

Then your secret reserves must be very much more?—They are not secret reserves.

If they are only paying 3 per cent. on dividend, and the Bank of New Zealand are paying 13⅔ per cent.——

Mr. Shaw: No, 11¼ per cent.

Mr. Langstone: It was 13⅔ per cent. some time ago; it may be 11¼ per cent. now?

Mr. Fussell: Of course you have to take other aspects into it; people will be prepared to accept a smaller return on bank shares because of the safety of the investment.

Mr. Langstone.] It seems to me that if we are to take the 3 per cent. literally ——?—You must take into consideration that the rates quoted have come down a good deal.

I asked previously about the question of the taxing of the banks on their assets, their landed property and premises. In 1900 these stood at £422,339 and in 1932, £481,463?—You are referring to the New Zealand premises of the Bank of New Zealand?

Yes; I have got some returns of the Wellington properties of the Bank of New Zealand, in Wellington: the valuation of the Stout Street property is £10,500 unimproved and £20,000 improvements, a total of £30,500; Lambton Quay, £75,000 unimproved and £55,000 improvements, total £130,000; Manners Street, £24,500 unimproved and £14,500 improvements, total £39,000; Riddiford Street, £2,045 unimproved and £5,035 improvements, total £7,080. There is £206,000 in four banks in Wellington. That is nearly half the total of £481,000 for all New Zealand?—Yes, but that figure includes depreciation and replacement.

The valuation I have here is the valuation of the City of Wellington for rating purposes, and is the Government valuation. It seems to me that if four premises in Wellington are going to be for £206,000 there is only one reason for the banks in writing down their property, and that is to avoid taxation?—I do not think that is the case. In other countries where the taxation is not on that basis, they write them down also.

Mr. Shaw: You are under that impression, Mr. Langstone, but that is not the case.

Mr. Langstone: What is the reason for it?

Mr. Fussell: Ordinary prudent reasons. In 1900 the values were, comparatively, very considerably lower, but the banks did not write them up. On the other hand, they recognize that banking premises are to a certain extent specialized premises. If a bank has to remove and the premises become empty, as is the case with several of our country premises, that is a dead loss.

Mr. Langstone.] That would apply to all other premises as well?—Yes; but we are talking from the bank's standpoint. We look at it from that standpoint, that it is prudent and in accordance with banking practice.

But other firms are not allowed to write down their premises by that amount?—Yes, they are. Other business firms do not have to pay on their reserves.

For ordinary taxation purposes, you are only allowed so much depreciation?—Other companies do not have to pay income-tax on the value of their premises, but the point about specialized premises is quite correct. If, for instance, a stone bank building on a corner section in a country town becomes empty, no one can use it if it is sold up. It would have to be sold at a very low figure and a lot of money spent on reconstruction.

That applies to a lot of other buildings?—Do you consider it is not a wise and prudent practice for the bank to adopt?

I think it is, but to me it seems that if it was written to its true value with due prudence, they would pay more in taxation than they do to-day?—They would pay more if they did not adopt that prudent policy, but any firm would be foolish not to make provision in such ways.

The banks say, "That is the valuation," and it is never questioned, but another firm cannot do that?—But it does not have to pay income-tax on it.

If a bank is paying on its assets and liabilities, on the average of its assets and liabilities, a liability is also an asset to the bank. If I bank £500 in the bank, the bank owes me £500—that is a liability?—Yes.

But if that bank lends that £500 to Mr. Munro, and he has to pay in security for £1,000, it is also an asset, because he pays the bank £500 plus the asset?—He does not owe that £1,000.

They have the security for £1,000. I have not got security for £1,000 for my £500?—The bank security is worth a lot more than £1,000.

It was not in 1894?—Nobody lost a penny, though.

The point is that every bank asset is also a liability, and *vice versa*?—Against the assets, they are liabilities; that is quite true.

They work one with the other?—But they pay on both.

On the average. Do you mean to say that a bank only earns £1 10s. per cent.?—It does not earn that much.

If you borrow £1,000 at 3 per cent., you do not lend it out under 5 per cent.?—Yes.

You make a 40-per-cent. profit there?—40 per cent.? On what?

If you borrow money at 3 per cent. and let it out at 5 per cent. that is 40 per cent.?—Yes, on the interest.

If I buy goods and get a 40-per-cent. profit on them with no chance of deterioration, it is good business?—I do not think your mathematics are quite correct. If I bought something for 1s. 1d. and sold it for 1s. 2d., I am making 100 per cent. profit.

You would have to charge 2s. 2d. to make 100 per cent.?—You are not working a percentage on the business, only on the profit, but not on the total business done. For taxation purposes, the tax is worked on the income you make, on the amount of business, on the asset and liability. I quite see what you mean, but the profit is really only 2 per cent. on £200.

You pay taxation of £1 10s. on every £100 assets and liabilities, and you pay about 6s. on the £1 10s.?—No, we pay 8s. 9d. per £100 on the average assets and liabilities.

Not 8s. 9d.?—It works out at that.

4s. 6d., plus 30 per cent.?—That is 5s. 10d., and then that is what is paid on every pound of ordinary income, and then half of that again—8s. 9d. It really comes to this, that the present basis of taxation taking everything into consideration, bears hardly on the banks because one of the principles of taxation, I think, is that it should be fair and equitable, and that when income falls the taxation should fall, and *vice versa*. But with the banks the assumption that they are making this amount goes on, and though their income is halved, they still pay the same taxation.

Mr. Ashwin.] And when it is doubled they still pay the same?—It does not double, unfortunately.

Mr. Langstone.] If all businesses were in the same position as the banks, there would not be any slump?—If other businesses had been conducted as the banks, there may not have been.

Captain Rushworth.] I think not, because the banks make their own money?—They do not.

Say the Government wants £1,000,000, and issue Treasury bills, you discount the bills; what do you do?—Hand the money to the Government.

Do you not create £1,000,000?—You do not create the money, you create a debt; you have allowed yourself to become a debtor of the Government.

Suppose the banks said, "No, we will not discount your Treasury bills," that money would not be in existence?—No.

And if the banks say, "Yes," the money comes into existence?—What they do is turn the non-liquid purchasing-power into liquid purchasing-power.

They monetize the Treasury bills?—They are in a form which is not currency. They do not just create it and make it out of nothing.

You just say, on the taxing of the people and the assets of the country, you are certain the Government can pay it?—The purchasing-power is there.

Directly you give them £1,000,000, that is reflected in further deposits in the banks?—It all depends on where it is spent.

It does not matter how it is spent. How will it not reflect in deposits?—If it is used to buy sterling. If it is spent in New Zealand it might be reflected in the deposits, and might not.

Could it be spent anywhere else?—The banks could give sterling balances.

So you issue the Government £1,000,000 worth of currency on Treasury bills and they pay that £1,000,000?—That does not go into anybody's deposit account.

It cancels out a deposit?—If you gave the Government a deposit of £1,000,000 and they spent it, they cancel out a deposit, but if the money is spent in England, you transfer the money.

It is purely book-keeping?—Yes.

Mr. Langstone.] I would like to get on to that point. Leaving the Government out of it, if a Japanese merchant who has sold goods in London and got £10,000 credit in London——?—You went through that last time you questioned me.

What I was trying to get at was this, that that increases the London balance by £10,000. If it is sold to the Bank of New Zealand in London to purchase goods in New Zealand, he gets a letter of credit. There is only a cross-entry debiting the London account by £10,000 and increasing the credit in New Zealand by £12,500?—He pays in £10,000 in London, and, leaving the exchange out of it altogether, he is entitled to £10,000 in New Zealand.

The money is still in London, but evidently some communication comes in and you give him £10,000 here in New Zealand. He takes goods away?—It has enabled him to do so.

You get the reverse action of somebody getting goods from New Zealand to Japan, but both of these transactions are settled in London, and the physical part we see is, possibly, wool going from New Zealand to Japan, and goods coming from Japan to New Zealand?—That is correct.

But the whole thing is settled in London?—London is the money-market of the world.

Is that what gives London dominance over the finance of New Zealand?—You would have to get me to admit, first, that London has the dominance over the finance in New Zealand.

Has it?—No, I do not consider it has.

The mere fact of settling our balances——?—We just do it there.

That does not give them the control of finance in New Zealand?—No, it does not.

I suppose that means money comes into existence by way of a debt anyhow. Originates in a debt?—Did you say currency or money, because there is more currency in use than money, so we will say currency.

I am talking of money in the general form. Anything that will pass for payment?—Cheques. Yes, we will call it money too. We understand that using money as we do now we are including all things that pass for payment, cheques and everything else.

Yes. Now that currency is in existence in the form of a debt?—To a large extent.

Then it just depends largely whether the banks will buy securities?—They do not buy them. The securities are pledged to the banks and the banks do not include those securities in the balance-sheet. They are not purchased.

Then it just depends how they lend against those securities, how much money there is in circulation?—Yes. To the extent that they are requested to, because the banks are willing to lend more than they are lending, but they cannot lend more because the people cannot borrow from them. But you mean that the way the currency comes into existence is that a person who has an asset wants to turn part of that asset into a form that can pass as currency, and the job of the banks is to do that.

But because the great bulk of our people possess no assets they do not come within the sphere of banking at all?—If they have no assets at all—no. I should not say that any person who has no assets would.

So that, although there may be a very dire need for purchasing-power in the pockets of the unemployed relief workers, that is outside the realms of banking. You do not pretend to be able to cure that?—No. The banks do not pretend to be able to give purchasing-power away, because they say themselves they cannot create it out of nothing, and if they gave anything they would be giving what belonged to somebody else.

Could the Government do it?—Do you mean by issuing money?

Yes. They issue Treasury notes we will say?—The Government is physically able to issue Treasury notes. Governments have done so.

Make them legal tender?—Yes.

And they could pay those to the unemployed and the other workers, and that would create a definite demand, an effective demand for goods, and that would reflect itself in the increased business in the ordinary banks and restore confidence?—I do not know that it would go all the way to restoring confidence, because, in the first place, by issuing that money the Government are issuing what cannot

be repaid by the people to whom it hands the money, and that money has got to be got back from somewhere, and in the meantime it is a Government debt. You would have to go into all the complicated question as to how much the debt would be and how much the confidence reposed in the Government would be affected by issuing that debt and the money issued without provision for cancellation.

But is not the lack of confidence reflected in a lower standard of living of the people. And they do not want a lower standard, do they ?—No. I think that some of the effects of lack of confidence are a lower standard, but the lack of confidence is the effect of something else, and the thing that caused a lack of confidence would be causing the lower standard of living.

I think I asked you before what caused prices to fall. Prices do not fall of their own volition, do they ?—No.

Well, there must be some reason for prices falling ?—Yes. One of the facts, of course, is the supply in proportion to the effect on demand in England. For instance, they can get supplies of butter for less. At one time they paid us 2s. 6d. a pound for butter. They could not get it for less, but they would not pay us 2s. 6d. now, because they can get it for less. The supply in relation to the effect of demand is greater, and if we charged more for butter we would not be able to sell it. They would probably use margarine rather than pay the high price.

Did not that come about first simply because the banks in Great Britain called in overdrafts and pursued a policy of deflation and took money out of circulation. If you take money out of circulation prices must fall, must they not ?—Yes. But I do not think the banks adopted a policy of calling in overdrafts, because it has not been my experience of banks that they do. They do not say "We are going to lower the volume of overdrafts and we are going to call them in." When they ask a man to reduce his overdraft it is in that man's own interest that he should, because the business is getting unsound and the security is not adequate support for it, and it is not good for a man to have the money on that basis because he can never repay it. The banker acts as a counsellor and counsels him to repay it while he can. They are quite sorry to have to do it, but they must take into account the security.

Do you not think that the continual fluctuation of prices gives the banks or the bankers greater control than they otherwise would have ?—I do not think so. The price has been fluctuating lately, and, as I have said before, the banks are so anxious to give more money out.

Suppose we pursued a policy where, in accordance with the increase in wealth production, the customers of the banks—farmers and others—had credits and did not need to borrow money at all, but utilized their own credits, how would the banks get on as a lending institution ? Their job would be gone ?—It most certainly would.

They do not want that, do they ?—No. They do not want their job to be gone, but on the other hand——

I mean to say, the profitable part of their business would be gone ?—Yes. But something has got to come from somewhere if everybody could get free credits.

Yes, if they could get free credits ?—It is only the amount of interest you are talking about now, the difference between whether the banks lend for nothing or lend for a rate of interest.

No ; there is more than that ?—Do you mean to say people using their own credit would just get the money and would not have to repay it ?

Yes, and there would be ample of it due to the ordinary exchanging of goods and services ?—I said, "And they would not have to repay it ? "

When you exchange goods and services you repay them do you not ?—No.

When do you repay ?—I am asking you. I do not know if there is any provision in the idea you are talking about for repayment of the credits.

Every time a transaction takes place and is paid for it is redeemed at that point. If I buy something from you and pay you for it that represents some tangible asset that I have had in monetary form. I give you my monetary form for it and take your tangible asset. That redeems the business so far as you and I are concerned, and then that gives you the right to go and buy something from somebody else, so that every time the transaction takes place it is redeemed ?—I do not know. What about that £10 you borrowed from the bank to buy that article from me with ?

Yes ?—Or from the Credit Board or the Government or anywhere.

Yes. But that has cost the bank nothing ?—That is not the case because, put it this way, that the bank lends you £10 and hands you notes for it. From some of the things I have read it seems to be thought that those notes are the bank's. They are debts. The bank is paying taxation on them.

In your statement that you made at the opening of your evidence you stated that the bank-notes could be used in buying gold and paying the services of those working in the bank. Now, then, if the bank has a whole block of notes printed, made legal tender by law, the only cost to the bank has been the printing of them, but directly they tear one off or a number off and buy gold with them or pay the services or perhaps buy property with them, then they are able to buy a value of many thousands of pounds for things that have cost them a few pence ?—But you must take into account that when that note is handed to the person who sold the gold that note is a debt of the bank.

But the bank has got the gold ?—I know, and they owe the amount of the gold too. Their position on their balance-sheet is exactly the same.

But there must be some beginning somewhere. If we were to give anybody else, any member of this Committee, the right of issuing money, they could start and go to the printer. They could get the notes and if they were made legal tender they could issue those amongst the people and the only cost to them would be the printing of the notes, but the value outside of the bank would be the equivalent in actual real value, in goods and services outside of the bank ?—But the cost to the person who issues them is the debt that he incurs by doing so. If he issues a million notes he owes £1,000,000.

Now, we come to the interjection of Captain Rushworth. Suppose that they have got to redeem the debt, what do they redeem the debt with. If I go to the bank with a note and ask you to redeem it what are you going to give me, another note ?—Yes. In the last resort the banks have assets which would enable them to redeem all their debts.

They do not need to have any assets ?—They have those assets, but as things go, and with legal tender, they do not supply tangible assets in redeeming notes. In redeeming a note they give you a credit with the bank. That means, make you a creditor of the bank in a way that will enable you to buy the tangible things. If you went to the bank with some notes and said, "Redeem those notes, and what I want for them is a car," the bank will say, "We do not keep cars, but you take the notes along and you can get the car." So that you can get whatever you want.

So that if I go to the bank and say, "Give me some notes" which have cost them only the matter of printing, but by law have been made legal tender, they give them to me, and I can go and get the car. I have now got the car. The other fellow has got the notes. If he goes back to the bank he cannot get another car to replace the car he sold me. All he can do is to get more notes ?—He can get another car with the notes. I do not see how it matters.

It is a very important point, that if the banks have the power to create money they have also got the power to destroy money ?—But what they do is to turn assets into a form that can be spent, but all the same they incur a debt in doing so.

But they could even go further than that. They could go and buy gold with notes. That gold has cost the other people so much labour and time and energy to create, but there is a vast difference between creating an ounce of gold and manufacturing £4 or £5 in notes by the printer ?—Yes. But if the person hands over the gold he wants the notes in exchange for it.

That is so. But they have got the gold, but they have not done anything to get the gold. What have they done ?—They incur a debt. They have not benefited their position. You say they have got the gold, but have they improved their position ? Have they increased their net position ?

Well, why are the banks complaining about the confiscation or the theft of their gold ?—Because in buying the gold they did not improve their position, and if it is taken from them again their position is worse.

They only gave notes for it and they used the notes to pay taxes with, so that really when a bank takes to paying taxes it does not pay taxes at all. If everybody had the same right as a bank has to issue money and to pay taxes and make it legal tender——?—But whenever they pay it in legal tender they incur a debt. That means that they have not really paid it. They still owe it.

Who do the banks owe to. We will say they owe £100 worth of gold. They have given the necessary notes for it. Who do the banks owe anything to ?—To the holder of the notes. If you brought the gold in and sold it to them and they gave you a hundred notes——

But when that man who has the gold valued at a hundred notes goes and deposits it in the bank and proceeds to spend the notes, he does not buy anything from the bank. He buys something from somebody outside the bank. Then the bank does not supply anything ?—No. The bank enables him to do so. The bank's job is this: The people have got the assets. The banks do not create purchasing-power. The purchasing-power is there, but the banks issue evidences of that purchasing-power and accept an obligation. They accept the debt for that amount, and any banking system at all would have to be on the same sort of basis, that there must be a debt against the credit, and that money itself or currency—legal-tender money—is not of value in itself, but is evidence of purchasing-power, and that purchasing-power has to be put up before the evidence can be brought forward.

That is admitted. But if I go to the bank for a loan and you monetize my assets and securities the bank is not giving me anything or expending anything and they have got a right by law to make it liquid, to monetize it, and if I do not repay the notes that they have given me, something happens, then they take my security and it belongs to the bank ?—But you have received value.

Not from the bank ?—If the bank takes your security it just takes a sufficient amount to enable them to pay the equivalent amount of the deposit—that is, to enable them to pay their debts. They do not take your security and pay the whole thing into profits.

But their profit is the charges that they make on the operation of the thing. But they can buy real tangible properties from people in the community with those notes ?—But they do not improve their position. They do not increase their margin of assets over liabilities by doing so, so that you can see that for the tangible property they get, or whatever they buy, they have got a debt of an equal amount.

The debts are only a figure in a book ?—The assets have to be written down, but the debt is an obligation.

Yes. But in the settlement of that obligation the bank does not give anything. Somebody else settles that obligation ?—But it must keep enough assets to be able to do so in the last resort. That would simply stop the process of the bank's becoming insolvent.

All it has got to do is to keep sufficient balance of cash in conformity with the statutory law. As you stated a little while ago, if they all went bankrupt what they would have to do would be to go to the Government and they would have to get a law where they could extend their note-issue, and if they could extend their note-issue they would not go bankrupt. They have got some rule of thumb. I do not know just what it is. But they have got to keep some relationship between their cash reserves and their other obligations ?—Yes. That applies more particularly, of course, in the Reserve Bank system such as we have here. The system here will be different in material respects when the Reserve Bank comes into operation. But still the general principle is the same, that the banks perform a service in the country and that service is charged for at a reasonable rate. For the size of their businesses, the profits are not out of the way at all, but this statement of yours that they cannot

give you anything for it, that really means very little, because in the last resort, if you said to the banks, "Now just show that you can meet all your obligations and give tangible assets for what you owe," the banks would say, "All right. Then we will go into liquidation and show you we can do it." And they would call in £100 advance and give it to a depositor, call in another £100 and give it to another depositor, call in the whole lot and square the whole thing up, and say, "We do not owe anything to anybody but the shareholders. Here you are, shareholders, take the premises." But trade would be stopped. So it can be done, but there is no need to do it. All the time it is a debit and a credit, and by issuing notes it issues debts. The notes in circulation do not belong to the banks at all. They belong to the people, and the people are effective creditors of the banks.

I quite realize that if I do something for somebody and they give me an IOU and I could use that, there is an equivalent of services, there is an equivalent of value, but if we can go to some concern and get notes and the only cost has been the printing of those notes, there is not the same value.

Mr. Ashwin.] But is not the point this: That if a man expects to get value for money, when he has got it he must give value to get the money?—Yes, that is so.

And the bank only comes in between those two?—Yes. The bank is the middleman.

The bank is the middleman in that transaction, and expects to get value from one man and give it to another?—Yes. I thought I had made that point before.

Mr. Langstone.] There is more than that in it. But they are able to acquire real tangible assets?—But only against a debt. They do not improve their position. The position is this, that I have got the right to create to a certain extent. I could go along to my tailor and say I wanted a £10 suit. You could say I have not given him anything and I have got the suit, but I have got to pay him some time.

But if we all came along and said, "We are allowed to issue notes," we could issue ten notes and pay the tailor. There is a vast difference between the making of the suit and the issue of ten notes?—No. My credit would be £10 and my debt would be the notes in circulation against me, £10, and my position would be just the same.

If anybody comes to the bank and they want to redeem a note, all the bank says is, "I will give you another for it"?—I have already explained that if you did not want them to do it that way they could wash everything up, but nobody would be benefited by doing that. You have mentioned a few times about this costless issue. The real point is not the cost that it takes to print the note, although there is all the overhead expense. It is the debt the bank incurs when it passes that note across the counter. That is the main thing.

What debt does it incur?—It owes the note-holder the amount.

Yes. But the note-holder can only go back to the bank and get another note?—The job of the bank is not to enable the people to treat the bank as a great emporium where they can get everything. The bank enables them to go where they can get the things.

If the bank has got a lot of notes unissued it has only cost them the printing, but directly it goes out into the public it assumes a new character altogether. When it comes back into the bank and it is not in circulation, but has to remain there, it would be just as it was formerly?—No.

Why? It is not in circulation?—But once it has been out, when it comes back it does not cancel out the indebtedness of the bank. It transfers it. You come to the bank and you get a £10 note. That note immediately becomes currency and then you pay it back into the bank. The banks do not say, "We are worth £10 more." They credit your account. They say, "We are still owing Mr. Langstone £10."

Yes. But that is transferred in the community into goods and services to that extent. When it comes back into the bank the bank does not give us any services for it. They do the book-keeping between the individual and the bank?—And all the profit they make is just a return for the services that they perform. I would like to get at what fault you are finding with the present banking system, because any banking system at all, whether done by the State or elsewhere, would have to have a system whereby there would be debts on one side and credits on the other.

I am not finding fault, but I do find fault with the banks trying to cover up that there is any such thing as practically costless issue of credit, and that the banks have got to give value, a *quid pro quo* for all the credit they issue. I think that is where I differ?—I think that you might change your view if you talked the matter over. It is very hard to talk it over here, but if you studied and went into it more carefully, because, after all, the banks do not get any more value than they give. When a person pays a cheque into a bank the bank owes him that amount, but what value has that person given the bank? He has made the bank his debtor for £10,000, say, by paying that cheque in, and in a gold standard country the bank owes him £10,000 worth of gold. But what service has he given to the bank? He has only given them a piece of paper.

Where did he get the paper from?—He writes it out himself.

Mr. Clinkard.] Could you compare the note to a promissory note?—Yes. A note is a promissory note. And this point about it not being money while it is in the till of the issuing bank, that would be just the same as if you wrote out a cheque. You could write out a cheque for £1,000 and put it in your pocket. It is not an asset and not a liability, but once it got out of your hands it would be an asset of the person that had it and a liability of yours.

But when that cheque comes back to me, if I issued a cheque and had nothing to back it up with, but it circulated and went round half-a-dozen people, it would do the business of half-a-dozen people and come back to me. There would be no fraud in it. I would just destroy it?—No. Because you could not get it back without giving £1,000 for it.

But it originated from me?—Yes, I know; but you incurred a debt by operating with it.

But I am saying that I issued a cheque and I had no money or credit to back it up with, but it passed amongst the people and did the business of the people and came back to me again. I would

have already received in my transaction the value of it when it came back to me ?—You return that loan. People do that every day.

And therefore the question of the cost of issuing it is not much ?—Not the mere cost of writing it out. But by issuing it you do incur a debt.

Yes. You can look at it that way ?—On one side there is the credit and on the other side the debit. You mentioned that the banks are trying to cover up that it was costless, but the banks do not consider anything costless that involves them in a debt.

But when the bank subscribed and took up war loans and issued the money to the Government, all they did was to hold the war scrip and gave the Government the money. They possibly sold those again to somebody else. I think you could put down £10 or £15 and get £100 worth. That was only a matter of giving credit by way of figures in a book. The bank did not give anything there, but they held the war scrip as security ?—Yes. They held the scrip and they were legally able to issue money against that, but their position is just the same. They are no better off. They have incurred the debt by issuing the money, and they have got the backing for the debt in the scrip.

But there was this about it, that they were able to get 4 per cent. or 4½ per cent. for that, and it has not cost them anything to do it and they can get the interest on it ?—But the total interest they get on all their advances is offset by the costs of banking, and the margin is the profit. Most certainly it is the profit, but the people of the country get it.

You cannot tell us, then, what proportion of the deposits that we have got in the banks in New Zealand is just purely bank-created deposits ?—I do not like you using the word "create" because to me "create" means to make something out of nothing. But you mean deposits that arise out of the bank advances. No. I could not tell you that. I do not think it would be possible to say.

Have you got any idea of the relationship between the business done by cheque and the business done by legal tender money ?—No. I could not give you that.

Cheque money is short-circuit money and legal-tender money you might call long circuit ?—I could not give you any figures at all, but a very great preponderance of business is done by way of cheques. I do not think there is any definite means of finding out the exact relation but you can get an idea.

I suppose we all recognize that there is something wrong somewhere. There is a screw loose somewhere ?—Yes. The world is pretty sick.

It is not the fault of the ordinary working-people, because they have played their part. There is something gone wrong somewhere or we would not be in the slump. Now, is that because we start to blame one another. You have just told us that the banks cannot issue money out into the public for relief workers because they have no assets and securities, but you have admitted that the Government could. Do you think it is in the control of banking, then ? I mean that the bank to-day possesses rights and privileges under the law, but has no legislative authority. If it had legislative authority it could meet circumstances as they arise. Do you think, then, we would be able to avoid a slump ?—No. I do not think so. What do you mean by legislative authority ?

I mean that if the banks had the same legislative authority as Parliament, and when they saw a slump coming they could meet it by issuing money, we will say, to people who have got no assets and securities by way of wages, keeping up wages, purchasing-power, salaries, pensions, and that sort of thing ?—I can see what you mean, but I do not think that it could be met that way, because it would involve giving money and currency for purposes for which the trading banks could not give it, because the business would not be considered sound and the money could not be repaid. That sort of thing has happened in other countries where the Government says, "We have got the right to give this money," and they give it, and when the time comes for meeting the debts they cannot be met and the money starts dropping in value and that starts a vicious spiral of inflation which is very hard to stop. The whole trouble with inflation is that it is very difficult to stop.

Do you not think that if you have a lot of production and no consumption then you bring about the very conditions that we are trying to avoid ? Do you not think that if there is a lot of production and the people have not got the money to buy that, then there is a slowing-down process. That brings unemployment, and we get the very vicious circumstances that we have got to-day ?—The people who are not entitled to get money—it is because they have no goods and no services that anybody else wants. The banks cannot make that good.

But I want to take it a little further. It is desirable that those people who are human beings with family responsibilities and citizenship, should have income ?—It is most desirable.

Under the present system of banking there is no method whereby the bank can meet that position ?—No method whereby the bank can, but it is really not a bank matter.

No. It is outside their sphere ?—As you know the banks are at least as anxious as any individual to see the suffering caused by the depression cured forever, but they cannot give what they owe to other people to help. For instance, if they said, "We will give £10,000 to the unemployed. We will issue that credit," that would mean the people to whom the banks are trustees are finding money taken out of their pockets for another purpose. The banks have no right to do that. Their duty and the basis of their confidence is in safeguarding the interests of those to whom they are under an obligation, and they could not depart from that; and it would not benefit the country if they did, because the moment they started doing that the confidence would fall away, and it is the confidence that they depend on.

But it would be quite possible for the State to go and pledge the security of the nation and say, "We want £10,000,000, or £20,000,000, or £30,000,000 and we are going to do it that way." And the bank would not question it ?—No. If the State does it the State says, "We are going to issue more money and in doing that we must lower the value to a certain extent, and we give our money claims on the bank by making it legal tender." That means the State says, "What belongs to some-

body else is now going to belong to us." And the State has the power to do that, but the banks have not got the power.

You admit that it is desirable that there should be some means whereby profits should be distributed amongst the people ?—I admit that it is desirable that everybody should have an income.

But that the State is the only authority that can do that ?—The only authority that can give the people that.

It is not in the interests of the banks to do that to-day—outside of their sphere of operations altogether ?—The banks cannot make money available without due regard to repayment.

If we wanted to remedy the position in New Zealand we have either to have some form of finance whereby the Government can make arrangements with the banks to provide the necessary money to meet the position, or we must establish a State Bank ?—I would not go as far as that. The position has to be met in some way. If those people who have no money and the services they have to offer are not wanted they must, for State reasons, be supported or helped in some way, and this is done at the expense of the other people.

Mr. Holland.] Is it a monetary problem ?—It is largely a State and fiscal problem. If the money belongs to some of the people and it is wanted to help others it must be got by some means of taxation.

Mr. Langstone.] If I want my house painted, and if I have no income I cannot get it painted. There is an ample supply of paint and painters and yet the painters are idle. The work is available and the workers are there, and therefore there must be some lag in the monetary factor to bring them together to get the work done ?—Money is available. Money has a definite relationship to tangible assets, and it is only because of a lack of tangible assets that the money is not there.

But your tangible assets to-day in New Zealand are as great as they were in 1929 ?—Yes.

You have had £80,000,000 less in circulation since then ?—Although physically the assets look just as good, the rest of the world does not want what those assets produce to the same extent as formerly, and therefore the assets fall in value.

But the people want these things that are produced. You cannot say that the people go hungry or ill clad by choice ?—No.

Who is to deal with the ordinary working-people outside of the banking sphere ? They do not interfere with the value of the exchange-rates, and the relation of money, &c. ?—We are talking about New Zealand. The New Zealand position is dependent to a large extent on the income derived from the selling of our produce overseas ?

What proportion ?—About 60 per cent.

Forty per cent., I think ?—I think it is about 60.

The exports of our total production is 39·1 per cent. of our total production ?—If you leave buildings, &c., out of it. You would not exclude money spent on building bridges, &c. I believe 60 per cent. is the portion exportable. I do not know whether I can get more exact information.

But the bridges are wealth just the same ?—I thought you were referring to the production of our produce exported.

Out income from overseas exports is about 40 per cent. of our total production ?—What about splitting the difference and calling it 50 per cent.

Then a fall in the overseas prices would affect only 40 per cent. and not the whole lot ?—Well, there again it is hard to say, because the goods we export have, more or less, a world market, and that means that if butter rises in the United States sufficiently high to make it effectively possible to export there we would do so.

I noticed the other day that butter in Berlin was 183s., per hundredweight, in London 70s., and in Paris 238s., all on the one day ?—All the same sort of butter ? I have not seen the figures.

A Member.] That is due to internal arrangements or protection ?—I could easily see how that operated. When the price falls overseas our income is less, and if that is so the price we are willing to pay here is less.

Mr. Langstone.] But that is made worse by this factor: The London price falls, and then the Government revenue falls, because it gets less in the way of income and Customs taxation, and if extra Customs and sales taxation is imposed to get more revenue in, you double the fall. The income has fallen and the price has risen, and it has a double effect ?—Yes.

Do you think that linking our prices with the overseas level in London, for instance, has been a rank failure ?—I do not think there is any conscious policy of meeting overseas prices. If we are only paid a certain amount that inevitably has that effect.

We have entered into obligations, the State, the farmers, and everybody else, all at a time when the prices were high ?—Yes.

When the relationship between money and goods alter and when prices fall, reserves of money become more valuable and goods less valuable ?—Yes.

Therefore farmers and others producing find that they cannot meet their commitments ?—Yes.

The food-value of a pound of butter is the same at 6d. as at 1s. 6d. per pound ?—That is the trouble.

Do you not think we could fix an internal price-level that would be free from fluctuations and oscillations in consonance with the overseas prices ?—I do not think that that would work well in practice. If you have stability of incomes on price-levels, you cannot have stability of exchanges.

How would that affect exchanges ? If you had a New Zealand price-level of 1s. 6d. per pound on butter and you exported you would be paid overseas ?—Yes.

You could only use that credit overseas to pay debts ?—Yes.

If the goods coming into New Zealand approximated our internal price-level would not that adjust the position ?—I do not think so. If the price-level falls 150 per cent. overseas, and you pay the same price here on purchasing-power already determined that would mean that the exchange-rate would

go up, and that would mean that instead of paying a debt with 20 lb. of butter you might have to use 40 lb. We would have to produce more.

Our trouble is that the farmer is lacking income ?—But income comes from overseas.

It comes from New Zealand ?—I know what you mean there, but if we send to London all our produce and buy on the London market, it means a great deal what the exchange value of our money is on the London market.

I do not see the difficulty there. The New Zealand farmers are producing more, and yet they have not the income to pay for the things they want ?—On account of a price fall. It is the same thing with the overseas debt. They were contracted in different times when we got a good deal more for our primary produce.

But our overseas debt is a minor matter ?—It is a large factor—£150,000,000 is it not ?

But the annual interest payment is only about £8,000,000, or 10 per cent. of our total production ?—That may be so.

So that only 10 per cent. is involved, and that is not a big thing ?—Perhaps not.

The great difficulty I see is that it is difficult to translate into money form the wealth the farmers produce, and indeed the wealth others produce, to enable us to keep on trading here amongst ourselves. In the last analysis every country consumes all it produces. They exchange goods for goods ?—Yes by exchange. Taking that further we are producing less than we did in value although the physical quantity is more. The goods we want others to consume do not return us the same amount. The goods we want to consume are more difficult to get.

That is reflected in the increased London balances ?—Yes.

They can be utilized there, if necessary, to pay off our national debt there ?—Yes, but even that would be difficult, because these balances were paid for at the rate of £125 for each £100. It would be an expensive method of paying off a debt in that manner.

If the exchange remains as it is, that would still have to be taken into consideration anyhow ?—Yes. It would mean an extra £40,000,000 in terms of New Zealand money to repay the national debt in London.

Mr. Clinkard.] Now, Mr. Fussell, I take it that to provide credit at a cheap rate, it would be necessary to prohibit other competitive parties from paying more than a stipulated amount for deposits ?—I would not like to say, prohibit, exactly, but it would be necessary to induce them either by prohibition or persuasion, no doubt.

Well, induce them, anyhow ?—Yes.

We have heard a lot about the value of the note. I listened attentively and it seemed to me that the case quoted by Mr. Langstone showed that the purchase of the gold would depend entirely on the confidence of the recipient of the note ?—Not entirely, but to a large extent. If it were legal tender he would not have any option of any other form—that is, if he wanted to part with his gold. He would stick to the gold no doubt, if there was not sufficient confidence. The banks have carefully built up that confidence by sound trading. Confidence is the greatest national asset we have.

That confidence is preserved by the legal assets of the banks—that is, by having assets available to back up the notes ?—Yes, and by careful trading, and with due regard to those other factors I have previously mentioned, not to lend unwisely, and not to allow assets to become frozen.

I take it that it is for that purpose that the banks pay interest on fixed deposits, in order that they may hold these assets against liabilities ?—If they do not pay interest and hold deposits they cannot make advances soundly.

If Mr. Langstone's suggestion holds good—and of course in actual effect we know that the banks can issue credit and so on—but if they did that unwisely and issued a considerable amount of currency without assets behind it, would they pay interest on deposits ?—I do not see the connection there.

The suggestion is that the banks can create their own credit out of nothing practically. They can print notes and issue them. If that was freely done would the banks then pay interest on deposits ?—Probably not. The real trouble is that if the banks advance without a proper backing in assets they are not able to pay back the depositors. The deposits are held against these advances.

Is a relationship maintained between the deposit rate and the rate of interest on loans made or notes issued ?—No, there is no definite relationship. The joint ratio is usually endeavoured to be maintained between the deposits as a whole and the advances, and the interest is paid on fixed deposits to bring up the total of deposits. If the banks paid no interest their deposits would not be large enough. There is no fixed relationship between fixed deposits and current account deposits.

But between the total deposits and the titles to goods and services the banks hold ?—Yes.

It is said that owing to some peculiar method of utilization of social credit you can at the present time place the country in a very advantageous position compared with our competitors. Have you a knowledge of the nature of the financial operations mentioned ?—I have not gone into that. I believe that in relation to sterling such currencies as are referred to are considerably depreciated. The lower standard of living in such countries has a bearing on the matter. No doubt, but it is said that although there is a lower standard of living that does not come into the question so much as the method of financing, and that consequently they are in an advantageous position. I would like to hear an authentic view on that contention. I think the general economic position in such cases is reflected in the volume and value of exports, and if there is a premium on exports, naturally exports are encouraged. In Japan, for instance, they are able to make goods cheaper than anywhere else, and if they get a premium on exchange naturally trading is stimulated.

Well, their units of value are smaller than ours.

Hon. Mr. Downie Stewart.] There are violent fluctuations in Japan at the present time ?—I think the yen was worth a fraction over 2s. at one time and is now worth a little over 1s.

Captain Rushworth.] Is it not a fact that the League of Nations has just arranged to send a Committee of observers to find out exactly what they are doing there ?—I do not know.

I have read cables to that effect ?—It will be interesting to see the report.

Mr. Clinkard.] I thought Mr. Fussell would have had some knowledge on the subject. Now, in reference to the cancellation of the note: When the bank issues a £1 note it practically issues a promissory note, just as I would take a book of promissory notes, and if my credit is good these notes will be accepted and if my credit is not good they will not be accepted. That is the principle is it not ?—These two cases are quite analogous.

I take it that before I can get back these notes for cancellation I would have to give value to the extent I received ?—Yes, give value or evidence of value.

And the banks would have to do the same ?—Yes. They have to give evidence of value, and that evidence may be in the form of deposits in the banks.

In the ordinary course of business a note goes out as new and after circulating in business it comes back to the bank from some one else, and the bank is merely custodian for the time being, the note being paid out again to whoever cares to draw the money ?—That is so.

Mr. Lye has referred to acceptability. I would deal with that under the heading of confidence. Confidence behind the drawer is the thing that makes the note acceptable ?—Confidence is the fundamental backing.

For instance, if a man of reputable standing draws a promissory note it is immediately accepted, but if some one of no standing draws a promissory note it is not accepted, and is treated as a piece of waste paper. I have been bitten once or twice like that. There seems to be a confusion of thought as between money and the interchange of goods and services. Supposing we were to divide all those who had nothing to exchange on one side of the street, and those who had something to exchange on the other side of the street, would an increase in the monetary system make any difference to them ?—If money were given to those who had nothing, Yes.

It would have to be given to them either by gift—if we do not care to use the word charity—so that they could obtain the goods from those on the other side of the street who had the goods to sell ?—Yes.

And after the money was exhausted ?—They would be in the same position they were in before.

That thing would have to be repeated ?—Yes.

Our economists say that with our production, the Hottentots would be able to live like millionaires, but the Hottentots must have something to give in exchange ?—Yes.

Would you say that so many people have nothing to give in exchange rather than that they have no money ?—Money is evidence of purchasing-power. I look upon money not as purchasing-power of itself, but as evidence of purchasing-power against which that money has been issued.

And it should reach the holder through some service rendered to the community in other ways ?—Yes.

And an additional quantity would not make any difference ?—An addition in quantity given to those without would enable them to spend that at once, but experience shows that you have to repeat that process.

By there being more money in circulation would not of itself mean that those who had something to exchange would have greater purchasing-power, only that the units being more, more would have to be given—in other words, there would be a rise in prices ?—I would not say that those who did not have anything before would not be better off.

I mean if there was more money in the community ?—You mean, if the banks gave more credit it might affect the position indirectly ? It might affect trade, and more men would be absorbed in employment.

I was referring to the greater volume of money, as it is usually referred to. Such, for instance, as the issue of large numbers of notes ?—If people want them ! You mean if people use more notes ? Several things would have to be taken into consideration. The velocity of circulation could drop to half, and there would be no difference in the actual work done. If more money were in circulation and it did not have work to do, there would be an increase in prices if the money circulated as quickly as before.

And an increase in credit at a low rate of interest might inspire expectation of profit and induce people to enter into different ventures from which they were previously excluded ?—It is such a small margin that if we reduce interest-rates say 2 per cent., and if we get the marginal men in, that would only help him by 2 per cent. on the amount he borrowed. I was reading a book the other day by Paul Einzig, whose view was that a low rate of interest does not have the same effect that some people imagine, because if a venture is going to be profitable, 1 per cent. one way or the other is not going to make much difference.

Of course, the interest-rate is not such a large factor in total production as many people imagine, but it is undoubtedly a factor, particularly if it can be obtained at a reasonable rate and without the fear of a very short period of recall ?—Yes.

Mr. Munro.] Is it a fact that in general practice between the associated banks that one bank will not entertain taking over an account that already has been secured in another bank ?—I do not know of any such arrangement.

Supposing a client of a bank has accumulated security in one bank, I am led to believe that if he goes to another bank they will not take his account even if he provides further security ?—I do not think that is the case.

Are you sure ?—If I were a banker and a man came to me I would give him an account against security even if he had an account with another bank.

The person who I am asking this question for said another bank would not take his account ?—Many people do have accounts with more than one bank.

You give that a flat denial ?—To the best of my knowledge. There may be some reasons which might prevent a bank from giving an account.

There might be some reason in connection with an individual client, but it is not a general practice ?—No.

Mr. Harle: I think you can put it this way: Although the banks act in unison so far as notes and other policies are concerned, amongst themselves there is intensive competition for business.

Mr. Munro: There is nothing in the nature of a ring ?

Mr. Fussell: No.

Mr. Munro.] Captain Rushworth asked you if the Government wanted £50,000,000 and they placed securities in the hands of the banks could the banks raise that £50,000,000 on behalf of the Government, and I think your answer was in the affirmative ?—If the Government gave, for instance, Treasury bills, yes. These is no machinery to bar them doing that, because the Treasury bills themselves form the basis for the issuing of the currency.

I was not talking of inflation. I wanted to get at the method by which the banks would do it. They would simply liquefy those Treasury bills up to the extent of £50,000,000 ?—The Treasury bills are assessed and the banks can perform the function of turning those assets into a form in which they would be spent. In the case of Treasury bills it might be under the heading of Government securities on the one side and they might pay a deposit into the Government's account on the other.

Notwithstanding the fact that approximately to-day the deposit of all the banks must be £50,000,000 ?—Yes. I think it is £61,000,000 at the present time.

Now, the Government wants to raise £50,000,000. The banks could find that money providing the Government would hand over to the banks Treasury bills ?—Yes. The banks could give the Government evidence of the purchasing-power which was inherent in the Treasury bills. The banks do not make purchasing-power, but they could do that. It was done in a general way during the war.

Would that appear in the banks' books—that would increase the deposits on Government security ?—It would increase the Government securities on the assets side and it would increase the deposits on the liability side, or, instead, it might reduce other people's advances.

The total of the deposits in the banks to-day is £61,000,000 ?—Yes.

The Government wishes to raise £61,000,000 in New Zealand by way of issuing Treasury bills to the banks. That is as much money as you have in the whole of your banks ?—That is correct.

It has been put up that the deposits in the banks are simply book entries—they are not real money ?—They are evidences of purchasing-power and they must have the backing of the purchasing-power before they could come into existence. Book entries are the only records which exist of indebtedness of the banks.

Supposing the banks raised that £61,000,000 on behalf of the Government, would that appear in the deposits of the various banks ?—If it was done by the banks discounting the Treasury bills the Government would go to the banks and say, "Here is £61,000,000 of Treasury bills, cannot you discount them ?" The banks would say, "Pay it into our credit account," and you would find Government securities on the asset side and Government deposits on the other side. If it was spent in New Zealand, some of it might not get back into deposit accounts at all—it might go into advance accounts.

It would appear in the first place as a deposit on behalf of the Government and it would increase the general deposits ?—Yes, by £61,000,000.

Notwithstanding the fact that you claim that you always advance only the deposit money in general cash reserves. Really the banks, on those Government securities, would bring into existence another £61,000,000 ?—The banks do not bring it into existence. The purchasing-power is there. The Government has set the purchasing-power, and all the banks have done is not to give advances at all. It is turning purchasing-power into currency.

At the present time could the banks raise that money in that way for the Government at the pure clerical cost ? Would that be inimical to the interest of the bank ?—It is very difficult to say whether it would be inimical. You would have to go to the question of whether it was inimical to the country. I consider that to have suddenly to increase the available currency by £61,000,000 would be damaging to the country at the present time. The shock would be less if it were done over a period of time.

It is a question of how long they are going to spread the expenditure of this money over ?—Yes.

I want to know, Could the banks do it even in a year if it was necessary for the Government to get the money ?—Yes. The banks could do it. In cases of national emergency if has been done.

The banks could charge 4 per cent. to discount ?—Yes. I cannot say what actual amount they would charge, it would be by arrangement with the Government. It would leave them a margin for profits over their costs. For instance, as regards the £61,000,000: On every £100 the banks would be paying tax to the Government and a tax would also be paid on any notes that came into circulation as a result of that.

That is the note-tax you are referring to ?—Yes.

Could the central bank raise that money in the same way as the present banks could do it ?—That is rather a difficult question for me to answer. The trading banks are allowed to use Dominion Government securities as a basis for note-issue. As far as I can remember the Dominion Government securities are not mentioned as the reserves that the central bank must maintain. It would have to get reserves in London.

I ask, Mr. Fussell, if the Government wished to raise £61,000,000 by Treasury bills could the central bank issue notes against it ?

Mr. Ashwin: No. The basis of the Reserve Bank issue is sterling.

Mr. Fussell: Read subclause (*h*), section 13 (1) of the Reserve Bank of New Zealand Act, 1933.

Mr. Munro.] Some people seem to have an idea that the central bank would be able to do exactly the same as the present banks could do on behalf of the Government. You do not think

that the central bank could do that?—Just on that particular thing they might not be able to issue currency on that basis, but I am sure the Reserve Bank will be able to make any arrangements for Government finance that are nationally considered necessary. I do not think the Government or national expenditure will be under any disability because of the establishment of a Reserve Bank.

If a client, say, for instance, myself, went to a bank and gives £1,000 security and gets a £500 advance from the bank does that £500 add to the deposits in the books of the bank?—It may do so, and it may not. For instance, if that £500 was received by you and you paid it into the overdraft account of another man who had an overdraft it would not go on the deposit side at all. On the other hand it may do so.

Supposing I get that £500 my security goes into the bank?—Yes.

I open an account for £500. My £500 advance would appear in the bank's books as a deposit, and that would be added to the total?—Yes. First, the overdraft might be £1 and you gradually draw more and as that money was put into circulation it might reduce an overdraft in another account. The bank gives you a claim on the bank. By exercising that claim you do not destroy it, you transfer it to somebody else.

Mr. Massey.] From time to time this question of costless credit has been presented to this Committee. Could you define costless credit?—No. I do not know of any costless credit. As a matter of fact, it must cost somebody something. If it is given by way of loan it is somebody's debt and somebody's credit, and whoever possesses it has to pay in taxation and the person who gets it has to pay interest.

Then, in your opinion, there is no such thing as costless credit?—If I lend you £5 without any interest it would not be costing you anything, but it would be costing me something.

Then it is bound to cost the country something?—Yes.

Again, the question has been raised and it has been pointed out that the banks of New Zealand are in the happy position of being able to make profits. It has been asserted that the banks could make profits out of the manufacturers' money. Is that correct?—No. That is entirely different from my conception of the thing. What the banks do is to convert purchasing-power into evidences of that same purchasing-power. You must have the value first.

Mr. Clinkard.] Put it into a liquid form?—That is what they do.

Mr. Massey.] A question has been raised in connection with £400,000 being borrowed from the Bank of New Zealand for the Government to be relent to the Intermediate Credit Board. Could you tell this Committee how that money is arranged?—I believe that money was not arranged by discounting Treasury bills, but by the Government hypothecating securities to the bank in the same way as a farmer might do. Mr. Shaw tells me it was a straight-out purchase, that would be the same as discounting the Treasury bills at the present time. The purchasing-power is handed to the bank and the bank turns that purchasing-power into evidences of purchasing-power or currency, and makes it available to the Government.

Then it would not be purely a question of book-keeping?—No, but book-keeping had to record the transaction.

Mr. Lye.] In the Prime Minister's office there is a Treasury bill typed out and signed by the Prime Minister and also by an officer of the Treasury, and it is handed in to the banks. The banks discount it, giving the Government the cash they require. Is the security behind this Bill the taxable capacity of the people and the authority of the State to levy taxation?—That is my conception of it, and it is a first charge on the revenue.

Mr. Massey.] You state that the banks endeavour to keep a certain ratio of advances to deposits. The figures over the last twenty years show that there is no constant ratio. Sometimes advances are ahead and sometimes deposits?—There is no constant ratio. There is no fixed figure.

Dr. Sutch.] What is the ratio you aim at?—If I myself were a banker, I would aim to have the advances round about 90 per cent. or slightly more of total deposits.

That only occurs by chance?—Yes.

Mr. Massey.] What is the average over the period of, say, the last ten years?—I could not say that without working it out—but between 80 per cent. and 90 per cent.

Could you work it out and let me have it?—Yes, I could do that.

What proportion of long-term lending is done by the banks?—That is another very difficult thing to say. As you no doubt know, the general principle of bank advances (I am not talking about long-term mortgage advances) is that they are repayable on demand. This right, of course, is not exercised by banks if they can possibly avoid it; but it is no good denying that at the present time a certain amount of the advances is on a long-term basis, because they have been in existence for a fair while and to a certain extent are protected by moratoriums, and they are not in fact called up, and probably could not be paid on the mark by the borrowers. But I could not say to what extent the farmers could not by realization buy back their advances at the present time. If there was a forced sale on a large scale, you can quite imagine that the prices realized would not be a fair market value.

I presume the commercial banks find that they can make more profits out of financing commercial institutions?—That would be rather an invidious thing to say, because it implies we rock the interest more hardly into commercial concerns, whereas we try to give every one a fair and favourable rate.

Could you give figures showing how much money commercial banks have lent out on long-term mortgage during the last ten years?—Only the Bank of New Zealand lends money on long-term mortgage, and the lack of demand seems to indicate that it is not desired by the farming community in that form.

Lack of demand?—Lack of effective demand, shall we say?

Mr. Langstone.] Or lack of security?—That would of course come into it. Mr. Shaw could probably say why the long-term mortgage department results have been disappointing. I read in the balance-sheet a few years ago that they had not lent a great deal out against broad acres during the past year on account of the lack of demand.

Mr. Shaw: I think most farmers prefer an overdraft, if they are working on a fluctuating account.

Mr. Langstone: That is not the point. I am trying to find out about the amount of money the banks have lent out on long-term mortgage.

Mr. Fussell: The only way to find out how much of the mortgages that exist now should be classed as long-term would be to carefully study each account and each security, and to assume how much of that mortgage the farmer could pay back if called upon within, say, a year. It could only be an estimate. None of the mortgages are lent out on long-term mortgage.

Mr. Langstone.] Except by the Bank of New Zealand?—If you go to the bank and say, "Lend me £500 for four years at 5 per cent." the bank will say, "You will have to go to a long-term mortgage department."

Mr. Clinkard: Did not the Bank of New Zealand set aside a particular sum of money to lend in that particular way?

Mr. Shaw: Funds were provided by a special issue of capital.

Mr. Clinkard.] It was not very generally taken up?—It has been rather disappointing, on the whole.

Mr. Fussell: Financing by overdraft is an advantage to the borrower, because he can get the benefit of the day-to-day fluctuations. If he pays in £10 in one day, the interest goes down immediately, but on a fixed mortgage the interest goes on all the time.

Mr. J. N. Massey.] You only lend on demand, and the demand can be made at any moment?—That is the basis. The bank's first duty is to the note-holders and the depositors, and if you have tied up your advances, the note-holders and depositors may ask how you are going to pay them. The depositors do not come on us for the full amount, because they have confidence in us, and we do not come on to the holders of overdrafts because we have confidence in the securities, and we realize that would only precipitate a crisis at the time when it is the last thing that is wanted.

Could Mr. Shaw tell us the amount of money the Bank of New Zealand has lent on long-term mortgage?

The Chairman: I think that question was replied to by Mr. Shaw this morning, Mr. Massey.

Mr. Shaw: Yes, £1,100,000.

Mr. J. N. Massey.] What proportion of losses do your accounts show?—I am afraid I could not answer that; it has not come under my notice. You mean on the long-term accounts?

Yes. Would it be reasonable to ask you to supply a statement to the Committee on that point?—I shall be quite prepared to arrange it, provided my general manager is agreeable.

Thank you. In connection with commercial concerns, do the banks do any investment business apart from the overdraft?

Mr. Fussell: In what way? In the system they have in Germany where the banks engage in trade? What you mean, I think, is do the banks act as a sort of holding company?

Mr. J. N. Massey.] Yes?—No, they do not do that.

Dr. Sutch.] Do they ever underwrite share flotation?—Not to my knowledge. I have not heard of any case where it has been underwritten.

Mr. Schramm.] Gold was referred to this morning. You say it was not a fair price to pay for the gold, the price set out in the Reserve Bank Act of New Zealand?—I did not say that; nothing like that was mentioned. While the matter is *sub judice* I would not like to say anything that would embarrass either side.

The notes that are issued to-day by the banks are really inconvertible note-issue?—In a sense. They are not convertible into gold, but into sterling. Legally they are inconvertible, but you can buy sterling.

Captain Rushworth.] You can buy gold too?—Yes.

Mr. Schramm.] They are pronounced to be legal tender and you have got to accept them. If a man came along with one hundred bank-notes, you would have to take them?—Yes.

You would have to accept them in payment?—Yes.

I put it to you that it does not matter whether they are inconvertible bank-notes or convertible?—If it were convertible into gold the fact that it was legal tender would not matter at all, because you can change it into gold. If they were convertible but legal tender, there would be no hardship on any one. I do not consider there is any hardship at the present time, because it is for the benefit of the country that they are legal tender.

But the State has to put through an amendment to the law to that effect to assist the banks?—To assist themselves. They use the banks to assist themselves.

And to help the banks?—Yes. It is quite clear that it was necessary for the efficient carrying-on of the banking business, but the object was to help the country.

That was the point I was coming to. To efficiently function, all banks must have at some time or other behind them the assistance of the Government?—I think that has been the experience. I do not say no bank could satisfactorily function without the Government behind it, but every bank is circumscribed with banking legislation, and the general experience of the world has been that it is necessary that the banks should have the Government behind them in some way or other.

If all the banks were owned and controlled by the Government, you officials, who have competence and ability, would not lose any of your competence or ability?—No, but that, of course, is not the objection. I do not think any one would argue against nationalization of the bank on the ground that it was not built for the education of bank clerks.

Bank clerks would be just as good, and would do their best under either system ?—Yes. In my own opinion, the difficulty I see in nationalization is that it would not confer the benefit on the country that was hoped. Banking operations and bank-running are so complicated and so technical that they cannot be reduced to the rules and regulations that would make them suitable for public service. As you know, those services and businesses which can be reduced to rules and regulations are most suitable for nationalization. Banking is not like that; it is a highly skilled sort of business, and depends on traditional knowledge that has been built up over many years. In England the banking system is supposed to be the best in the world, and the envy of the world, yet there is no place where there is so little legislation. England looks to the bankers as a sound race of men. In America they are far more circumscribed in their operations, and it seems to have a hampering effect. Mr. Ramsay Macdonald, in the election campaign in 1931, was asked whether he proposed to nationalize the Bank of England, and he mentioned then that, if that was brought forward to solve the difficulties or the position at the time, people would be so frightened that there would be no bank left to nationalize. That was the Labour Prime Minister.

Mr. Schramm.] Not in 1931; he was then an ex Prime Minister ?—Do you know the date when he left them ?

Just before that; about September, say ?—The election was in October and this was reported in the *Times* of 14th October. That was his view and probably sound.

I prefer to accept the views expressed some time before that in his book, where he believes that the State should control the banking system ?—Of course, the State is behind the Bank of England, which is not at variance with the State at all, but probably his considered opinion was the better one.

You were talking this morning about the cheque system. That is a very important part of banking ?—It has been said that if the cheque system had not been evolved it would have been very much more difficult for the economic progress of Britain to take place, though I will admit that the use of bank-notes on a much larger scale may be done, as in France where the cheque system is not nearly so common.

Of course, some people do not even understand the cheque system. As a matter of fact, when cheques are issued they are not accepted by prudent business people unless they are known ?—Quite correct. I could not pass in my own cheque here; they would not take it.

It has often been stated that the depositors in the Post Office Savings-bank should have the right to issue cheques; what is you opinion of that ?—I have not thought it out, but it is one of the practices of the Post Office Savings-bank that deposits are not withdrawable by cheque, and I think it is useful for this reason: It is harder to get the money out, and therefore it is more likely to be saved. When I was a lad in the country and had a Savings-bank account, it was too much bother to get the money out; I had to go to the Savings-bank, and wait for a couple of days before I got the money. In most cases I would not bother spending it. Had I had a cheque-book, I would have done so.

It would increase the cost of running the Savings-bank ?—Yes, I think it would.

You would have to have special staff ?—They seem to have a very efficient system for the working on the present basis. It is just as well, too, because the money is not put in for the same purpose as in an ordinary bank, for current expenses, and anything that would encourage people to save should, I think, be left. But I do not think it would be vastly unsound if they had cheques.

Mr. Langstone.] If you could not spend your money because it was a little bit of trouble to get it out of the bank, it would not suit the man who sells the goods ?—If you really wanted anything, you would get the money for it.

Mr. Schramm.] From the point of view of efficiency and cost ?—It is more efficient on the present basis.

There is not the slightest doubt in your opinion that it would cost the State a great deal more to to run the Post Office Savings-bank ?—With the cheque system ? More than on the present system.

In connection with the power to issue bank-notes under the law as it existed before the Reserve Bank of New Zealand Act was passed, have you compared the powers under the old law and the new law ?—Under the old law, notes themselves could be issued to the extent that Government securities were held and there was no legislative necessity for the gold. Under the Reserve Bank Act they specify certain securities and balances, and say this must constitute the reserves which will be at least 25 per cent. of the bank's note-issue and for demand liabilities; the demand liabilities of the bank that the notes are to be reserved against. You notice the reserve is 25 per cent. instead of 100 per cent. The effect is that the other liabilities make it a sound basis.

But it is not as broad as the other basis ?—It seems rather broader because it combines more.

Government securities do not come into it ?—You do not have to have 100 per cent.; the Reserve Bank will have large sterling reserves.

You think it is a broader basis ?—Yes; it is very hard to say, but it gives more latitude to the extent that you did not have to have reserves of 100 per cent. It includes more. The reserves quoted against the funds of the trading banks includes only notes, but this includes liabilities as well.

Mr. Murdoch.] In connection with the valuations of your properties, what is the fixed period or length of period between the valuations you make of your banking properties ?—I do not think it can be said that banks have a definite periodic one, but they see that the valuations are made at reasonable intervals, and keep a steady watch on the position, but they do not say, "This is the 1st April, we must value the property at so and so to-day." They might not revalue it at all where they know the property very well and are getting the balance-sheets every year and can see the position is sound and the balance is well within the value of the security.

I notice from the returns that the advances to-day are more or less at a low level, while the fixed deposits are at a high level ?—The total deposits also are.

How do you account for it ?—The advances would be higher if people could effectively use the credit. The banks openly say that they want good lending business, for sound purposes, and with due regard

to repayment. That business is not forthcoming. The banks could offer people money, but people will not borrow unless they can use the money to advantage, and as a result of that we find that there is a large gap between the advances and the deposits, and that is caused to a large extent by the discounting of Treasury bills.

Have you any idea whether the drop is in rural securities or in town securities ?—No ; that would require investigation by the banks. I cannot guarantee whether it would be policy to give that information, but if it is available I shall be glad to hand it in.

You discount Treasury bills to the Government at 4 per cent. ?—I do not think it is as low as 4 per cent.

Five per cent. ?—By agreeing to rebate, the rate would be a bit lower.

We are told that the business in England is increasing very largely on account of the fact that there is so much cheap money, from ½ per cent. to ¾ per cent. How can they operate in England at that rate while here for our best securities the rate is 5 per cent.?—In an old country, and a country where there is a short-term money-market, money is very much freer, but if in England they had the same system of banking taxation (I am not saying this as a complaint) as they have here, they could not do it, because they would find they would be paying 8s. 9d. on every £100 of their assets and liabilities by way of taxation, and that would absorb more than all the interest they got. But the reason is that, with the supply of money in the hands of the banks, they would be getting nothing for it if they did not lend it at a low rate of interest, and they find it better to get that than nothing at all.

It struck me that it might be possible for the banks to give a lower rate of interest ?—I could not say anything about that, but I will say that the banks' expenses in connection with their business are such that I do not see how they can do it. I personally believe it is as low as we can reasonably get, and the banks' profits have subsided a lot as a result of the depression. The banks themselves would like to see the rates lower, and would welcome anything that would assist them in that direction.

We often hear that there is no reason why £10,000,000 of costless credit should not be issued. What, in your opinion, would be the effect on the general security of the country, and on the general borrowing-powers of the country (assuming they had to borrow) with the issue of either £10,000,000 or £20,000,000 ?—I cannot understand that there would be any credit that would be costless. If the banks issued that credit, £10,000,000, that would be a debt, that would comprise a debt of the bank ; that would give claims on them for £10,000,000 and if it were costless, why come to the banks ; you could afford to give it yourself. It cannot be done. We will put it, the issue of £10,000,000 of credit ?

Yes ?—If the Government hypothecated or sold securities to the banks to enable them to do that, that would increase the Government internal indebtedness by £10,000,000. The method of spending that would have to justify that debt, because it would have to be repaid. I could not say what effect it would have.

We have a lot of money from overseas. With the issue of further money here we are building up greater liabilities. What effect has that on the lending overseas ?—That comes again to the same thing, because the lending overseas depends upon the confidence in the national credit here. If the Government decided for reasons of its own, quite sufficient reasons, that they would borrow internally another £10,000,000 for public works or other necessary expenditure, I do not think that that would affect the credit overseas as long as the money was soundly spent and provision was made for sound repayment. I do not think that that would be to our detriment overseas at all, as long as we did not behave in a way which would shake the confidence overseas in us. Naturally, if they know that the Government will repay that £10,000,000, they think that the Government will pay our £10,000,000, and they would be willing to lend also.

Mr. Holland.] I would like to know if it is the policy of the trading banks to increase the rate of interest on overdraft when times are bad and to reduce it when times are prosperous ?—No. That is not the policy, so far as it could be said to be a policy. They are anxious in hard times to lower the interest-rate, and in the present hard times you will see they have lowered it from 7½ per cent. to 5 per cent.

But that reduction was under pressure ?—No. I would not say that, because the banks realize that in hard times it is most desirable, and I think that I am right in saying that the banks have suggested to the Government before that the outside rate, the Government over-the-counter rate and the Post Office Savings-bank rate, should come down. Let them lower their deposit rates to pave the way for lowering advance rates. I think that suggestion has been made from the banks, and so the general policy in hard times is to make things easier for their customers.

The banks mark various accounts first-class, second-class, and third-class, and, it may be only gossip, but it is common talk that the banks, in order to charge a higher rate of interest on overdrafts have shifted those accounts from first-class to second-class and in some cases to third-class ?—I will guarantee that that is not the case. I am absolutely sure of it.

I am glad to have your assurance of that. Suppose I have a property which is valued at say, £8,000, and I have £500 on fixed deposit in the bank, and I require temporary accommodation for, say, £200, for a short period—two or three months. Can you imagine any bank refusing to give me that accommodation ?—I could not. I know for certain in our own bank they would be very glad to give you the accommodation, and I know, from speaking with members of other banks, that they are the same. Banks usually do all they can to meet their customers. If you have a fixed deposit and you want temporary accommodation you get it, and, moreover, the banks make it favourable for you in that they do not charge you more interest on the advance than you are getting on the deposit. If you are receiving £20 interest on your fixed deposit they will not charge you £21

on whatever you borrow against that. So that they facilitate it for the customer as far as possible, though technically, of course, it is better to finance in other ways, but the banks always meet the customers.

That has been done, though, a good many years ago. They have declined the advance against fixed deposit?—Of course, I do not know of any such case, and I can only speak from what my experience has been. It seems hardly possible to me that they would do so.

Mr. Harle: I know of no experience in my twenty-nine years where such a thing has happened in my institution.

Mr. Murdoch.] What bank do you represent?—The Union.

Mr. Fussell: I do not know what other reasons there might be.

Mr. Murdoch.] I deal with the Union and I have not had such an experience; but a brother of mine was saving up to buy a farm and he had a fixed deposit in the bank and before the deposit matured he tried to get an advance to pay a deposit on his farm and they would not grant it?—But in the banks' regulations there are specific provisions made whereby that can be done. It is down in black and white. He might have tried to break the deposit.

He offered to sacrifice the interest that was due?—I do not know about that. I have known cases where deposits have been broken. For instance, if you had a fixed deposit and you were going away unexpectedly and wanted the money the bank would break the deposit for you.

Mr. Clinkard.] I have known that to be done by the Colonial Bank in Australia, but they charge you in that case?—If he had a two years' deposit at 2 per cent., say, and he broke it after three months he would be paid a different percentage on the three months' rate.

Mr. Holland.] But they do break it?—Yes. As a matter of grace, but not as a matter of right. They can do whichever you like. They would advance against it. You have got the security. They will advance against another bank's fixed deposit, which is a gilt-edged security, so if they advance against another bank's they advance against their own also.

Do you think it would be wise policy that when times are very prosperous and there is a tendency for reckless speculation for the banks to increase their rate on accommodation?—That is a politic matter. It would be rather hard for me to say anything about it, because why should people who are trading soundly have to pay a higher rate because some people want to speculate. I think the best way is for the banks to look into the business and if the business is good business for advancing they make the advance, but if it is not good business or suitable for banking, they just decline it.

When butterfat was 2s. 6d. a pound there was a big tendency to buy land at extraordinary prices, and if the rate had been increased it would have acted as a deterrent?—Only to a small extent, I think, because they were all the time banking on a rise. They would think that whatever they paid in interest they would be able to pass on to the next man. "The market is going up and I will make a profit whatever happens." So it would be very hard to stop the speculator by adding another 1 per cent. or ½ per cent.

Captain Rushworth.] When you were here before you elected to answer certain questions in writing. Did you produce those?—They will be handed in with the transcript of the evidence, and will be available very shortly.

They are not available to-day?—No.

So that we cannot ask you any questions on them?—I should not think so.

Under the law as it exists to-day, the banks, in collaboration with the Government, can issue any amount of money. Is that right?—They can do so. If they were subjected to force, which I do not think they would be, they might have to issue it unsoundly, but given the security of the State they can transfer the value received.

That is not the question. The question is, in collaboration with the Government, is there any limit to the amount of money they can issue?—No. Because the Government could enable them to issue what the Government demanded.

So that, if there were a run on the banks, so long as the Government issued public securities, the banks could issue any calls upon them for cash?—Subject to the legislation being amended, of course, if necessary.

What legislation?—Legislation about note-isues.

What legislation?—The legislation that note-issues must not exceed the gold and public securities.

But we can eliminate those, can we not?—You mean by handing over the securities against the notes.

Yes?—Yes. They could do that. I would have to think over it to see whether it would cause dislocations later on, but if the Government required it and the banks co-operate they could issue notes against the Government securities to any extent.

Dr. Sutch.] There would still have to be one-third of gold?—Not under the suspended legislation.

Captain Rushworth.] That is my whole point?—I would like you to know that in saying they could do it I did not mean to imply that they could do it soundly.

We are taking an exceptional point, the point of a run on all of the six associated banks. It is an impossible situation, of course?—Yes. If it were done the Government could provide means whereby the banks could issue notes to the full extent of the demands made on them.

In other words, to the full extent of the deposits, so that it would be possible for the banks to meet the whole of their depositors without calling in one single advance?—Yes. They could do so with the Government's collaboration.

Yes. That is the point. The question of depreciating bank premises was mentioned. By depreciating the value of bank premises are you not creating a frozen asset?—No. I do not think so. In what way would you say it would be frozen?

Well, it is an asset is it not?—Yes.

And it is demonetized, otherwise frozen ?—No. I would not call an asset that is not expressed in the balance-sheet as frozen.

If you have bank premises that cost £400,000 and you gradually depreciate them until there is nothing there at all, is that not a frozen asset ?—No. Because by writing them down you create a fund for replacement.

Do you create a fund ? What happens when you depreciate ?—When you write down the value ?

Yes ?—I consider that creates a fund or builds up a fund from which it can be replaced.

Your physical assets remain the same, but your money assets are depreciated by the extent of the depreciation obviously.—Certainly. The asset does not appear as money.

Mr. Ashwin.] Possibly it would be written out of your profit and loss account, and you would pay that much less in dividend ?—That is what is done. The profits for the year are allocated towards creating a fund. As far as the country is concerned it would not make any difference if the banks built up a fund on the other side of the balance-sheet. That is my opinion.

Captain Rushworth.] You say the banks have plenty of money available and they want to get it out. Why is it that everybody seems to be experiencing the banks insisting upon a reduction of the overdrafts ?—I do not know that that is the case, but I know that the banks are anxious to extend credit to sound businesses.

Are they not reducing overdrafts ?—Overdrafts are certainly coming down, but the banks wish them to expand. But if in individual cases the bank ask for a reduction it means that the security is such that the advance is not safe.

Is that not the general practice at the present time ?—No. I do not think so. Only in cases where the security is not adequate.

Is that not general ?—I do not think so.

Have not securities been falling in every section of the community ?—Yes. But the banks make an allowance for that in granting the advance.

Mr. Ashwin.] It is a fact, of course, that the present fall in advances is really due to the excess of exports over imports. In other words, there is not a volume of imports ?—Yes. To a certain extent, the cause which creates an excess of exports over imports is the same one that causes the fall in advances.

Mr. Langstone.] Has that not been countermanded by the issue of Treasury bills against that ? I do not know what you mean by countermanded, but it has been offset.

Captain Rushworth.] The question was raised as to how the banks pay for gold—that is by notes, generally speaking, or the equivalent ?—Yes. They receive the gold and they accept an obligation to the extent of the value of that gold. By buying the gold, however, they have not increased their assets or their net position.

I was just asking how they pay for the gold ?—They might pay for it by notes or they might pay for it by allowing a credit balance, which is the same thing.

Yes. We will not argue about that. The possessors of gold have no option in the matter have they ?—You mean to say if they bring them to the bank ?

No. The possessors of gold have no option in the matter in that they are not allowed to export it themselves ?—There is no prohibition on the export of bullion.

I am talking about ordinary gold ?—Yes. They can export that and they do.

If they want to sell it ?—Yes. They can sell it overseas. The banks sell it on their behalf and give them what they get for it.

And they pay for it by means of these notes. Now, you mentioned that those notes are a debt owed by the banks, but do they owe it ?—The banks owe it to the holders of the notes.

And how do they redeem it ?—At the present time they are not called upon by law to redeem it in any way.

How do they redeem it now, to-day ?—They do not redeem the notes to-day, because the notes cannot be presented for redemption under the Act.

You mean you have a debt that you cannot liquidate. You are bankrupt then ?—No. We are not bankrupt. The banks could liquidate them.

How ?—By gradually repaying some of the deposits and then calling up some of the advances.

But if I have a pound-note and I call upon you to redeem it how can you redeem it ?—The notes are inconvertible. That is the principle at the present time. A note is inconvertible, but if the country as a whole, for some unknown reason, desired physical redemption of the notes, considering that, after all, they can only get from the banks what they can get without going to the banks for it, that means physical property, they can buy physical things with the notes, and the banks cannot give them anything more, and the only way the banks can give that to the depositors is to liquidate.

But that does not get away from the point that you said that the notes are a debt owed by the banks ?—Yes. They are a debt owed by the banks.

To the holders of the notes ?—Yes.

Well, what does the debt consist of ?—A debt is an obligation to pay, which they are not called to redeem in physical assets, any more than the holders of advances, people who are indebted to the bank.

Can they redeem those notes in any other way than by issuing other notes ?—I have told you that they can physically redeem them by calling up advances and handing over the proceeds.

You have already agreed that it need not be necessary to call in a single advance to meet all the calls upon them ?—But the banks do not do that in that case. All they have done is to purchase Government securities and to give the Government a deposit.

Yes. There is a difference between a deposit and a note. We are not talking of deposits at the moment. We are talking of notes, and your claim that a note is a debt due by the bank is a matter

that requires further consideration?—It is a debt due by the bank and you mentioned the case of whether they could repay the depositors in notes if the Government authorized them to do so. I say, "Yes. But those notes are still a debt of the bank. They have not repaid their debts."

The depositors do not come into the question. The possessors of the notes, whether they deposit or otherwise, have a claim on the bank?—Yes. They have a claim on the bank.

What can they claim?—They can claim evidence of purchasing-power.

They cannot claim anything more than they have got?—The idea of currency is not to go to the bank and get from it something that a bank does not supply, but which the bank will enable you to supply.

I think the difference between us is this, that you are dealing in shadows and I am considering realities?—I think the reverse is the case.

It is quite obvious that the notes are representative of things that the community can supply—goods and services. The goods and services are realities, but what the bank supplies is only the shadow of those realities?—It is not. It is the evidence of those realities.

Yes. Evidence, that is all. You do not supply the commodities themselves, so that you cannot redeem them in commodities?—That is not the case. If the bank's business was washed up, they would collect the debts due to them and they would pay the debts due by them, but that would not be in the interests of the country, and the Government, realizing that that is not in the interests of the country, have made notes legal tender.

And in making them legal tender they have removed any suggestion of debt by the bank to the community?—No. They have not.

Because the bank cannot, by the very nature of things, render anything to the community in exchange for the notes that they have issued?—You will remember that when notes are made legal tender they are made legal tender for a limited time, so as to remove any idea of debt.

For a limited time. But that time has been extended time and time again?—Yes. For the benefit of the country.

Or for the banks. It is immaterial?—I can say that it is to the benefit of the banks as banking institutions. The banks are part of the country, but I read that an English banker said that so low is the profit that the banks make on such business, that it would pay them to call up all their advances and repay all their deposits, and then to take their net assets left over and invest them in Government securities. They would make more money. So they are performing a valuable service, and the idea of having the notes legal tender I submit to you, that if you were Minister of Finance you would not suggest that the legal-tender quality be taken away from those notes.

That opens up a vista. If I were Minister of Finance I would have a fiduciary inquiry into the money system to start with. But money that is issued by the banks; you have laid great stress on the fact that that is out on loan and must be repaid. Originally, when all money was metallic, before the introduction of paper money, the money was coined at the mint and was put into permanent circulation, not as a loan. Is that right?—That does not get away from the idea of loans. Loans were probably as frequent then as they are now.

Possibly, but money generally was started in circulation not as a loan?—No. It is quite possible that the money did not enter circulation as a loan, but, of course, it was hoarded and kept out of circulation.

Yes. But the essential point is that in those days money started not as a loan and to-day it does start as a loan?—Yes. That is a fair enough comment. I am saying that the evidences of purchasing-power now start by way of a loan. But I would like to say the reason for that is that the evidences of purchasing-power at the present time are evidences of purchasing-power that exists. The purchasing-power exists and it is turned into evidences of that purchasing-power, and that is a wonderful service to humanity that that has been able to happen. If it were not, I should say most of us would never have been alive at all.

That is perfectly true, but at the same time it seems evident that those evidences of purchasing-power have got into the wrong box somehow. That is what we are trying to get at?—We will have to agree to differ there.

Naturally. I am representing the submerged tenth. You are representing the people on the box seat?—In other words, I am representing the majority.

That is a matter of opinion too?—You said you represented the submerged tenth. I submit that nine-tenths is more than one-tenth. So I represent the majority.

Not necessarily.

Mr. Langstone.] Nine-tenths have not got money in the bank?—I agree with you there.

Captain Rushworth.] Perhaps you can explain this—just a little local thing, but it illustrates the point: I was in Canterbury some time ago and they had at that time a great glut of potatoes, but no timber and no coal. I went across to Westland and as soon as I got over the ranges there were stacks of timber and a plentitude of coal, but no potatoes, and I made inquiries. I said, "Why do you not exchange your coal and timber here for the glut of potatoes they have in Canterbury?" Although there was a train running each way each day it could not be done, because there was no money. That was the explanation given. The potato-growers could not accept timber and coal, because they had to pay mortgage interests and county rates and things of that sort in money. Similarly with the coal and timber people. They had to have money to pay their debts?—I do not think that is a proper explanation. If they wanted the potatoes they could have accepted potatoes in exchange for the timber.

That is the point. The people who owned the timber and coal did not want the potatoes and *vice versa*?—Well, that is all right. If they do not want them you cannot make them exchange them.

But if the money had been available the exchange could have been effected ?—I do not think so. If the people did not want to exchange on an exchange basis, they would not have done it for money.

You have no other explanation to offer ?—No. I would say that if the people who have got the potatoes will not exchange them for the timber, there is the reason why the exchange does not take place.

Is that not an epitome of just what is happening all over the world to-day ?—To a very large extent. Those who want purchasing-power have nothing to give in exchange for it.

Mr. Murdoch asked what the effect would be if we increased the money in circulation here. The general idea was that it would cause a dilution of the money system and an increase in prices. The question of confidence was brought into it, but, generally speaking, if you increase the money-supply here would that not tend to increase prices generally all round ?—There is a tendency for increasing the monetary supply to increase prices, but I would like to say that there is a sort of Economic Committee overseas that looked into the question, and they said that although a rise in prices may be held to be advantageous, a rise in prices can only be a benefit to the country when it is accompanied by confidence and not by fear.

Never mind how it comes about. Would not that rise in prices cause an increase in value of assets ?—No. I do not see that; that is a different thing, because the increase in the value expressed in currency might be only a measure of the depreciation of the currency. Or put it this way: It would increase the money value of the assets if the prices go up.

If the money value of the assets of this country were going up do you not think overseas investors would strive to put their money into those properties ?—I could not say that, because so many other things come into it.

But has that not been the general effect throughout the world ?—Overseas investors have been investing in New Zealand. Yes. And I do believe that if New Zealand wished to float a further loan on the London market that we would probably be able to do so. That means that people would be willing to invest in New Zealand.

You think that would be sound ?—I do not say that. We would have to go into the whole question. Only the experts dealing with it would know just how the money could be spent and what use could be made of it.

Supposing, instead of floating another loan, the Government achieved the same thing here in New Zealand by issuing their own money. We will call it a special Treasury issue ?—The same as in Canada, shall we say ? There is a Dominion note-issue there.

Or as they did in Great Britain during the war, an issue of Treasury notes. But what is the fundamental reason why the Government of the country, the State itself, should not issue notes instead of borrowing overseas ?—I do not see any fundamental objection to it because it has been done soundly before, but it lets in a political danger. The people say, "If £10,000,000, why not £100,000,000, and let us all have something ?"

I quite admit there is a political danger, but it seems to me that we are being forced to run the risk of that danger by the very nature of the things that are happening now. We have the reverse situation now ?—In what way do you mean ?

We have a general fall in the price of commodities and a fall in the value of assets ?—Of course, that cannot be said generally; as you know, there has been a most substantial rise of millions of pounds, in wool.

I know, but that is another story altogether, probably due to very special circumstances, possibly due to certain things which we may rue very bitterly ?—The point you are dealing with is that the Government could issue a certain amount of Treasury notes. I could not possibly say that they could not do that, but though I might doubt the wisdom of the policy it has been done and it could be done.

The Government could do that without making much difference ?—I did not say that it would make much difference there, because, by issuing that money they are giving claims on the Government.

If they did that, if they issued their own money instead of borrowing on Treasury bills from the banks, that would be costless to the Government, whereas it is now costing them 5 per cent. ?—I do not think it would be costless to the Government, because they would be giving people claims on the Government which would have to be liquidated some time.

Who by ?—By the Government, by taxation. Unless you can say that they are not going to redeem them at all ever.

Suppose they use that money to pay the Public Service with ?—If it was paid out by the banks, there would be a claim by the banks. The Government has already taken steps to establish a Reserve Bank.

I know, but we are getting off the point. I am dealing with Treasury notes. During the war, Great Britain issued Treasury notes. Did that cost the Government of Great Britain anything ?—I do not think it did. If the Government hands security to the Bank of England to take over the Treasury notes issued——

Are you sure that that is the position ?—I understand that to the extent that the Government has not liquidated the notes, it will still have to do so.

Mr. Ashwin.] There are one or two points I would like clarified, particularly that dealing with the effect in the fall in advances. It is correct that there has been a fall in advances, but there has not been a fall in deposits as a whole ?—That is so.

Is not the fall in advances a reflection of our external position rather than of internal action ?—To a large extent, but I think conditions arising in New Zealand have affected the position. The two effects are from the same cause.

I am dealing with the actual trade balances ?—Well, if an advance were given to the extent of £20,000,000 to purchase surplus London funds, that would wipe out that surplus and bring up advances, and the fact that that has not happened is to a large extent a reflection of the London position. I would say that that is the cause of it. I would also say that not only in respect of our external business, the trading prospects are such that advances business is not sufficiently attractive to potential borrowers to induce them to borrow. I agree, however, that the London position is to a large extent a reflection of a lag of borrowing here. Probably both are due to the same cause.

And not, generally speaking, to the policy of deflation on the part of the banks ?—Certainly not in that connection.

I wanted to know whether this policy was due to the general fall in advances or a reflection of an excess in trade balances ?—The banks view with concern the fact that advances are so low. They would welcome it if you came along with a business proposition and asked for a few million pounds.

If I came along and asked for £100,000, and you gave it to me by way of an advance, that would not narrow down the margin between the deposits and advances ?—I would not say that, but from the trading point of view that comes into it. We are anxious to do business.

I wanted to clarify these points. Now in regard to the issue of notes by the State, when we borrow overseas, what do we borrow ? Economically speaking we borrow in goods ?—And you pay back in goods.

And when we borrow internally are we not taking a larger share of the existing stock for capital purposes ?—Yes. To a large extent yes, but not necessarily, because when loans are issued the Government provides purchasing-power by way of securities which are sold to the banks for the loan, and that is not taking money out of any pockets, physically speaking, although by raising prices that might be an effect.

Does it come to this, that when the Government raises a loan from the banks the stated amount of credit is transferred to the Government and used by the Government for war or for capital purposes, &c. ?—That is so. When a Government loan is taken up by the banks deposits decrease by that action, and the spending of these deposits means that the money goes through the various channels in the usual way.

And to that extent the purchasing-power is not increased, but its purpose is deflected ?—Yes.

Supposing you issued State notes in lieu of borrowing ?—I think that is borrowing.

That is the point: Has it not worked out as a sort of forced loan through the depreciated value of money ?—The Government has the power to do it, and if the Government issues notes that would be a forced loan. The notes might be retired eventually by taxation, and thereby be paid, but that is what it comes to.

The Government secures a loan in the meantime, and is able to pay it back by a tax ?—Yes.

Those are the only points I wished cleared up.

Mr. Lye.] I have two questions arising out of Captain Rushworth's statements about the redemption of notes. I do not think the matter was very clear. I wish to put it this way: If I realize on some of my real wealth, and deposit it in the bank, and in due course I want to draw on my credit established at the bank, I get £1 notes, do I not ?—Yes.

That is a receipt for goods or a claim on wealth, and if I want to change that into some other kind of real wealth I am sure of the acceptability. The acceptability of those notes is made possible by the resources of the bank ?—That is true.

That makes it generally acceptable, and by virtue of the fact that I have this promise issued by the banks, I am able to go anywhere and redeem portion of my wealth deposited with the bank, and I am able to turn it into real wealth that I am short of—I can use it in the open market ?—I look upon currency as a medium. If you have a farm to sell, and you sell it putting the proceeds in the bank, and then later take that money out of the bank and buy a house with it, you are using the money as a medium between the farm and the house. It is another way of exchanging the farm for the house.

The point I wish to make is that the medium that effects the exchange of real wealth between individuals—money—is not real wealth ?—Leaving gold out of the question, currency is not wealth, but evidence of wealth.

Exactly. After I make a deposit in the bank I can draw on the bank and get bank-notes enabling me to purchase requirements or services anywhere because of the general acceptability of the notes issued, backed by the banks' resources ?—I think that is very well put. That is the actual economic position.

Now, I want to pass on to the other questions raised about the coal and the potatoes, and the inability to exchange coal for potatoes. In the final analysis goods pay for goods, and we are really working under a kind of barter system which is facilitated by a medium of exchange or a measure of value commonly called money ?—In the last analysis we are still on the barter system, but we use a sort of middle medium.

The next point is that money is not purchasing-power because we can exchange goods and services freely—but not so conveniently—and still have purchasing-power without money ?—I firmly believe that money or currency is not purchasing-power, but evidence of purchasing-power, which must be there before it can be expressed in terms of money.

Therefore to increase the volume of money whether by bank-notes or otherwise does not mean that we are going to have a superabundance, or an increase in the ability of the people to exchange real wealth ?—It does not increase the purchasing-power of the people as a whole, although if you give it away it would.

You would not agree that the unemployed men are suffering because of a chronic shortage of purchasing-power, rather than that he has nothing to sell that some one else wants ?—I think it is not a case of chronic shortage of purchasing-power, but that his services are not in demand by some one else.

Then before he can get purchasing-power he must be in profitable employment which will enable him to get the necessaries of life in exchange for his labour ?—He must be necessary to some one else in some way or another, or have something necessary to some one else.

The mere addition of currency would not overcome the unemployment question ?—I firmly believe it would not.

Mr. Langstone : Unless it was issued to the unemployed ?

Mr. Lye.] That would only be when the unemployed were unable to give something in return ?—If you give money to the unemployed it would mean the same thing as taxation. I am personally very sympathetic indeed with the unemployed, and I do not think the sacrifices made by the rest of the community are at all out of the way.

The capacity of an individual to exchange real wealth for real wealth is purchasing-power ?—Yes.

One cannot get something for nothing ?—No.

To sum up the position of the unemployed is that these men, through one cause or another, have nothing to sell that other people want, therefore they have no purchasing-power ?—I would rather put it this way : That he has nothing to sell, whether by goods or services, that anybody else has a more effective demand for.

There is any amount of work to be done, and there is the labour available to do this work. The people have not the wherewithal to pay for the work to be done ?—There is a shortage of purchasing-power and there is a tremendous amount of deposits. There is purchasing-power somewhere. There is £70,000,000 in free deposits in the country at the present time. That could be spent if desired by the depositors. It would still go round in the usual channels. It does not change hands. That is the trouble.

According to the Macmillan report, 1931, page 136, we see that it is the policy of the banks to-day to make credits available at low rates of interest ?—That matter was also mentioned by the Chairman of the Midland Bank, who contended that the way to get out of the trouble was to keep on as we are doing, and make abundant supplies of cheap credit available.

Well, in the Macmillan report, to which I have just referred, we see this passage :—

> Very low rates of discount prevail, it is true, already, but have so far failed to bring about the transfer of money from short-term to long-term loans. The main practical obstacle which we see in the way of resumption of long-term investment is the shortage of acceptable and willing borrowers, for the purpose of new enterprise due to the general unprofitableness of industry.

Now, one of the reasons why industry is unprofitable to-day, apart from the fall in prices, is the high rate of interest charged. According to the Macmillan report, the banking policy is directed now to releasing large credits by inducing people to borrow and invest in industry at a lower rate of interest thereby enabling them to show a profit. The point I am leading up to is that the establishment of a Reserve Bank and the handing-over to that bank of the assets and securities of the associated banks, against which the Reserve Bank will issue notes to the associated banks, will no longer mean that the associated banks will pay a note-tax of 4½ per cent. ?—You mention assets and securities—I do not think they issue notes against the security we hold, unless you refer to the gold. Balances will not be the basis for note-issue.

What will be the basis of the note-issue of the Reserve Bank ?—The associated banks will hand over the gold, and they can also hand over sterling.

Will these be the only sources against which the Reserve Bank will issue notes to enable it to carry on ? Section 17, subsection (2), provides for the following reserves :—

> (*a*) Gold coin and bullion in the unrestricted ownership of the bank :
> (*b*) Sterling exchange, comprising—
> (i) Deposits at the Bank of England :
> (ii) British Treasury bills with an unexpired currency of not more than three months :
> (iii) Bills of exchange payable in London bearing at least two good signatures, with an unexpired currency of not more than three months.
> (*c*) Net gold exchange . . . in the unrestricted ownership of the Bank, if such exchange is on a country the currency of which by law and in fact is convertible on demand at a fixed price into exportable gold. For the purposes of this paragraph the expression "net gold exchange" means—
> (i) Balances standing to the credit of the Bank at the central bank of the country of origin of the currency in question :
> (ii) Bills of exchange payable in a gold currency maturing within three months, and bearing at least two good signatures :
>
> less any liabilities of the Bank in currencies other than New Zealand currency.

You said this morning in answer to a question that it was desirable to bring about a demand for these credits, or to release them and put them into active employment in industry, and it might be difficult to reduce interest-rates because of competitive interests. I gathered that it would be difficult to arrive at an agreement other than by legislation ?—I do not anticipate any difficulty as between Government Departments and the banks. That can be talked over in an amicable way, but there are many others who are interested, and you must have uniformity of policy. I do not think that that could be arranged solely at a round-table conference.

You say that there would be no difficulty so far as the State lending Departments and the Government were concerned ?—I would leave the Government to do what it considered reasonable.

And the other lending institutions are largely financed through the banks ?—Yes. The mere fact of the advances rates being lowered to enable them to lend at lower rates might induce the lowering of deposit rates, and I would like to point out that some of these other financial institutions trade on their own capital without getting accommodation through the banks.

There are very few of them ?—The building societies and to a certain extent stock and station agents and so on.

Would it not be possible if the banks and the State lending institutions reached a common agreement to substantially reduce the rates of interest, to reach a complete agreement between all financial institutions, private and public, to substantially reduce the rate of interest, particularly in

view of the fact that in the last analysis most of the private lending institutions are financed through the banks?—I mentioned this morning that there would be machinery difficulties in the way.

Do you not think that the result would be worth while?—Most certainly, if it could be done.

Taking that question in conjunction with this fact, that the banks will not be paying 4½ per cent. note-tax when the Reserve Bank is in full operation—and neither will the Reserve Bank have to pay that—that should automatically bring about a reduction in the lending-rates should it not?—Yes, but it all depends on whether the trading banks are to benefit in the long-run, because, although the trading banks will not pay the 4½ per cent. on their notes, they have to leave 7 per cent. of their demand liabilities and 3 per cent. of their time liabilities on which they will get no interest or benefit, so that what they get in the way of a benefit in one direction may be curtailed in another.

Would it be discounted in full?—It is hard to say. All these factors would have to be worked out.

Would you suggest that something be put in to clear up that point? I would say, in view of the circumstances I have mentioned, that there is justification for accepting a lower rate of interest as a result of the reduced taxation by virtue of the fact that you are no longer paying the 4½-per-cent. note-tax?—I would be glad to look into that.

And make any suggestions regarding the possibility of reducing taxation further in order to bring down the interest-rate?—I do not say that that will necessarily follow, but I will make any suggestions I probably may. It is probable that an agreement between the Government and the banks about the reduction of interest on deposits—the Government over-the-counter rates, the Savings-bank rates, and other rates—might be effected by negotiation. I think I said this morning that legislation might be necessary, but, thinking the matter over, I am of opinion that if an agreement is made between these two—the Government and the banks—I do not think there would be loss to other institutions who might give more.

Well, that eliminates what might have been a great difficulty?—Yes, I have thought it over; and it seems to me that an agreement between the Government and the banks might give us a workable basis to go on.

After all is said and done, if the rate given by the Public Trust Office for investment in the Common Fund, as well as the rates given by the Government Savings-bank and the private banks for fixed deposits are fixed by negotiation, private competitors would not attract a great deal of business?—Of course, there are certain difficulties, because the banks would go on paying the present rates of interest in respect of existing lodgments.

There is always that difficulty, and it takes time to adjust?—That is so. The banks adhere to the rates of their own free will, even if entitled to reduce the rate they would not take advantage of it, because they feel that they have made a contract and that they will hold to it.

It is possible, then, by agreement to effect a reduction in the rates of interest?—Yes, I believe so; but I would point out that if you reduced fixed-deposit rates by 1 per cent., that would not mean that you would be involved in reducing all interest-rates by the same amount, because the relief from paying 1 per cent., on £30,000,000 on fixed deposits, for instance, is not going to make up for getting so-much less on £56,000,000 on advances and discounts.

One more question arising out of the suggestion placed before the Committee in Auckland, that it is a sound thing in every respect for the State to borrow money for the prosecution of public works, and that the money so borrowed and expended should be free of interest. Do you think that that contention is sound?—Do you mean the Government getting the money from the banks free of interest?

Yes?—The thing would not work out.

Well, issuing it themselves from a national credit authority? It was claimed that it could go on issuing fresh capital for public works and that it would be sound to do so?—I do not think it would be sound. There would be danger of public pressure. People would say that it costs nothing to produce this capital for bridges and roads, and it is only human that the electors should press their parliamentary representatives to get more for their districts. They would be forced to do it; they might be told to issue more or get out. It is a dangerous policy. Once you started it it would be hard to stop.

I presume—being a banker or a banker's representative—that you would say that it was reasonable to charge and accept a small rate of payment for the use or utility value of the money, and also as an insurance against loss?—You mean from the Government?

Yes?—If the Government lends money it is entitled to charge interest, because wherever you lend money there is some loss, and the interest paid has to pay for these losses, and also the risks involved, plus the running and working expenses. The person who gets the money should be able to turn it over at a profit and pay the interest charged.

The Chairman: I think that concludes the examination of the officers representing the associated banks. Mr. Fussell, Mr. Harle, and Mr. Shaw, I should like, on behalf of the Committee, to thank you for your attendance and for the evidence you have given. You have had a pretty lengthy examination, one way and another, and I must congratulate you all on the very ready answers you have given to the questions put to you. I think that, with one or two exceptions, where you preferred time to consider the matter,——

Mr. Fussell: In several cases the information can be secured. It could not be given without looking it up. I am getting some information for Dr. Sutch and others.

The Chairman: Very good. I wish to say that I have been agreeably surprised at the result of the examination of the representatives of the banks. A vast amount of information has been imparted to the Committee. You have given the information freely, and we appreciate that very much indeed. I wish to thank you again for the evidence you have given, and the promptness and readiness of your replies.

Mr. Harle: Mr. Chairman, on behalf of my colleagues and myself, I wish to thank you very much for those kindly remarks, and I ask you to accept our thanks for the very courteous and kindly manner you have listened to us. I thank you.

WELLINGTON, MONDAY, 23RD APRIL, 1934, AT 2.30 P.M.

Statement in Reply by D. O. WILLIAMS to Monetary Committee Questionnaire.

"*Banking and Currency in New Zealand,*" *by A. D. Park and B. C. Ashwin.*

I am in substantial agreement with the opinions and conclusions expressed in this statement. In my opinion it ably sets out the main features of the New Zealand system.

The chief items concerning which I am in doubt or in disagreement are—

(i) *Pages 8 to 9.* Velocity of circulation: The method of computation is not clear to me, and, as the utility of the graph on page 9 depends on the method employed in its preparation, I am not prepared to accept (or reject) it in its present form.

(ii) *Pages 11 to 12.* Recent changes: The statement is made that it would be the duty of the Reserve Bank "to maintain the value of currency by holding the exchange-rates within a swing of approximately 30s. per cent. either way, that being the approximate cost of shipping gold from London to New Zealand and *vice versa.*" This appears incorrect. In the first place, the authors have themselves pointed out that in practice there is no free movement of gold into or out of New Zealand. The so-called "gold points" have no practical application to a sterling-exchange system. The margin of fluctuation round any given par, therefore, will depend on exchange policy and not on the cost of gold transport. Where the movement of gold is of no consequence in the maintenance of an exchange system it would appear perverse to make the cost of its movement the determinant of exchange policy. It is much more logical to recognize the practical unimportance of gold-movement and to rest exchange policy on other considerations. Such considerations are discussed in answer to question 1, 2, and 3, and 12.

(Questions 1, 2, 3, and 12.)

1. *In view of present conditions and the prospective outlook for the next few years, what should be the exchange policy of New Zealand?*

2. *On balance would devaluation at New Zealand £125 to £100 sterling be in the best interests of New Zealand? This question assumes that £125 would be the "normal" exchange-rate about which adjustment might be made if warranted in the future.*

3. *What would be the advantages and disadvantages of lowering the exchange-rate on London from the point of view of (a) the budgetary position, (b) the economic structure of the country?*

12. *Would you favour a rigid exchange-rate with sterling?*

(*a*) These questions are complementary and are best treated in one general answer. It would, in my opinion, be wise to seek a new par of exchange in the vicinity of the rate of £125 New Zealand to £100 sterling. In present conditions and in view of the uncertainty of future prices for our export trade, any substantial lowering of the exchange would involve a gamble with the solvency of primary industries, unless it were possible to provide assistance of another sort to replace the protection now afforded by the exchange. In practice this would mean borrowing internally in order to pay a subsistence dole to farming. I am convinced that the practical difficulties in the way of borrowing money for the purpose of farming subsistence, of allocating it equitably, and of preventing it from leading to undesired overproduction, as well as the danger of alienating still further the English Administration, make the subsidy proposal an unsatisfactory alternative to the exchange device. Even though it may be pointed out (fairly or unfairly) that the exchange device has operated inequitably in that it has conferred benefit on the deserving and undeserving alike, that it has stimulated overproduction, and that it has irritated people overseas, yet it is a much simpler weapon than any subsidy could be, is fairly elastic in both directions, operates most directly on the major source of our national income, and does not pile up unproductive debt for a later operation. In what follows, therefore, I am assuming that exchange policy is to be considered without reference to possible alternative forms of framing relief.

(*b*) Certain apparent advantages would follow upon a lowering of the exchange-rate on London. The money costs of overseas payments for debt charges would be reduced, and to that extent the Budget would be relieved. I suggest, however, that nationally (as distinct from the relatively narrow field of the Financial Statements) there would be no relief. If an economist may be permitted the luxury of going back to simplicities, it is to remark that overseas interest is basically paid in butterfat, meat, wool, apples, and honey. One bale of wool at £10 sterling pays a debt of £10 sterling whether the exchange is £100 New Zealand or £125 New Zealand to £100 sterling. At the traditional par a £10 sterling debt and a £10 bale of wool both mean £10 New Zealand money. At a par of £125 New Zealand to £100 sterling a £10 sterling debt means a £12 10s. New Zealand obligation; but also a £10 bale of wool (sterling) means a £12 10s. New Zealand means of payment. The Minister of Finance taxes the people additionally to meet the additional money costs of the debt; but there is a larger national income in terms of New Zealand money to meet the extra taxation. The incidence both of the larger taxation and the larger national income are indeed altered, and the real as well as the money costs of overseas debt press more heavily on some sections that formerly; but that is a question of expediency and equity which does not affect the validity of the general proposition that nationally the real costs of overseas debt have not even increased by the higher exchange and would not be diminished by a reduction of the exchange. The real costs of the overseas debt have been increased not by a raising of exchange, but by the fall in sterling prices. My conclusion is that the real burden of overseas debts would not be lightened by a reduction in the rate of exchange on London.

(*c*) In the case of internal-debt charges, money costs are unaffected by the exchange-rate; but the real costs are definitely influenced by it. A lowering of the rate of exchange would increase the weight of internal debt. A lower level of money incomes derived from exports sold under a lower exchange-rate would widen the gap between farming receipts and costs and would compel adjustments which would be reflected in a general reduction of money incomes. The fall in the internal price-level would increase the real burden of all fixed debt charges—national, local-body, and private. (See Report of Economic Committee, 1932, pages 30 to 32, for a fuller exposition.) The exchange-rate of £125 New Zealand to £100 sterling has supported internal prices above the level which would have prevailed under any substantially lower rate, and therefore has provided (nationally) some relief from the dead weight of debt. Summed up: The higher exchange adds to the money costs of the external debt but does not increase its real burden; the higher exchange adds nothing to the money costs of internal debt but does decrease its real burden.

(*d*) A lowering of the rate of exchange would stimulate imports in the first instance, and this would swell the Budget. Whether the increased revenue would be maintained would depend, however, on the course of external prices. The cost-price structure of farming would immediately suffer by a lowering of the rate, and unless export prices rose by an amount at least equivalent to the loss of income sustained through exchange reduction the economic distress of farmers would rapidly spread to the rest of the community and prejudice their power to meet direct taxation as well as their power to purchase imported goods. Since there is no valid reason for assuming that lower exchange-rates would cause a rise in external prices, the result on the Budget is unpredictable. If no rise in export prices occurred, revenue from other than imports would be more difficult to collect, and imports would also decline once the loss in farming income began to express itself in diminished buying. My conclusion is that, in our circumstances where national increase and therefore taxable capacity is so sensitively responsive to the course of external prices, a rise in prices should precede any lowering of the rate of exchange.

(*e*) The initial stimulus to imports under a lower exchange would set a limit to further accumulations of exchange funds purchaseable by the Government, but would involve a loss on the amount now held. This loss would be of little economic consequence if rising external prices restored farming and national prosperity; but it would be serious if prices failed to rise and the cost has to be borne by a Budget weakened through the diminished revenue consequent upon a fall in money incomes.

(*f*) A consideration of these various factors convinces me that the Government would be unwise to lower the rate of exchange in the present depressed and obscure circumstances. It might conceivably be justified if it were certain that external prices would rise sufficiently to restore the profit structure of farming. But there is no such certainty. The risks of undermining still further our farming industries while they still remain our major source of income are too great to be assumed. The serious consideration of a proposal to lower the rate should be postponed until either higher external prices or lower internal costs (or both) have definitely restored the profit equilibrium between costs and receipts.

(*g*) It would be wise, I think, to go further than this and definitely devalue our currency at the present rate. I justify this on the grounds—

(i) That it would be unwise to lower the rate:
(ii) That it would be difficult or impossible (politically) to raise the rate:
(iii) That gradual cost adjustments to the present rate have made it an appropriate rate:
(iv) That devaluation would introduce a degree of certainty now lacking from the exchange situation.

In regard to the last point: it is probable that uncertainty as to the future of the rate, combined with an expectation on the part of importers and traders that the rate would fall, has done much to cause the accumulation of credits in London. It has been fully enough stated (but with what authority I cannot say) that a generally cautious policy of importation due to the fear of being caught with large stocks bought at a high rate has prevailed, and that British exporting firms have opened accounts with New Zealand banks rather than pay the costs of transferring money to Britain (see *National Opinion*, 12th April, 1934, p. 7). If this is so, the only apparent explanation would be the hope or expectation of currency appreciation. A definite act of devaluation would therefore remove the incentive to these practices. It would also have the broader effect of minimizing distrust in the future of the currency. I would point out that at present there is not only the distrust entertained by those who fear a further depreciation, but also the distrust entertained by those who fear appreciation. Farmers and many who trade in farming belong to the latter group. Many cases have been brought to my notice of potential purchasers of farm lands who refuse to conclude the deal until they are reasonably sure that the rate of exchange will not be lowered. This is quite rational, since they are not prepared to assume important exchange risks in addition to the ordinary risks of farming at the present time. Although the effect of this uncertainty both in limiting importations and in freezing land transfers is not measurable, it may be of considerable importance, and is certainly of some importance. My conclusion on this point, therefore, is that stabilization of the exchange is desirable as a measure to increase the fluidity of trade. Moreover, I think that stabilization should be effected through devaluation at the rate of £125 New Zealand to £100 sterling, since a lower rate is likely to have serious repercussions on our key industries, while a higher rate is, I believe, inexpedient at present.

(*h*) The stabilization I have in mind, however, must permit of some elasticity. It has been suggested that the margin of fluctuation round the par should not exceed 30s. per cent. either way, on the grounds that this represents the cost of gold transfer between New Zealand and London. This, as I have said, is not relevant, since gold transfers are not normally important in our exchange system. I admit, however, that initially at least the limits of fluctuation set by law will be largely

arbitrary, and subject to modification according to experience. Two considerations have to be reconciled in deciding on these limits :—

(1) The desirability of narrowing exchange risks as much as possible.
(2) The need for exchange flexibility in a country which depends so largely on export sales for its income and which has a relatively rigid cost structure in its key industries.

The first point has already been discussed. The second is, however, more important. Any country whose economic structure rests predominantly on farming for export experiences wide fluctuations in national income but narrow fluctuations in costs. The result is in periods of rising prices a very marked boom and in periods of falling prices a very marked recession. Moreover, where (as in New Zealand) there is " no bullion market, no bill market or short-loan market, and generally no money market in the full sense of the term " (Park and Ashwin, p. 1), the power of a central bank to influence economic conditions by internal measures is likely to be more limited than in more developed countries. Variations of discount-rates and open-market operations are likely to be of small importance so long as our money-market is immature and as long as our economic conditions respond as clearly and quickly to external changes. In our circumstances the most promising point of control, therefore, is the exchange-rate. I believe that some power to alter exchange-rates as a deliberate act of policy is necessary in New Zealand if we are to minimize the effect of external disturbances on our economic structure. Thus, the most dangerous time for us is invariably the period when rising prices, mounting into boom, exaggerate the normal optimism of farmers and others and lead to serious land speculation and the extravagances of competitive finance. It is at least probable that a deliberate lowering of the rate of exchange before the situation reaches the danger-point might save us from the worst effects of too much prosperity.

While I have no desire to be overconfident as to results, I consider that the sphere of exchange control is a proper field for monetary experimentation in this country. It would be illogical to support the use of the exchange as a relief measure in times of depression and then challenge its use as a " deflation " in times of boom. It would be quite logical to object to its use on either occasion, but I strongly urge that its utility as a weapon of economic control be more thoroughly explored.

It is only through properly controlled experimentation by the Reserve Bank that we can arrive at any sound opinion as to the limitations of such a device. The knowledge and experience gained will permit a proper balancing of the claims of exchange stability in the interests of overseas trading and the claims of greater price stability in the interests of domestic security. In the meantime I suggest that the limit of fluctuations be set somewhere between 30s. and 100s. per cent. either way. The former is too narrow to give any substantial control over the effects of external price variations, and the latter may be too wide to give the sense of security required. Having decided this point, the exchange should be held between the limits set for as long a period as possible—that is, the limits should not be widened in either direction unless the economic situation changes so much as to make them anomalous. In such an event it may prove necessary to determine a new par. It will be evident that these suggestions do not regard any par as necessarily permanent, but they aim at a greater degree of stability than exists at present.

Question 13. Has the exchange-rate in the past been governed by the supply of and demand for London funds? Was the exchange-rate ever "free," or was it always " pegged " ?

It is reasonable to suppose that some degree of control over the exchange was normally exercised, since the rate remained steady despite wide seasonal fluctuations in demand for and supply of funds. In the words of the Economic Committee : " This involves a considerable measure of control ; but that control is customary and necessary and would require to be maintained under any system of exchange operations." (See Report of Economic Committee, 1932, pages 27 to 29, for a further statement, with which I agree.)

Witness : Mr. D. O. Williams.

The Chairman : We are very pleased to have your replies to the questionnaire, the second part of which came to hand this morning and members have therefore not had the opportunity of studying it. I would suggest that you read it through to the Committee.

Mr. Williams read the statement in question, as follows :—

4. In what respects can the Reserve Bank act as an instrument in securing national control of the monetary situation in New Zealand?

4. As an instrument of monetary control, the Reserve Bank will—
(*a*) Be the sole note-issuing authority ;
(*b*) Hold minimum balances of the trading banks ;
(*c*) Control the exchange-rates ;
(*d*) Possess full information as to the position of the trading banks statutory returns to be supplied.

(See Park and Ashwin, pages 12, 13, for a fuller statement.)

I have always viewed the functions of a Reserve Bank as essentially experimental in nature. What is appropriate elsewhere may not prove entirely applicable here. What is appropriate now may prove inappropriate in the future. In other words, although the bank will commence its operations on the basis of the above machinery, it has to learn the details of its job in the light of experience and intelligent

trial and error; and it has to endeavour to create a situation which will strengthen its powers of control. Thus it will have to consider the special problem of exchange policy in the light of the special importance of such a policy on our credit structure, and it will need to build up, if it can, a more important short-term money market. Neither the proper exchange policy nor the short-term money market is ready made for it; and it will eventually prove more successful the less ready-made are its own ideas. A further reference to its powers of control is made in answer to Question 5.

5. In so far as stock and station agents act as banks, should they be classed with the six trading banks for the purposes of better co-ordination and control of banking policy?

I think that experience will show that control and co-ordination of banking policy will remain imperfect if any large and important financial institutions are left as free agents outside the area of control. In New Zealand the stock and station agents are of great importance as financial institutions and in principle, therefore, should be linked to the Reserve Bank. Here again the potential dangers of unco-ordinated financial institutions are most apparent in prosperous times; and it is my opinion that in the past the competitive scramble for accounts between trading banks on the one hand and stock and station agents on the other have greatly accelerated boom conditions and facilitated the overcapitalization of farming ventures. The opinion has several times been expressed to me by both bankers and stock and station representatives that in such times they have been powerless to resist the eager demands of customers for finance even where they doubted the wisdom of acceding, since there was no certainty that competitive institutions would also refuse and since the loss of accounts in any number might jeopardize the position of a local manager. If such a situation is true generally, it would strongly support the principle of including all important competitive financial institutions within the sphere of Reserve Bank control. In practice the obvious difficulty is that stock and station agents have important functions other than those of banking, and it might prove difficult to impose control at one point without unduly restricting activities at another. I am not competent to express an opinion on such a matter but would suggest that the companies concerned be invited to state their case.

6. In view of the fact that much capital in New Zealand is wasted by unsupervised investment, would you favour the setting-up of an Investment Board, not to guarantee a return on investments, but to give an opinion as to the economic soundness of any project for which the public were asked to subscribe for shares?

I favour the principle of such an Investment Board, but strongly doubt the possibility of establishing it on a practicable basis. The qualification and training required of the members are unlikely to be found outside members of the stock exchanges. In practice the Stock Exchange Association of New Zealand—or a central committee of the Association—would probably prove the most competent body to estimate the economic soundness of any given project open to public investment. There are, however, obvious dangers in placing judicial responsibilities on the shoulders of people whose pecuniary interests are involved in their decisions. This might be overcome by a strict limitation of brokerage charges—say, to $2\frac{1}{2}$ per cent.; but I am sceptical of the outcome. It is apparent that the Exchange would be bound to refuse to list the enterprises against which they had reported adversely, and this would, in fairness, involve some Appeal Board, and so raise again the problem of an appropriate personnel. The most promising immediate developments would appear to be (*a*) to provide as much legal protection as possible for the public; (*b*) to provide as much information as possible to the public. The first point is being met by the recently appointed Commission to inquire into company promotion. The second might be be met by the issue of advisory statements through the appropriate public services. For instance, an account could probably have been published setting out the state of existing knowledge, the technical difficulties, and the reasonable risks of such enterprises as forest, flax, tung-oil, and tobacco plantations. Put in a more general way, wherever the Government is in possession of knowledge (either through the research activities of its own institutions or from any other source) which is likely to be helpful to the investing public, the information should be made available. All the more so if the information clearly discounts or contradicts the claims of professionally optimistic promoters. Information held by public services is obtained with public money and is intended for public service. Neither departmental policy nor the economic interests of special groups should cause the information to be withheld from the public if it can be of help to them. The public may not be in any way grateful for such a service; but if the ethics of Government are to claim respect the public must be served in spite of itself.

7. Would you advise the setting-up of some additional institution to facilitate small savings?

I have given no attention to this matter, and therefore have no useful suggestions to make.

8A. What are the limits of economic recovery in New Zealand by internal expansion of (a) *Treasury or bank notes?*

The internal expansion of notes would, I think, have no appreciable permanent effect in raising internal prices. In any case there are no cramping restrictions on their issue while the demand is limited to the requirements for minor payments.

8B. What are the limits of economic recovery in New Zealand by internal expansion of (b) *Credit?*

On the supply side the amount is strongly influenced by the banks' demand liabilities overseas. This may partly be inferred from the account given by Park and Ashwin of the mechanism of the New Zealand exchange and the marked influence of overseas trading on our economic structure. It is normal for credit expansion in New Zealand to be associated with or to lead to increased importations. A limit to further credit is set by the need of the banks to meet the overseas payments for importations.

On the demand side the limiting factor is the requirements of business and these depend upon the estimates which men make of the opportunities for the profitable use of funds. At the present time profit-making opportunities are relatively few, and it is not to be expected that a much stronger demand for available finance will develop until there is greater confidence in the future of prices and until a closer adjustment between costs and prices has been made. Experience has shown that the prevalence of cheap money is not sufficient to promote recovery if confidence in investment possibilities is lacking; but that cheap money is helpful once this confidence emerges. In present conditions I doubt the possibility of forcing much new commercial credit into circulation. There is a growing body of opinion that in such circumstances it is desirable that increased public expenditure should be undertaken. I am inclined to favour the view that a careful investigation should be made of the possibilities of expanding national and local-body expenditure on useful public works.

9. In New Zealand is there any reason why the Govrnment should pay interest on Treasury bills?

I cannot see how Treasury bills could function in their present character unless they bear interest.

10. What limits do you place on the Government's financing construction schemes by non-interest-bearing Treasury bills or notes?

I think it would be inadvisable to attempt any such policy.

11. Assuming normal conditions, has New Zealand reached a stage of development such that overseas borrowing will in the future not be necessary?

I find it impossible to answer this question since it involves a knowledge of (*a*) what "normal" is, (*b*) how long it will take us to reach this "normal", (*c*) what the requirements of the country will then be for new capital, (*d*) what the resources of the country will then be. If the question is modified somewhat to ask whether we should aim to provide internally as much as possible of the capital required, I would answer, Yes. The growth in the world of economic self-sufficiency has brought about the position that a debtor country is more and more exposed to external policies which may seriously impair its ability to meet external obligations. While it has no control over such policies, it is reluctant (as in our case) to ask for debt concessions, since these involve delicate questions of national credit. Conversely the creditor country has little or no control over the policies of the debtor country and may find (as at present) that these policies endanger the security against which the loans were made. In present conditions, and if the trend to economic nationalism continues, the separation of the ownership of capital and its control is hazardous for both creditor and debtor country. And it is probable that in the future there will be a greater reluctance on the part of creditor countries to lend, particularly if they are successful in finding more opportunities for home investment. In view of recent experience, I think it desirable that lenders and spenders should be as close together as possible, and therefore that we aim at financing from local sources as fully as possible.

12. Would you favour rigid exchange-rates with sterling?

This has been answered in my earlier reply to questions concerning the exchange.

13. [Answered above.]

14. What determines the rate of interest charged and paid by the banks?

(i) The conditions of supply and demand as outlined in my answer to Question 8B; (ii) the influence of such competing institutions as stock and station agents and Government lending Departments; (iii) the rate at which money is available in other countries.

15. If deposits and advances rates were lowered would this tend to promote economic recovery?

The effect of lower deposit-rates would be to encourage the search for investment avenues, and would liberate funds which, at present rates, are "doubtingly" left on deposit. The effect of lower overdraft-rates would be to reduce costs. The combined effect would be to improve the prospects of profit-making.

16. Do banks in New Zealand lend their deposits? Is there any fixed relationship between deposits and advances in New Zealand? What factors determine an increase in advances?

(*a*) Deposits are lent in the sense that banks could not make the advances they do without having deposits in addition to their capital.

(*b*) No. For short periods there is no constant connection between them; they do not increase or decrease together. On the contrary advances may increase when deposits are increasing and vice versa. Over a long period of years, however, the expansion or contraction of trade will be accompanied by an expansion or contraction of both advances and deposits.

(*c*) The extent to which bankers are willing to accommodate the increased demands of the business community generally, which in turn is related to the overseas balance of payments, the banks' estimates of the future course of economic activity, and the character or security of the applicants.

17. The fluctuations in export values of New Zealand products are reflected in changes in ecomonic conditions within New Zealand. What can be done by monetary means to ease the effects of these fluctuations?

I have answered this in my reply to the questions relating to exchange, particularly in the section concerning the possible use of the exchange as a control device. I would like to make this general statement: that I hope the Committee does not look upon me as an expert in money affairs. I am very interested in them, and I know sufficient about them to recognize that there are large debatable areas upon which I personally do not wish to be in any way dogmatic. I think I have said all that

I really feel I need say upon the question of the exchange-rates; that to me was the most important question of the questionnaire because I feel that our local conditions are such, while we remain a relatively immature country, that external influences are of predominating importance at present. The extent to which this country derives its national income from overseas trade necessarily exposes it to external conditions to a degree that is not felt by most other countries, and it therefore seems to me to be logical that if we are to seek for control over our money system we must seek it at the point where the main disturbance occurs, and that is in relation to our overseas trading. That is why I think the exchange-rate, however much it may be anathema to some or all of you, is nevertheless the crucial point of attack; at least that is my own view. I would go further and say that I very much doubt the possibility of an internal control by the central Reserve Bank which limits itself to the ordinary devices of variation of the discount-rate, and so on. Any bank which ignores the very direct and obvious impact of external influences upon us must fail to be really effective. I suggest in the later section that we have to try and reconcile the need for as much exchange stability as possible with the necessity for using the exchange as a control device, and I suggest that the appropriate fluctuation might be somewhere in between the points of 30s. and 100s. per cent. either way. I want you to understand that I have no particular figure in mind, and that after discussion with other people I might be quite prepared to abandon any figure that I had previously decided upon. I feel that there must be enough room round about the par—whatever that might be—to give the central bank an effective weapon, and I particularly stress the point that it is probable that the most effective use of that weapon will come when prosperity returns and is reaching the danger point of boom conditions. That will not be very popular with the farmers in New Zealand, but I think the banking system has much more power of influencing conditions when things are good than when things are bad. The only other point of any importance in my reply from my own point of view is that which relates to question 11 in regard to the borrowing overseas and borrowing locally. I have not developed the idea to any extent, but I think the notions are clear enough. To a large extent it does depend upon an estimate of the future trend of events. Those I anticipate to be for some considerable time, say a decade or a generation, a continuance of the present process towards greater national self-sufficiency, and that I think will eventually have its reactions upon New Zealand in compelling adjustments which, whether we like or not, will make us a more self-sufficient country than at present. I mention this at this stage because it will be evident that if this country in its endeavours to adjust itself to a declining world trade, or a world trade which expands very reluctantly, endeavours to multiply industries in New Zealand, it will to that extent be less dependent upon external influences and therefore as that process develops, the importance of the exchange rate may diminish. I think it is important in that connection. There is a very good statement to which possibly the attention of the Committee may have been drawn on the question of self sufficiency, by J. M. Keynes: I am prepared to attach that to my statement if it is desired. It definitely emphasizes the point of view of a creditor country, that it will be preferable for a creditor country to have closer control over the spending of the money that it lends. I think we may find it difficult in the future to borrow even if we want to; that may compel us to live upon our own capital resources more than we hitherto have done.

Dr. Sutch.] I think I follow very well what you have given us; very few points arise as far as I am concerned. In regard to the small savings in this country, people who prefer a rate of interest greater than they can get in the savings-bank invest in concerns whose security is questionable; if we could get some institution in New Zealand of the type of an investment trust to take over small savings and ensure a continued return to the saver, would you favour such an institution being set up?—It seems to me to be unquestionable in those conditions.

That was the point of the question on small savings?—I rather understood the question to mean was I dissatisfied with existing institutions for small savings, and I was quite complete in my answer that I really had not thought about it.

You have mentioned Government lending Departments, would you favour greater expansion of these?—I have had the feeling, which has grown stronger in recent years, that so far as rural credits are concerned it would be a vast improvement if those various sources of credit could in some way or other be canalized. I think one of the weaknesses at the present time is the multiplicity of creditors which farmers and others have to face and compromise with, and it does seem to be the experience that, unless those creditors voluntarily get together and make pooling arrangements for a *pro rata* adjustment of their debts, some suffer much more than others. Apart from the advantage which it would be to co-ordinate the sources of credit from the point of view of adjusting them in times of difficulty, it would also do away with what I think is one of the most objectionable features of the present system, which is the overcompetitive nature in good times of rural advances.

Does that include Government rural advances too?—Yes, definitely.

In your opinion they should have some greater control and co-ordination?—That is my opinion.

You also mentioned methods of controlling the credit situation. In England we understand it is largely done by means of the bank rate, the rise and fall of which affects economic conditions in the country very materially. What would be a corresponding measure in New Zealand, or corresponding implement, to bank rate in England?—I do not think there is any corresponding implement so far as the internal control over credit is concerned. It comes back to the point I have already made, that we are in a very different position from England—a very different position from America. We have probably the largest external trade *per capita* in the world, which is only another way of saying that we are more than usually dependent upon overseas conditions; and therefore I would say that it is the rate of exchange which is likely to count as the controlling weapon in New Zealand, not the rate of discount. On the other hand, to the extent that we mature and become less dependent upon overseas trade, to that extent the bank rate may assume a bigger importance than it can possible have at the present time, but at the present time I believe that the exchange-rate is likely to be the most potent weapon in exercising control over our internal credit.

It would seem that there are no economic text-books which explain New Zealand's position ?—We are building them up with the Monetary Committee and other Committees like that.

Assuming that the Government paid its wages bill out of Treasury notes, what would be the effect of doing that ?—Candidly I do not know, but I think that the effect would be a temporary increase in spending-power, which would eventually mean, while general profit-earning opportunities remain as bad as they are, the retirement of existing purchasing-power or currency. I think there would simply be a replacement of the old by the new, or simply, if you like, the retirement into fixed deposit of funds, in just the same way as is happening now. It seems to me to be the same point I have already made. I cannot myself see how any substantial injection of currency can be made while, under the profit-earning system, profits are not being earned.

Mr. Langstone.] Does the payment of pensions have that effect ?—I do not know what effect the payment of pensions has.

Dr. Sutch.] There would be a transfer of purchasing-power, would there not ?—I do not know, and I do not suppose anybody else does, what the effect of that is. Can anybody say ?

Captain Rushworth.] But they are paid out of revenue are they not, so, as Dr. Sutch suggests, it is merely a transfer from A to B ?—Quite possibly.

Dr. Sutch.] So that, if the tendency of business and confidence and the price-level was all downwards, it would be difficult to help our economic situation by injecting currency ?—I think so. I think that the situation is this, as I understand it; that it is all too easy to inject currency into the system when the trend of prices is upwards, and that is part of the trouble. It is all too difficult to do it when the trend of prices is downwards, and that is the whole trouble as far as we are concerned at the present time, and I make the inference from that, although it is of very little comfort at the present time, that every energy should be bent, when prices are rising, to see that they do not run amok.

So that, in view of the conditions you envisage—no confidence, no profit-making opportunities—a vigorous public-works policy would not necessarily revive economic prosperity in New Zealand ?—No. I think that the public-works policy would act as a sort of stop-gap, that while business is itself because of its dependence upon profit-earning, reluctant to embark upon capital expenditures, that the State might do so, provided the objects selected were selected wisely. That would be beneficial in itself from the point of view of liberating a certain amount of purchasing-power, but if your question is, Would that public-works policy cause a revival of business activity, I do not think so. But I do think that it is a very useful device if ways and means can be found for helping things along, provided, of course, on the other hand, that the public-works programme is pared down when business is running right.

A good deal of our production depends for its profit on overseas price-levels. 40 per cent. of our production is exported, approximately. The question arises, then, how much of the local market is affected by export price-levels ? Perhaps I could put in this way: What proportion of our total production is determined or has its price-level determined by overseas price-levels ?—May I just invert the thing in this way by saying that my own estimates are that primary exports represent about 80 per cent. of primary production. That excludes items of primary production which are not exported. Wool, butter, cheese, lamb, mutton, and a few other grass products make up about 80 per cent. to 85 per cent. of our total exports, and of that primary production four-fifths is exported so that you can say that external prices affect not only the actual amount which is directly exported, but by repercussion 20 per cent. of that farming produce which is not exported, but which is sold locally. I think that is quite an important point really, because, where there is a fairly close relationship between the prices of exportable commodities and their domestic prices, the tendency is for the local price to rise and fall in rough correspondence with the rise and fall externally. If I may restate my reply to make it a little clearer: Taking the more important items of our farming produce, 80 per cent. is exported and 20 per cent. sold locally, and I think that, in taking account of external influences upon our national income, we have to consider its effect not only on the bulk which is exported, but also by repercussion on the amount which is sold domestically.

That brings me to my next point. If farm costs are more or less fixed, then sometimes the return to the farmer is much higher than costs, so that his surplus purchasing-power might be, in a boom, very great, in a depression would not exist at all, so that, would not the result be accentuation of conditions really, because costs are fixed but the return to the farmer varies tremendously ?—I personally look upon that as the A B C of any interpretation of the repercussions of external conditions on New Zealand conditions. It is perfectly obvious that it does not matter twopence what the level of prices is or which way they are going, if all series move in harmony. It would not matter if prices were a thousand times higher or if they were a tenth of what they are now, if all other costs were automatically adjustable; but they are not.

Mr. Langstone.] If we moved them like we move the clock we would not know any difference would we ?—No.

Captain Rushworth.] That is taking into consideration the existence of contracts ?—Yes. Contracts, customs, and that sort of thing, introduce that immobility into charges which prices do not experience.

But custom is much more mobile than contracts ?—Of course, contracts can give you absolute rigidity.

So therefore, a stable price-level would be the thing to aim at in view of the fact that contracts are fixed ?—Maybe. I have my doubts about that. Absolute stability of prices is, I think, very much more desirable than the instability which we have at the present time. At the same time I think a certain measure of subsidence, lowering of prices, is in the interests of humanity, if it comes about as a result of the advances in technical knowledge, invention, and science.

Dr. Sutch.] Do you think there is any such thing as a general price-level ?—The concept of a general price-level is a useful one to simplify our ideas, but it does not really exist of course.

Mr. Langstone.] Does a price-level exist at all ?—No. It does not.

Dr. Sutch.] Could you tell us what mechanism would be necessary on the monetary side to aim at a general stable level of prices ?—No. I am afraid I cannot. I seriously doubt the possibility of achieving such a thing. I think that some measure of control will be got through a wise manipulation of the exchange-rate plus such other devices as the central bank may be able to discover in the course of its experimentation, but I am afraid I cannot think of any way in which absolute stability could be got.

And in any case, if you had internal stability, would the external value of your pound remain stable ?—Not necessarily. Only on the assumption that there was absolute stability of prices in all other countries. That is, if you got a world stability of prices you would have both domestic stability and exchange stability, but I think that is rather remote.

You have a question here about deposits. In various articles that have been submitted to us, the sources of deposits have been the returns from our primary produce, and the deposits have also come from advances. In what sense do you mean that advances are lent against deposits ? I am not quite sure of your terminology. Question 16 : Do banks lend their deposits ? That is what some of us are not quite clear about. " Deposits are lent in the sense that the banks could not make the advances they do without having deposits in addition to their capital." Could you explain that a little more ?—There is the relationship between advances and deposits in this sense : that when a bank makes an advance some of those advances become deposits. There is that relationship from that point of view, and that the aggregate of deposits, in addition to the capital which the bank has, permits that bank, in certain circumstances, assuming that the deposits are abundant enough, to make further advances, because the bank naturally makes its money by extending those advances as far as it can safely do so.

Mr. Langstone.] There are economists who say they do not make money that way ?—That is very possible. Economists say all sorts of quaint things at times.

The question has arisen, what happens to fixed deposits in a bank ?—Do you mean, where do they go to ?

Yes ?—I do not really know, but normally the bank makes its own investments when profit conditions are appropriate. I do not know the internal history of fixed deposits at all in the present circumstances.

Do you think that they become fixed properly ?—In a really critical stage they are completely fixed in the sense that they are utterly frozen.

Dr. Sutch.] Internal and external borrowing has been mentioned, and you also mentioned that we borrow on our own capital when we borrow externally. Do we borrow physical things ?—A loan raised externally may come into New Zealand solely in the form of goods, hydro-electric works, engines, and so on.

Our national income over the last ten years has been augmented by external borrowing, which has meant that New Zealand has had more wealth at its disposal. If this borrowing had been internal, would the position have been the same ?—I would like to reflect over that question. At the moment I see no fundamental difference except upon the terms of our international trade. Could you give me notice of that question ?

Perhaps I could explain it a little further. In your paper you say that the limits of lending are sterling funds held overseas ?—Yes. The banks demand liabilities to provide sterling to meet importers' drafts. That is what it comes to.

So that, in the long run, if we borrow overseas we get more imports ?—Undoubtedly, if they come in the form of goods. That is, assuming that your loan is for that particular purpose.

If it is not for hydro-electric machinery or something similar, sterling funds are available for other goods, so that locally you would have consumers' goods brought into the country and a diversion from capital production, perhaps, within the country. That is with external borrowing, but with internal borrowing you have the diversion to capital production but not a similar amount of consumers' goods available as you would have with external borrowing ?—Initially, perhaps, that is so. There is always that distinction between the initial effect of a loan, whether it is internal or external. The initial effect of an internal loan, it it were for production purposes for the setting-up, say, of adequate woollen-mills or boot and shoe factories, would be a diversion of funds into capital requirements, but the ultimate effect is an additional production of goods.

I would like you to go into that. I would like your considered answer on the problem ?—I rather sense that I have not quite met your point upon the matter, and if you will give me the question I will think it over.

Mr. Clinkard.] I would like to say, in reference to your remarks on self-sufficiency, if we are to finance ourselves we will require a substantial excess of exports over ordinary imports, I take it, in order to provide a balance for the State to purchase materials and so on for internal expansion. Would not that be so ?—That is another way of saying that if this country were to aim at building up its non-primary industries, you would have to purchase, in the first place, the machinery and capital equipment.

In order to do that would it not be necessary to maintain a high exchange so as to reduce the importation of what we might call non-essential consumable goods in order to leave that margin ?—The effect of your exchange is the same on whatever class of goods, whether it is machinery or consumers' goods.

It would be, but the important point is this : That, in order to have that balance available for the State to utilize, the State might utilize it irrespective of the effect on the exchange, whereas the ordinary consumption would be more likely to be supplied by internal production ?—Yes, eventually. But is not the problem that you are facing at the moment the problem of getting your initial capital equipment ?

That is so.—Well, what exactly is the point ?

My point is that in order to do that we must maintain a good sterling balance on the other side to a comparative lack of the importation of consumable goods ?—I misunderstood you. I think you are quite right.

My point is this : There are two ways in which you can spend the proceeds of your exports, either in imported more or less non-essentials because they may be supplied internally, or the absolute essentials for the development of further capital goods, and the maintenance of the high exchange would prevent the importation of what I have termed the more or less non-essential consumable goods which could be produced inside ?—I think you are right up to a point, but are you not going a little far in suggesting that the high exchange in itself would discriminate between the classes of goods ?

No. I do not say that at all, but I say that the result of that would be to leave, as we have at the present time, an amount of sterling more or less accumulated which the State, more or less irrespective of its cost, could then utilize for the purchase, say, of hydro-electric machinery ?—I agree with that.

Do you think that it would be advisable for this country to endeavour to establish fresh industries, in order to provide more or less for its own sustenance ?—I very sincerely hoped that that question would not be asked. I cannot answer that in two or three words. I would have to make a more or less extended statement to do myself justice.

I should be very pleased if you would do that, because it is a very important question ?—I will put it this way : The question you have put to me is, Do I think that it should be a wise policy for New Zealand to encourage production in other than primary industries. Hitherto we have based our past prosperity, in common with the rest of the world, on what we might call the economics of internationalism, which has, in effect, meant the growing interchange of surpluses between nations. That was highly profitable to us and highly profitable to the rest of the world, because such surpluses, although they were increasingly great as the years went by, were still scarcity surpluses in the sense that the demand for them was growing just as rapidly as the supply, or perhaps more rapidly. So that, until the last two or three years, there was never any question from New Zealand's point of view of a limitation of markets. We could go along quite happily and confidently believing that the market for our primary products was an insatiable market, and that since nature had made us most efficient on the primary producing side through natural resources and climate, the wisest thing for us to do was to expand our primary production as much as we possibly could and as fast as we possibly could. That, I think, was a perfectly rational attitude to take in the circumstances. It would be unreasonable to have expected even economists or others to have foreseen that the trend of events which had lasted for over a century was going to be dramatically reversed ; but it has been reversed, and in the post-war years we have seen an increasing emphasis upon what I think is most properly called economic nationalism or increasing self-sufficiency. That is the essential change which has come over the world ; a development to a degree that is often frenzied of economic nationalism, and I have likened that to the situation which occurred during the war when isolation became more and more intense as belligerent countries became more and more efficient with their various systems of blockades. The world at the present time is developing a similar sort of economic isolation, and international trade is, to a very large extent, at a discount. It may turn out in the end that the new developments of economic nationalism may prove a great deal more lethal to standards of life and economic prosperity than the blockades during the War, but I am very careful not to be dogmatic on that point of view, because I believe that a carefully planned system of national economy might go a long way to protect us from the worst effect of economic nationalism. I would like most emphatically to present that as a rider to the general proposition that there are dangers inherent in a system of economic nationalism—the dangers of lower standards of living. It is possible that if we are sufficiently courageous and wise we may convert economic nationalism into a weapon of well-being. I would like to emphasize, however, the point that the dangers are there, and that it would be very unwise for us to ignore them when we isolate ourselves more and more from international trade and international specialization. We may get a great deal more security, but that is of little value to us if we get that security on a bread and butter diet ; so the task, from that point of view, seems to be to get not only your security, but some plum pudding with your bread and butter as well. Although those dangers are there, and although a properly brought-up economist shudders somewhat in his soul at the thought of the reversal of the world from the faith of free-trade, still we have to be realistic enough to admit that the tendencies of the world are in the direction of greater and greater self-sufficiency. It is of little consequence that we should dislike it ; it is of immense consequence that we should accept the facts when they are there and consider what adjustments we can make to those facts. It is a perfectly easy thing to say, as our farmers will say, that it is against nature, or pure folly for England to increase her farming when we are a vastly more efficient country, and in the sense of nineteenth-century philosophy that is perfectly true ; but this is the twentieth century and the thing that concerns us is the fact that England is doing it, Germany, France, and Spain are all doing it, and endeavouring to live more fully off their own resources, and becoming less dependent upon the outside world. I think that is a fair interpretation of the various great social experiments which are being made in Europe, America, and Russia—very different experiments in motives, spirit, and ideals, but all of them, for the moment anyway, concentrating to a unique degree upon home production and home consumption. We may distinguish fairly correctly between the emphasis which is now put upon the home market and the emphasis which was formerly put upon the external market. Nineteenth century economic evolution was based primarily upon the expansion of overseas markets and the control, financial or political, of overseas countries. At the present time country after country is giving its prior attention to domestic rehabilitation and looking upon the external market as a desirable but incidental adjunct to the rehabilitation of the home industries and the home market. Now, that change from the expanding nationalism of the nineteenth century to the developing nationalism of

the twentieth century carries with it quite a number of consequences. It carries a present diversion and a possible greater future diversion of capital from overseas investment to home investment. That is already dealt with in my answer to the question of borrowing. It is a matter of interest to observe that those countries which went further in the direction of internationalism are the countries leading now in the reverse direction of self sufficiency—America, England, and Europe. That is not entirely surprising, because the rich resources and large populations which prompted them to build up their great industrialisms and conquer the world's markets are precisely the conditions which enable them to support the cost of the change. They have huge home markets and many millions of people which are the most fruitful means of developing new industries. The various points which I have made up to date lead to the point I wanted to make: that this development towards economic self-sufficiency represents a substantial reversal of the whole of the nineteenth century and is therefore, I think, likely to be tenacious. I think it would be a mistake for us to assume in New Zealand that the policy which England has embarked upon, and which other countries have embarked upon, is a policy which they will reverse in a few years. Once any system is established, however illogical or bad it may be, it tends to survive far beyond the time when it should have collapsed. Institutions do not collapse merely because they lack logic; they even survive for that reason. And therefore I think that in New Zealand we cannot hope for any early return to expanding internationalism. This, of course, is a point upon which I may be completely wrong—you understand it is only my rough judgment of the course of events—but I feel that the farming policy of England is likely to see out the generation of farmers which it has called into being, putting the shortest possible time on it. If what I say is true, and if the world is heading harder and harder for self-sufficiency, and if that policy is likely to be maintained for a decade or a generation, then we have to face very seriously the problem of the reactions of that policy upon New Zealand. One of those reactions, and the one that concerns us most, is the possible limitation which it is going to impose upon our selling overseas an expanding volume of primary products. It is conceivable that we may have to face, before very long, a limit imposed upon the amount of primary produce which we can export. If that is so, it is clearly inadvisable for this country to spend capital and labour and hope and ambition on producing surpluses which are unsaleable. It would be far better for us to use that capital and labour to produce things which we are now importing. That is the point upon which I am most likely to be misunderstood, and I would like to be as careful about it as I possibly can. The production of surpluses which prove unsaleable is sheer uncompensated waste; there is no return for it at all. We might just as well load it all on to the wharf and push it into the sea, and recognize once and for all that it was not worth doing; that capital and labour put into the production of other things would at least be less wasteful than the production of unsaleable surpluses, and therefore if the trend of events I have tried to delineate has been correct, then it would pay us to consider nationally in what ways we might diversify our various forms of production. One other point in that connection: It seems to be that statesmen to-day, in looking at their unemployment problem, have to consider the following two alternatives—whether they prefer to have a body of people in jobs and reasonably secure in those jobs, enjoying a reasonable standard of living in those jobs, together with a body of people which has no standard of living and no jobs—that is, an army of unemployed people; or whether it might not be better, as an alternative, from a human point of view if not merely from an accounting point of view, to spread that unemployment more evenly through the whole community. That undoubtedly could be done by a multiplication of our industries. I want it to be very definitely understood that, so far as our aggregate national income is concerned, such a policy might mean a lower national income, but we could give every man a job and spread the cost over the whole of the community in a lower average standard of living. I am merely putting those two alternatives and not casting my vote in favour of one or the other—whether it is better to have a system such as we have at present or one in which the incidence of unemployment is spread throughout the whole community. If you choose the latter, then you advocate a multiplication of non-primary industries in the country, and that may turn out to be the best thing.

In connection with public works, I think you suggested that it might be wise, though not a cure, to increase public works during times of depression. Would you suggest that it would be essential in doing that that the work should be carried on at a reasonably low cost and not as competitive with ordinary industrialism? There are as you know two schools of thought: the one suggests that any such work should be at standard rates, the other is that any such work should always leave a sufficient margin to induce the industrialist to look for ordinary channels of employment. What is your view?—I favour the latter; either that or let us put the whole country on the dole.

Otherwise it would simply be restraining the tendency to re-enter commercial channels?—I think so.

Would you be in favour, so far as is possible, that the currencies and credit should be directed towards a rise in prices to an agreed satisfactory level, and thereafter maintained at that level? Would that be the objective?—As a broad policy, if it could be done; I would like to see no attempt at stabilization at the present level of prices, but a rise in prices at least sufficient to cover costs of production before any attempt to stabilize were made. You understand I am very sceptical of the possibility of doing so.

So far as currency and credit could do so, you think it advisable to get to an agreed level nad thereafter attempt to keep at that?—Yes.

Captain Rushworth.] I was particularly interested in your long answer to Mr. Clinkard's question about the economic nationalism, because that is becoming a very important world question. It has struck me—I do not know whether you have the same opinion—that the old ideas of free trade are advanced freely to-day by international finance. Have you observed that at all?—No, I have not.

From things I have read recently, it struck me that this development of economic nationalism is a kind of subconscious revolt against the idea of international finance. International finance in order to obtain the movement of its funds, must of necessity have free trade to follow it ?—I must confess I have not observed that relation which you suggest. It seems to me that the causes leading up to economic nationalism are of a different sort. I find myself completely baffled to put my finger on what you might call the first cause of any of these things, because there are such a mass of conflicting factors. But I think that at some stage or other this situation developed : After the war the heavily indebted countries naturally sought to pay their indebtedness by means of an expanding export trade, getting the necessary margin that way in which to pay their obligations, but unfortunately were met in the case of all creditor countries except England with very forbidding and in some cases insurmountable tariff walls, and that therefore their obligations to creditor countries could be met only either by the export of gold or by borrowing from their creditors, as Germany did from America, or in the last resort by endeavouring to get their surplus of exports over imports not by expanding exports but by limiting imports. By repercussion the high tariff walls of creditor countries compelled still higher tariff walls on the part of debtor countries, and once that set of forces was in operation the volume of world trade began very rapidly to contract, and countries which, like England, depend largely upon their export trade found their markets disappearing and were caught up in the same system and were obliged to turn to more and more local production and less and less external.

Economic nationalism carried to its logical conclusion means the cancelling of all international debts ?—Completely. It surely is the position that in recent years an expanding volume of debt has had to be carried on a decreasing volume of trade.

We hear a good deal of the dangers of another war developing. It is suggested on the one side that war would be brought about by the desperate endeavours of most, if not all, countries seeking to obtain a market for their surpluses ; that sounds logical ?—I do not think it is likely.

That is suggested in various quarters ?—I have not seen that thesis developed at all fully. It was the other way about : in the nineteenth century expanding internationalism was associated with a great deal of war.

It was urged that Germany was driven to war by her attempts to seek a place in the sun, where she would get more materials and find markets for her exports ?—The same thing as the " white man's burden."

Whilst I have heard that argument a good deal, on the other hand economic nationalism may be safe for those countries which produce enough for their own consumption but very unsafe for those countries which do not produce enough food ?—Unsafe for England, safe for us ?

Or for Japan, say ?—Yes. You are still assuming, are you not, that economic nationalism will be carried to extremes ?

Yes, carried to its logical conclusion ?—Yes. Carried to that extent, that is with international trade finished altogether ; all those countries not particularly well endowed with farming resources are open to the danger of famine.

I am personally very interested in that subject. Coming to more mundane affairs, you are a supporter of the 25 per cent. exchange New Zealand on sterling ?—Yes.

It was necessary for the primary producers ?—As a relief measure at the time.

Supposing that that is the case, that that is the best way of dealing with a desperate situation, would you go so far as to say that the exchange-rate should be raised sufficiently to provide the necessary support for the primary industries ?—You mean lift it, say, from 125 to 130 now ?

To whatever figure is required to enable them to meet their contracts ?—I think that there we run into a conflict between what seems perfectly valid and logical in theory and the practical reality of the situation. There is nothing in logic to object to a rise in the exchange-rate from 125 to 140.

Or to whatever figure is required ?—Yes, whatever would have been effective in closing the gap between farming costs and receipts, except this : That things are often quite good if done gradually, and very bad if done suddenly. That is the trouble.

If you were to increase the exchange-rate gradually, you think it might be a good thing ?—Yes, assuming the same existing disparity, because the necessary dislocations accompanying that, and the adjustments, are so much slower. It is just the same as a fall in prices of 50 per cent. spread over fifty years ; it is neither here nor there, but if it happens in three years it is a very different position.

By making it too drawn out—the application of relief—you are causing a great deal of distress and worry upon many of the primary producers ?—That is a question of a correct interpretation on the part of statesmen of the compromise between what is theoretically desirable and practically expedient.

Still, assuming that it is the best way of dealing with the subject, seeing that primary products are not all realizing the same prices—I have particularly in mind butter and wool—would not a higher rate of exchange on butter be justifiable than that on wool at the present time ?—As I have suggested in one of my replies, admittedly a general relief measure such as the exchange-rate or a subsidy does benefit some who do not really need it, and perhaps not benefit enough others who need it considerably. It is a clumsy weapon.

Could it not be rendered less clumsy by making the exchange-rate on wool 10 per cent. and on butter 25 per cent. ?—I am afraid I do not think it is possible.

It never has been done, but you would not say it passes the wit of man to devise something of that sort ?—I would not suggest for a moment that anything is past the wit of man ; he has been able to do almost everything except solve his own domestic problems.

If it were possible, it would be less clumsy ?—It would be a refinement, but I cannot conceive it. It is equivalent to having a series of independent commodity-moneys.

With regard to Question No. 16, the subject of the banks lending their deposits : It is of course the practice of the banks to make their advances in ratio to their cash reserves ?—I have indicated,

I think, in one of my answers the connection between those things and the overseas balance of payments. You will accept that ?

Yes. It would be possible for the banks to carry on making their advances even although they have no deposits at all ?—That means to say, if they have no assets in London ?

No. The banks in New Zealand could still maintain their advances even though they had no deposits ?—Is that not what I say ; no deposits would in practice mean that they hold no exchange funds in London.

Not necessarily. You quite correctly say that the total of the advances create the deposits in certain cases—that is true of the banking system as a whole—but the deposits are not essential to the functioning of the banking system at all, apparently ?—In the sense that I have expressed it, if there were no deposits the magnitude of advances which they now make would not be possible.

Why ?—Because the external relationship between advances and deposits is of considerable importance. It is not possible to exclude the overseas funds when discussing the banking system of New Zealand.

That is not clear at all. The banks gave us in evidence that they could carry on without the deposits ?—With the same external trade ?

Yes, under the present arrangements ?—That surprises me.

They also told us that if the Government came along to them at the present time and offered them securities for £100,000,000, they could provide the money straight away, but if they lent their deposits they would have to look in the deposit pool to see if there were enough there or not ?—Is there not perhaps this point : That it is the difference between the nature of advances which is causing some of the confusion ? The question of advances on ordinary overdraft, say, on trade account, and the question of long-term investments ?

We are not dealing with the long-term ones ; these are all moneys at call—even moneys lent to the Government. The only thing is that when they buy securities those moneys are really at call because they can sell them ?—I am very intrigued with the notion that with the complete absence of deposits advances could be indefinitely extended. That is the proposition.

The Chairman : I thought I asked the banks the question whether, if the deposits were all called up, they could carry on their advances, and the reply was, No.

Captain Rushworth.] If the Government deposit £100,000,000 of securities with the banks surely on that alone they could meet all their depositors in cash without calling up a single advance. That was the question put to the banks, and they said, Yes. It is so patent. It is not worth arguing about. I only asked Mr. Williams because his wording here was not quite clear. The next point is on Question 10. You were asked a question, " What limits do you place on the Government financing construction schemes by non-interest-bearing Treasury bills or notes ? " Your answer was, " I think it would be inadvisable to attempt any such policy." Why ?—I think that such a policy would be quite possible in a society of a different sort to the one that we have. In other words, it seems to me to be a perfectly logical part, say, of a thorough-going Socialist State. I think that would be necessary because that would automatically and by inference exclude the question of interest. I think that so long as we have this sort of rough compromise which we call the capitalist system, this compromise between socialism and individualism, that the adequacy of control is wanting. That could be expanded, as you readily understand, into a very extensive answer, but I feel that logically such a development would mean a State bank, which I am not necessarily averse to, but State ownership of all other things too.

Does that necessarily follow ?—It does not necessarily follow, but it is the point of view from which I approach it.

You mean it would be the thin end of a wedge ?—The very thick end I should think. I think it would follow inevitably if there were no other obstacles ; but I have a feeling that in New Zealand there are two impossibilities, one is a return to individualism and the other is a socialism of the order and completeness which such a proposal would, I think, necessarily involve.

You think that national control of the money system would necessarily involve national control of everything else ?—Yes. If I might refer the Committee to a more carefully thought out answer to that question, you will find a published article of mine in the *National Investment Review* of August or September, 1933, in which the central-bank proposal was discussed by me and in which I suggested that national control of money while you still have a profit-making system allied to a representative Parliament of the present sort was too dangerous. That is merely the result of certain private emphases which I put upon certain elements of the system, and I may be quite wrong.

You think that Parliament, as at present constituted, is not fit to control the money system ?—I would be inclined to say, Yes.

Although Parliament is regarded as fit to make peace or war ?—Quite so. I think there are so many deficiencies in the present parliamentary system that it would be inadvisable for me to express myself too emphatically upon the point.

Parliament is entrusted with very considerable powers at the present time ?—Yes. I might sum it up by saying that I think that social evolution has proceeded in a very different direction from parliamentary evolution, and that an institution which was very admirable for its early purposes is not necessarily suited for such a complex economic situation as has arisen, unless, by some democratic accident, it throws up men of sufficiently dominating personality to override the inadequacies of the institution itself.

Do you think it would be a good idea to take the control away from Parliament of the fighting forces and educational services and put them under private enterprise too ?—No.

Well, you advocate the leaving of the monetary system under private control do you not ?—No. I do not. You misunderstand me. My statement was that so long as the bulk of your economic system is, in fact, in the hands of private enterprise. I doubt the wisdom of attempting to place the control of money entirely in the hands of the State.

Money has to be managed, does it not ?—Yes.

And you think that the management should still be left in the hands of private corporations ?—Yes, since the system functions on a profit-making basis; but here as elsewhere the State has supervising-powers even if it leaves the detail to private enterprise.

Of course, under those circumstances, it is quite understandable why you should think that the Government should go to a private corporation and borrow any money that it requires ?—Yes.

The private corporation being the fount of money ?—You understand that I am refraining from making any comments, and I ask you not to press me on the point as to whether I think other changes of a more comprehensive sort would be desirable.

My question to Mr. Fussell, representing the banks, was this: "Is there any physical difficulty to the banks creating and lending to the Government £100,000,000 if the Government were prepared to give them public securities for that amount?" Mr. Fussell answered, "No. They could do that" ?—What would the bank do with those public securities ?

That is the point. The point I was asking you was that as the banks do not hold £100,000,000 of deposits it is not the deposits that they lend obviously ?—I have no more to say on the point.

In your statement, referring to the £12 10s. that is paid in New Zealand as compared with £10 sterling, you go on, "But there is a larger national income in terms of New Zealand money to meet the extra taxation." I want to put it to you, is it not the case that a large number of individuals who received that £12 10s. were heavily in debt, and that that money was taken in liquidation of debt and did not percolate into the general community ?—Undoubtedly.

So that there would have to be an exception made there. That is not capable of meeting the extra taxation ?—Yes, in the sense that you are objecting to that statement on the grounds that £12 10s. is not spread through the whole body of the people, but may be located at specific points.

According to the information at my disposal, very few men did, in fact, have that extra 25 per cent. to meet their ordinary expenditure ?—You mean that it tended to pile up in institutional hands rather than go out as spending-power. That is perfectly true.

Mr. Langstone.] The wage-earners would not get any of it would they ?—That is not necessarily true. They might have got it indirectly. The indirect effects are there. It is not quite as simple as perhaps it sounds in my statement.

The Chairman.] Have not the dairy-farmers had it ?—To a certain extent, yes, but not to the full extent of the 25 per cent. exchange. As Captain Rushworth quite rightly says, those indebted farmers have had their income docked naturally by their creditors, and in the existing order of society, quite rightly. You cannot object to that.

Mr. Ashwin.] And to that extent it has been deflationary up to the present ?—Had those institutions concerned not received the income, they would have been more financially embarrassed than they are at the present time, and might not have been able to carry the farmer as much as they have done.

Captain Rushworth.] In some cases the money was taken even further back in the liquidation of debt to the banks, in reduction of overdrafts and was cancelled out of existence ?—At the present time that group of people whom I call the intermediate mortgagees (you understand the type of man I mean, who has perhaps been a farmer and who has sold his farm and is a mortgagee to the new purchaser but a mortgagor to the bank or to a stock and station company) are being squeezed, and squeezed badly; and in any financial system in which you have a chain of indebtedness from your producer up through a series of credit-issuing persons or bodies, you have a chain equally of indebtedness to some ultimate mortgagee, who, of course, under pressure, is legally (and according to your philosophy ethically) entitled to whatever residue is left when the final wash-up is made.

Under the present monetary system, where practically all money comes into existence as a loan, is it possible for individuals or nations ever to get out of debt ?—I do not think so. They do not want to. All business is run on debt.

In your statement you say, "It is at least probable that the deliberate lowering of the rate of exchange before the situation reached the danger-point might save us from the worst effects of too much prosperity." That strikes me as a curious phrase ?—I am not too sure whether it is an earlier reference in which I say that I think the most critical period in our history, and probably in the economic history of all countries is when everybody is well off. That is when you have your competitive scramble for money and the competitive scramble to give money, that is a competitive scramble to build up debt.

You do not really think we can have too much prosperity ?—Too much prosperity in the sense that men use it unwisely and convert prosperity into exaggerated debt. Put another way, they over-capitalize their prosperity into mortgages.

If we had too much prosperity it would be bad for ourselves ?—I admit that is a provocative phrase, but it need not be misunderstood.

Mr. Massey.] I would like to clear up this point. Do the banks lend their deposits ? Judging by what Mr. Fussell said the banks lend against deposits ?—No. I gathered from what Mr. Fussell said that they do not need to have any deposits at all. I cannot conceive of any banking system, not a commercial banking system, which did purely advance business and had no deposits at all.

Mr. Fussell said that if the Government could lend £100,000,000 of securities to the bank they would lend against those securities ?—I will take a modest little bet that they would not, because I do not think that £100,000,000 worth of securities would be acceptable at the present time. Assuming the securities were there, what would they lend on at the present time ?

If the Government of the country were to deposit £1,000,000 of securities they would then have made a deposit ?—That seems to me to be a reasonable statement. I do not know whether we are talking a different language or not. I think that what you say is correct.

The bank would then proceed to make an advance against the deposits ?—Yes.

I presume that you agree that there are many factors which come into the present discussion. The monetary factor is only one, and the various nations of the world are planning industry in order to try and get out of their present difficulties under the proposed or suggested schemes. Do you think it is advisable to establish an Investment Board in New Zealand in order to control the Government lending institutions, and also private lending institutions which are not actually controlled by the banks ?—It might be quite a good idea. It is the type of question that needs to be answered in the light of a detailed proposal, but the general idea of a Board to which Government proposals for borrowing for expenditure might be submitted seems to me to be quite reasonable.

You are aware of the fact that most of the Government lending institutions are in competition one with the other ?—Yes. There is a point there which I would like to make, one that I did not include in my answer to your questionnaire because it did not seem particularly relevant to the questions asked, and that is this: I make the suggestion that all Government lending Departments who are lending money against rural securities, and for that matter all institutions—banks, stock and station agents, and mortgage investment institutions, should have attached to them a staff of competent people to advise them upon the wisdom of the investment, In some cases they have such a staff, but the number in the country is far too few, and many institutions really have no effective staff of the sort that I mention. I contemplate the type of men who has had, say, the training involved in acquiring a degree, say as a bachelor of agricultural science, and then about ten years' practical experience, say, with the Department of Agriculture or elsewhere. That is the type of man who would be invaluable to those financial institutions, who, to a large extent, lend at the present time very much in the dark and very much upon what the applicant says. That type of man would be a man whose training had taught him not only what the farm could do at the present time under its present management, but what it might do under different management, and that is the type of man who could, I think, to a very large extent check the optimisms of lending institutions in good times and perhaps encourage them in bad times.

You are of the opinion that we should have more control over the Government lending institutions as well as the private institutions ?—Most definitely.

Would you link them up with the central bank ?—I suppose that would be possible. We are contemplating rather a different type of business in a way, because many of the Government lending Departments are dealing with long-term investments, which is not the function of the central bank or of the trading banks, but so far as short-term credit, and what we call intermediate credit is concerned, I think most definitely that there should be a link between the State short-term lending Departments and the central bank.

Why not the long-term ?—I would not at the moment definitely exclude it; but there is a big distinction between a loan which was for six months, or up to five years, and one which was for thirty-six years. And yet they might be linked if it were possible to tackle this question of farmer indebtedness through the possible amortization of short-term loans and amortize them into long-term loans. I make that suggestion to the Monetary Committee—that they consider the possibility of to what extent existing short-term indebtedness of farmers might be amortized into long-term indebtedness.

Do you not consider that there is a distinct difference between long-term and short-term ?—You have your shortest term of credit, which is providing for seasonal credit, your intermediate credit, which is providing for improvements, and your long-term credit which is providing for land-purchase.

And land-development ?—Yes.

At the moment I think you are aware of the fact that we have quite a number of State Departments which are competing one with the other ?—I think that they ought to be rationalized—brought together.

On the same lines, say, as the Local Government Loans Department ?—It is all very well to make that broad recommendation, but I fancy that in practice the rationalization of the Government lending Departments would involve quite a substantial modification in the existing structure of Government Departments. I think it would mean cutting across existing functions. It would involve more than merely taking the lending functions from one Department and giving them to another, but it is a most fruitful suggestion that ought to be explored fully.

Take a farmer who actually gets a loan from the State Advances Department on a long term. He would probably go to the Intermediate Credit Board and obtain a short-term loan ?—Do you mean for five years, say ?

Yes. For seasonal credit. We find to-day that, with the exceedingly low prices, the Intermediate Credit Board on the one side demands an order on the produce of the farm which actually leaves the State Advances Department in mid-air ?—Naturally. It does not matter, does it ? That is an inter-departmental quarrel, but it is analogous to the position I mentioned in the case of private creditors.

And then you will find the State Departments actually coming into competition one with the other when they sell their bonds ?—You are not asking me to put up a clear-cut plan at the moment ?

No ?—I am entirely in sympathy with your view that the whole lot should be brought together, and, if possible—the word I used before—the whole of State lending to farmers canalized through the one body: you know where you stand then. Here a man can get an advance on sheep, an advance on wool, and very soon will be able to get an advance on the hair on the wool.

In reply to a question put to you by Mr. Clinkard in connection with trade relations, also exchange, you dealt with the question of quota ?—I dodged the word as hard as I could.

I admit you did not use the word, but you got very near it. Do you consider that the New Zealand dairy-farmer is taking up the right attitude to-day in fighting against trade restrictions in Great Britain ?—I must ask to be excused from answering that question.

You admit that you got very near the point ?—Would you mind letting that point drop.

In connection with exchange you dealt very fully with that question. May I ask you, has the full benefit of the raised exchange been fully felt in New Zealand ?—I really do not know. It is by way of

being an impossible question, I think. There are no means of measuring that. Are you asking, Has the benefit of the exchange now reached its end? Have internal-cost adjustments reached the point where there is no further benefit of exchange?

I was asking the question as to the financing of the farming community. Take the farmer with a fairly big mortgage, Has he felt the full benefit of exchange?—You mean, if he sold his butter, has he received the whole benefit of the exchange?

Yes?—Oh, yes, he has received the whole benefit in some form or other, although not at all necessarily in the form of additional purchasing-power or spending-power. He has experienced the benefit either in the form of additional spending-power or in the form of decreased indebtedness.

That is one of the main points?—Undoubtedly. That advantage may not in itself have put him upon his feet again, but it has made his position less precarious than it was before. That particular point in itself, in view of what has happened subsequently, is not sufficient to make him entirely solvent, because we know quite well that in many cases the dairy-farmers of the country are to a large extent quite insolvent.

You state that it is not advisable to reduce the present pegged rate of 125 at the moment?—I think it is inadvisable.

Would you be prepared to advocate that it should be reduced slightly?—Not at the present time. My general attitude to the thing is that a definitive rise in prices should precede any lowering of the exchange, my interpretation starting from the price cost structure of the farming industry. When you are assured that he will not suffer by such a discount, may, in fact, benefit, then by all means lower it, and the time to lower it will be when rising prices start to stir the hearts of the farmers once more and they feel that they can commence, once again, the business of buying and selling lands instead of farming them.

Then you agree that the Australian farmer had a distinct advantage over the New Zealand farmer when the rate of exchange was pegged at 125 in Austraila as against 110 in New Zealand?—Quite.

And you are of the opinion that it would be much better to increase the rate of exchange than lower it at the moment?—That is so. I do not think it is politically possible to so so: I think it would be dangerous to attempt it from that point of view, but I am completely averse to any suggestion to lower it at the present time.

In effect it is one of the main factors of the monetary problems at the moment?—So long as New Zealand is so dependent upon her external trade, the rate of exchange must always be of particular importance.

Mr. Langstone.] If the exchange was such a good thing for the dairy-farmers. how is it that quite recently they asked for a subsidy of £3,000,000 to assist them?—It was most mistaken of them to do so, in my opinion.

They wanted it?—From the point of view of their individual interests, they no doubt needed it.

Evidently the exchange-rate was not a success?—Surely that is an incorrect inference from my remarks.

It was done to increase their income, but it did not?—There are two ways in which a thing may operate. If external prices had remained stable, then the additional exchange would have been an addition to the New Zealand prices; but if external prices fell, then the effect of the exhange was to prevent that fall in prices expressing itself as fully in New Zealand as it would otherwise have done. Had there not been the 25-per-cent. exchange they would have asked not for a subsidy of 2d. a pound for butterfat but for at least 4d. a pound.

It would have interfered with the ebb and flow of the trade?—A subsidy might have been more disastrous.

And it might have been the most beneficial?—I do not think so.

We have had to finance New Zealand on Treasury bills for which we have paid 5 per cent.; £20,000,000 of them: that is £1,000,000 a year. And that £15,000,000 overseas has been earning not 1 per cent. Is that good business?—There is a very good statement, I think, in the Treasury memorandum by Park and Ashwin on those exchange funds overseas, if you would content yourself with my support of that general statement.

I am not going to content myself with that. There are people in England making margarine and going into competition with New Zealand butter. If they can get cheap finance to reduce their costs, is that a good thing for the New Zealand farmer? Is that what is happening?—It may be, but what relevance has that got to any particular statement of mine?

The question is this——?—I am not responsible for what the British Government does for margarine.

We have to take into consideration all the possible consequences?—If I might convert your own statement into terms of subsidy, the application of a subsidy to butter in New Zealand is not going to affect the margarine policy in England.

Yes, it would. The money would not have been present in England for them to get it cheap?—The amount of money we pay does not economically affect the English policy in regard to dairying at all.

The question of the banks lending their deposits: The national debt of Great Britain grew in four years from £700,000,000 to £8,000,000,000, but the banks lent their deposits. Where did it come from?—You know as well as I do there were various devices by which that was financed.

I suppose Reginald McKenna is fairly correct?—I should say he is usually very correct.

He states definitely as chairman of the directors of the Midland Bank, that every loan or overdraft creates fresh deposits, and every repayment of loan or overdraft destroys deposits. Those are spent internally?—Our position seems to me to be the same except for our exchange position which complicates it.

When any one goes to a bank for financial accommodation, he must take securities along?—Quite so.

And the bank's process is only monetizing or liquefying those securities; it is not a question of the deposit there at all?—The inflationary procedure possible during the war-time when the war psychology favoured very definitely the expansion of enterprise and the expenditure of money is not necessarily possible at a time when business psychology is so averse to undertaking investment enterprises.

It may be good for destruction but not for construction?—Very possibly.

Do you mean that something can be put in force for destruction, but not for construction?—Yes; people do lots of things for destruction that they would not do for construction.

The principle could hold good either way?—We could wish it would. We could wish that the principle would operate the other way and be good for construction but not for destruction, but I am afraid it does not work that way.

Would it help the nation?—No one could be more anxious than I that it would work that way.

The question then comes to our immediate needs. Evidently New Zealand is short of income?—Yes, in relation to her costs.

If we take things by and large, taking wealth in its broadest sense, the assets and securities and real wealth of New Zealand to-day are physically as great as ever they were?—Yes, they may be greater.

So the foundation of finance is there; the people are short of income; farmers and others are unemployed. Why are they short of income?—I would explain it in terms I have already used: So far as business is concerned, it is the price that is put upon the thing or the service in relation to costs incurred which determines whether business is successful or not. In periods of boom or prosperity, it so happens that for those doing business the prices which represent their incomes move more rapidly than do those prices which represent their costs, and therefore there is to them a favourable margin which might quite usefully be called a surplus. In the reverse situation, which we are going through at the present time, the price which is their income has fallen more rapidly than the prices which represent their costs, and in that sense I believe that there is a deficiency in purchasing-power derivative from the deficiency in profit-earning due to that situation.

Somebody must have changed the gears from forward into reverse gear?—Once upon a time I did always look for the nigger in the woodpile, and I felt you could pin everything down to one person or one set of circumstances; but I do not do so now.

You think it is just like Topsy, "It growed"?—There are many factors involved.

There must have been some human factor that brought it about?—Undoubtedly. We work as human beings; but whoever brought it about probably did not know what he was doing or did not know he was doing it.

The question of every nation trying to get a favourable balance of trade: Is that possible?—Not quite.

If one country has a favourable balance, some country must have an unfavourable balance?—That is so.

Our money system in New Zealand, then, is linked with whether we can get a favourable balance of trade in the scramble for trade?—At the present time it is necessary to our solvency to have a favourable balance of trade.

You think that is the best idea—the very best of all possible things we can fix our money standard to?—No. I do not believe in the perfection of any existing institution at all. Why should I assume that any existing system which is obviously so imperfect is the best thing we could have?

It does seem that the only alternative to sterling-exchange standard is an internal price-level?—I think that the line of development is the one which I have suggested—that is, start with the fact of a sterling-exchange standard. I think we will remain on such a standard so long as we do any important overseas trading. From this basis see to what extent with rationalized banking institutions you can devise modes of control which will lessen the evil effects. In other words, I feel that there are no absolute certainties that any of us can point to at the present time; that it is a case of an institution such as the Central Bank doing its very best, by what I have called intelligent trial and error, to find which is the most effective, sound, and safe way of handling our monetary machine. And I will quite definitely say there is no man living able to say here and now what is the right and permanent policy for that bank to adopt. They have to find out as they go along.

Our external trade is about 40 per cent. of our internal trade?—Yes.

Our internal trade is about 100 per cent. Should the 40 per cent. control the 100 per cent. or the 100 per cent. the 40 per cent.?—It might seem very unfair for the smaller to control the latter, but to a large extent it does.

It does, I know. We are trying to find out?—By all means try and see whether through your central bank you can limit the effects of that 40 per cent. upon your 100 per cent.

But if your central bank works on a sterling-exchange standard, how can it be different from the ways we are working now?—In the ways I have suggested, through experimentation on the one side, with the exchange as a control weapon.

We are trying that now. The exchange is in operation now and we are still on the sterling-exchange standard on the basis of our monetary system. In what way is the central bank going to alter that?—Exchange is in operation now but in a very uncertain way, so much so that business people do not know what is going to happen to-day.

Even if they make it permanent, it does not alter the principle?—I am not suggesting for a moment that in our present circumstances the exchange-rate by itself is going to solve all our difficulties. It would be folly for me to say that. I do say that an intelligent use of the exchange is one of the weapons we must learn to use; but there are lots of other things beside.

Although the exporters' income is determined by prices overseas, my experience has been that the internal price-levels are not determined by prices overseas. It is determined by all sorts of things internally, and therefore we have disparity between an income based upon external prices to meet the very inflated or increased internal prices you have got now ?—I have said that already. We have spoken quite a lot about what we may call the rigidity of our cost structure. That is our position; we have an internal cost or price structure which is relatively rigid, while our external one is relatively fluctuating. That is our trouble.

How can cost go down unless you take money out of circulation ?—It can.

The Chancellor of the Exchequer says it cannot ?—I will take leave to disagree with the British Chancellor of the Exechequer, because it can go down, even if the circulation of money is increased—namely, through greater efficiency.

Could wages go down ?—Not necessarily; they may go up higher. The Chancellor of the Exchequer was incorrect if he said that: it is contrary to experience.

If you like to read the report of the World Conference, he made a statement there ?—Well, he made a mistake.

Do you not think you are making a mistake ?—I do not think so. One of the beneficial effects of the application of science and invention to industry is to enable production to be undertaken at much lower cost; but that does not necessarily involve a lessening of the amount of money in circulation.

If you take away costs, you take away some-one's income, and then they cannot spend ?—You are on to an entirely different set of arguments. I was speaking of one of the beneficial effects of the application of science on industry.

I am talking about taking New Zealand as a running concern, as it is to-day. What costs would you reduce ?—At the present time ? I would like to see interest come down.

We have reduced costs in this country fairly considerably, this last two or three years. Has that been a good thing for the country ?—Yes, in the circumstances; in this sense (we must be very careful to see that neither your questions nor my answers are taken out of their context): a higher level of costs would certainly have promoted a wider degree of insolvency than exists at the present time. I think that the devices which have prevented a wider spread of bankruptcy have been in the main beneficial. I find it difficult to believe that the thorough-going bankruptcy of New Zealand would have been a good thing; but I quite recognize that there are some people who think that that would have been the best way to get back to normal.

Putting up the exchange-rate did not reduce costs ?—Not necessarily. It might tend to raise some of them.

Getting back to the question of internationalism, I notice that Major Elliot, the Minister of Agriculture in Great Britain, speaking in the House of Commons, made a statement that they put 1,100 people on the land in Great Britain in the last six years. It was black treachery to put them there, and it was black treachery to those who were there, until they had a guaranteed market. If it is black treachery to put people on the land in the Old Country where there is a market at the door, it does not seem to be a good outlook here ?—It seems to me to be inadvisable to put people on the land here or to encourage production if we are certain that the markets for our products are restricted or lowered.

By a process of true reciprocity we are able to arrange a price for our exports ?—That may be a very good idea.

Or we are to fix an internal price-level here to give them the income ?—I do not think that is possible.

The present thing is breaking down ?—What do you mean by breaking ? It is pretty badly bent.

The farmers, and the nation, and some of the local bodies are in a very serious position financially ?—We remain solvent by not paying our debts; that is the position.

That is not satisfactory is it ?—No; it is a transitional phase, of course.

Mr. Murdoch.] There is one point you make in your statement about the co-ordinating of companies. You suggest that they should have a Board ?—Is that the Investment Board ?

Yes ?—It was a very qualified approval, was it not ?

I took it that the notion you had was that it would be advisable to set up a sort of Advisory Board or Inspecting Board if you like ?—Is that in reference to a question asked me by Mr. Massey, or in reference to a question in the questionnaire ?

It is a question in the questionnaire ?—The question in the questionnaire was whether I thought it would be advisable to set up a Board to advise the investing public on the economic merits of any proposal, and my answer to that was that I favoured the principle but doubted the possibility of getting a competent personnel outside the Associated Stock Exchange, and doubted whether it would be wise to constitute that Stock Exchange a judicial body, seeing that they were tied up financially in the decisions which they would have to make. I would like to see it done if it could be done.

The point I see is the danger of any Board or any representative of, say, a Government institution "OK-ing" any proposal ?—Yes; that is very dangerous. It might kill the Board and prevent anybody being willing to go on to it.

A public-works policy was tried in Great Britain to relieve the unemployment situation and it has been definitely turned down now as not being feasible or satisfactory ?—Somehow or other I feel that the question of embarking upon a public-works policy in New Zealand should not really be investigated as an isolated proposal but should be linked up to a much more comprehensive investigation as to what are the possibilities in New Zealand of enterprises of all sorts, and on a basis of such a comprehensive investigation to decide what would be the proper sphere, if any, of a public-works policy and what the proper sphere for the encouragement of private enterprise.

I assume, from your statement, when you say you want to encourage production in other than primary industries, that the indication given is that you would suggest that we promote more of our

manufactures in New Zealand and concentrate to a lesser degree on the agricultural side ?—I think it is probable that we will need to consider very carefully in what ways we can economically encourage other than primary industries, but there are so many qualifications to be attached to that, from my own point of view, that it is rather dangerous to pursue it. It is a part of my working philosophy that encouragement given to any private enterprise should have associated with it a definite responsibility on the part of the private enterprise to the body which gives it the help.

I quite see your point, and I appreciate it because I realize that we have got to come to that sooner or later, but here is the point where I see our greatest difficulty. Take a country like Japan, where they work the machines twenty-four hours a day and their money is greatly inflated. Assuming that they are manufacturing the same class of goods as we are manufacturing, what proposals have we to check them ?—That certainly is a difficult problem. I think it would become one of straight-out political policy if it came down to bedrock. I think there is a case to be made out, certainly at the present time, for prohibitions.

Do you not think that the tendency the world over at the present time is for countries to be self-contained ?—Yes ; I had that in mind.

We have coal in plenty in New Zealand, yet we have our coal-miners idle ; our fields not working to capacity. Of course, the answer is that we have substituted electricity and oil. Have you any suggestion for checking that ?—I do not think that it is possible to rectify that situation while you maintain the present *status quo* of industries. It might be very possible to rectify the position if, in conformity with a comprehensive national plan for the encouragement of other industries, you provided those coalfields with economic opportunities for use.

Mr. Schramm.] You had some objections to the State having complete control of the banking and credit system ?—An objection, you will understand, in the present situation. I think that, to repeat my answer to Captain Rushworth, it would be inadvisable for the State to be entirely responsible for credit in this country so long as the bulk of other economic activities was in private hands, and so long as other or Parliamentary institutions were still open to the impact of democracy.

You would not hand over the administration of justice in a democratic State to private control ?—No. There is no profit-making in justice—all loss, judgment summonses and things like that—different category of events altogether.

It is a most important function of the Government is it not ?—Yes. John Stuart Mill called it one of the necessary functions of Government, like defence, taxation, and so on.

You would not hand over defence to private enterprise ?—No.

And the Post Office ?—No.

And education ?—No.

And yet you would hand over the money machine ?—I think so at the present time. I am not going to be too tenacious upon the point because there have been so many transitions from private enterprise to State enterprise in other fields that through the medium, say, of a central bank, a gradual transition may be made from unco-ordinated private banking through co-ordinated banking up to State banking. All I say at the moment is that I would like to see, before the State becomes the State banker, further advances in the form of control over the non-banking economic activities of society. It is no good listing any more of those things like defence and rates and post-offices and that sort of thing.

I am with you there. So you will come along that road too ?—Yes ; I may be there before you.

You have studied the Reserve Bank Act ?—Yes.

Did you think it was a wise thing for the Government to allow private capital to come into that ?—I think it was a very expedient thing. They could have done the other, of course.

Mr. Ashwin.] Do you think that the level of the national income is now anchored with the present exchange-rate ?—I cannot tell that, because I have no exact means of measurement, but I should say this, if I may invert your question : that the present exchange-rate is a truer expression of the general level of prices than a lower exchange-rate would be.

By that I infer that all the readjustments to the rate have been completed ?—I have suggested in my answer to one of the questions that probably most of the adjustments to that higher exchange-rate have been made by now. It is very hard to determine.

I agree. But how much longer do you think it will take before those adjustments are completed ?—That depends upon the extent to which adjustments have already occurred.

We cannot really say they are complete until it will carry itself. That is what it comes down to ?—I would not be prepared to be dogmatic about that, but it is probable that some higher exchange-rate would more truly express the present situation than the present one. I would put it the other way round, in the negative way, by saying that the present rate is more truly expressive of the price situation than a lower rate would be ; and I would like to leave it at that because it is highly speculative ground.

The Chairman.] You were speaking about cheap money. You would like to see the rate of interest reduced by the banks ?—I would like to see it as low as possible—lower than it is.

Would you be in favour of the banks lowering the rate of interest to, say, 3 per cent. or 3½ per cent. providing protection was given in the matter of the deposits. The rate, of course, would have to be reduced accordingly ?—Yes.

And I may say that while the banks would bring down the rate of deposits, we would have to see by legislation that other institutions were brought into line ?—Undoubtedly.

And you would favour that ?—I would.

We thank you very much, Mr. Williams.

WELLINGTON, THURSDAY, 19TH APRIL, 1934, AT 10 A.M.

Witness: Professor A. H. TOCKER.

The Chairman: We welcome you to the Committee this morning, and I might say that your statement and questionnaires have been circulated among the members of the Committee, so it will not be necessary to read them over, but I take it that you will be referring to them as you go along with your speech. I would suggest to you that probably you might speak for an hour or something like that and then give the members of the Committee an opportunity to ask you questions on the questionnaire, and also any matters that you bring up.

Professor Tocker: Mr. Chairman and gentlemen, if I may, I think the best approach would be to read this paper that I have already submitted and to expound certain matters as I go along. Two questionnaires and a paper prepared by the Treasury have been submitted to me. I propose first to offer some general comment on the subject-matter covered in the Treasury's paper, in order to provide a general foundation for my evidence, and then to answer the questions in detail briefly. I find myself in substantial agreement with the general conclusions reached in the Treasury's paper, but I would like to offer a different approach, particularly to the subject-matter of the latter half of that paper. I would separate the first half of the paper, and agree upon the following conclusions:—

(1) That the New Zealand monetary system is a sterling-exchange standard based upon an approximately fixed par of exchange with Britain.

(2) Our external trade is unusually large and has a proportionately important effect upon internal conditions. Variations in the balance of external payments govern variations in exchange funds held abroad and these funds are an important factor in regulating the volume of credit in New Zealand.

(3) Banking is well developed in New Zealand. Cash money is subsidiary to credit money, and the note-issue is regulated largely by the demands of the public. The latter half of the Treasury's paper describes the development and operation of the banking system and particularly the methods by which credit may be created. I think that Mr. Ashwin, in his effort to be simple and clear, has followed the economist's usual practice of isolating those factors he meant to discuss, and has therefore had to omit much that is important. I would offer a different approach to this question. A survey of the bank records of the past shows clearly that no close relationship exists between the movements of bank advances and bank deposits in New Zealand. When the balance of payments with overseas countries is favourable, deposits increase and advances decrease. When that balance is unfavourable, deposits decrease while advances increase. I described this relationship in the *Economic Journal* nearly ten years ago, and have followed it closely quarter by quarter ever since. Exports from New Zealand are normally paid for by bills on London. The banks presenting those bills in London get money in London, sterling money of some sort, and credit their customers' accounts with the appropriate amounts at this end. When imports are paid for, something is taken from money at this end and is paid out by the banks with money at the other end. Therefore any excess of exports over imports means an accumulation of funds overseas and an increasing excess of deposits over advances in New Zealand. The relationship was very clear in the 1920–21 period, when we had a huge excess of exports which was built up during the war period, a big excess of deposits over advances also built up during the same period, and a lot of money was available to spend. Then we had a huge flood of imports come in. The excess of exports over imports went down and became very much a negative quantity. The excess of deposits over advances went down in turn.

Mr. Langstone: Did that include loan-moneys?

Professor Tocker: No. As recovery developed exports exceeded imports, more money flowed into the banks, and the banking figures went up in turn. A study of the figures for free deposits shows a fairly serious slump 1907–9, which reached its lowest point in March, 1909. There was a boom in the middle of 1920. The subsequent slump reached its lowest point in the first quarter of 1922. A high point was reached again in 1925–26; there was a falling-off in 1927–28; a high point occurred at the end of 1928, and a low point in the latter half of 1932. There has been a continuous increase since. Free deposits figures have fitted very closely on to anything else we have been able to get representing business activity. It is as good an illustration as you can get of booms and slumps in New Zealand. I think if one takes the actual figures over the period 1900–1933 there is abundant proof, which leaves no question at all about the operation of the exchange standard and the relation between overseas payments, advances, and deposits in New Zealand. Bank advances do not necessarily create bank deposits. The best approach to the relationship of advances and deposits is through a bank balance-sheet. The balance-sheet is a device used by accountants to show the distribution of the funds used in a business. On one side of the balance-sheet are set out the sources from which various amounts are drawn, and these are described as liabilities. On the other side are set out the channels through which funds are employed, and these are described as assets. Both sides of the balance-sheet, however, refer to precisely the same funds, the total funds used in the business, and the balance-sheet classifies the funds in accordance with the sources from which they are drawn and the channels through which they are employed. Since both sides describe the same funds, the balance-sheet must necessarily balance. Any increase or decrease on one side must therefore be accompanied by a corresponding increase or decrease on the other. The point I want to make is that the balance-sheet does describe the same funds on both sides, and it therefore must balance. An increase in advances, which is one item of the asset group, may therefore be balanced by a corresponding decrease in any other asset on the balance-sheet or by a corresponding increase in any liability on the balance-sheet. An increase in the banking advances, then, may be offset by reduction in discounts, call-moneys, securities held, or property and premises—that is, you may have an increase in advances

offset by a similar decrease in any other item on the assets side of the banks' balance-sheet. On the liabilities side an increase in advances might be offset by an increase in capital, in reserves, in the profit and loss account, in the note-issue, in the deposits (free, fixed, or Government), or in any other liability, and there is not that necessary connection between deposits and advances which so many people and so many text-books have assumed.

Mr. Langstone: Reginald McKenna has assumed so.

Professor Tocker: He is speaking there with certain limitations implied. Is it not perfectly obvious to anybody that, if a balance-sheet does balance, then an increase in advances may be offset by any other item in the assets side or by any other item on the liabilities side. There is no fundamental difference between the balance-sheet of a bank and the balance-sheet of any other business. It is only when all assets and liabilities other than advances and deposits remain the same that an increase in advances must necessarily be accompanied by an increase in deposits. In much of the modern talk about controlling the volume of credit in the interests of stable economic conditions, the instrument of control advocated and used takes advantage of the very fact I have been trying to explain. One of the methods of control is to control the total volume of deposits and notes issued by open-market activities, and a bank may extend its liabilities by buying securities in the open market. If it buys securities it usually gives somebody either notes or a deposit on its books for the amount, and it may extend credit or cash to that extent; if it wishes to contract the volume of credit or of notes it may sell securities, and the cheque paid for the securities will decrease deposits by that amount, or the cash paid may be withdrawn from circulation. Hence deposits and the volume of credit outstanding can be affected by methods other than by increase or decrease of advances, unless, of course, you include securities in your advances. In the case of Government securities, where they are real advances to the Government, that inclusion is perhaps justified, but where a bank goes into the open market and buys and sells on its own account they are scarcely advances in the ordinary sense. In the case of the banks operating in New Zealand, their assets and liabilities are distributed between New Zealand, Australia, and Britain. An increase in the assets held in New Zealand may therefore be accompanied by either a decrease in assets or an increase of liabilities held overseas. That is what usually happens. Conversely an increase of liabilities in New Zealand, deposits, for instance, is usually accompanied, not by an increase in advances in New Zealand, but by an increase of assets in the form of exchange funds held overseas. It follows that the view commonly advanced that advances and deposits must rise and fall together does not as a rule hold true for New Zealand conditions. I have the banking figures since 1919, and I can refer to any particular period if you like over the last fifteen years. Taking March quarters, bank deposits have increased during the past two years by round about £9,000,000, while advances have declined by about £9,000,000. The explanation lies in the fact that these changes have been offset by variations in funds held overseas. Over any short period no close relation can be found between changes in advances and deposits in New Zealand. It is seldom true that increased advances mean increasing deposits, or that decreasing advances mean decreasing deposits. Generally deposits are increasing when advances are decreasing and *vice versa*. Over long periods both deposits and advances expand with the increasing value of production and trade. Since notes are subsidiary to credit instruments, bank credit is the chief form of money in use and the volume of bank credit is important. This bank credit consists of the total liability undertaken by the banks to find cash when called upon. In New Zealand cash consists of notes, which are legal tender. Since there is no effective limitation on note-issue, the liability to find notes presents no real limit to credit expansion. But the real liability which the banks undertake is the liability to find cash abroad. Past experience has shown plainly that increasing credit in New Zealand is always accompanied, sooner or later, by an increase in imports. The increase in imports, if it goes far enough, must necessarily create an unfavourable balance of payments. The banks must then find money overseas for their customers in New Zealand, and this money usually has to be provided in sterling. The period 1920–21 might be quoted in illustration. A large accumulation of deposits in 1920 was followed by a heavy influx of imports, and bank figures show that between the June quarters of 1920 and 1921 the banks had to find for their customers £28,000,000 in overseas money. Similarly between the June quarters of 1925 and 1926 the banks had to find abroad nearly £7,000,000 to meet their customers' requirements. A bank's ability to extend credit is therefore limited by its liability to provide sterling, and its deposits must be kept within such limits in relation to exchange reserves held overseas as experience has shown to be safe. It is this relationship that fixes the limits to which banks can safely extend credit. On the other hand the banks depend largely on advances for their gross income. They are commercial institutions which have to find profits to cover operating-expenses, dividends, and expansion of reserves, and they usually want to advance as much as possible in order to maximize their gross income. But there is another limit on their power of lending, for they cannot normally lend beyond the amount demanded by their customers. Marshall, the father of modern economics, says that in every community there is a certain proportion of its wealth and income which the community finds it convenient to hold in the form of money. This proportion is determined, not by the banks, but by the users of money who are customers of the bank. These customers pledge their credit and obtain bank advances. Customers' credit in this sense may be regarded as the confidence which bankers have that those customers will fulfil their obligations when due. This confidence may rest on the pledging of assets or on knowledge of the customers' circumstances, character, and ability. Bank customers have to pay for the accommodation given them, and they therefore usually take no more than they can employ to return them something more than cost. The demand for credit, therefore, depends upon the demand of creditworthy customers, which depends upon the extent to which they can use bank credit profitably. It is to the banks' interests to provide as much credit as possible and so augment their own incomes, but their power is limited by their liability to find funds overseas as well as by the limited demand of their

customers. The price at which advances are made—that is, the interest rate on overdrafts—is usually determined by the conditions of supply and demand of bank credit. Among those conditions must be included the competition of other forms of credit such as long-term credit. That is, any person requiring money may go to a bank for it, but there are other ways of getting it, and if he can get it elsewhere on more favourable terms he probably will not go to the bank. His demand for banking credit is therefore determined partly by conditions in the rest of the money-market. These are the general conditions governing the volume of bank credit in most countries where banking is highly developed. The special features of the New Zealand system—that is, the exchange standard features—have developed mainly to meet the needs of the country and the community. The present system appears to be sound, flexible, and very closely interwoven with the economic life of New Zealand. Its adequacy to supply the volume of credit needed may be judged from recorded figures. I have had curves fitted to several statistical sources showing the rate of increase over the period 1870 to 1930. These figures show the general trend or rate of growth over the period and omit seasonal and cyclical deviations. They show the general rate of increase to be 4·4 per cent. annually for the value of total production in New Zealand from 1900 to 1930, and 4·4 per cent. both from 1870 to 1930 and from 1900 to 1930 for bank advances. That is the rate of increase per year. It is cumulative, of course—a compound-interest rate. Bank deposits, imports, and exports have all increased at an average annual rate of 4 per cent. The same is true of the general rate of the growth of advances; and advances have increased over this period at a slightly more rapid rate than deposits. The chief causes of the ups and downs are the differences in the overseas trade balance. With exports and imports again you have ups and downs, and the rates of increase are exactly the same, a 4-per-cent. rate of increase over the whole period. The fact that production has expanded more rapidly than deposits probably means that production is now financed to a larger extent with long-term credit, as might be expected with the increased mechanization of industry. From the fact that advances have increased more rapidly than deposits either of two conclusions may be drawn. First, the banking structure may be sounder because shareholders' funds bulk larger and deposits smaller in the total liabilities, or, second, there may have been a variation in bank practice whereby bank advances bulk larger in the total assets and other assets bulk smaller. Either of those would give the results that we have found. Figures show conclusively that over a period of thirty years bank credit has expanded in rough correspondence with the needs of production and trade. I know of no evidence, statistical or other, to support the view that arbitrary restriction of bank credit has ever been the cause of depression in New Zealand, and the view that it has been does not agree either with bank practice or with the published returns of our monetary system. During the period of the present depression, taking figures for the March quarter to avoid seasonal variations, bank deposits fell from £58,200,000 in 1929 to £53,300,000 in 1932, and have increased to £62,300,000 in 1934. Bank advances amounted to £45,200,000 in 1929, £53,200,000 in 1931, £49,500,000 in 1932, and £40,300,000 in 1934. These figures are taken from the bank returns from March, 1929, to March, 1934. Deposits fell by just about £5,000,000 over that same period; advances increased by £4,000,000. Deposits fell while advances increased. From 1932 to 1934 deposits went up £9,000,000 and advances decreased £9,000,000. There cannot be any close relationship between advances and deposits under those conditions. These figures show that deposits are by no means wholly dependent on advances, and that there is now no scarcity of bank money. There has, however, been a remarkable change in the amount of bank credit in active circulation. Taking March quarters again, in 1929 free deposits were £25,700,000, and in 1932 £17,000,000. In March, 1934, they had risen again to £21,600,000. There has been a big fluctuation in free deposits, the part of deposits which are being actively used in business. These variations have been due, however, largely to the fact that, under the conditions existing, bank depositors could not use as much of their money profitably in their businesses and have preferred to place more of it on fixed deposit. The total sum of free deposits has been falling since 1920, but more recently it has risen again, and the advance recently is very promising. The League of Nations once took the relationship of free to fixed deposits as the best indication there was of general fluctuations in business confidence. Where free deposits fell in relation to total deposits it was considered a sign of falling confidence. Where free deposits rose confidence was regarded as improving. In New Zealand the fall was from £25,000,000 in March, 1929, to £17,000,000 in March, 1932. The figures are back to £21,600,000 for the March quarter, 1934. The improvement is very striking. The lowest figure since 1929 was below £16,000,000. I turn now to the questions set me, and take the larger questionnaire first.

1. *In view of present conditions and the prospective outlook for the next few years, what should be the exchange policy of New Zealand?*

2. *On balance would devaluation at New Zealand £125 to £100 sterling be in the best interests of New Zealand? This question assumes that £125 would be the "normal" exchange-rate about which adjustments might be made if warranted in the future.*

Under present and prospective conditions I would favour maintaining the exchange at the present rate. Stability is highly desirable, and this is emphasized in an agreement signed by the British Empire Representatives at the World Economic Conference of 1933. Last year's increase in the exchange-rate created a considerable disturbance in trade, and any violent downward movement would create a similar disturbance. I discuss the advantages and disadvantages of a reduction in answer to the next question, but I consider that in the absence of any excessive rise in export prices it would be wise to maintain the present rate, and perhaps ultimately to devalue the currency to a level of 125. Should export prices rise so far as to threaten an undesirable boom, which would almost certainly be followed by an equally severe slump, a downward movement in the exchange-rate might modify the boom and limit the severity of the subsequent depression. But it is difficult to determine New Zealand's exchange

policy until we know what the rest of the world will do or what conditions will develop. When conditions are sufficiently settled, and when Britain has settled her own currency policy, we may be able to determine ours. It should be remembered that for most countries in the world the parities adopted when currencies are ultimately stabilized will differ from the parities ruling prior to the depression. For most countries the old pars of exchange have lost their significance. They were the pars under the old gold standard.

3. What would be the advantages and disadvantages of lowering the exchange-rate on London, from the point of view of (a) *the budgetary position;* (b) *the economic structure of the country?*

I would prefer to consider the effect on the economic conditions in the country first, as I think the budgetary position will be dependent on these conditions. The advantages to the country of a reduction in the exchange-rate would be to provide a temporary stimulus for imports and to lower costs in New Zealand money both of these imports and of some New Zealand products competing with imports. It would also reduce the exchange that has to be paid on interest, &c., due overseas, and the taxation necessary to cover that exchange. These reductions would lower some of the costs of living and of production. My own idea is that that fall in the costs of living and of production might be round about one-quarter to one-third of the falling exchange. The disadvantages of such a reduction include a corresponding reduction in all receipts from exports, in the prices of exportable commodities sold locally, and in the price that may be charged for local goods competing with imports. It would place New Zealand exports in an unfavourable position compared with those of our competitors in overseas markets whose exchanges are also depreciated below parity with sterling. These competitors include Australia, Argentina, and Denmark. It would increase the real burden of all internal debts and other industrial costs, most of which are rigid. It would contract the national income and the monetary demand for goods; it would lessen profits and turn some profits to losses. It would check recovery and might promote further depression. The first advantage to the budget would be to reduce the amount that has to be found for exchange on debt service due overseas. I think this is the only permanent gain to the Budget. The chief disadvantage is the fact that the national income, which is the source of all taxation, would be reduced roughly in proportion to the decrease in the value of exports, and the yield of taxation would also be reduced at least proportionately, and probably more than proportionately. Under present conditions, too, if the advantage of the present exchange-rate were removed, it would be difficult for the Government to withstand demands for subsidizing certain export industries. I have said here that I think the only permanent gain to the budget would be the cost in the exchange of debts due overseas. There has been some misunderstanding of the cost of high exchange to the budget. A distinction must be made between the cost of the high exchange-rate and the cost of the Bank Indemnity Bill. A reduction in the exchange-rate would not remove the latter cost. The cost of high exchange consists mainly of the increase in the cost of debt services overseas. Under the Bank Indemnity Bill the Government has undertaken to purchase all funds accumulated overseas since the rate was raised, and it borrows on Treasury bills in New Zealand for this purpose. If the Government has to take over, say, £10,000,000 sterling at 125, paying for it £12,500,000 in New Zealand, and has later to sell this amount at par in New Zealand, the loss will be £2,500,000. But if the present rate is maintained until that surplus is worked off, there will be no loss on account of this temporary surplus. The loss, if any, can not therefore be determined until the rate is ultimately stabilized, and it will depend upon the new parity of exchange and the amount of surplus funds outstanding at the time when parity is adopted. There is also a cost to the Government of the difference between the rates of interest earned by surplus funds held in London and the rates paid on Treasury bills for money used to buy those funds in New Zealand. This cost would not be escaped if the exchange-rate were lowered, and I do not think it can properly be regarded as an exchange cost. It has been stated, too, that loss of Customs and other taxes have followed the rise in the exchange-rate. The world has had abundant experience since the war to prove that inward and outward trade, including invisible items, will balance ultimately at any rate of exchange. The effect of a high rate, then, may be to cause a temporary decline in imports and a consequent temporary loss of Customs duty, but both the decline and the loss must necessarily be temporary and must be offset by later gains. I can see no reason for believing that any other taxes will be reduced by a movement of exchange which increases the income of the country expressed in its own money. They should rather increase at least proportionately to the rise in exchange.

4. In what respects can the Reserve Bank act as an instrument in securing national control of the monetary situation in New Zealand?

Answer: The Reserve Bank may act as an instrument of monetary control by—

(1) Control of the note-issue;
(2) Pooling and economizing both note and exchange reserves;
(3) Holding the reserves of other banks in New Zealand;
(4) Determining, in the light of the conditions prevailing, and with fuller knowledge of currency and finance throughout the world, as well as by close study of New Zealand conditions, what our domestic credit policy should be from time to time.

The Reserve Bank might express this policy through the rates at which it will buy and sell exchange, the rates at which it will lend to customers, on both old and new types of loans, through the development of a short-term money-market in New Zealand, and through the encouragement it might give to the better organization of long-term markets, as well as by its advice to the Government, the commercial banks, and its other customers.

5. In so far as stock and station agents act as banks, should they be classed with the six trading banks for the purposes of better co-ordination and control of banking policy?

Answer: The question whether the stock and station agents should be regarded as trading banks is a very open one. I think it should be decided in the light of the experience which the Reserve Bank accumulates after its opening. I imagine that our future monetary system will have the Reserve Bank at the centre, an inner ring of the commercial banks closely associated with the Reserve Bank, and an outer ring including the stock and station agents and other financial institutions, associated probably more closely with the inner ring of commercial banks, and to some extent associated also with the centre of the ring—the Reserve Bank. But I am not prepared at present to say whether the outer ring should be more closely associated with members of the inner ring or with the centre, or whether the association should be voluntary or compulsory.

6. In view of the fact that much capital in New Zealand is wasted by unsupervised investment, would you favour the setting-up of an Investment Board not to guarantee a return on investments, but to give an opinion as to the economic soundness of any project for which the public were asked to subscribe for shares?

Answer: I do not think the advantage of such an Investment Board would be sufficient to balance the disadvantage. It might, however, be desirable to consider increasing the protection now given, by statute, to the investing public against undesirable practices.

7. Would you advise the setting-up of some additional institution to facilitate small savings?

Answer: I know of no good reason for setting up additional institutions to facilitate small savings. There are already many in existence.

8. What are the limits of economic recovery in New Zealand by internal expansion of (a) Treasury or bank notes, (b) credit?

Answer: (*a*) I can see no good reason for increasing the internal expansion of cash through Treasury or bank notes. We have already ample freedom of note-issue; (*b*) one of the effects anticipated from high exchange was the expansion of bank credit in New Zealand. Bank deposits have increased considerably. Normally as bank deposits increase and the excess of deposits over advances expands, bank funds overseas expand and the banks can lend more and under easier conditions in New Zealand. Under the Bank Indemnity Act, however, any expansion of overseas funds, which is reflected immediately in an expansion in the excess of deposits over advances in New Zealand, is automatically taken up in Treasury bills. The banks, therefore, have a buyer at a fixed and profitable rate for every additional £1 of resources they have available in New Zealand. I consider this arrangement has restricted advances to the public and has maintained the rate of overdraft at a level higher than would otherwise be the case. If this is so, it has also probably retarded recovery and business expansion. A few minutes ago I was trying to explain how credit could be expanded or contracted by banks' open-market operations—buying and selling of securities. I am rather looking for some one to examine the New Zealand banking figures who does not know the big differences operating in New Zealand, and who will show that for the last two years deposits have expanded £9,000,000 and advances declined £9,000,000, the difference being taken up mainly by Treasury bills. Any one who looked at those figures not knowing our particular conditions would say immediately, "Here is inflation, here is a Government that has probably got an unbalanced Budget and has borrowed £17,000,000 or £18,000,000 to meet extraordinary expenditure, and all this money has come back, some to increase deposits and some to decrease advances, and here you have a violent inflationary process caused by a Government spending more than it has been getting. That is what any observer from outside would say.

Hon. Mr. Downie Stewart: Inflationary or deflationary?

Professor Tocker: Inflationary. Here in New Zealand we know that a curious arrangement was made whereby every extra £1 the banks had available in New Zealand of surplus deposits over advances was taken by the Government at a fixed rate.

Hon. Mr. Downie Stewart: If the advances were contracting to the extent of £9,000,000, would not that be deflationary?

Professor Tocker: That would be a deflationary tendency, but presumably the deposits are being used to contract the advances.

Hon. Mr. Downie Stewart: The net result is deflation?

Professor Tocker: No, inflation. There is an amount of £18,000,000 involved. The balance of payments is responsible for £18,000,000 of inflation, but the banks' customers use half of that amount to repay advances; the other half increases deposits. The net result is inflation of £9,000,000. I am not accusing the New Zealand Government of inflationary action; this is the curious result of our having an excess of deposits over advances, which is the effect of an excess of exports over imports. But all that extra money is being taken up automatically by the Government at a fixed rate, and that means that the increased money is not available for our ordinary business and that money is not available at lower rates.

Mr. Langstone: It is spent by the Government?

Professor Tocker: But not in New Zealand; it is used to buy funds in London; both the loans to the Government in New Zealand funds and the funds in London are immobilized; that is deflationary.

Mr. Langstone: That will be corrected if the Central Bank takes over London funds later on?

Professor Tocker: Yes. I have already explained in my first section the limits and conditions of credit expansion, and I think these limits and conditions should be maintained in any sound monetary system.

9. In New Zealand, is there any reason why the Government should pay interest on Treasury bills?

Answer: There are strong reasons why the Government should pay interest on Treasury bills. Neither money nor credit can be expanded arbitrarily without serious effects. The amount must therefore be limited. Interest is the means by which limited supplies are rationed amongst those who can use money to advantage. On the matter of inflation, I happened to be in England last year and asked quite a number of people what was European opinion about this. I asked Mr. Keynes, "Why did not a lot of the countries of Europe, which were maintaining the gold standard at tremendous costs to themselves, only by means of trade restrictions and so on, why did not these countries get off the gold standard and free their trade? They would get better prices in their own country for exports and could relieve their position tremendously." Mr. Keynes told me, and a large number of other people expressed the same opinion, that in Europe one of the strongest factors in politics is the objection to inflation. They said, "You cannot swindle a people twice in the same way in one generation." Most of those countries had had serious inflation during the war period; most of the people thought it had been a swindle. When they got back to the gold standard they looked upon that as the safeguard. I am merely reporting what Europe is said to think.

Captain Rushworth: As they have gone off gold again, it seems as though they are working the same swindle twice?

Professor Tocker: There are four countries still on the gold standard—Holland, Belgium, France, and Switzerland. Quite a number of other countries, including Germany, are attached to the gold standard by the same gold par of exchange, maintained by all sorts of restrictions on trade and exchange. I said, "Why do those countries not depart from the gold standard"? The answer was that they dare not; it was stated that no Government could stay in power in many of those countries if they went off the gold standard. That is the opinion of people who have experienced fairly serious inflation.

10. What limits do you place on the Government's financing construction schemes by non-interest-bearing Treasury bills or notes?

Answer: I do not think any Government should be permitted to finance construction schemes by any loans or bills free of interest.

11. Assuming normal conditions, has New Zealand reached a stage of development such that overseas borrowing will in the future not be necessary?

Answer: It is at present not possible to say whether overseas borrowing in future will be necessary or not. I do think that there has been unwise borrowing in the past, and that it should be avoided in future. After a recent examination of the finances of the Dominican Republic, a Board was set up containing both Government and private-business experts who had to approve of any scheme of construction involving loan-money before it could be submitted to Parliament. Some such safeguard may be needed in New Zealand.

12. Would you favour rigid exchange-rates with sterling?

Answer: I would not favour absolute rigidity of exchange with sterling. A fluctuation limited to 1½ per cent. either way would provide some flexibility and appears to be sufficient. This might reasonably be embodied in law when a permanent exchange policy is decided. A wider variation could then be permitted only in case of real emergency, when the law would have to be suspended. I do not want to be dogmatic about the range of fluctuation. It is customary in most countries to tie up the currency within certain limits, and it is realized that if a real emergency arose the legislation might be suspended.

13. Has the exchange-rate in the past been governed by the supply of and demand for London funds? Was the exchange-rate ever "free" or was it always "pegged"?

Answer: In the past I consider that the exchange-rate has usually been pegged within narrow limits, and that such wider movements as have occurred—for instance, in 1921 and 1923–24—were due rather to Australian than to New Zealand conditions.

14. What determines the rate of interest charged and paid by the banks?

Answer: This question was answered in my comment on the banking system.

15. If deposits and advances rates were lowered, would this tend to promote economic recovery?

Answer: I think a reduction in bank interest rates would tend to promote recovery. It would reduce one of the costs of industry and increase the margin of possible profit, thereby tending towards business expansion. I would expect a reduction when the Reserve Bank is established.

16. Do banks in New Zealand lend their deposits? Is there any fixed relationship between deposits and advances in New Zealand? What factors determine an increase in advances?

Answer: This question was also answered in my earlier comment.

17. The fluctuations in export values of New Zealand products are reflected in changes in economic conditions within New Zealand. What can be done by monetary means to ease the effects of these fluctuations?

Answer: There is really little that can be done to prevent fluctuations in export values of New Zealand products affecting economic conditions in New Zealand. Two methods suggest themselves. There is usually a shortage of money when export prices are falling and while imports are being maintained, and the balance of payments is unfavourable. During this period the crisis might be eased by

the extension of credit. Bank figures show that this is normal practice. When export prices fell heavily from 1929–31, bank credit in New Zealand did expand substantially. The same thing occurred in 1920–21 and in 1925–26. Bank advances generally expand in a period like that. During the development of a boom, too, it would be desirable to prevent unhealthy business expansion and speculation by tightening up credit. I do not know if this practice has been followed to the same extent. Some part of the effect might be removed if the exchange-rate were made to fluctuate, rising when export prices fell and falling when export prices rose. It would not be practicable to move the exchange-rate to the full extent of the variations in export prices, and any wide movement of exchange would create internal disturbances which might be less desirable than the effects of changing export prices. For normal conditions, including variation of export prices within a range of, say, 20 per cent., I do not think an exchange movement outside the 1½ per cent. either way suggested above can be justified. I might illustrate this a little. Some years ago it was suggested in Canterbury that we should move our exchange up and down in order to secure stable export prices; that is, if export prices fell 25 per cent. our exchange-rate would have to go up 33 per cent. in order to give the exporters the same prices in New Zealand and the advocate of that scheme claimed that it would stabilize prices in New Zealand. It happens that when export prices fall in New Zealand import prices and many local prices usually remain very much the same. One of the factors in changing conditions is that export prices do move widely, and import prices very much less widely. Suppose export prices do fall 25 per cent., we move our exchange up in the ratio of 75 to 100, we have got to make up the rate 133⅓ to give the exporters as much currency in New Zealand as before. We would also have to pay 33⅓ per cent. more for our imports if import prices had not fallen, and it would be equivalent to giving all our protected industries in New Zealand a 33⅓ per cent. tariff which would stimulate their expansion until export prices rose again. Then the exchange would fall, and immediately all that protection would be taken off. What you do in these conditions is remove the instability of fluctuating prices from the export industries and put it somewhere else. There is usually a wide disparity between movements of the two groups, import prices and export prices, and more so between export prices and internal prices. You cannot remove this disparity by monetary means.

Mr. Langstone: Should the lesser govern the greater?

Professor Tocker: Which is lesser?

Mr. Langstone: The total internal production is much greater than our external trade. Which should be the determining one?

Professor Tocker: I think they both have to be considered, and that what is wanted is to adopt such a plan as will give a minimum of inconvenience and disturbance over the whole. Naturally that plan would vary with every particular slump.

Mr. Langstone: The sun pulls the earth: the earth does not pull the sun?

Professor Tocker: Yes.

Questionnaire 2: 1. What was the originating cause of the violent fall in commodity price-levels?

Answer: I should say that the originating cause of the violent fall in prices was the wide variation in public confidence, in the period 1928–31. This included the speculative boom on the stock-exchanges and the subsequent collapse, and also the remarkable changes that occurred in the flow of short-term funds between the world's money-markets. There are, of course, many other underlying causes, including international differences of opinion about matters such as reparation and war debts, restrictions on trade, and the incompatability between the national and the international management of monetary systems.

2. What was the cause of the rise in price of gold?

Answer: The price of gold has not increased in gold-standard countries. In countries with depreciated exchanges the rise is due to the depreciation of the paper money in terms of which the price of gold is expressed.

3. Are booms and depressions an inherent part of the economic system rather than the monetary system?

Answer: I regard booms and depressions as an inherent part of the economic and political system rather than of the monetary system. A bad monetary system may, however, intensify them and a good monetary system modify them.

4. Does banking control or merely reflect conditions?

Answer: I consider that, generally speaking, and particularly in New Zealand, banking reflects rather than controls economic conditions.

5. Is the existence of money profits an inherent defect in the economic system?

Answer: I do not consider money profits an inherent defect in the money system. The counterpart of profits is losses. It is not practicable to estimate precisely what the returns of any business venture will be, and profits over and above that interest rate on shares are the result partly of erring on the safe side. If business men erred on the other side and losses were continuous, they could not long remain in business.

6. Does the fact that banking is often in private hands constitute a weakness in the banking system? Does this lead to a chronic deficiency of purchasing-power?

Answer: My answer to both questions is No.

7. Would it be possible, by law, to fix and stabilize internal price-levels irrespective of oversea price-levels?

Answer: It would theoretically be possible, by variations in the New Zealand exchange-rate, to maintain average internal prices at stable levels in New Zealand. The causes of dislocation lie, however, in disparity in the movements of particular groups of prices, which would not be overcome by this means. In New Zealand during the past five years export prices fell more than 40 per cent., while internal prices and costs declined much less. This dislocation cannot be overcome by varying the exchange-rates, and I think that particular cure, if generally adopted, would be worse than the disease.

8. Does the volume of money and credit determine the general price-level?

Answer: In the long-run and with variable exchange-rates, the general level of prices in any country might be determined by the volume of money and credit. In the short-run and with fixed exchange-rates, experience has shown that prices may move very widely, regardless of volume of money and credit.

9. What was the principal means of financing used during war-time in New Zealand? Did advancing by way of overdraft for the purpose of subscribing to war loan play an important part in inflating the currency?

Answer: I believe New Zealand financed the war by means of loan-money. I can find no evidence that the extension of overdrafts for the purpose of subscribing to war loan played any important part in inflating the currency. Throughout the war deposits expanded rapidly owing to the increase in the value of exported products, while advances expanded slowly. We had a very favourable balance of payments for most of the war period. Taking the averages for the years from 1914 to 1919, deposits increased by £23,000,000, while advances increased by only £12,000,000. Throughout the period the increase in deposits preceded the increase in advances.

10. To what extent does our oversea indebtedness link New Zealand to gold or sterling?

Answer: I do not think that our overseas indebtedness necessarily links New Zealand closely with sterling. Our connection with sterling is much closer than with gold, but both that connection and the fact that our indebtedness is to Britain are probably due in large measure to the fact that so great a proportion of our overseas trade is with Britain. At the present time very many countries are linked very closely to sterling for purposes of finance, because London is the chief centre through which international payments are cleared.

Mr. Ashwin.] So far as the mechanics of the banking system are concerned, I do not think there is any conflict at all between my statement and that put in by Professor Tocker, except that he has preferred a different line of approach. There are still one or two points I would like to clarify. You state that it is seldom true that increased advances mean increased deposits, or that decreasing advances mean decreasing deposits?—In New Zealand?

Yes. Your reason for saying that, I assume, is that deposits and advances are usually the reflection of external trade?—Yes.

You would agree, however, that an additional advance used solely for New Zealand purposes would lead to an increase in deposits?—No, not necessarily. It might be taken out in gold, might reduce call money, be used to pay off bills discounted, to buy securities in the hands of the bank, or to buy property and premises.

But the immediate effect?—No. If I go to a bank and arrange with the bank, all the other deposits and advances remaining the same, I get an overdraft of £100; the immediate effect is not necessarily to increase deposits. If I buy something from you and you pay that £100 into the bank, that increases deposits, but I may not do this, and my advance may affect any other asset on the balance-sheet. It may affect also any other liability on the bank balance-sheet.

Apart from the case where you used your £100 to buy something off the bank, it would have that effect? It generally does? I wanted to clarify that point?—I might pay it to you to repay your advance.

Yes, that is so?—The point I want to make is that advances do not necessarily create deposits. Admittedly they often do.

You draw attention at the present time to the large increase in deposits and the fall in advances. You would agree that this is a reflection of the surplus London assets, and not actually a restriction of advances in New Zealand?—Yes.

In fact, the first thing to occur is the favourable balance of payments, the increased London assets and increased excess of deposits follows, and, following upon that, we now get an increase of advances to the Government as an effect of the increased deposits, because the increase in deposits in New Zealand is a reflection of the increased London funds?—No. Would not the increase of deposits have been there if the Government had not purchased those funds from the banks, and therefore not issued the Treasury bills?

Yes, but the effects are that the Government has, and the effect of the increase of deposits under the arrangement is an increase in advances to the Government. To separate the two sides, the Government purchase of the surplus exchange has no effect on the deposits at all. The same causes that lead to the Government purchase of exchange create the deposits?—Yes, it is the excess exports that have created the deposits. If you include the Government securities as advances, they are not spent in New Zealand at all.

You have got the increase in advances, but that is only a reflection of the fall in the bank's holdings of London assets?—Yes.

Where you discuss the exchange policy, you state and elaborate the argument that stability is desirable, and therefore it would be wise to maintain the present rate. Do you not think the present position is inherently unsound in that we have not got that measure of confidence which is the main object in desiring stability. The lack of confidence that exists in the country as to the position—that is not an indication of the benefit that should be derived from stability ?—I think that an important part of the lack of confidence in the country is the lack of confidence in the stability of the present exchange-rate.

That is really my point. The present position is really inherently unstable ?—Not because the present rate is 125, but because the public fear that the rate might be reduced, and on that account many importers are deferring imports until they can be more certain, and many exporters to New Zealand are leaving funds in the country.

Does it not follow that we have not got stability until we get an exchange-rate in which the country has some confidence ?—I think that the lack of confidence in the stability of the present exchange-rate is due not to the level of the rate, but to the public's failure to understand how the Government is going to deal with its accumulation of funds in London.

Does that not mean that the lack of public confidence is due to the fact that they recognize that the rate at present is not a true one, but is a pegged rate ?—What would you regard as a true exchange-rate under present conditions ?

It would be one in which there was no surplus ?—You think there is now an exceptional surplus ?

Yes ?—In 1929 we had a certain amount of money in London. By 1931 we had lost £11,500,000 of it. I am quoting this from bank figures. Since then the banks have got back £4,500,000 of it. From the 1929 levels we went down £11,500,000, got back £4,500,000; the banks themselves are £7,000,000 worse off than in 1929. I do not know what amount is outstanding in London funds, but supposing it is £11,000,000; the banks are still £7,000,000 below 1929 levels; if they took over £7,000,000 from the Government they would be back on 1929 levels. If £4,000,000 is being left in New Zealand by British exporters, our balance of payments is exactly as in 1929.

Do you think that if the indemnity arrangement was not in existence the rate would be maintained where it is ?—I think it can be maintained where it is quite readily. I think that if at the present time the public were certain the rate was going to remain where it is for twelve months, if importers did not fear a fall in the rate bringing them loss, we would get a rapid increase in imports.

You would consider that if the banks themselves put this rate up to the present level, without the arrangement with the Government at all, they could have held it without any undue accumulation ?—Yes.

You would not expect the banks to accumulate funds purchased at the rate of exchange that they could not expect to sell it at ?—I feel quite sure that any monetary authority can fix its rate at any level, so long as it pursues the corresponding monetary policy. Either the banks or the Government could put the rate up to 200 per cent. The result would be that exporters would get very much more money in New Zealand. This money would circulate throughout the country and in due course it would create a demand for the imports which would balance the exports. That would for the time being accumulate a lot of money in London which would mean easy credit conditions. Easy credit conditions would mean easy rates for money and in due course conditions would adjust themselves to the new level of exchange. In the case of France you had 25 francs to the £1 before the war and the exchange after the war was adjusted at 125 francs to the £1.

Because that year it was about its true level ?—No, it was not at its true level. Its true level was probably about 70 or 80.

Nearer than that. They had slightly undervalued it ?—Not to that extent. The fact that they had fixed it at 125 meant that internal conditions still had to be adjusted to that rate.

Then you say you can fix the rate at anything you like, at 200 per cent., and you can hold it if you can stand the racket while the adjustments are taking place. You can eventually make that the true rate ?—Yes.

But you will agree that the country concerned might suffer considerably in the process ?—It might, yes.

Now, another point. You say that one of the disadvantages of reducing the rate would be that it would place New Zealand exports in an unfavourable position compared with those of our competitors in overseas markets. Do you not mean New Zealand exporters, not New Zealand exports ?—Actually I do not think our exporters do go to the overseas markets as a general rule.

Then where is the unfavourable position ? If butter is produced under any rate of exchange and sent to London and sold in an open market there is no marked disability in Great Britain ?—I admit it is badly stated. What is meant is that conditions of export production in New Zealand would be unfavourable compared with every other country with a more depreciated exchange.

In other words, you mean that they would find it difficult to carry on and maintain production at the level of exchange ?—Yes.

You were speaking of the chief disadvantages and of the effect to the national income if the exchange-rate, which is a source of national income, should be reduced. Do you thing the national income at present is in accord with the present rate ?—No. I think it is lower. The national income will follow the rate of exchange and other conditions, but it lags behind.

You agree that the national income has not risen to the rate at present, otherwise we would not have the surplus ?—No. You have to maintain the rate and the national income will go on rising towards it.

In regard to that same surplus, you stated that if the present rate is maintained the surplus will be worked off. How long do you think it would take to work off the surplus if we adhered to the rate ? In other words, how long do you think it would take before really the national income is in accord with

the present exchange-rate ?—I do not think the working-off of the surplus is the same question as bringing the national income in accord with it. At the present time we have had a rapid fall in advances and a rapid increase in deposits which means a rapid expansion in the excess of deposits over advances. The total deposits at the present time are just about the same level as they were in 1920 and the balances overseas I think are less than they were in 1920.

Oh no, I do not think so ?—In 1920 the volume of money in London and the volume of money in New Zealand got into circulation, was spent, and brought the biggest boom in imports in history. I am a little bit scared that we might get another boom in the not distant future, which might eat up the whole of this surplus.

You are basing that on an assumption that at present the additional income to the producer arising out of exchange is going into purchasing-power, I mean for goods ?—It is, in a way. It is going, first of all, into deposits. Up till quite recently the greater part of it has gone in fixed deposits. Now it is going back into free deposits. The Government takes a great deal in advances against Treasury bills, which are not being spent in New Zealand, but are used to buy London funds. With the establishment of the Reserve Bank I expect those advances to be repaid by the Government. I think the Treasury statement mentions the same thing. These advances are to be repaid to the banks and they will then have a substantial amount of money for which they will have to find borrowers.

On the other hand, the banks at present do not give us any money which they think they can find any other use for, so there is no actual obligation arising out of the transaction ?—They are lending you a certain amount of money at 5 per cent. and I doubt very much if they could lend that money in New Zealand at that rate if you would not take it.

No, but if they could get a trade demand for that money they would not sell it to us—in fact, that is the arrangement ?—I do not think there is any doubt that they could get a trade demand for it at a price, but not at the price you will pay them.

Mr. Langstone: The Government has to hold it in London for next to nothing.

Mr. Ashwin.] You say here in relation to this exchange arrangement that you consider the exchange has restricted the advances to the public ?—Yes.

And maintains the rate of overdraft on a higher level than you would otherwise pay ?—Yes.

The banks themselves stated that they were anxious to increase their advances to any one who could put up a reasonable proposition or present a safe security ?—Surely these things are dependent upon supply, demand, and price, and if the banks can sell one-third of their resources to the Government at 5 per cent. they are not going to sell the remainder of the resources at less than 5 per cent. If they would lower their rates they would get a demand for an increased amount.

That is the point I was coming to. You thought it was holding the overdraft rate up. I would have thought it would have had a tendency to put it the other way, in that the margin between their deposits widening they would have made an endeavour to increase their advances to bring their earning-power up ?—But they cannot increase their advances to the public at 5 per cent. The public will not take any increased amount at 5 per cent. and they can sell to the Government at 5 per cent., if 5 per cent. is the rate, and it is a very profitable rate for some of the banks for the time being.

Mr. Langstone: If they do not buy outright they can pay with an IOU.

Mr. Lye.] I have followed this paper fairly closely. I would like just a few simple definitions. What would be your definition of bank resources ?—I should say that the only way to define bank resources is to define them as all the liabilities shown on the bank's balance-sheet.

Is it correct or otherwise to say that every bank loan or advance creates a deposit ?—No. It might wash out another advance or any other asset.

Can banks make advances without a deposit ?—Yes. It is conceivable that you might have a bank the whole of whose resources consisted of shareholders' capital and that bank could make advances, but only to a limited extent.

Oh, yes ; but the extent is limited by its resources.

In that bank's resources, then, deposits are included ?—Yes.

Can it be said, then, with a certain degree of truth that the bank does lent its deposits because it lends its resources ?—I do not think the question throws any light on the subject. It seems to me that the money we have on deposit is used as a medium of exchange. When we transfer funds from one to another by writing cheques to pay debts, we are transferring bank deposits, which are debts from the banks to us. They are bank liabilities and the bank's power to extend those liabilities is limited by the nature of its assets. In New Zealand its real liability is to find abroad the cash necessary for trade purposes.

You deal with the question of what would be the advantage or disadvantages of lowering the exchange-rate on London. There is a school of thought in New Zealand which is advocating that we can fix our own internal price-level in New Zealand irrespective of the London parity. It is advocated at times that we could give the farmer to-day 1s. 6d. for his butter when it is only worth 10d. according to the London parity with exchange. In that event the fixation of the internal price-level would tremendously increase the exchange-rate would it not ?—It depends on the level at which you fix it. If it was very high, say 100 per cent. up, it would have its reflection in the increase in the exchange-rate and the increase in the rate would approximately equal the rise in price.

What actually happens is the artificial raising of the exchange-rate to a higher level. What effect does it have on the assets and securities held by people in New Zealand. Is it not equal to confiscation or levy upon those who have assets and securities by the depreciation of the external currency which permits debts and obligations to be met with a depreciated currency ?—I think you are talking about two distinct things. The currency appreciated in terms of goods before it was depreciated. The value of capital depends upon the earning-power of all these things expressed in

New Zealand currency. With the rise in prices in New Zealand currency the value of capital will rise also. Holders of claims to fixed incomes will lose by the rise in prices.

Therefore it must be unjust in that respect ?—It does affect a transfer of real wealth from the lender class to the borrower class. One must remember, of course, that any fall in price will effect the opposite transfer and if the exchange-rate is raised to offset a fall in prices, a rough measure of justice may be achieved for all parties.

Mr. Langstone.] Let us take a case. You say that the fixing of the internal price-level is reflected in the exchange. Supposing that we fix our internal price-level for butter—monetize the butter at 1s. 6d. but the prices went up to 2s. in London and we still maintained it at 1s. 6d. What would be the effect of the exchange-rate ?—The exchange on London would be 75.

What about transport costs ?—I am omitting transport costs, of course.

We give 1s. 6d. in New Zealand for butter, the world price is rising, and they get 2s. for it in London ?—Quite. You have to convert 2s. in London to 1s. 6d. in New Zealand,which is equivalent to converting at 75.

This is the effect, that you would be giving the farmers and the people of New Zealand by way of imports 2s. worth of value for 1s. 6d.?—1s. 6d. in New Zealand would be worth 2s. in London under the conditions you laid down.

New Zealand money can only be spent in New Zealand and English money can only be spent in England, and the respective price-levels of other countries is a matter for those countries to determine ?—Broadly speaking, yes.

But that is not done. Let us take your question of the buying of securities. Assuming that the Government have had to give the banks £20,000,000 worth of securities for sterling in London, now, in addition to paying that premium of £4,000,000 we pay 5 per cent. on it as well ?—You pay 5 per cent. on £20,000,000 ?

Yes ?—The premium on the £4,000,000 has never been paid and may never have to be paid.

Yes. But the £20,000,000 that you have got in London, what is it earning ?—About 1 per cent. I think.

Not 1 per cent.—nowhere near it ?—It is a low rate.

Not $\frac{1}{2}$ per cent.—$\frac{3}{8}$ per cent.—7s. 6d. per cent. ?—I have seen no statement of the actual earnings.

But in your profession it has been quoted there down as low as 5s. or 6s.?—Quite. But more recently, when that money has been accumulating rapidly, some standard has been taken by the money-market in London and the rates on Treasury bills, I think, now are about $\frac{15}{16}$ per cent.?

Dr. Sutch : 17s.

Mr. Langstone.] They vary from time to time ?—Well, that is the minimum rate.

Now ; but the minimum rate a little while ago was 5s. And do you think that the effect of the exchange-rate going up in Argentina, New Zealand, Denmark, and Australia, has been an inducement to those people to flood their goods on to that market, and that has depressed the price considerably ?—I do not quite get you. An inducement to what people to flood what goods on to what market ?

I should say, if you and I were farmers we would send our goods where we can get the highest price, and if there is a bounty on an exchange-rate given we will send our goods there to get that bounty. Australia will do the same, Argentina will do the same, and Denmark will do the same, and if there is the one class of goods going on to the one market the tendency is to glut the market ?—Quite. But why the one market any more than ever before, because the only exchanges that were moved were those of the countries you speak of, and their exchanges were moved in relation to all markets. The tendency is certainly to encourage their exports, but not necessarily concentrate them on any one particular market any more than before.

The actuality of it is that it has concentrated them all on the one market ?—I think that is rather the result of something else.

You cannot send to America. You find there is trouble in Canada with your butter going in there ?—Those are not exchange matters.

No. But they are trade matters, and if the trade was there they would be exchange matters ?—But are you not saying that the effect of the exchange is to concentrate them on those markets, whereas they are concentrated on those markets on account of trade restrictions in other countries.

But the effect has been partly to reduce the price-level, and if the price-level is reduced, then it has done away with any benefit of the exchange ?—The price-level was reduced very much more before ; the New Zealand price-level was reduced about 48 per cent. before the exchange was raised, and it made production for many people unprofitable.

But the big fall came in the prices after the exchange went on ?—It may have come anyhow. I do not think that is true.

Hon. Mr. Downie Stewart.] The week that the exchange went up 15 per cent. flax dropped 15 per cent. on the London market ?—In 1932 the index number of all export prices was 892. In 1933, 896. All export prices were very slightly higher in 1933 than they were in 1932.

Mr. Langstone.] Is that just New Zealand export prices ?—Yes.

Then we find this with regard to the exchange, because prices have gone up. We will say wool 18d. a pound. The exchange bounty on that would be 4½d., because the price has gone up, but butter at 6d. a pound is 1½d. because butter at 6d. a pound is not a paying proposition. So we find that the incidence of the exchange-rate is that those who need it most get least, and those who need it least get most ?—You are right that the higher the price received the greater the amount of the bounty. The bounty is proportionate to the price.

And the less they need it ?—I do not think you can judge relative needs in that way because wool prices were very much lower than butter prices have ever been proportionately over a period of three years.

I know that; but the point is here that the dairy-farmers are in a desperate position. You see that by their coming to the Government and asking for a bounty of £3,000,000 to assist them, so that really the exchange-rate has not been any benefit to the dairy-farmers. It has worked out that way?—I think the exchange-rate has given them 25 per cent. more than they would otherwise have got.

I think it was commonly known that all the things that were already in New Zealand in the stores and the warehouses and factories appreciated as soon as the exchange-rate went on?—I could not say. I have been told that some of it did and some of it did not. I could not generalize.

If you had been a storekeeper or a business man and you knew it was going on and you rushed to Wellington to get here as soon as the warehouses opened in the morning, and you wanted to buy things to try and get in before the exchange had been put on, and they told you that you could not buy them without paying that extra 15 per cent. you would have known then that prices went up, would you not?—Yes.

That is actually what happened. In fact, I was very closely associated with a very small book-selling business. The retail booksellers held a meeting and they decided they would try and keep the goods that they already had in their shops at one level, but the wholesalers were putting them up 15 per cent. immediately. Now, a business person could not have two books, one at one price and another at 15 per cent. dearer because one came in one day and the other came in the next day?—It is possible that different shops were selling at different prices under those conditions. One shop might have been overstocked and want to get rid of them.

They had a meeting and decided that they would all put up the prices, that it was not good business to have different prices for one article, so that we found that the effect of the exchange, first, was to raise prices in New Zealand not of everything, but of a lot of things. That would be deflationary, would it not, if you had a higher price and no more money in circulation?—Well, the tendency of anything that makes for higher prices, any monetary change, I think, I would regard as inflationary.

But if you had no more money to balance?—But we did have more money.

Where did you get it from?—From the bonus on exports.

But if the exchange-rate goes on to-night and to-morrow morning the prices go up, where do the exports come in?—The bonus goes on to the exports just as soon as the price goes on to imports.

But the price has got to be paid to-morrow for goods that are sold to-morrow, but the exporter will not get paid for a month?—He can generally discount his draft immediately, and in many cases I think he does.

Would not the dairy-factories discount their advances?

The Chairman: They get it as soon as the butter goes into the cool store.

Mr. Langstone: But the butter would not go into the cooler for a month.

The Chairman.] Yes, it does. It goes every day?—In the sense that the banks give a credit here at 125 for 100 in London, whereas formerly they had been given a credit for 100 here against 100 in London.

Mr. Langstone.] So the banks do create the money?—Yes. In that sense. When they create money they undertake a liability. That is all.

Just the same as when the wool-buyers come here to buy wool. They bring a letter of credit. That is their authority. The real money to pay for the wool is credit here in New Zealand based upon that letter of credit?—The real money to pay for the wool is in London, and the banks undertake liability to find a certain amount of money in New Zealand for a certain amount in London.

The point I want to get at is this, that if the banks are willing, and they evidently are, to give the credit to sustain the price that a wool-buyer is prepared to give, that is practically what it amounts to, why would not they do it for the Government or anybody else?—I do not think the banks are prepared to do that without limits. The credit the banks are prepared to give to the wool-buyer depends upon the amount of his letter of credit in London and on the exchange-rate.

But the price-level is a different thing. Suppose he has £10,000. He may be a Japanese and may have sold goods in London. He has got a Japanese bill in London. He sells it to the bank or the Government of New Zealand. I suppose they buy it now. The banks bought it. Therefore, that increases their exchanges in London, the sterling in London by £10,000. Then there is only a cross-entry in figures when that person comes here to buy wool, but the banks are prepared to give him £10,000 worth of wool whether he pays 1s. a pound or 2s. a pound. He fixes the price-level?—Quite. But his price-level means taking so-much from his credit in New Zealand, which means so-much from his credit in London.

He cannot go beyond the £10,000. I admit it is not the question of the £10,000 that is affecting the farmers here. It is the actual price-level that is affecting him. So much per pound and he wants a price for his wool just the same as the dairy-farmers want a price for their butter, and they are not getting it to-day, and the result is that every asset and security that was formerly based—if I take a farm to-day, while butterfat is 1s. 6d. a pound I could meet all my commitments, but when butter comes to 9d. a pound, then I cannot meet my commitments. The physical attribute of the farm is the purchasing factor. The cows have not altered, but the money factor has altered. Who controls money?—The money factor in one sense is controlled by the exchange-rate. You can give the dairy-farmers any amount of money you like for their butterfat by varying the exchange-rate.

To manufacture boots we have got a boot-factory. To manufacture timber we have got sawmills. To manufacture clothes we have got clothing-factories, and to manufacture money we have got banks. Banks manufacture money in exactly the same sense as boot-factories manufacture boots, do they not?—No. Banks undertake liabilities against assets held for the most part overseas.

I know that. A boot-factory could not make boots unless they had the leather. But the fact is that they make boots and the fact is that banks make money, and if a bank, as you have already stated, by buying securities had increased the money and by selling securities had decreased the money, can any other concern do that. Is there any other concern outside the banks can do that sort of thing?—Yes. There are others which can do it.

If you had a boot-factory, and you sold your boots, you would have either less boots in stock and more money in your account, or if you did not sell your boots, more boots and less money, but the bank is in a totally different position; if they purchase, then there is more money, and if they sell, there is less money?—Other things being equal, that is so.

They create and destroy money by that process?—They have the power to do that.

If it is in their power to do it, and that is the only source that money comes from, then, not in New Zealand only, because New Zealand is only a replica of the world, is it possible that the Bank of England have decided on a policy of deflation, therefore they have called in overdrafts, that demanded a huge amount of selling, and provided less money to buy those things, therefore there is a fall?—That is certainly not the case in the Bank of England or in any country connected with England by fixed exchange at the present time. It was the case prior to England's going off the gold standard in 1931.

You heard what Mr. Neville Chamberlain, the Chancellor of the Exchequer, said at the World Conference?—I heard him, but I do not know what you are particularly referring to.

He referred to the fact that going back on the gold standard had been a most deflationary policy; it brought about a tremendous amount of hardship and suffering, and he went on to say that prior to the war England would assist its customers by lending, but after the war, that position had not obtained, and therefore they had a period of chasing prices downwards, trying to establish equilibrium. It would have been all right if prices had remained stable, but as they took money out of circulation, prices began to fall just as rapidly, and therefore they had this vicious spiral in an endeavour to obtain equilibrium?—I think, and many people now think, that England made a mistake in going back to the gold standard in 1925.

He goes further and says that it is a monetary factor of raising prices, and he said it rests with the banks. He said that definitely in the statement he made at the World Conference. You had a meeting there, as well, trying to deal with the monetary factors?—We had two Committees.

And that was his statement definitely that it rested with the banks. Was he right or wrong?—In the long-run he is right. In the short-run, there are other things that take charge at times.

I do not know whether there is much difference between the short-distance run and the long-distance run. With regard to the lack of confidence, I suppose that must be something; I do not suppose there is any lack of desire among the great bulk of the people of New Zealand to buy things?—There is no lack of desire to consume things.

No; there is a lack of money?—Over New Zealand as a whole, no.

I was referring mainly to the working-people?—Amongst many of the working-people, yes.

The banks in their operations never touch the great bulk of the people; they are practically confined to business relations, people with assets and securities dealing with goods and the distribution of goods. The person who is working for wages or a salary has very little to do with banking?—I think on average most people on, say, more than £300 a year have a bank account. Or they did until the bank charges were raised.

How many banking accounts are there in New Zealand?—I could not say offhand.

I remember asking that question in Parliament at the time the charge for account-keeping was raised. I thought in the Post Office there were about eight hundred thousand accounts, and there should be something similar in the other banks, but according to Sir Henry Buckleton there are less than two hundred thousand in New Zealand, and some people have three or four accounts?—That is a good proportion. There are only about 550,000 breadwinners in New Zealand.

Taking the women, too? Many women have banking accounts. There must be seven hundred or eight hundred thousand adult people in New Zealand?—Two hundred thousand banking accounts is a very large proportion.

It is not as great as the proportion that have not got accounts?—That is so.

The point is that the system of banks as we understand it to-day cannot possibly reach that class of people that we are very desirous should be reached?—It is reaching them indirectly, because it is financing the industries in which they are employed, and the trade through which they buy their goods.

Do you not think that the only way in which they could be reached—it is not a question for the bank at all, other than that they are the instrument through which the thing may be done; the initiative really needs to be taken by the Government. The Government have legislative power which a bank has not, and a Government can pursue a policy which would be totally incompetent for a bank to do, by way of a policy of public works, or giving national superannuation, or increasing old-age pensions. The bank could not do that?—It is not the bank's functions.

But the Government could?—Yes; if it could get the money.

This is the point we want to come to; Do you think there is a void somewhere between the authority of sovereignty and the lesser authority that the banks have? Do you not think there should be some continuity of control between the Government itself as an issuing factor of the money necessary to stabilize prices and to give incomes to the people so that they can become effective consumers of the goods in the country?—I do not think you can run any economic system on a basis of giving any one anything for nothing. What you give to any one in the form of money must be return for some value, otherwise you are producing money without producing goods, and prices rise. You take from one set of people what you give to the other set.

Do the banks not get anything for nothing?—They render certain services to the community.

If people make a profit over and above paying for those services, we assume the ordinary services rendered to be the counterpart of that profit they have made?—The value that they receive for the services they render is determined like everything else by conditions of supply and demand.

That has all been paid for. That is not represented in profit; the profit is over and above that?—The people are willing to pay for the services the banks give.

It is not a question of willingness to pay; it is a question of what you have to pay. You were dealing with the bank balance-sheet, and say it showed the relationship between advances and deposits.

I am going to repeat what I said the other day; the bank balance-sheet need not be just a correct statement of the real position, need it?—It is very difficult to say what the real position is. It is a statement of the position as it appears in the books of the bank.

Is that position in accord with the real physical things outside?—The value of the real physical things can only be estimated, and the estimates may err.

If they write off to secret reserves, they demonetize real assets?—Yes?

If they demonetize, they take money out of circulation?—That would be so, if they did that.

Let us see whether it is: I went into the bank figures from 1900, and I found that the landed property and premises in the year 1900 was valued, in round figures, at £420,000. In 1932, thirty-two years afterwards, notwithstanding the huge increase in values, notwithstanding the huge increase in the number of buildings, and the fact that the buildings were much more palatial, the valuation was £480,000. I found that four buildings in Wellington belonging to the bank, valued by the Government Valuer for ordinary rating purposes, totalled £206,000. Do you think that is a fair statement of the position?—That probably means that the banks are not disclosing the whole of their assets in property.

They are demonetized?—No, they are reducing the value on the asset side, the money value of their buildings; on the liability side they are reducing the amount of reserves held. That does not affect other advances or deposits directly.

We will assume they write it up into their balance-sheet at somewhere near the real figures, and pay a dividend on those figures; there would be more money paid in dividends and that would mean more money in circulation?—That is another matter. If they increased the figures for property assets on their balance-sheet they would have to balance them with an increase in reserve liabilities. The paper entry would not affect the amount in circulation.

It would increase the amount of dividends?—That is a different matter, surely.

If they monetized their secret reserves and brought them into money form and distributed them, that would make more money?—They can increase the circulation by distributing the reserves they at present hold without doing that, but the process would lessen the soundness of their position, because they have certain liabilities to customers that are backed by assets, and they have shareholders' funds backed by additional assets, so that their assets exceed their liabilities to customers by the amount of their capital and reserves.

Is share capital necessary?—It is certainly necessary. In banking, generally speaking, a customer of the bank who has put his money on deposit wants something else against that amount than an equal amount to bank assets.

How is it that the Commonwealth Bank of Australia got away?—It had the credit of the State behind it.

In 1894 when you had share capital in the bank and it went into insolvency, did the State of New Zealand have to put credit behind it?—Yes.

And would it not have to do it again?—Yes, in similar circumstances.

Mr. Lye.] The Reserve Bank has rendered that unnecessary?—The bank capital and reserves make that unnecessary.

Mr. Langstone.] The value of the services is only the value of the opportunities obtained. If this position went on much longer you would not be able to monetize your reserves in the bank at all. If everything came down in price, the investments that the banks have there would not be worth anything?—Quite. Is that not one of the reasons for the secret reserves and for writing down their assets.

No. That shows the stupidity of it. You cannot put away a sinking fund. We live on current production?—Yes, mainly.

You cannot save up to-day what you are going to consume twenty or thirty years hence?—But we do.

That suit of clothes that you have on was not left you by your father?—No, but I can buy to-day the house I am going to use twenty years hence.

That simply is because it is longer in consumption, but there are some things which we consume over a longer period and there are other things we consume over a shorter period, but in the main we live on food and things, and we cannot live on those things that will be produced in the years to come. We live in the main on current things. How can you put away a sinking fund or reserve?

Mr. Massey.] Professor Tocker, Mr. Langstone drew attention to the fact that in his opinion the pegging of the exchange at the high level did not have any effect on the New Zealand dairy-farmer. I would assume that the Dairy Control Board have all the facts at their disposal. Would you say that they have set the facts out correctly?—What particular set of facts.

May I hand this to you? It is a "Table of approximate Values of Butter and Cheese based on London Prices," issued by the New Zealand Dairy Produce Board on the 1st September, 1933. I think that table shows clearly the effect of pegging exchange at 25 per cent. has had on the New Zealand producer. Would you be good enough to read that out?—They have given a series of prices on the London market and equivalent butterfat prices in New Zealand. With butter at 75s. per hundredweight, and with exchange at par butterfat is 6·94d. per pound; with exchange at 25 per cent. premium butterfat is 8·61d. per pound. I think that is an adequate statement of the situation.

You would agree with that?—Yes.

There is just another point, that was that when we raised the exchange from 110 to 125 it had the effect of lowering the price of New Zealand produce in London. Do you agree with that?—It is very difficult to say. It happened that when New Zealand raised her rate of exchange Denmark did pretty much the same thing. I do not think the raising of the rate of exchange increased the supply of New Zealand or Danish butter in London. At that time Germany was imposing quotas and a surplus of a variety of things was concentrated on the British market. That could cause a decline in the price of butter. That decline would have occurred whether we raised the exchange or not.

I cannot give you the exact figures, but probably you might remember that on the 19th January in the year in which the exchange was pegged (1933) at 125 the cables showed that New Zealand butter was 2s. per hundredweight higher on the London market than the Australian butter. The Australian butter was then pegged at 125 and New Zealand butter was still 2s. a hundredweight higher. The day on which our exchange was lifted to the Australian level there was a similar position. I think if you studied the figures right through you will find that New Zealand butter is still 2s. per hundredweight higher than the Australian. If those are the facts, does that give the proof that the lifting of the exchange-rate in London had no effect on the sales ?—It is very strong evidence in that direction.

And you have stated on two or three occasions this morning that in your opinion the export price-level has a decided effect on the New Zealand community ?—Quite. It is the influence I think that makes booms and slumps.

That is exactly what I want. You have already explained this morning your opinion of the position of the London trade balance. Would you mind repeating your statement and show how they have operated over a period of years ?—What particular point is it you want ?

1929 ?—I cannot tell you at any time how much money the banks have in London, but I can tell you for any complete year or between any two quarters the changes that have occurred in the amounts held overseas on New Zealand account. Taking March quarters, between 1929 and 1930 the bank funds held overseas on New Zealand account declined by £8,300,000. For 1930–31 a further fall of £3,200,000 occurred making the decline in London funds £11,500,000 between 1929 and 1931. In March, 1931, the funds overseas would be considerably greater than they were in December, 1931. The exchange control scheme was started in December, 1931. I should say in December, 1931, the amount of funds held in London was at least £12,000,000 less than it was in December, 1929.

And if the British exporter received payment for the goods that he sold in New Zealand what effect would that have on the fund ?—You are inferring that some payments were held up at that time.

Yes ?—If further payments had been held up that would have reduced London funds still further.

And in your opinion if the exchange-rate is still pegged at 125 it will soon do away with the London trade balance if it is maintained at that rate ?—If the community here know that is is going to be maintained, then I think imports will recover rapidly and the amount of money held in London will get down to something like normal levels.

We might get a boom in imports in the near future ?—There is the possibility.

Did you deal with the position a few years ago when the New Zealand Government pegged the rate of exchange at 110 ?—The banks did that, did they not ?

Oh, the banks pegged the exchange-rate at 110. Have you analysed that position ?—No. But as far as I can see from figures, in the beginning of 1931 the rate went up to 110. By the beginning of 1932 there had been a considerable fall in London funds.

Can you give us any idea of the correct value at the time or the correct rate of exchange at the time ? Should it have been higher than 110 ?—That depends entirely on what you base the rate of exchange on. If on the availability of London funds, which had been the practice all along up till that time, then I think it could have been maintained for the time being at 110 in the beginning of 1931. It was maintained throughout 1931 and 1932 at 110.

Funds had time to accumulate then ?—Yes. They accumulated less when the fear of the high exchange came along and people were keeping money out of New Zealand.

But before the thing was mooted there was a tendency for funds to accumulate at 110 ?—Yes there was. Imports had fallen very low.

Was the 110 rate an artificial rate ?—I have the impression that the 110 rate was imposed in the first place largely owing to Australian shortage of money in London and not New Zealand shortage of money, and that it was more or less artificial. As far as maintaining the balance of payments in London went, New Zealand could have carried on at par, but there was an acute shortage of Australian money and the New Zealand money was used for Australian purposes.

What about the economic effects ?—The economic effects on New Zealand would have been that we would have had a very much worse slump that we have had.

In your opinion, then, the Government was quite justified in lifting the rate ?—In my opinion, yes.

Would the Government be quite justified in lifting the rate from 125 to 135 to-day ?—I think if the rate were to be raised to 135 there would be a tremendous amount of complaint throughout the country, particularly from importers.

Never mind about the importers for the moment. What effect would it have on New Zealand as a whole ?—If we could isolate New Zealand from the rest of the world and consider only the effects inside New Zealand, it would give another £10 on every £125 to New Zealand exporters, and some of them need it pretty badly at the present time. But we cannot isolate New Zealand. When we did this last time Denmark did it too, and a little later the Argentine did it. At the present time there is a tremendous lot to be said for maintaining stability of exchange throughout the world as nearly as we can, and we cannot ignore the rest of the world. The fluctuation in exchanges throughout the world which we might well start, might mean more drastic restrictions against our exports to other countries, which might do us more harm than the rise in the exchange would do us good.

But by bringing the rate of exchange from 125 to 130 or 135 it might give the New Zealand Government a profit on exchange balances ?—On the exchange balances which they hold overseas ? If they were to lift the exchange to 135 and later to sell at 135 all the money they bought at 125, the profit would be there.

Is the New Zealand pound the same as the English pound ?—No. The New Zealand pound is worth 16s. in English money.

Mr. Clinkard.] Owing to what ?—Owing to the depreciation of the New Zealand exchange.

Mr. Massey.] Was the New Zealand pound the same in value when they were at parity ?—They exchanged for one another at parity, so they were of the same exchange value against one another.

Then was it the same pound ?—It was issued under another jurisdiction. It was legal tender within another area. There are some senses in which it was pretty much the same, and some senses in which it was a different thing.

Mr. Ashwin.] But they were both based on a sovereign. You could get a sovereign for either of them ?—Yes.

Dr. Sutch.] But the dollar in Canada and the United States of America was 4·886 to the English pound. Were they different ?—They were of equal value.

The Australian and New Zealand rates in England are comparable. Then are the Australian and New Zealand pounds the same ?—No. In some senses they have the same value.

Mr. Massey.] If we were to suddenly reduce the rate of exchange in New Zealand and Australia continued at the present pegged rate it would place us at a disadvantage ?—Decidedly.

Captain Rushworth.] What is the cause of the depression in New Zealand ?—Primarily the fall in income received from exports.

The prices received in Great Britain ?—The price received in New Zealand currency, which is the British price converted at the ruling rate of exchange.

In your statement you say, "It would place New Zealand exports in an unfavourable position compared with those of our competitors and might promote further depression." Is that what has been happening during the last four or five years ?—Yes.

So that something has occurred somewhere. What has occurred and where ?—To promote the fall in prices all over the world ? That is what you want is it not ?

Yes ?—From 1920 to 1929 the world was trying to get back to equilibrium after the war, with a good many causes operating within it to promote further dislocation. One was the dissatisfaction and the impracticability of paying reparations and war debts on the scale which was demanded. Another was the fact that England was off the gold standard for a long time and a great deal of the gold of the world accumulated in France and America. Under the gold standard it has often been said that the gold standard game was not being played according to the rules. The gold standard exists mainly to maintain equilibrium. Under a gold standard, if gold flows into a country, and if that gold is used as the basis for further note and credit expansion prices tend to rise in that country. That country then tends to import more and export less, to have an unfavourable balance of payments, which will lead to an outflow of that gold. That will lead in turn to a reduction of prices in that country and a rise in the country to which the gold goes. The result is you will have price equilibrium throughout all countries operating a free gold standard. France accumulated a lot of gold, and, owing partly to French law on the subject, partly to the French way of looking at things, that gold was not permitted to raise prices in France. It was immobilized. To some extent the same thing happened in America and in other countries.

It was carried to secret reserves ?—No. It was simply not permitted to have its normal effect in raising prices and in adjusting prices throughout the world. It was, in effect, demonetized, and that tended to contract prices in those countries and to increase the international dislocation. Such dislocations multiplied and accumulated until there was a big break. The break came, as I said, on the Stock Exchanges in America. They had a tremendous boom. In America, the movement was due largely to the mass psychology of the American people. In America (I am speaking from memory now) between 1922 and 1928 the total amount of money in the country increased by about 50 per cent. There was 50 per cent. inflation consequent upon a variety of changes, including the inflow of gold. Prices of goods remained at about the same level. Prices of securities multiplied about four times. The increased money in the hands of the people was not used for purchasing goods and for increasing ordinary consumption, but was used by the people themselves for speculation. There was an enormous tide of speculation. I travelled through there in 1930 and practically everybody in the country appeared to have been speculating. Then they forced security values up to entirely false levels, far beyond the earning-power of the securities. There was a collapse on the Stock Exchanges. Prices fell tremendously. During that boom a great deal of money was attracted from Europe to finance the Stock Exchange boom in America. The same type of boom was going on in less degree in European countries, and the money was taken out of ordinary production and consumption to finance speculation by the people themselves. Then, when Stock Exchange values fell, confidence fell to a very low level, and individuals all over the country tried to hold more money in order to meet emergencies that might come or to meet commitments that were due, and so on. Consequently, of the total money in circulation, much less was circulating actively. I think that is the monetary aspect of these changes. We have similar results here in New Zealand, where deposits did not fall anything like the total value of commercial transactions, but where a much larger proportion of deposits was on fixed deposit and not in active circulation, and a much smaller proportion on free deposit and in active circulation.

That rather suggests that the commencement was the speculation on Wall Street ?—It was the speculation that precipitated the slump, but I think the slump must have come owing to the accumulation of dislocations after the war.

The depression would have occurred in any event ?—I think so.

Then what part did the speculation play ?—The speculation first attracted a lot of money out of commodity markets.

Was the speculation caused by the endeavour to pay war reparations ?—I do not think so. It simply happened. There was a great deal of prosperity, partly inflationary. Conditions promoting

prosperity encouraged people to speculate, and there was a mass movement towards speculation amongst the people.

What were the inflationary conditions to which you refer?—A large amount of the inflation was the attraction of gold to America owing to the very profitable part she played in the war and the expansion of money on the basis of that gold.

But the bank officials told us that it is not inflation so long as you have the gold. You do not agree with that?—No. I think you can have gold inflation as well as note inflation.

So far as the speculation is concerned if there are losses on one hand somebody gains on the other do they not?—I do not think so necessarily.

There is no total loss is there? No net loss?—I think there might be. Money was flowing into the American markets largely out of commodity markets. With the increased money flowing into the American markets the body of securities was growing, but the money offered against those securities was growing at a much more rapid rate, so a security which in 1922 was worth £100 in 1928 was worth £400 and people were paying £400 for it. Then the estimate of those securities in the market fell and they came to be worth less than £100 again.

Pretty well all the world authorities I have been able to get in touch with ascribe the commencement to a policy of deflation. Has there not been a general policy of deflation?—The policy of deflation I think, followed that fall in the value of securities, because most bank loans were lent against securities and they would be valued for purposes of loan at their market value.

But you told us just now that the policy of inflation caused the speculation?—It was one of the causes.

A policy of deflation would smash that would it not?—Yes.

So that the speculation was not the cause of the deflation, but the deflation was the cause of the smash of the speculation?—I think they are linked together, that that speculation was the cause of the deflation in the value of securities, and the deflation in securities was the cause of the monetary deflation which occurred in America.

Have you seen that formula which was issued from Columbia University by Dr. Walter Rauchenstrausch, showing that population is increasing as the square on the increment of time, production is increasing as the cube on the increment of time, and debt is increasing as the power of four on the increment of time?—I have not seen the formula.

It suggests a train of thought, because this question of war debts particularly has engaged a good deal of attention, and there is a tendency in some quarters to ascribe most of the troubles to those debts and the attempts to pay them. In reality, with the Young Plan and the Dawes Plan, and the moratorium that was established, those debts have not in fact been paid, have they?—I could not quote the figures exactly, but I think most of the payment that has been made has been balanced by fresh loans to Germany.

In other words, they have not been paid?—No. They borrowed the money to pay them.

So that it is not really sufficient for us to ascribe the trouble to the payments of the war debts, reparations, or whatever it might be?—A good deal of the trouble occurred when the flow of money from America to Germany for loans to finance construction stopped, because that flow of money was attracted into American speculation. Then Germany could not pay. Then difficulties came to Germany.

Is not there a better field for investigation there, the fact that it is not only since the war but before the war that national debts were increasing in progressively larger sums?—You mean State debts?

National debts, of course?—Public debts, not private debts?

I am not in a position to speak about that, but we have the information about the national debts. Statistical information shows that?—I do not know whether the national debts were increasing proportionately to our total value of production. That seems to be the important point.

Production has been increasing progressively for over two centuries?—Very rapidly.

And debt has been increasing apparently at least as fast?—I could not say.

The figures you give us here show that, so far as New Zealand is concerned, over a certain period there was an increase in production of 4·4 per cent., and an increase in advances of 4·4 per cent. Advances is only another name for debt?—Yes.

So that you have production and debt increasing proportionately?—Yes, but that production is financed in part by long term debt—that is, in part by the savings of the community (if it is a man's own savings there is no debt), and in part by debt to the banks, and our monetary system consists of financing trade in part by debts to the bank which are balanced by debts of the bank to other people.

It seems as every asset we create is treated as a liability?—Not every one. If we are pledging an increasing proportion of our total wealth, we will probably get into trouble.

If we did not pledge our assets in that way, the whole thing would come to a stop?—I said that in every community there is a proportion of its total wealth that it is convenient to hold in the form of money. That proportion is the chief factor governing the general level of prices.

Inflation can be brought about by a rapid increase in the issue of loan-moneys?—If those moneys are issued on creation of bank credit, yes; if they are brought about by simply borrowing money or the savings of the people, it is only a transfer, and there is no increase in money.

Most of the money is in bank loan-money, is it not?—At the present time we have £60,000,000-odd of deposits and round about the same amount of loans by the banks.

But the money in circulation is almost entirely loan-money?—It is money lent by the public to the banks on the one side, and by the banks to the public on the other side. It is bank liabilities.

I was talking of it when it was entirely metallic; it was then in permanent circulation?—Not necessarily; because a very important factor in money is the fact that individuals hold varying proportions of their total money out of circulation.

I am not talking about where it is held for the time being, but the money that actually comes into existence, when it was entirely metallic, was minted free of charge. If you took the bullion to the Royal Mint, they minted it for you, and it was yours; it remained in circulation?—I think that is true, generally speaking.

When it was worn out, it was reminted free of charge, and was in permanent circulation, but to-day is it not a fact that all money comes into circulation as a loan involving a debt on the community?—It is customary for the people to place their money for purposes of convenience in the hands of the banks. Against the money held the banks lend to others; they create liabilities; and we do a large amount of our business by the transfer of bank liabilities.

If the old system had been carried on, it would have been possible for me to have a piece of paper, take it to the Royal Mint, receive coin for it, and then for me to spend it and have it in permanent circulation?—The Mint might hold all the gold and undertake quite a mass of liabilities against that reserve of gold.

At the World Economic Conference they set out on a fairly exhaustive agenda, but all the non-monetary factors were subsequently held in abeyance until the Monetary Committee had been able to investigate?—Various committees were set up in the early stages of the Conference to deal with different sections of the agenda. There was the Permanent Monetary Measures Committee, the Immediate Monetary Measures Committee, and the Economic Committee. These Committees met simultaneously.

Ultimately the Monetary Committee made a recommendation that we go back to gold?—I think they recommended the ultimate re-establishment of the gold standard.

Arising out of that, a proposal of some sort was made to President Roosevelt. He refused to consider it, and thereby brought the whole thing to an end; the World Economic Conference was not able to proceed with its non-monetary projects?—It was considered by many people at the World Ecomonic Conference that the non-monetary projects could not be proceeded with except on the basis of some agreement regarding stability of exchange. Roosevelt refused to agree to stabilize the dollar exchange which is an important part of the total world exchange.

At that time Britain had gone off the gold standard and inflated her monetary system; America had not?—America went off gold in March, 1933, and the Conference was held in July, 1933.

But the British policy had shifted once again. They inflated their money still further in the sum of £300,000,000 for slum clearance. That was a further inflation?—Was it? I do not know. It depends how they raised the money.

Nobody knows that; they will not tell?—I do not know.

Supposing that were done by means of an additional issue of money from the Bank of England or elsewhere, that would have been a further inflation, giving Britain with a further inflated money system an advantage over the United States in the world's market?—Yes.

President Roosevelt said in effect, "No, you have had your move, it is my move next," and refused to stabilize on the basis Mr. Ramsay MacDonald suggested, because of that, perhaps?—He refused to stablize on any basis. There was a good deal of discussion among many people about the Conference as to what was an appropriate stabilization figure.

Under the existing system, is there any possible chance of any nation or the nationals of any nation ever getting out of debt?—Under the existing system? The existing system is one whereby most of our monetary transactions are carried on by means of transfer of debts; it has evolved over a long period, and is embodied largely in custom. It is an obvious impossibliity to get entirely out of debt under the system, because debt is an essential part of the system.

Can we not go even further and say that our present social order cannot survive unless we have a progressive increase in national debts and individual debts, for that matter?—I would not go so far as that, because I do not think there is any fixed proportion of our total wealth which is required to be converted into debt for monetary purposes. I would not therefore go so far as to say we must have a progressive increase.

We could avoid that by ceasing production?—We could avoid it also by increasing production without increasing debt. It would mean falling prices, which are liable to promote depression.

Governments are then not able to meet their liabilities, or nations, for that matter?—They could meet their liabilities only by consuming less goods or producing more.

Dr. Sutch.] I think your article is very much the same as the Treasury's except that, as you say, you have introduced one or two other factors which Treasury omitted intentionally with the idea of simplifying. At the bottom of the first page here, you say that, "when the balance of payments with overseas countries is favourable, deposits increase and advances decrease"; why do advances decrease?—In effect there is more money coming in and going out. Some use it to increase deposits, and some to repay advances. I simply record what happened.

In the converse case, where countries are depressed, I suppose advances would increase to expand credit to those poeple who would otherwise perhaps have more deposits available?—When the balance of payments is against us?

Yes?—Generally speaking, that occurs when export prices fall and when imports have been ordered on the assumption that export income will be maintained. Those imports have to be paid for, and importers have to borrow the money from the banks to pay for them.

Then advances that go up in times of depression are advances to importers?—I would not say that is the whole story, but that is my impression.

From your figures, we find that advances go up a certain time after deposits have gone up; is that a definite time-lag?—Yes. They generally move in inverse order. Deposits go up and advances down when the balance is favourable. The favourable balance seems to increase the amount of purchasing-power in the country; it creates a demand for imports; there is quite a big time-lag.

Do you think it might be a year ?—Quite. Possibly more than that.

The figures at the present time, then, point to the fact that in some months' time we should have a big influx of imports, so that our banking position is a very favourable one at the moment ?—Yes, on the figures alone at the present time, and ignoring relative costs, one would anticipate that we are moving towards a very big boom. Of course, we know that confidence in the country has not yet fully recovered, and one has to modify that conclusion accordingly.

Assuming prices were brought into line with costs through the exchange-rate, would that justify us in lowering the exchange-rate ?—You would immediately alter your level of the prices and costs.

To say we shall keep the exchange-rate up until prices are level with costs does not mean we should reduce it at the end of that time ?—No.

It would bring about no material adjustment ?—Yes.

Mr. Langstone.] On that point, if everything was to come into conformity with the exchange-rate, it would cease to be an exchange-rate internally ?—It would be the appropriate parity of exchange in view of New Zealand internal and overseas conditions.

Dr. Sutch.] Do you think that manufacturing in New Zealand, local industries, has been maintained or made progress other than it would have made if the exchange-rate has not gone up ?—I think the rise in the exchange-rate has helped local industries competing with imports from overseas very considerably.

Even if we have not an increase in local industry, the exchange-rate has prevented deflationary tendency and local industries going out of business ?—Yes.

If our exchange fell 25 per cent., how much do you think the cost of living would be affected ?—By round about one-quarter of the movement in the exchange-rate, I think.

So that, if the exchange-rate fell 25 points, the cost of living could be expected to fall 6 points ?—Round about 5 to 7, I think.

That is, other things being equal. For example, the exchange-rate has gone up 15 points, but the retail price-level did not go up at all ?—That is so.

It was offset ?—Possibly if the exchange-rate had not gone up the retail price-level would have fallen more than that.

If the country were to lower the exchange-rate to, say, 120, do you think that there would be much fall in the price of imports ?—Very slight, I think.

I am inclined to agree with you. They are very sticky, I think ?—Yes.

Have you had any evidence to show that English exporters have evaded the exchange costs in order to sell in the New Zealand market ?—I know of no positive evidence ; I have heard rumours.

I have seen one or two actual examples. I am still a little uncertain as to your attitude as to exchange depreciation as a competitive weapon ; what is it that determines a price in a country ?—Supply and demand.

So that the price of our butter in England is a result of the supply of that butter contrasted with the demand ?—Yes.

And subsidies at one end would not affect the price ? The Patterson plan in Australia would be an example ?—I think the effect of that plan is to give a better price to butter-producers in Australia for the same price overseas. The difference is extracted from the consumer and the butter-producer gets more than he otherwise would.

So that the Patterson plan has only affected the price of butter in England in so far as it has increased the production of butter or perhaps increased the amount of butter that has gone to the London market ?—It looks like it.

It is the supply in London that affects the situation ; then exchange depreciation has prevented some farmers going out of business ?—Theoretically, yes ; practically, farmers go out of business very slowly.

So that our exchange depreciation has affected the price in London only in so far as it has kept the farmers in production, who would otherwise have gone out of production, but as you say there would have been very few farmers who would go out of production. The possible effect would be that exchange depreciation has not affected the price of butter at all ?—That is the possible effect.

So that to say that the price of exports has fallen because of that is quite wrong ?—I do not know of any evidence to justify that conclusion.

That statement is often made ?—It is not borne out by an examination of price movements.

Coming on to question 7, you are aware of investment trusts operating in New Zealand ; long-term savings go into these concerns. Do you think they have been badly handled ?—I do not know much about them. I have not gone into it.

The Company Commission is of course pursuing that point. If we could have an investment trust in New Zealand which could guarantee a long-term rate of interest without abuse such as has been happening in New Zealand with investment money, would it be a desirable thing to set up such an institution ?—I think you have those institutions now, over the range of investment companies. You have probably got good and bad, and when this question was set I visualized the Public Trust, Savings-banks, building societies, and a great many others.

Company promotion is being investigated now, and the further protection of investors by setting up an impartial body on the lines of the Auckland Savings-bank which would pay out on long-term investments a rate of interest that was reasonably certain. Would you be in favour of that if brought down ?—I would like the concrete detailed proposition before expressing an opinion.

Question 9, Interest on Treasury bills : You say that interest is the means by which limited supplies are rationed amongst those who can use money to advantage. Do you think that the supply of Treasury bills is limited at the moment in New Zealand ; it is a difficult question, I know ?—Do you mean the supply of money for Treasury bills, or the demand for money on Treasusy bills ?

If the Government wanted further Treasury bills, could it get them ?—Yes, I think so ; only the bankers of course can answer that.

Do you think the rate of interest is a deterrent to Government borrowing on Treasury bills ?—Not to the same extent it is to private borrowers.

So that the rate of interest mentioned in question 9 would not be a material factor in Government borrowing on Treasury bills ?—To some extent it would. A higher rate, of course, would increase the charges against the Budget, and *vice versa*.

There is no doubt it is a big charge. When the Government is in the mood to borrow the interest-rate does not seem to weigh with it ?—Yes.

Do you think the Treasury bills that have been held against the exchange overseas have held up advances other than by the fact of 5 per cent. interest-rate ?—I do not think so.

So that there is a plentiful supply of credit in New Zealand ; the difficulty is that there is too high a rate ?—The difficulty is that the demand is not sufficient at the price.

Why should the banks charge 5 per cent. to the Government on the best security in New Zealand, and at the same time charge a smaller rate to much less secure private and local-body enterprises ?—I am afraid the banks would have to answer that question.

You think they are charging what the market will bear ?—I do not know what the details were when the arrangement was made. It is possible the arrangement was a 5 per cent. arrangement.

Some of it, I think, was 5 per cent., some £5 8s. 9d. per cent.—although I would not be sure. You stated that your fluctuation of $1\frac{1}{2}$ per cent. either way on 125 was not a fixed thing ; you did not fix that because it was the margin of gold points ?—There is something to be said on the gold points. Between England and America, both on the gold standard, the gold points were narrow.

Three-quarters ?—Much less. In New Zealand the margin is much wider largely on account of interest. I worked it out at $1\frac{1}{2}$ per cent. ; I do not know that any one else has done so.

It covers all those costs ?—Yes. Between England and America, if a favourable balance of trade occurs, it may be corrected quite speedily by the people concerned, because the distance is short. Here it takes much longer to correct, because of the much longer time it takes goods to come to New Zealand.

On a gold standard ?—On any standard, but there is additional justification for a wider range because we are so dependent on exports. The prices are so variable, and we might use a wider range to correct balances and to modify the effects.

You do not think a gold standard held in New Zealand even before the war ?—I have no doubt that the system was practically a gold exchange standard.

Gold movements do not affect price-levels in New Zealand ?—No.

So that, even though we had gold sovereigns circulating, we were not on a gold standard ?—No. It depends how you define the gold standard. Our balances were corrected by expansion or contraction of funds held overseas, and not by expansion or contraction of gold held here.

I am wondering whether our system is going to change materially when the trading banks hold reserves in the central bank rather than overseas, but we will leave that. Do you think the exchange-rate which was so long at parity was at times held there artificially ; in other words, was pegged ?—I think undoubtedly it was held there.

By the banks—pegged ?—Yes.

And that pegging is what the banks call " natural " ?—Yes.

So that the present rate which the chambers of commerce have described as " artificial " is no more descriptive of it than the parity rate which the banks enforce ?—I should say, without examining the figures, that in 1920, owing to the fact that the banks held considerably more money in London than they do at the present time and did not alter the rate then, our rate is a more natural rate now than the parity was in 1920.

That is true, and the changes that the banks have made in the rate have been artificial changes as far as New Zealand is concerned, in so far as they have been affected by Australian conditions ?—There is no doubt about that. In 1923–24 there was a shortage of notes in Australia and the banks were not in a position to give credits in Australia to the full amount of funds in London. The rate there went to about 96. There was no limitation whatever in New Zealand, and full credit could have been given in New Zealand for funds in London, but our rate went to 97 purely in sympathy with the Australian rate.

The whole of our trading community was penalized because of Australian conditions ?—Our exchange-rate moved entirely on account of Australian conditions.

It has been stated by the banks' representatives that the exchange-rate is a result of the interaction between supply and demand of London funds, but the banks themselves did not know what London funds they held on New Zealand account. They were not segregated ?—Quite.

So that it is a sort of artificial definition, to say that it is determined by demand and supply of London funds.

Mr. Langstone.] But that would presuppose that there would be a returning trade from Australia eventually to balance it ?—I think so. It is three-sided really—London, Australia, and New Zealand.

Dr. Sutch.] If our exchange were put up to 130 it might conceivably be in the national interest, but as you pointed out formerly there are disadvantages that might lead to a depression as between countries ?—That is one possibility. It would also create disturbances in New Zealand.

But we would take it that the ultimate result of those disturbances would be in favour of New Zealand rather than adversely. If overseas conditions were equal the outward advances might be in favour of New Zealand ?—It would be in favour of some people, of course, against others.

But any such funds which the Government have taken over have been financed by Treasury bills. The issue of these Treasury bills has not been inflationary ?—No.

The money has been spent in London in investing in the short-term market ?—The money borrowed by the Government on Treasury bills in New Zealand has not been spent in New Zealand.

It has been used to buy funds in London and, in effect, both those funds in London and the advances on Treasury bills in New Zealand immobilized.

But the deposits against those funds are available and are being spent ?—Yes.

They are represented in bank debits ?—The deposits are available ; a big proportion of them is being held on fixed deposit still.

Do you think, in view of the fact that there are enormous balances from year to year in sterling funds, that it is a fair thing for the banks to ask the Government to take over all surplus exchange ?—I do not think that arrangement is fair at all. There are three separate sections to that surplus exchange, which ought to be distinguished in discussing the arrangement. (1) Funds in London were increasing at the time. That increase would have gone on for some time at least, regardless of the rate of exchange. (2) The exchange was fixed on the 20th January, just at the beginning of the export season, and there was a big seasonal accumulation due which would have occurred regardless of the rate of exchange. (3) There was the accumulation which did occur as a result of the exchange. Added to that, the Government took over the lot at a low rate on London and paid a high rate here, and they took over unprofitable assets from the banks and gave in exchange assets profitable to the banks.

When the Reserve Bank takes over, that will be wiped out ?—Yes.

If the exchange had not moved, if we had stayed at parity, I take it that local manufacturers and the whole economic fabric of New Zealand would be damaged by the effect of the slump ?—Yes. Damaged to a greater extent than if the exchange-rate had not been raised.

So that if importers are slightly set back now by a rise in the exchange it only means that later they would have had a greater setback owing to the lessened national income which would have come about through parity of the exchange, so importers were going to suffer any way ?—Yes. I talked to lots of them and they have failed, I think for the most part, to distinguish between the effects of the slump and the effects of the high exchange.

Mr. Lye.] Are they not getting an added advantage in that additional protection by the increase of the exchange-rate ?—Not importers. Manufacturers are, but I think we have had the exchange long enough for the importers to be suffering not at all from the high exchange. I think the additional money that has come into the country and been circulated throughout the country has had time to get back to the importers, and their customers have got more money to spend on account of the high exchange.

Dr. Sutch.] What percentage of our total production is exported ?—35 per cent. to 40 per cent.

But a good deal of the price fluctuations overseas are reflected here, so that even though 40 per cent. of our production is exported a much greater percentage of our production depends on overseas price-levels ?—Round about 55 per cent., I think.

So that we must take account of overseas price-levels in our national economy ?—I should say that round about 55 per cent. of our production is either exported or governed by export prices ; in addition, some of our prices in New Zealand are governed by import prices. The wholesale-price index in New Zealand has little meaning. It is composed of three distinct elements, the export-price element, the import-price element, and the purely internal sheltered price element, and they move very differently.

So, to make up an index of those three would not help us if we wanted to peg prices at that level ?—You might peg prices or adjust your exchange in such a way as to maintain stability in an index number of wholesale prices, but that would not prevent wide disparity in the movements of the different groups.

So that you could have unemployment and depression despite a stable level of prices ?—Yes.

You could have a falling level of prices and prosperity, too ?—Yes.

The 110 rate was fixed by the banks. That would go to prove, would it not, that just because the exchange-rate goes up the banks do not suffer necessarily ?—Certainly.

Would our lowering of the exchange-rate from 125 down to parity be comparable with England's going on to the gold standard in 1925 ?—It would be a step of the same kind. The movement in New Zealand would be greater, I think.

So that it would be a deflationary action on the part of the Government ?—It would be about a 20-per-cent. deflation. I understand that Britain's going on to the gold standard was about a 10-per-cent. deflation.

So that ours would be a greater deflation to get back to parity than it was for England to get back on the gold standard ?—Under present conditions, yes.

Agriculture was depressed in the United States during 1920, despite an inflation. Do you think that was a factor in the world depression ?—Very probably, because a large amount of the trade of the world was trade between the agricultural producers on the one side, and the manufacturing producers on the other side. And I think manufacturing production was maintained in America by a short-term demand for construction of various kinds, while the long-term demand for agriculture was falling most of that time.

So that you had a maladjustment on the production side helping on the depression ?—Yes.

There were a good deal of investments in Germany during that period also. That would be another factor ?—Yes.

The World Economic Conference, I have been told, would have failed quite apart from Roosevelt's action in not agreeing to stabilize ?—I think it would have.

What difference is there between the minting of a sovereign and the printing of a note. Is not value given in each case ?—The printing of a note is a promise to pay in value. A sovereign is commodity value.

Do you think that the change-over from minting of sovereigns to printing of notes had any material effect on our economic situation ?—No material effect other than that by going from

gold-circulation standards to gold-bullion standards, gold was economized, was made to go further and to sustain higher price-levels.

So that any effect was all to the good ?—It was in the direction of higher prices and more prosperous conditions.

If England spent £300,000,000 on slum clearance, would that necessarily raise prices in England ?—While that money is being spent there will be more money available to buy goods, and it would tend to raise prices, but at the end of the period there might be a consequent slump.

If it tended to raise prices how would that help England to compete in foreign markets ?—It would tend to retard her ability to do so.

I understood you to say this morning that this £300,000,000 that was spent had the effect of helping England to compete in foreign markets ?—I did not intend to convey that. I have had no means of verifying the figure. I am not in a position to accept it or reject it.

Do you think, to clear up the lack of knowledge in the minds of the people, it would be better if we made it definite that the New Zealand pound is different from the English pound ?—It would clarify things certainly.

Certainly from the Government Statistician's point of view ?—Quite.

Mr. Clinkard.] The question has been raised on several occasions as to the advisability by monetary action of maintaining internal prices on a fixed or price-index basis. Do you think that could be done if we allowed the exchange to swing where it likes ?—Theoretically I think it is possible to maintain the level of wholesale prices or the level of retail prices, or of any particular index of prices, at a stable level, at least at a fairly stable level.

How would that occur ?—Simply by moving the exchange up and down.

But it has been suggested that by direct monetary action, such, for instance, as increasing or restricting credits or something of that sort, it can be done. Do you think that that is possible ?—To a very small extent only.

Then it would not be practicable to maintain prices at a fixed level ?—No.

So that the only way you see by which it could be done would be by what you might call extreme exchange action ?—Yes.

You refer to the advantages of stabilization. You would not suggest perhaps stabilizing at present prices or best prices, but you suggest trying to stabilize at some fixed advantageous level ?—Stabilize what ?

The word "stabilization" appeared in your report. I was wondering just exactly what you referred to. That is exactly the words I have "stabilize what." You say, "Under present and prospective conditions . . . stability is highly desirable"; is that stability of exchange ?—Yes, the maintenance of stability in world exchange is referred to there.

That would be so, but as we cannot deal with world exchange, how does it apply to our own ?—Our share is by keeping our own exchange stable.

Practically to maintain the level at the present time, and maintain it stable at that ?—Yes.

The term "destroy money" has come in. When it is said that the bank destroys money, supposing I make a payment in liquidation of an overdraft, it is asserted by some that, when the bank writes that off, they destroy that amount of credit. My contention is that the transaction having been ended, my repayment returns to the quarter where it was originally drawn, and is again available for further issue ?—I think that is correct; I think it is again available for fresh issue, and as far as I can see from looking through the New Zealand banking figures, it has always been issued again when needed, as far as the banks could allow it.

We see there is a very close approximation to uniformity over a fairly long period of time in the flow of current advances ?—Quite, and in the long period the rate of increases was 4·4 per cent. In the short period movements are governed in our overseas trade balances.

It has been stated repeatedly that there is no increase in money. I think if we were to use the word "credit" it would illustrate my purpose better. The way I see it is this; and I think you yourself refer to the fact of the State issuing Treasury bills to cover that amount, but in actual practice does it not work out this way ? Assuming that the exporter has sent £10,000,000 to the foreign market, there is actually paid out in credits here in New Zealand £12,500,000; that is the actual practice ?—Yes.

Consequently there is really £2,500,000 in that case more in circulation than there otherwise would have been ?—That is so.

Assuming that our sterling credits accumulated to a very large extent at the other end, could that not be utilized, if necessary, in order to reduce our national debt at that end, and transfer the indebtedness to this end by internal borrowing ?—That could be done, but that would be deflationary.

In so far as it would withdraw from internal use that amount of currency ?—Yes; to pay that debt at the other end. For instance, the Government has to borrow from bank depositors here; you get then a transfer in New Zealand. Supposing you borrowed from bank depositors here, deposits would be reduced by transfer to the Government and the Government would transfer those funds overseas to pay debt. You have reduced total deposits in New Zealand in that way.

Of course, once the central bank is in operation, quite a considerable amount might be taken by the central bank without necessarily depleting the amount of currency in circulation ?—I anticipate that when the central bank is established it will buy exchange funds from the Government and treat them exactly as the other banks treat similar funds in London now. They will undertake the liability and give the Government a deposit here for them. The Government transfers that deposit to the other banks in payment for Treasury bills. The banks, instead of earning 5 per cent., will have a deposit at the Reserve Bank earning nothing.

There is quite a lot of discussion as to the cause of the world depression, and as to whether it is purely a monetary difficulty. Some hold it is monetary; others, like myself, believe there are

other reasons. Clause 1 of the explanation in the memorandum sent in by the Associated Chambers seems to meet the case, "The primary causes of the present economic stress arise from conditions which are beyond the control of the monetary system, such as economic nationalism; war debts and reparations; political inflation of currencies during the war and after; tariffs and their effect on international trade"?—I agree with that.

Do you think that the trouble we have been passing through during the past three or four years could have been dealt with and obviated entirely by monetary action?—I think they could have been modified if England had gone off the gold standard before, but she had to hang out as long as she could.

Particularly in view of the fact that she was a great debtor nation?—And in view of the fact that London held a tremendous amount of money as balances for other countries, who would have lost heavily when England went off the gold standard.

She had a double responsibility, the maintenance of her own stability and the maintenance of other stability, or an attempt to maintain it?—Yes.

Mr. Munro.] In reply to a question as to the possibility of the Reserve Bank being able to control the monetary position in New Zealand, you state that the Reserve Bank may act as an instrument of monetary control by—"(1) Control of the note-issue; (2) pooling and economizing both note and exchange reserves; (3) holding the reserves of other banks in New Zealand; (4) determining, in the light of the conditions prevailing, and with fuller knowledge of currency and finance through the world, as well as by close study of New Zealand conditions, what our domestic policy should be from time to time." I take it that (3) is the reserves held in London at the present time?—I do not know how much of the reserves of the other banks the Reserve Bank will hold. 3 per cent. of their time liability and 7 per cent. of their current liabilities must be deposited; they may deposit as much more as they like; that is the minimum. If the other banks transfer to the Reserve Bank the funds they now hold in London for exchange purposes, and take in exchange deposits at the Reserve Bank in New Zealand, they can convert those deposits into notes which will be available for lending in New Zealand to a great extent, and the Reserve Bank will be able to provide the money that is necessary with a smaller reserve than the individual banks would be able to do each holding its own reserve.

There is an economy?—A decided economy.

The fourth clause, "By determining, in the light of the conditions prevailing, and with fuller knowledge of currency and finance throughout the world, as well as by close study of New Zealand conditions, what our domestic credit policy should be from time to time"; and "They might express this policy through the rates by which they will buy and sell exchange, the rates at which they will lend to customers, on both old and new types of loans, through the development of a short-term money-market in New Zealand, and through the encouragement they might give to the better organization of long-term markets, as well as by their advice to the Government, the commercial banks, and their other customers"; what do you mean by that?—By "Lending to customers"? I understand that the bank will be prepared to do a discounting business. There is one thing not expressed clearly in this which I would anticipate from the Reserve Bank—not quickly, but as a slow development—that is, the building-up of a short-term money-market. In New Zealand practically the only form of commercial loan is the overdraft at the overdraft rate. In developed money-markets there is a great variety of different rates for different types of loans, most of them below the overdraft rate. I know businesses which have big demands for money for short terms and know perfectly that they will have money to repay in two or three months; if they can borrow from the Reserve Bank by rediscounting at a lower rate, they can get money cheaper, and that cheapens the cost of production. Those bills could not be renewed, they must be paid. If we can teach the business community that they can get money cheaper so long as they stand fast on their obligations, we will get rid of a great deal of long-term debt.

As far as I read the Reserve Bank Act, there will be no private customers?—I am not sure how this will work, but I think a real effort will be made to build up the short-term market, which will be based on discounting. It may mean that business men can discount with their own banks who in turn can rediscount with the central bank, but I anticipate that the central bank will do a good deal of discounting or rediscounting business at low rates for short-term money.

It is all part of the same explanation—through encouragement they may go to the long-term markets?—I think there is decided room for better organization in the mortgage market. A group of people with a knowledge of finance might be able to give useful information.

We hope that will be so. Question 10: "What limits do you place on the Government's financing construction schemes by non-interest-bearing Treasury bills or notes?" Answer: "I do not think any Government should be permitted to finance construction schemes by any loans or bills free of interest." Will you give us your reasons for answering in that manner?—In the first place, they cannot borrow from the real savings of the community free of interest; the community will not lend to any one free of interest while there is some one else in the market who will pay interest, therefore that must mean creation of that money. If they create that money, then they are creating spending-power; they create no equivalent value in goods. In doing that they are increasing the purchasing-power against the goods without increasing the goods, therefore increasing the price-level. They are inflating their money, diluting their money, and reducing the real return to every one who has money.

If the Government were going to carry out capital or construction works, therefore creating this money in this way, they have the power to do it through the Reserve Bank; would not that be simply a temporary inflation until such time as their values of the commodities or the works they were commencing—would that not mean that when that work was completed they would have the equal value, and it would take away the inflationary effect?—It might be comparatively harmless on a small scale, but it would be a very dangerous thing to introduce. It would be said, "You did it once, do it again."

I take it that if the Government carried out work, to give unemployed wages, necessary public works, railways, roads, &c., they would have assets, completed, in existence, physical assets, that would still take away the inflation ?—What guarantee is there that the physical assets created would have any value. Take the construction of a piece of railway; suppose a piece of railway is constructed that will earn £1,000 a mile; supposing operating expenses to be £900 per mile, and the rate of interest 5 per cent., the net return is £100; capitalize that at 5 per cent. and you are justified in spending £2,000 on that railway and no more, because that is the amount it would earn.

Captain Rushworth.] Does the same argument apply to the erection of a museum or art gallery ?—The same argument is not applied to the erection of those things in practice, but I am speaking of a business proposition.

Mr. Munro.] You are speaking from this standard, I take it, that the Government could, and a lot of people hope they will, do it in this way, and you emphatically think it has dangers and should not be allowed. I wanted to get your reasons ?—Suppose interest-rates are 5 per cent. in this country. Those rates are determined again by supply and demand, and they are fixed at 5 per cent. because the community can use money in other propositions that will earn 5 per cent. Therefore, if the community can use all the money that is available in propositions that will earn 5 per cent., it is wasteful for the Government to invest the people's money or even to create money to invest it in anything that will earn less than 5 per cent., and anything that cannot earn 5 per cent. under those conditions is not justified. The interest-rate, in that way, is a method of selecting between the more justifiable and the less justifiable construction schemes.

Mr. Schramm.] You said in reply to the question, "Does the fact that banking is often in private hands consitute a weakness in the banking system? Does this lead to chronic deficiency of purchasing-power? My answer to both questions is 'No'." What are your reasons for the answer to the first question ?—The obvious alternative to private hands is public hands, and the contrast is between private management and public management. In a matter such as banking it is absolutely essential that the confidence of depositors should be maintained and the business should be so conducted that depositors can always get back what the banks promise to give them. I personally have more faith in a private institution fulfilling those obligations in the long-run and managing its business on sound lines than I have in a public institution.

You will agree that banking and finance is the heart of the present system ?—It is a very essential part of it.

It pumps the stream needed to keep economic life going ?—Yes.

Notwithstanding that you say that you would have more faith in the private control of that system than you would in the public control of it ?—Yes. And on New Zealand records of banking, which I am speaking from, there is no evidence at all that that stream has not been available over the period that I have examined.

That is a question of argument ?—No. It is a question of fact.

You would not place the administration of justice in private hands would you ?—No.

Do you not think the administration of the banking and financial system is just as important as the administration of the judical system ?—It may be just as important, but it is entirely different in nature.

Why ? Because there is a profit in one and no profit in the other ?—No.

Why ?—Because money can be used to buy things and money is an intricate technical business which is seldom understood by the people who determine politics. Ultimately, the people who determine politics are the voters at the polling-booths, and they do not understand the technical side of banking.

But the rank and file would not administer the banking system. It would be still administered, surely, under any reputable Government, and any Government having any sense of duty, by those who knew something about it ?—I should hope so, but the views of the experts might be overruled for political reasons.

Should not the experts carry out the financial policy of the Government in power ?—I think the best way to meet that case is that the Government should decide by legislation the general frame-work within which the experts should operate, and leave the experts perfectly free within that framework to decide their technical job in their own way.

Let technicians do the technical job ?—Quite.

Would you have any objection to it if the State was the owner of the whole machine ?—I would still prefer private ownership.

Will you agree with me in this: that notwithstanding there is private ownership of the banks to-day, that the banks could not function at all and would have been out of business as private banks were it not for the power of the Government behind them ?—I do not know quite what your statement means.

If the Government did not come to the assistance of the banks and help them, would they still be in business to-day ?—I think five of the banks in New Zealand would be in business. The Bank of New Zealand might have been out of business. Its business might have been taken over by another bank, just as the Bank of New Zealand took over the Colonial Bank.

That is the most important bank of the lot, is it not ?—Yes.

You will admit, then, that the most important bank in New Zealand, if it was not for the Government, would be out of business to-day ?—The bank which is now the most important would perhaps have gone out of business forty years ago if it had not been for Government assistance at that time.

What do you think was the effect of the Government bringing down legislation to the effect that bank-notes were no longer redeemable in gold ?—The immediate effect was to have the gold withdrawn from circulation.

Would not it be the fact that the bank-note itself was really an inconvertible piece of paper ?—Yes.

Would you agree that inconvertible notes having a backing of law behind them are just as good for all purposes and perform the same function as the ordinary convertible notes ?—So long as they are properly administered and not overissued. Their value falls if they are overissued.

In answer to question 5, you say, "I do not consider money profits an inherent defect in the money system. The counterpart of profits is losses." Of course that is logical. Whom do the losses fall on at present when the bankers reap the profits ?—But do the bankers reap the profits ?

I am putting it to you. This is your answer. "I do not consider money profits an inherent defect in the money system. The counterpart of profits is losses." The banks at the present time make a profit. Who do they make it out of ?—I think the profit is a fair return for the services rendered. I do not know what the rate of profit is, but I have it in mind that I saw the other day that over the whole of New Zealand 3·4 per cent. was made on shareholders' funds.

Would you say that that, directly speaking, is a profit ?—Profit is simply the name given to it, and it is from that that the return to shareholders for the use of their money has to be made.

That is the view you take ?—Shareholders are entitled to a return for their money just as much as if they invested it in industry.

The shareholder only puts his capital in. He does nothing to earn his money, except leave his capital with the bank ?—Yes. But our system is such that capital can be used to increase production. In a sense banking is production, and some part of the return goes to the person who puts capital in.

Can a bank be started without capital ?—A bank has been started without capital in Australia.

It functions all right ?—Yes.

And the same, I suppose, could be done here ?

Mr. Lye.] Was it not only a saving-bank in the first instance ?—I could not say.

Did they not first get some capital through operating purely as a savings-bank and not as a commercial bank ?

Mr. Schramm.] No. Now there is this phrase often used "political control." Do you think there is really anything in it after all ? Do you think it is a bogy ?—I do not think it is a bogy. I am afraid that certain matters might be controlled in the interests of political parties. Our political system is founded on the assumption that you will get a swing from one party to the other. The danger is that you will have things controlled and influenced in one direction because one party thinks they ought to go that way, and then the other party comes into power and it thinks they ought to go the other way. The change is bound to create maladjustment in the economic system, which is undesirable.

Captain Rushworth.] Has that happened since the Government have had the majority on the Directorate of the Bank of New Zealand ?—No, I think not. I think it has happened in America.

But not here ?—No, not here.

Mr. Schramm.] But you have political control now, have you not ?—A good deal of it, yes.

The party in power, of course, to the best of their ability, makes appointments to the Public Service, and they control the highest positions in the land judicially and when you come down to the last analysis it is a political appointment is it not ?—Over the whole field of our activities there are some that are best controlled by the public authority.

Do you think that anything done by the party in power, in the final analysis, is a political matter, taking it right to its logical conclusion ?—Politics certainly influence everything more or less.

For instance, they would not appoint a professor to the University who was absolutely antagonistic and hostile and had used his position as a propagandist bitterly opposed to the Government ?—If a person did that he should not hold a position as a professor under any Government. If he is a propagandist pure and simple he should not be a professor.

Sometimes it is a question whether a man is a propagandist pure and simple ?—I am assuming he is not even a teacher.

That might be just a small part of the business. Do you think it is a good thing to borrow money ?—I think it is a good policy, if you have to borrow money, to borrow it in the cheapest market.

Do you not think it would be better to create it here ?—I would rather not see any money created in the sense that it is simply inflation.

If you deposited Treasury bonds in a bank and you issued currency with that backing, would you call that inflation ?—It depends entirely on the purpose for which it is used. Borrowing on Treasury bills to buy funds in London at the present time—that is not inflationary : that is deflationary.

What would you call the process by which the Bradburys were issued in England during the war ? Would you call that inflation ?—The Bradburys were not directly inflation. They were issued in response to the demand of the public, but the credit inflation during the war was highly inflationary.

And it was highly profitable for the Government and did the job, and the war was financed that way ?—The war was financed largely out of inflation.

And do you not think, if you use the term "inflation" in a time of national stress and danger, if they used such a measure, then such a scheme during a time of economic war would equally serve the purpose ?—I think the war gave us ample evidence that inflation, if carried too far, brings very grave difficulties in its train ; it should be as moderate as we can manage.

I agree ; there is a limit ?—We have inflated considerably in New Zealand.

We have deflated ?—Raising the exchange was inflation, and balancing our Budget by borrowing on Treasury bills.

Cutting down wages was deflation ?—That is a deflationary method. We had it on both sides.

Mr. Murdoch.] You say "The special features of the New Zealand system have developed to meet the needs of the country and the community." Do we take it from that that you think the system we have in vogue in New Zealand is a thoroughly satisfactory one ?—The system is generally satisfactory. Incidentally, I have pointed out some things as weaknesses, but as a general system of working, I think in the main it is thoroughly satisfactory, or as satisfactory as we are likely to get. It has grown up side by side with and is an essential part of, the economic organization of the country.

On a previous page you say, " since there is no effective limitation on note-issues, the liability to find notes presents no real limit to credit expansion." You have heard it stated that we issue our own credit here in New Zealand; we have had such things mentioned as costless credit; will you give the Committee any enlightenment on this costless credit?—I think I might have convinced the Committee that I at least do not believe in costless credit; in fact, there is no such thing; some one has to pay for it. There is nothing of value that some one does not pay for somewhere.

Captain Rushworth.] Could you say " costless creeds " ?—That is better.

Mr. Murdoch.] Do you approve of the establishment of a Reserve Bank?—Yes.

What effect do you think that will have on the general banking of New Zealand?—I think that it will economize the reserves of the banks and enable them to undertake more liabilities, to give easier—perhaps more—credit on a given amount of reserves, and it will be able to guide and direct the monetary policy of New Zealand more effectively than has been the case in the past. I have detailed certain points.

It has been stated before the Committee that the Reserve Bank was to be established under the domination of the Bank of England. Do you think there is anything to that?—I do not think there is anything in it at all.

You think it would have come naturally, that it would have naturally evolved?—While we retain our trade and financial connections with London there must be some connection between our monetary system and the London system. I think that is as far as it goes.

You mention that the internal price-level could be maintained by a variation in the exchange; do you think that is a practicable solution?—Theoretically it could be done; I do not think it is really practical. I think the cure would be worse than the disease.

And what would be the effect on, say, the traders in the town when you were manipulating exchange?—If you got a fall of 25 per cent. in export prices, and you pushed up the exchange to equate those prices in New Zealand, if import prices had not fallen at all, you were paying an additional $33\frac{1}{3}$ per cent. tariff on imports. When the import prices came back you put the exchange down again. You do not stabilize, but transfer the instability from the farmer to some other group of people.

Do you think business people can work under those conditions?—I think the farmers can stand instability, within reason, better than any other group of producers.

With regard to the question of war debts: Do you care to express an opinion on the cancellation or otherwise of the war debts?—I think most people agree that, in the interests of world recovery and a sound economic system throughout the world, it would be better if the war debts were cancelled or reduced to amounts that might be met reasonably easily.

The Chairman.] Yesterday we had a gentleman here who principally advocated the Government purchasing the whole of the trading banks. Do you think that would be a wise step?—I think there is a lot to be said for competition, and while there is some monopoly in the present banking system there is also some competition. Further, it is quite probable that different banks operating do so on different lines. I think that variation and flexibility, and a certain amount of competition, are necessary.

You would not favour it?—No.

Do you think that the Government acted rightly in taking gold from the banks by the central bank at the price it did?—Quite rightly.

In the course of his remarks, Mr. Langstone was referring to butter, and the price he mentioned was 6d. a pound. We have to take the price of butter over the whole season, and I suppose it is safe to say it would be 8d. or 9d. That is a better approach. He said the exchange had been of no benefit to the dairy-farmers; have you any figures as to what the exchange has meant to the dairy people?—I have no figures, but surely it is fairly obvious.

I have a statement here made up, and I thought it might interest you. The total of the twenty-five per cent. is given since the introduction of the rise in the exchange, 20th January, 1933, to the 31st March, 1934, as £4,353,525?—To all exporters?

No; butter and cheese only, so that it has been a good thing for the dairy-farmer?—Yes.

On behalf of the Committee, I would like to thank you, Professor Tocker, for coming up from Christchurch, and also for the statement you have put in and the ready replies you have given to the members of the Committee.

Reply to Committee's Questionnaire by Professor H. Belshaw, Auckland.

1. In so far as Stock and Station Agents act as banks, should they be classed with the six trading banks for the purposes of better co-ordination and control of banking policy?

In principle I would reply to this question in the affirmative, since if such institutions are uncontrolled the capacity of the central bank to control currency and credit policy in the general interest will be weakened. In certain circumstances the policy of stock and station agents might be a source of serious financial danger, especially through the acceptance of a large volume of short-term deposits and the granting of a large volume of advances during conditions of boom. With the advent of depression the " freezing " of advances would endanger the liquidity of deposits. In practice, it might be difficult to exercise such control without hampering the non-banking business of stock and station agents; and I should not be prepared to give a final opinion without a comprehensive investigation

into the affairs of such companies. Tentatively, I would suggest that your Commission should inquire into the desirability of—

(*a*) Preventing such concerns from accepting deposits for a shorter period than, say, two years.

(*b*) Providing that the rates offered should bear a definite relationship to the deposit rate of commercial banks.

2. *In view of the fact that much capital in New Zealand is wasted by unsupervised investment, would you favour the setting-up of an Investment Board not to guarantee a return on investments, but to give an opinion as to the economic soundness of any project for which the public were asked to subscribe for shares?*

This question trenches on the ground of the Commission into Company Promotion, of which I am a member. For this reason I should prefer not to answer it.

3. *Would you advise the setting-up of some additional institution to facilitate small savings?*

See answer to question 2.

4. *What are the limits of economic recovery in New Zealand by internal expansion of—(*a*) Treasury or bank notes; (*b*) credit?*

(*a*) Notes: The volume of notes in New Zealand is determined by the demand for currency to make small payments. An increase in note-issue would lead to temporary expansion of purchasing-power, but in the main the new notes would replace existing notes or other means of payment, and it is unlikely that there would be a net increase in purchasing-power.

(*b*) Credit: The present ratio of advances to deposits is extremely low—64·64 per cent. for the week ending 19th February, 1934. This indicates that there is a considerable volume of funds available for lending. It suggests also that there is not the demand for credit from borrowers with adequate security. Hence the effective utilization of the surplus deposits appears to require action by the Government and/or local authorities, preferably by way of expenditure on public works. This might be financed either by way of Treasury bills or loans for a longer term. The choice between the two would be influenced by (*a*) relative costs at the time; (*b*) prospective changes in short-term and long-term rates and the Government's policy in regard to these. My present inclination would be in favour of the former, since the entry of the Government into the long-term market might raise long-term rates or prevent them from falling. It would probably be cheaper in the long-run to finance by Treasury bills and fund these when long-term rates are lower. A decisive answer would require more information than I have at my disposal, and the Treasury would be more competent to judge.

The extent to which recovery might be facilitated by these means is limited by the effects of internal credit expansion on internal prices. Up to a point, internal credit expansion might be expected to "take up the slack" without causing a rise in internal prices. Beyond this point, prices would rise and prejudicially affect export industries through the increase in costs.

Such a point cannot be determined in advance, but is a matter of rough practical judgment and experiment. I do not think that an expenditure of £5,000,000 to £6,000,000 per annum would be unduly high. To the direct increase in purchasing-power would be added an indirect increase due to the stimulus given to other trades. Mr. Keynes estimated for Great Britain that this would amount to one-half the direct expenditure. On a similar basis the total increase in purchasing-power in New Zealand would be £7,500,000 from an expenditure of £5,000,000 and £9,000,000 from an expenditure of £6,000,000. While the national debt would be increased, there would be a countervailing advantage to the Budget due to increased taxable capacity. Probably 20 per cent. of the total would return to the State by way of taxation, unemployment taxation, and other receipts; or £1,500,000 on a direct expenditure of £6,000,000 and £1,125,000 on a direct expenditure of £5,000,000. In addition, the pressure on unemployment funds would be reduced.

Provided that the expenditure was limited to such an amount as would not cause internal prices to rise, such a policy would facilitate an upward movement in economic conditions and ease the situation pending an improvement in world conditions or internal reconstruction by other means. It might of itself lead to some permanent improvement by stimulating confidence and by the indirect fillip which it would give to local industries. It could not be regarded as a permanent measure, because it would involve an increase in debt charges; nor would any policy of interal credit expansion be of itself sufficient to bring about complete recovery.

5. *In New Zealand, is there any reason why the Government should pay interest on Treasury bills?*

As long as banks pay interest on deposits, the Government should pay interest on Treasury bills. I think, however, that the rate should be substantially lower than the present rate.

6. *What limits do you place on the Government's financing construction schemes by non-interest-bearing Treasury bills or notes?*

The limits to the financing of construction works by means of Treasury bills, whether interest-bearing or not, are indicated in reply to question 4. If the central bank took up Treasury bills the limits would also be affected by the legal ratio of reserves to liabilities.

7. *Assuming normal conditions, has New Zealand reached a stage of development such that overseas borrowing will in the future not be necessary?*

This question cannot be answered in the form in which it is put; nor is it of immediate importance. At the present time, in view of the excess of deposits over advances, of an accumulation of exchange funds, and of heavy unemployment, there should be no need to borrow abroad. Whether or not overseas

borrowing or local borrowing is to be preferred in the future will depend on the circumstances of the particular time when the projects for which borrowing is required are contemplated, as well as on the relative costs of borrowing in New Zealand and abroad.

The effect of overseas borrowing will be different according to whether the sum borrowed is to be spent overseas or in New Zealand. In the former case there is an immediate increase in imports to the extent of the borrowing, but no effect on the London balances or on currency and credit in New Zealand. In the latter case there is an increase in London balances to the amount of the loan. This is credited to the Government's account in New Zealand and increases the ratio of deposits to advances. The expenditure of the loan-money by the Government increases purchasing-power, both directly and indirectly, as indicated under 4 (*b*). Imports are encouraged to the amount of the increase in the London balances, and the ratio of deposits to advances is again reduced. This tends to a restriction of credit in New Zealand. By contrast with internal borrowing, an overseas loan increases the capacity to import by the amount of the loan. It therefore makes it possible to free the labour which would be required to make such goods for the works for which the loan was raised.

The effect of an internal loan is to divert labour and capital from other uses, unless such labour is idle in the form of unemployed workers and capital in the form of a substantial excess of deposits over advances.

Part of the additional purchasing-power will be expended in imports, which will reduce the London balances. If the ratio of deposits to advances is low and exchange funds are low, there will tend to be a restriction of credit by the banks which will react prejudicially on private industry.

The case for internal borrowing would be strengthened—

(1) When a surplus of saving was indicated by a substantial excess of deposits over advances :
(2) When there was an accumulation of exchange funds in London :
(3) When interest rates in New Zealand were low relative to those overseas :
(4) When prices were falling and were expected to continue falling.

The case for overseas borrowing would be strengthened—

(1) When the ratio of advances to deposits was high :
(2) When overseas interest rates were low relative to those in New Zealand :
(3) When exchange funds were low :
(4) When prices were rising and were expected to continue rising, since this would reduce the real burden of overseas loan.

My general opinion would be that, while the above circumstances should influence the decision at any particular time, the policy should be to rely less on overseas borrowing and more on internal borrowing than in the past because—

(*a*) Assuming the return to " normal " conditions, it should be easier than in the past to maintain a reasonable standard of living and at the same time engage in capital works out of savings within New Zealand :
(*b*) Internal debt is less burdensome than external debt if prices fall :
(*c*) Reliance on annual overseas borrowing as a normal policy increases the problem of readjustment if the source of overseas borrowing suddenly dries up.

8. Has the exchange-rate in the past been governed by the supply of and demand for London funds? Was the exchange-rate ever "free," or was it always "pegged"?

No. The rate was always " pegged," or " artificial," prior to the crisis. This is demonstrated by the fact that it remained at or near to parity with sterling despite considerable fluctuations in the London balances. The mechanism of control was not fluctuating exchanges, but changes in deposit and overdraft rates.

9. What determines the rate of interest charged and paid by the banks?

Interest rates would be affected by a number of factors including—

(*a*) Rates offered by the Government and competitive institutions (there is perhaps some doubt as to whether the influence is other than psychological) :
(*b*) The ratio of advances to deposits and the state of the London balances :
(*c*) The rough practical judgments of bankers as to conditions of demand and supply :
(*d*) Rates offered in other countries—*e.g.*, Australia.

I believe that there has been a considerable arbitrary element in interest-rates. During the immediate post-war years, people became accustomed to high rates and for some years interest-rates have been too high. Apart from the influence of (*d*) above, I see no reason why interest-rates could not have varied about a substantially lower level, provided the Government, the banks, and other financial institutions had co-operated.

10. If deposits and advances rates were lowered would this tend to promote economic recovery?

Yes ; it would help. Lower deposit rates would force funds into more active use. Lower overdraft rates would reduce costs.

11. (a) Do banks in New Zealand lend their deposits? (b) Is there any fixed relationship between deposits and advances in New Zealand? (c) What factors determine an increase in advances?

(*a*) Yes.
(*b*) No.
(*c*) The demands of traders, manufacturers, farmers, and others for accommodation and the willingness of bankers to grant them having regard to (i) the volume of deposits ; (ii) the prospects of the enterprises demanding advances ; (iii) the nature of the securities offered.

The ratio of advances to deposits is determined mainly by the balance of payments, which in turn is influenced mainly by the balance of trade and by Government borrowing. The balance of payments affects the London balances and the ratio of deposits to advances in New Zealand. This has a bearing on (*b*) above. Since I am in substantial agreement with Treasury's statement in these matters, there is no need to develop the argument.

12. What would be the advantages and disadvantages of lowering the exchange-rate on London from the point of view of (a) the budgetary position, (b) the economic structure of the country?

The balance of argument is overwhelmingly against a reduction of the exchange-rate on London. I would summarize the advantages and disadvantages as follow :—

(a) Budgetary Position.

Advantages.—(1) The cost of transmitting interest overseas would be reduced.

(2) There would be a temporary fillip to imports and a *temporary* increase in Customs revenue.

(3) This would discourage the further accumulation of exchange funds in the hands of the Government.

Disadvantages.—(1) The Government would suffer a loss on the volume of exchange funds now held and bought at 125.

(2) Internal deflation which has been checked by the increase in exchange would be resumed. This would reduce taxable capacity and receipts by way of interest, rents, &c.

(3) The deflationary process would increase unemployment or at least make it more difficult for unemployment to be reduced. The burden on the unemployment funds would be greater and some assistance from the Budget might be necessary.

On balance there is little doubt in my mind that the budgetary position would be made more difficult.

(b) Economic Structure of the Country.

Advantages.—(1) The price of imported goods would be lowered somewhat.

(2) The volume of imports would be *temporarily* increased.

Disadvantages.—(1) The disparity between farmers' costs and selling-prices would be increased.

(2) The deflationary process in evidence before the exchange was raised to 125 would be resumed and purchasing-power would be reduced, with discouraging effects on production and employment.

(3) After a temporary revival in imports there would tend to be a check in imports as internal purchasing-power declined.

(4) With declining internal incomes the burden of debt internally held would be increased as also the burden of taxation required to raise a given amount of revenue.

(5) The reduced purchasing-power of farmers transmitted to the rest of the community would strengthen any movement towards wage and salary reductions.

(6) Local manufacturers would be faced with increased competition from overseas, in the first instance followed by a reduced demand as deflation continued.

13. On balance would devaluation at New Zealand £125 to £100 sterling be in the best interests of New Zealand? This question assumes that £125 would be the "normal" exchange-rate about which adjustments might be made if warranted in the future.

Yes. This question is partly covered in answer to question 12, but the following additional comments should be made :—

(1) It is argued in some quarters that the increase in exchange has been of no benefit to primary producers. For the year ended January, 1934, the sterling value of exports was £33,700,000, and the value expressed in New Zealand currency was £42,100,000. Hence New Zealand exports were valued at £8,400,000 higher than at parity. In 1930 the value of exports totalled £49,000,000, and an official estimate made in that year allowed 26 per cent. for the cost of materials in the index number of farm expenditure. If we assumed that the whole of the value of exports went in expenses, the cost of materials would total about £12,125,000. If the exchange had been at 125 in that year, and all materials had risen by 25 per cent. in price, the additional cost would have been about £3,100,000. The expenditure on materials at parity would probably be much less than £12,500,000 at the present time, and an increase in the cost of materials of £3,100,000 as the result of the present exchange premium of 25 per cent. would be a very generous estimate indeed. This leaves a net increase in farmers' returns of £5,300,000. A reduction of the exchange-rate would undoubtedly reduce the purchasing-power of farmers and through them of the rest of the community. In short, it would have a deflationary influence.

(2) At the present time there is an appreciable accumulation of exchange funds in the hands of the Government. This is much greater than is warranted by the balance of trade. The following figures give the sterling value of exports and imports for the years ended January, 1933 and 1934, respectively :—

Sterling Value.

Twelve Months ended	Exports.	Imports.	Excess Exports.
	£	£	£
January, 1933	32,700,000	22,300,000	10,400,000
January, 1934	33,700,000	20,700,000	13,000,000

The value of exports was £1,000,000 greater for the year ended January, 1934, than for the year ended January, 1933. Imports were £1,600,000 less, and the favourable trade balance £2,600,000 more. Allowing for overseas interest payments of Government and local bodies to the extent of, say, £9,000,000, this would leave a surplus of £4,000,000. I understand that the surplus is very much greater than this. In my opinion the accumulation of funds in the hands of the Government has been influenced by the following factors:—

(i) An unknown volume of funds was transferred abroad prior to the raising of the rate, in anticipation of a rise. This lowered the datum line above which surplus exchange would be calculated. Much of the money would be returned to New Zealand when the rate was raised.

(ii) Since the rate was raised there have been persistent rumours that the exchange was to come down "shortly." This has led to uncertainty and has—

(*a*) Discouraged imports:
(*b*) Encouraged overseas exporters to leave funds in New Zealand on account of goods imported into New Zealand rather than accept payment in London:
(*c*) Encouraged the transfer of funds to New Zealand in order to make a speculative profit by retransfer when the rate is lowered.

I believe that these factors are operating at the present time in the expectation that the rate will be lowered at the end of the export season.

My conclusion is that the accumulation of funds is due not to the raising of the rate but to the fear that it will be reduced. I am confident that, had it been generally accepted that the exchange would remain at the present level for some years, there would have been little, if any, surplus of exchange accumulated. Certainly it would have been less than £4,000,000, allowing for Government and local-body requirements. If the currency were devalued, imports would increase and the above practices making for an accumulation of exchange funds would cease.

(iii) Although there may be a gradual rise in overseas prices any rapid and considerable rise is extremely unlikely. Hence the shelter of the exchange premium is still likely to be of value to farmers in helping them to bridge the gap between costs and selling-prices.

I conclude that the currency should be devalued at the present level of exchange, at the earliest possible moment,—

(*a*) Because farmers still require its assistance, and are likely to do so for some time:
(*b*) Because it would remove uncertainty from the minds of importers, and encourage an increase in imports:
(*c*) Because it would remove the main causes leading to the accumulation of exchange funds in the hands of the Government:
(*d*) Because it would relieve the Government of the prospect of loss from the sale of exchange bought at 125 and disposed of at a lower figure.

It should be noted that while the prejudicial effects of a rise in exchange in public revenue were felt at once the beneficial effects by way of increased income-tax and other receipts is not yet fully felt.

14. In view of present conditions, and the prospective outlook for the next few years, what should be the exchange policy of New Zealand?

This question is partially answered in reply to questions 12 and 13.

Having regard to existing and prospective conditions, my opinion as to exchange policy is as follows:—

(1) The Government should immediately declare a new parity of exchange of £125 New Zealand = £100 sterling.

(2) It should announce that this parity will hold for at least two years, save as the result of extraordinary and unforeseen events.

(3) It should be the duty of the central bank to hold the rate between, say, £3 of parity either way—*i.e.*, between £122 New Zealand = £100 sterling and £128 New Zealand = £100 sterling. This proposal is, in reality, a proposal for a parity fluctuating within narrow limits. Any change in the rate during the next two years should require the approval of the Minister of Finance.

(4) In two years the rate might be reviewed in the light of the price situation and the general economic position at the time. It might then be desirable to declare a new parity, but the above margins should be retained.

(5) Since the responsibility for maintaining the rate will rest with the central bank and not with the commercial banks, and since the danger of loss to the commercial banks from a lowering of the rate will be removed by devaluation, the Bank Exchange Indemnity Act might be repealed or at least amended.

My present feeling is that it would be wiser to hold the rate at not less than 125 during the next two years because I do not anticipate that world prices will rise sufficiently during that period to permit of adjustment at a lower rate. The proposal to widen the margin of exchange fluctuation permitted by statute beyond the 30s. either way, originally provided in the Reserve Bank Bill, is made for the following reasons:—

(*a*) It would provide the central bank with a method of control over imports and exchange funds more elastic and effective than interest-rates:
(*b*) Occasions might arise when it was desirable to take action affecting the accumulation or reduction of such funds without raising or lowering interest-rates in New Zealand:

(*c*) A variation in the rate might be used as a cushion reducing the effects on prices and economic conditions in New Zealand of fluctuations in export prices—*i.e.*, the device would permit of a greater measure of price stability in New Zealand.

(Note that the old margin of 30s. either way was roughly representative of the gold points. There is no need to return to this particular margin if another is more satisfactory, because New Zealand is no longer on the gold standard.)

Reply to Questionnaire from a Member of the Committee by Professor H. BELSHAW.

1. What was the originating cause of the violent fall in commodity price-levels?

The fall in commodity prices cannot be attributed to any single cause. Amongst the major factors are the following:—

(*a*) Political insecurity and growing economic nationalism:
(*b*) Reparations and war debts:
(*c*) Increase in international debt for other purposes, which became burdensome when once prices began to fall:
(*d*) Different and changing monetary policies in various countries for some years after the war:
(*e*) Changed character of international lending, leading to frequent disturbing short-term movements of funds (and gold) from centre to centre:
(*f*) Accumulation of gold in France and the United States of America and the depletion of gold reserves in other countries:
(*g*) Deflationary policies in some countries, notably Great Britain:
(*h*) Inflationary policy prior to the crisis in some countries, notably the United States of America.
(*i*) Increasing rigidity of price, preventing adjustment to changing conditions and leading to marked price disparities:
(*j*) Increased tariffs and other hindrances to trade:
(*k*) Rapid changes in the directions of trade:
(*l*) Unbalanced production.

These were the main underlying causes. The event which actually precipated the crisis was the Stock Exchange boom and collapse on Wall Street.

2. What was the cause of the rise in price of gold?

The price of gold in countries on the gold standard—*e.g.*, France and till recently the United States of America—remained fixed, but the price in other countries rose in proportion to the extent of the depreciation of their exchanges on gold-standard countries.

3. Are booms and depressions an inherent part of the economic system rather than the monetary system?

In my opinion booms and depressions are inherent in the economic system, but a properly devised system of monetary control would mitigate the effects of cyclical movements due to other causes, especially if such a system of control were international in scope. Monetary factors undoubtedly exaggerate considerably the amplitude of the trade cycle.

4. Does banking control or merely reflect economic conditions?

Banking policy in large measure reflects economic conditions, but it also controls them in the sense that it may encourage or discourage movements due to other causes.

5. Is the existence of money profits an inherent defect in the economic system?

The existence of money profits is a defect in the sense that—

(*a*) The volume of profits is not always closely related to the performance of a social service:
(*b*) The pursuit of profits under competitive conditions may lead to misdirected effort and a distribution of resources not in the best social interest.

On the other hand, profits are the mainspring of effort under capitalism and may be said to be responsible for a great part of the achievement as well as of the defects of the present system.

6. (a) Does the fact that banking is often in private hands constitute a weakness in the banking system?
(b) Does this lead to a chronic deficiency of purchasing-power?

(*a*) The answer depends on what is meant by the question and on the type of social order which is visualized. As long as the economic organization is based predominantly on private profit, the balance is in favour of retaining commercial banking in private hands. In such circumstances the banks must pass judgment on propositions in terms of prospective profits, and not on the social desirability of the enterprises considered. In the case of publicly owned financial institutions, the latter consideration would be paramount, and this would not always be consistent with the needs of a system predominantly competitive and profit-making. If socialization were projected or imminent the socialization of banking would be an essential preliminary step.

If a considerable measure of planning were contemplated within the general framework of a capitalist economy, it might be found desirable to establish a separate public institution to finance the planned activities. Even under a system based fundamentally on private profit, commercial banks should not be uncontrolled. A central institution, or Reserve Bank, whose broad policy is laid down by the Government, is desirable to put that policy into effect and control the general conditions of currency and credit in the social interest.

(*b*) Sometimes it leads to an excess, sometimes to a deficiency.

7. Would it be possible, by law, to fix and stabilize internal price-levels, irrespective of oversea price-levels?

It would be possible by appropriate exchange policy to have a considerable increase of price-stability, but such a policy is not wholly advantageous. (See reply to questions 12 and 14 *ante*.)

8. Does the volume of money and credit determine the general price-level?

The general level of prices is determined by the combined effects of—

(*a*) The volume of currency and credit:

(*b*) The velocity of circulation of currency and credit:

(*c*) The volume of transactions for which means of payment are required.

This is perhaps an oversimplified statement, but to answer the question fully would require an intricate and extended argument.

9. What was the principal means of financing used during war-time in New Zealand? Did advancing by way of overdraft for the purpose of subscribing to war loan play an important part in inflating the currency?

The principal means of finance in New Zealand was the issue of war loans. I understand that arrangements were made with the banks to grant advances to enable persons to subscribe to such loans. The Treasury would know more about this aspect of the matter, but I am satisfied that such advances were relatively unimportant in relation to the total issue. The large volume of subscriptions to the war loans was rendered possible by the high prices then received for exports of primary products.

While the war demand was responsible for that rise in prices, I do not think the flotation of the war loans in New Zealand was directly responsible for the increase in the volume of credit in New Zealand. The explanation of this is contained in the Treasury statement wherein it is pointed out that through the operation of the sterling exchange standard our price-level moved in sympathy with that of Great Britain. As more was received in sterling for our exports more was added to deposits in New Zealand, while, on the other hand, more had to be paid for imports. Hence the large increase in deposits and advances during the war period.

10. To what extent does our oversea indebtedness link New Zealand to gold or sterling?

Overseas indebtedness does not "link" New Zealand to gold or sterling in the sense that it forces us to accept any particular parity of exchange. It does, however, strengthen somewhat the case for a fixed parity of exchange with sterling.

Statement submitted by THE ASSOCIATED CHAMBERS OF COMMERCE OF NEW ZEALAND (A. O. Heany, Secretary).

My association takes this opportunity of placing before your Committee the views of the business community, as represented by my association, with regard to the inquiry being undertaken by your Committee. Our views may be briefly set out as follows:—

1. The primary causes of the present economic stress arise from conditions which are beyond the control of the monetary system, such as economic nationalism; war debts and reparations; political inflation of currencies during the war and after; tariffs and their effect on international trade.

2. The confidence of the commercial community in the banking system of this country has not been shaken, and we are confident that it can and will adapt itself wherever necessary to any changes that may occur in the development of industry and commerce whether local or international.

3. Except so far as changes may be necessary in the circumstances suggested in the preceding paragraph, the commercial community is not prepared to forgo the present system in favour of some new system that is unable to command the same confidence.

Factors distinct from the operation of the monetary system which have to be borne in mind in connection with present conditions in New Zealand are—

1. We have suffered a severe drop in the prices we receive for our produce sold overseas, the proceeds from which are the chief factor in our prosperity. Our interests are therefore interlocked with economic conditions overseas.

2. Government and local-body borrowing has for years constituted no small part of what we have regarded as our income, and this source of supply has now been seriously curtailed.

3. Overborrowing and overspending by the public authorities, by private enterprise, and by individuals, aided in some directions by an overextension of credit facilities, have resulted in the inflation of almost all kinds of assets beyond their real value, and much harm has resulted from the efforts which have been made to sustain these false values.

Monetary measures—

1. The majority of the monetary-reform schemes that are being propounded are variations of inflation in one form or another, and it is unnecessary to remind the Committee how impossible it is to control inflation so as to avoid the disastrous consequences of such a policy, which are well illustrated by post-war Germany and other Continental countries. My association does not feel called upon to deal with the claims of these schemes, one of which can only be described as plainly confiscatory. The schemes do not, in themselves, impress the commercial community as likely to be efficacious in the important sphere of banking, currency, and credit, and they also lack completely that authority that would come from their operation elsewhere.

2. By no possible method of manipulation of currency can the Dominion break away from the inevitable valuing of its currency in terms of sterling, in which latter currency payment is made for our exported produce, sterling thereby still determining the basis and value of our income.

Further, the large sums payable overseas every year for the service of New Zealand debts, national, local and personal, form another unbreakable link between sterling and our own currency.

3. England has not dabbled in monetary experiments, but has adopted certain prudent modifications of its well-tried and almost traditional system to meet unprecedented international monetary conditions over which she herself had no control, and to-day London is more than ever the world's financial centre. New Zealand has a system similar to the English banking system, and the manner in which the banks in New Zealand have functioned throughout an unprecedented depression is ample evidence of their fundamental stability and soundness. The Associated Chambers of Commerce of New Zealand is therefore strongly of opinion that local monetary experiments should not be tried.

Remedies: Concerning the steps to be taken in our present position in New Zealand,—

(*a*) The present values of all inflated assets must be allowed to find their true level in the process of readjustment that has become inevitable as a result of both the public and the private extravagance of the past.

(*b*) We must guard against further waste and extravagance, balance our budgets, public and personal, and so bring costs into accord with the new standards of values that have been established.

(*c*) The commercial community believes that the only changes that should be made in the existing system are such as the banks, in consultation with the Government, deem necessary to secure stability of exchange between New Zealand and Great Britain.

The above constitutes the statement my association desires to make on the subject. We do not consider it necessary to appear before the Committee in support of the statement, but we are prepared to appear if the Committee requires it.

Correspondence between MAJOR C. H. DOUGLAS and GOVERNMENT MONETARY COMMITTEE.

Government Monetary Committee,
Parliament Buildings, Wellington, 14th February, 1934.

Major C. H. Douglas, Evening Post Building, Willis Street, Wellington, C. 1.

DEAR SIR,—

The Government of New Zealand has set up a Monetary Committee to inquire along the lines as set out in the order of reference enclosed. A copy of an advertisement which has been inserted in the press throughout the Dominion is also enclosed for your information.

Owing to the prominence given to your proposals, the Committee feels sure that you will welcome the opportunity of meeting a Government Monetary Committee, and is therefore very desirous that you should submit a proposal or any other definite scheme which might be made applicable to New Zealand.

The Committee would also appreciate your appearing in person in support of your plan, and will be glad if you will select a date suitable to yourself. Arrangements will then be made accordingly. The Committee has decided to commence its work on the 27th instant, but if, owing to your short stay in New Zealand, you would prefer an earlier date than the 27th, then the Committee will be glad to alter its present arrangements to meet your wishes.

The Committee, however, would be glad to have your proposals a few days prior to your personal appearance in order that the members may have the opportunity of studying them.

Yours, &c.,
D. BARKER, Secretary to the Committee.

Fifth Floor, Evening Post Building,
Wellington, C. 1, 19th February, 1934.

The Secretary to the Committee, Government Monetary Committee, Parliament Buildings, Wellington.

DEAR SIR,—

I am obliged by your letter of the 14th instant.

(1) It would be a source of pleasure to me, and I have every wish to render effective assistance to your Committee in obtaining information which would further the welfare of the people of New Zealand.

(2) In regard to the suggestion contained in your letter that I should submit a proposal or definite scheme which might be made applicable to New Zealand, and on which your Committee might report under their terms of reference, the position is complicated by the circumstance that, as I have been requested to assist at a somewhat similar Parliamentary Committee in Canada at an early date, and have inescapable commitments in the United States in regard to the same matters subsequently, I am obliged to leave Wellington towards the end of this week.

(3) I am confident that you will agree that, in order to deal with the subject in question in a manner which would provide a complete survey of the situation and would carry appreciable weight with responsible opinion, it is necessary that the defects, if any, of the current monetary system be established by a judicial inquiry. At such an inquiry suitable defendants of the existing system might be examined by agreed counsel for its critics, both sides being in a position to call witnesses as to questions of fact. A similar procedure would no doubt be applicable to any suggested means of rectifying any defects exposed. Such an inquiry on behalf of the New Zealand Government might quite suitably be held in London.

(4) Since, at this juncture, time does not permit me to assist at an inquiry so organized in Wellington, even should your Committee desire to take action along such lines, I can, perhaps, be most helpful if you would inform me—

(*a*) Whether your Committee is prepared to regard it as now being beyond reasonable discussion that the existing monetary system creates financial debts in excess of the capacity of the public to liquidate it, and that this situation arises from the lending and other disposition of financial credit, constituting purchasing-power, by institutions claiming the exclusive prerogative of its creation.

(*b*) Whether, on the contrary, your Committee does not wish to comment on or investigate the current working of the financial system, and is therefore precluded from a favourable view of proposals which would traverse it.

The suggestions I should be prepared to make in the latter case would, if carried out, naturally be less effective than those made on the basis of the assumptions contained in (*a*), but I am hopeful that you might, even so, find them of value.

(5) It is perhaps unnecessary to add that any suggestion would be made with a view to implementing the wish contained in the second paragraph of this letter, and not with a view to obtaining an expression of opinion as to their technical soundness. To deal with this latter aspect, a more elaborate procedure than that which your Committee has so far suggested is indispensable, as proposed in paragraph (3).

(6) In order to economize the small amount of time available, I am despatching this letter to you by hand, and should much value your reply, if possible, within twenty-four hours.

Yours, &c.,
C. H. Douglas.

Government Monetary Committee,
Parliament Buildings, Wellington, 19th February, 1934.

Major C. H. Douglas, Fifth Floor, Evening Post Building, Willis Street, Wellington.

Dear Sir,—

I have to acknowledge the receipt of your letter of the 19th instant; in reply, I am directed by the Chairman of the Committee to thank you for your offer to assist, and to express his regret that your engagements may prevent you from devoting more time to the subject-matter of the inquiry.

As set out in the order of reference, the Committee was appointed to consider any proposals for the reform or improvement of the monetary system that may be placed before it. Incidental to the making of a case for such alteration, it would presumably be necessary to expose the weaknesses in the system at present in operation. Thus answering your second question first, I am directed to assure you that the Committee will not exclude any criticism of the existing system, and will undertake such investigations or call such evidence as may be considered necessary to examine any proposals for improvement.

The Committee, of course, cannot approach its work with other than an open mind, and obviously cannot prejudge any issue nor at this juncture make any statement in respect of the existing monetary system or of any proposed system while the matter is *sub judice*. This answers your first question. The Committee are certainly not precluded from taking a favourable view of any proposal which is shown to offer advantages over the present system.

Further, I may add that if at all necessary, the Committee may co-opt further expert assistance, and no obstacles will be placed in the way of making the inquiry as full and complete as possible. It is felt, however, that any inquiry into monetary systems applicable to New Zealand should be held within the Dominion and not, as you propose, in London.

In view of the fact that time does not permit you to assist at an inquiry in Wellington, the Committee are prepared to meet you by endeavouring to arrange a hearing in any other part of New Zealand and at any time which may suit your convenience. In the meantime, could you submit to the Committee the suggestions referred to in your letter in order that they may give them full study before meeting you?

Yours, &c.,
W. B. Sutch, for the Secretary.

Fifth Floor, Evening Post Building,
Wellington, C. 1, N.Z., 21st February, 1934.

The Secretary, Government Monetary Committee, Parliament Buildings, Wellington.

Dear Sir,—

I have to acknowledge receipt of your letter of the 19th instant, and to thank you for the information contained therein.

1. From your letter I gather that you regard the proposition put forward in paragraph 4 (*a*) of my letter of the same date as still *sub judice*, to which attitude I cannot, of course, take exception. It will, I feel sure, commend itself to you that it is necessary to establish the facts of the situation before proceeding at any length to put forward proposals which, to have any value, must be relevant to the facts. I should prefer, therefore, with your permission, to await the publication of your conclusions in regard to the existing financial system before taking up your time with the consideration of more far-reaching proposals which assume that fundamental defects have been exposed.

2. I am therefore attaching certain proposals in outline, based upon the working of the monetary system in its present form which for these purposes is assumed (without admitting such to be the case) to be self-liquidating. This involves the assumption that sufficient purchasing-power exists at any time to buy the goods which are for sale, at prices which are reasonably remunerative to those concerned in their production and sale. Any observed defects in the industrial, social, and economic systems, under this hypothesis, are due to maldistribution of a sufficient quantity of purchasing-power.

3. For the purposes of reference, I would tabulate the major observed defects as follows :—

(*a*) Surplus (unpurchasable) production—*i.e.*, goods in excess of purchasing-power ;
(*b*) Consequent "unemployment"—*i.e.*, surplus productive capacity ;
(*c*) Consequent "poverty"—*i.e.*, lack of purchasing-power, accompanied by economic need ;
(*d*) Redundant industrial machinery and plant—*i.e.*, surplus productive capacity in relation to purchasing-power available ;
(*e*) Consequent cut-throat competition to sell—*i.e.*, to exchange goods for purchasing-power ;
(*f*) Disappearance of industrial profits (expressed in purchasing-power) ;
(*g*) Consequent business and industrial depression and failure (bankruptcies, &c.) ;
(*h*) Competition for foreign (export) markets to offset failure of home markets—*i.e.* pressure to export real values for purchasing-power ;
(*i*) Consequent international friction, threatening and ultimately leading to war.

It is possibly superfluous to observe that the attached proposals do not deal comprehensively with these defects, which in my opinion, result primarily from a radically defective conception of the proper function and ownership of "financial credit."

4. I would repeat my desire to render any further assistance to your Committee on the basis of ascertained fact, coupled with a statement of objectives to be attained, and I shall welcome any correspondence addressed to me in London for the purpose of proceeding further along the lines suggested.

5. I am holding myself at your disposal from 9 a.m. to 1 p.m. on Saturday morning, the 24th instant, in Wellington, for the purpose of elucidating any points in the attached proposals on which you desire further information.

I am, &c.,
C. H. Douglas.

Proposals referred to in my Letter of Even Date.

I. From the enactment of these proposals no bank in New Zealand shall distribute a dividend either in or outside New Zealand in respect of operations carried on within the Dominion, of more than six per cent. (6 %) per annum on the subscribed capital.

II. No bank shall increase its capital in such a manner as to affect the gross amount of dividend distributed in respect to business carried on in New Zealand, except with the consent and through the agency of a legal enactment of the Dominion Legislature. Within three months from the enactment of these proposals, every bank operating in New Zealand shall make an exact return of its assets, specifying in particular all stocks, shares, and debentures purchased by the bank, the prices paid, and the prices at which such stocks, shares, and debentures are held on the books of the bank for the purpose of the annual balance-sheet.

The same procedure shall be adopted in regard to all real estate, buildings, and all other immovable property, together with furniture, fittings, and appliances in the bank's ownership. Such statement shall include a sworn valuation of the current market value of all such assets at the date of the return, such valuation to be made by an independent surveyor or valuer.

III. Where it is found that the figure at which such assets are held on the books of the bank for balance-sheet purposes is lower than the market value as obtained by the sworn valuation, an amount equal to such difference shall be transferred to an account to be known as "Suspense Account No. 1." Where the bank in question operates in other countries than New Zealand, a complete return shall be rendered and a proportionate allowance for external business shall be made.

IV. All profits earned by the bank from any source over and above the amount necessary to pay a dividend of 6 per cent. shall be transferred to an account to be known as "Suspense Account No. 2."

V. Six months from the enactment of these proposals an amount equal to 50 per cent. of the amount standing to the credit of Suspense Account No. 1 shall be applied to a reduction of the overdrafts debited to the customers of the bank, such appropriations being made *pro rata* on the basis of the average overdraft of the bank's customers for a period of three years preceding the date of the enactment of these proposals, and such appropriation of half the balance of this account shall be made annually thereafter.

VI. One month after the publication of the annual balance-sheet of any bank, an amount equal to seventy-five per cent. (75%) of the amount standing to the credit of Suspense Account No. 2 shall be applied to the reduction or reimbursement of interest paid on overdrafts by the banks' customers, such reduction or reimbursement being made upon the same *pro rata* basis as that laid down in paragraph V.

VII. A similar procedure to that laid down in the preceding paragraphs shall be applied to the accounts and assets of all insurance companies operating in the Dominion, with the exception that the funds required for (Insurance) Suspense Account No. 1 shall be provided by rediscounting the disclosed reserve with the New Zealand Reserve Bank, and that the disposition of the funds so provided shall be as in the following paragraph :—

Fifty per cent. (50%) of the amount to the credit of (Insurance) Suspense Account No. 1 shall be applied annually to pay for preference shares or debenture stocks applied for by any natural-born New Zealand subject over twenty-one years of age, to the extent that applications for shares to be paid for by this fund can be met. Such shares shall be allotted *pro rata* to the applicants without charge,

and shall be registered as non-transferable and as not good security for loans. On the death of a holder, or his permanent residence outside the Dominion, such shares shall be cancelled.

VIII. (Insurance) Suspense Account No. 2 shall be retained as a Dividend Equalization Fund to ensure that the dividend on all preference and debenture stocks allotted under the preceding clause shall receive a dividend at the agreed rates. Should this fund increase at a rate exceeding five per cent. (5%) per annum, such excess shall be allotted to a *pro rata* increase in the dividend on such shares as have been subscribed for under clause VII.

IX. These proposals are intended for consideration in the light of the correspondence which precedes and accompanies them.

Government Monetary Committee,
Parliament Buildings, 22nd February, 1934.

Major C. H. Douglas, Fifth Floor, Evening Post Building, Willis Street, Wellington.

DEAR SIR,—

I have received your letter of the 21st instant, together with the proposals put forward by you for the better working of our monetary system.

The Chairman has directed me to reply that the Monetary Committee wish to take advantage of your offer to elucidate any points in your scheme which may not be perfectly clear, and for this purpose the Committee will meet you, as you suggest, at 9.30 on Saturday morning, the 24th instant. The Whips' Room, Parliament Buildings, will be used for the occasion.

As was indicated in my letter of the 19th instant, the inquiry into proposed monetary systems was set up with a view to examining all alternative schemes in relation to the existing monetary system. The Committee, therefore, cannot agree that it would be wise or logical to bring down a report and later take further evidence as to alternative monetary systems, especially in view of the fact that your presence in New Zealand gives the Committee an opportunity to discuss personally with you your social-credit plans. As you will be in New Zealand until 6th March, the Committee extend a further invitation to you to place before them the general outline and basis of your credit proposals. This, of course, may involve an examination of the working of the present monetary system; to this end, the Committee will call all possible evidence in order that there may be a searching examination of all proposals placed before them.

The Committee are, of course, prepared to suit your convenience and to meet you in Auckland or any other town in New Zealand in which you may have engagements.

Yours, &c.,
W. B. SUTCH, for the Secretary.

Fifth Floor, Evening Post Building,
Wellington, N.Z., 23rd February, 1934.

The Secretary, Government Monetary Committee, Parliament Buildings, Wellington.

DEAR SIR,—

I am obliged by your letter of the 22nd instant, and will be at the Whips' Room, Parliament Buildings, at 9.30 a.m. to-morrow.

I note your remarks in regard to the submission of further matter for the consideration of the Committee, and as stated, I shall be happy to render any further assistance at a somewhat later stage of the proceedings, should you find that your examination of the existing system warrants procedure which would traverse the general propositions upon which current finance is based.

I regret, however, that the whole of my time prior to my departure from New Zealand is now allotted, and any further assistance I am able to render will either have to be by correspondence or on a future visit to New Zealand. I will furnish you from time to time with my address, between my departure from New Zealand and my arrival in Great Britain, probably about the beginning of May.

Yours, &c.,
C. H. DOUGLAS.

WELLINGTON, SATURDAY, 24TH FEBRUARY, 1934.

Witness: Major C. H. DOUGLAS.

The Chairman: I am sure it is a very great pleasure to us this morning to be privileged to welcome Major Douglas at this meeting. We look upon him as a distinguished visitor, and one who has spent many years studying the question of social credit and purchasing-power, and all other monetary matters, and coming as he has done to New Zealand on this occasion and the Committee having been set up as the result of petitions that were forwarded to Parliament asking that the present monetary system should be considered, it is fortunate that his visit has taken place during the Committee's investigations. Unfortunately for us, from the correspondence that we have had from Major Douglas, while he has suggested that he could evolve a plan for New Zealand, he unfortunately finds himself in the position that there would not be sufficient time during his present visit and he has made certain proposals to the Committee for their consideration. However, I would say even now, at this late

stage, that if Major Douglas finds that after having met the Committee this morning and given his views in accordance with what he has submitted to us that he can elaborate his proposals still further, the Committee is prepared to meet him at his own convenience and in any other part of New Zealand. However, that is a matter entirely for Major Douglas, if he can see his way to do that. However, we welcome Major Douglas to New Zealand, and are pleased to see him with us this morning, and we sincerely trust that as a visitor to our Dominion he will be able to leave it with pleasant recollections of the people he has met here. Major Douglas has already submitted certain proposals to the Committee, and we would like him to elaborate them.

Major Douglas: I will elaborate my proposals if you would like me to do so. I am very grateful for your kind words, and my one desire is to help you.

The Chairman: I think it would be preferable for you to speak first, and we will then take the opportunity of asking you any questions.

Major Douglas: The proposals that I have had the honour of submitting to this Committee are based on the result of many years' training and experience as an engineer. I have not, purposely, gone further than what I may call the ascertained facts of the position. One feels very strongly in regard to these matters, and it is desirable to say that there is nothing in these proposals which I have for the moment put forward which traverses anything which is generally accepted in the existing financial system. There is not underlying these proposals anything controversial in regard to the existing financial system. I do not myself, of course, agree with the contentions of those who support the existing financial system, but in order that one might proceed from what one might call the accepted state, I have put forward certain proposals and with the permission of the Committee I will read them out. I might mention that these proposals are based on the ascertained facts at the present time.

PROPOSALS REFERRED TO IN MY LETTER OF EVEN DATE.

I. From the enactment of these proposals no bank in New Zealand shall distribute a dividend either in or outside New Zealand in respect of operations carried on within the Dominion of more than 6 per cent. per annum on the subscribed capital.

II. No bank shall increase its capital in such a manner as to affect the gross amount of dividend distributed in respect to business carried on in New Zealand, except with the consent, and through the agency, of a legal enactment of the Dominion Legislature. Within three months from the enactment of these proposals, every bank operating in New Zealand shall make an exact return of its assets, specifying in particular all stocks, shares, and debentures purchased by the bank, the prices paid, and the prices at which such stocks, shares, and debentures are held on the books of the bank for the purpose of the annual balance-sheet.

The same procedure shall be adopted in regard to all real estate, buildings, and all other immovable property, together with furniture, fittings, and appliances in the banks' ownership. Such statement shall include a sworn valuation of the current market value of all such assets at the date of the return, such valuation to be made by an independent surveyor or valuer.

III. Where it is found that the figure at which such assets are held on the books of the bank for balance-sheet purposes is lower than the market value as obtained by the sworn valuation, an amount equal to such difference shall be transferred to an account to be known as "Suspense Account No. 1." Where the bank in question operates in other countries than New Zealand, a complete return shall be rendered and a proportionate allowance for external business shall be made.

IV. All profits earned by the bank from any source over and above the amount necessary to pay a dividend of 6 per cent. shall be transferred to an account to be known as "Suspense Account No. 2."

V. Six months from the enactment of these proposals an amount equal to 50 per cent. of the amount standing to the credit of Suspense Account No. 1 shall be applied to a reduction of the overdrafts debited to the customers of the bank, such appropriations being made *pro rata* on the basis of the average overdraft of the banks' customers for a period of three years preceding the date of the enactment of these proposals, and such appropriation of half the balance of this account shall be made annually thereafter.

VI. One month after the publication of the annual balance-sheet of any bank, an amount equal to 75 per cent. of the amount standing to the credit of Suspense Account No. 2 shall be applied to the reduction or reimbursement of interest paid on overdrafts by the banks' customers, such reduction or reimbursement being made upon the same *pro rata* basis as that laid down in paragraph V.

VII. A similar procedure to that laid down in the preceding paragraphs shall be applied to the accounts and assets of all insurance companies operating in the Dominion, with the exception that the funds required for (Insurance) Suspense Account No. 1 shall be provided by rediscounting the disclosed reserve with the New Zealand Reserve Bank, and that the disposition of the funds so provided shall be as in the following paragraph:—

Fifty per cent. of the amount to the credit of (Insurance) Suspense Account No. 1 shall be applied annually to pay for preference shares or debenture stocks applied for by any natural-born New Zealand subject over twenty-one years of age, to the extent that applications for shares to be paid for by this fund can be met. Such shares shall be allotted *pro rata* to the applicants without charge, and shall be registered as non-transferable and as not good security for loans. On the death of a holder, or his permanent residence outside the Dominion, such shares shall be cancelled.

VIII. (Insurance) Suspense Account No. 2 shall be retained as a Dividend Equalization Fund to ensure that the dividend on all preference and debenture stocks allotted under the preceding clause shall receive a dividend at the agreed rates. Should this fund increase at a rate exceeding 5 per cent. per annum, such excess shall be allotted to a *pro rata* increase in the dividend on such shares as have been subscribed for under clause VII.

IX. These proposals are intended for consideration in the light of the correspondence which precedes and accompanies them.

Major Douglas: That correspondence is, of course, merely an elaboration of the suggestions which I put forward. The idea behind these proposals is this: It is extremely probable, we may say, that there is a remarkably large difference between the disclosed assets of financial institutions and the market value of those assets. I do not want to enter into the grounds of speculation and therefore I will not offer any figures as to what that difference is likely to be. That difference between the disclosed value of such assets and the real value of those assets if they were marketed according to ordinary business principles—that is to say, not all put upon the market at once—represents the physical basis for a creation of credit. That creation of credit cannot, I think, by any process, either of logic or ethics, or what is perhaps even more important still, pragmatically, be regarded as anything but the property of the general public. These proposals are intended to monetize the concealed reserves without traversing the existing financial system. They are not so far-reaching as to deal

with the whole of the difficulties which do arise in our opinion out of the existing financial system, but I have no doubt whatever that they will form a very considerable mitigation in New Zealand of the difficulties which arise from that system. Now, the idea in practical form is that this monetized reserve shall be applied by methods which are quite orthodox and known by bankers and other people familiar with financial processes to wipe off the overdrafts of the general community on a *pro rata* basis, that being done in accordance with the well-known principle that the repayment of a bank loan is the destruction of a deposit—that is to say, that the money which was created in this way by the monetization of these reserves would be destroyed by being applied to the repayment of an overdraft. The second provision is that any excess profits over the 6 per cent., which, incidentally, is the dividend paid by the Bank of England, therefore is a rate of payment of dividend which has a well-known precedent, should be applied to the reimbursement of those people who have provided, at any rate, one source of that excess dividend—people who have paid interest on an overdraft. That is merely a reimbursement of an excess earning of dividends. In regard to the Insurance Account, Suspense Account No. 1, the idea behind the monetization of the reserve is the same. The application of it to the payment for the allocation of shares on what you might call public funds is, of course, novel, but it does not in any way traverse existing canons of finance. The practical result of that allocation of shares is to provide or allow for or make preparation for the distribution to the general public of a national dividend without the nationalization of the industry—that is to say, that you have in this way a participation by the general public in all the benefits of shareholding allotted to a national source without any interference with the private initiative of the concerns involved, other than those which are involved in share ownership, and so far as preference shares and debentures are concerned, it is a well-known fact that so long as the preference shareholder or debenture-shareholder gets his interest he has no say in the management of the concern. And in order that he shall get his interest the dividend equalization fund provided in Suspense Account No. 2 is provided. In that way you provide an increasing interest, a most definite gain by the whole population in the industries, and the progress of the economic development of the country. It will be small at first; it will increase later; I hope that by the adoption of other far-reaching proposals at a later stage it will increase very much more rapidly, very much further; but the essential point I should like to make is that there is no interference with the actual management of those concerns, but what is involved is that the general population obtains an interest in the prosperity of the concerns involved and also more purchasing-power with which to absorb production. Those, gentlemen, are my main points.

The Chairman: We now have the privilege of asking Major Douglas any questions.

Mr. Holland.] This question is a very big one to grasp at the moment and ask intelligent questions, but I would like to ask this: The proposal allows the bank a dividend of 6 per cent., which seems quite reasonable, but in years of stress and difficulties if the banks or insurance companies make no dividend, what would happen if they had no reserve fund?—I find it extremely difficult to imagine any circumstances under which that would occur if we knew what the accounts of financial institutions really represent.

Then if this proposal is a good thing for the banks and insurance companies, why not make it cover the whole of the mercantile community paying over 6 per cent.?—That is quite easily answered. The ordinary mercantile community, the ordinary producing community, produces goods and services; it provides the real wealth of the country. The financial institutions of the country merely produce a somewhat erratic number of units which we call monetary units which the producing community scrambles for. It is not in the profit by the producing community wherein the difficulty lies; it is in the manipulation of the production of monetary units wherein the difficulty lies.

In this country we are suffering from an economic depression and it is commonly known that we are suffering severely in consequence. How can that be remedied in a land of plenty; and we have a land of plenty and yet there is poverty and stress everywhere. Can you suggest a remedy?—This scheme of mine is the beginning of the remedy.

I am not just clear on the point, but this is all information. Suppose a man wants to purchase an article for 15s. and only has 10s. in his possession. Would your scheme deal with him?—This particular proposition under discussion is specifically stated not to traverse the existing financial system, and therefore it cannot deal with the ordinary matter of prices. There is no provision in this scheme dealing with prices. The idea I have at the back of my mind is that if you proceed along these lines you will yourself see the necessity of dealing with the price problem, but I do not want to force that on you. This is simply a preliminary suggestion which does not traverse anything which would not be accepted as perfectly orthodox by any authority on the subject.

I understand that no scheme can be devised which will meet the requirements of all the world. Each country must have a scheme of its own, is that so?—No. I should not agree with that. I think that there is a desirable difference between the application of certain underlying principles to a comparatively new country, such as New Zealand, with very very largely undeveloped resources, as compared with an old settled country like Great Britain, but the underlying principles of any scheme would be satisfactory to both of them—as to principle the same; the application would be slightly different.

In your written statement to the Committee you mention that if you were residing in England and were asked to build a bridge in New Zealand, you would have to come to New Zealand to study the conditions and prepare all the details. Do I understand that to apply to the monetary system?—Not to the monetary system, but to the conditions under which the monetary system operates. I have quite clear views on the monetary system, but the application of those ideas and the principles underlying them to an undeveloped country and an old settled country is, I think, capable of adjustment. That goes into the range of politics rather than economics. It is quite justifiable, within my view of the problem, to have slightly different applications in different parts of the world.

Referring to my previous question regarding helping the man who has only got 10s. and wants to purchase an article which costs 15s.: I understand from correspondence I have had with supporters of the scheme that this scheme would help that man to get that article?—What it does straight away, if my scheme were put into operation, would be to give him a little more than 10s., perhaps only very little and indirectly it makes his 10s. buy more, because, by reducing the out-of-pocket expenses of the producer, by reducing his overdraft, reducing the amount he has to pay interest on his overdraft, and reimbursing him in regard to interest he has already paid, it should enable him to charge lower prices. If it does not enable that, then you will have to give effect to the second part of my scheme.

Mr. Langstone.] Yes, I will follow up that question. Suppose a man never paid any interest and never had a bank overdraft, how would he benefit?—He will apply for a proportion of the shares of every new issue of preference or debenture shares issued in New Zealand, and he will get a *pro rata* allocation of those shares for nothing.

It would be some time before they were issued; it would not immediately affect his 15s.?—It would not affect it this week.

In the next two or three months?—In order to affect him at once, you will have to traverse the whole of the tenets of the existing financial system.

I would like to ask you this: Is not price the keystone or the determining factor at all?—Yes.

Therefore in formulating any scheme you must have some definite form of price-level or price-fixation?—Agreed. You are now asking me questions which I am answering in accordance with my own beliefs, not in accordance with the existing financial system.

This Committee can consider things not just in line with the present financial system; we can discuss or get information on all proposed remedies for the defects and errors of the present financial system?—I feel confident—if you will let me put it that way—I feel confident, from my own experience, that no specific results are likely to accrue from that course. We almost immediately get into a maze of statements as to the positive fact. I might very rapidly say a number of things which would immediately be contradicted by traversing the existing financial system as it works at the present time. In order to proceed any distance along these lines it is necessary to establish the facts, and in order to do that I feel sure that only one method will apply, and that is an inquiry at which witnesses are produced and the matter is threshed out. The fact that I say such-and-such is so does not, I think, carry necessarily any weight, and therefore I am trying not to say anything which will be merely an expression of opinion.

You talk of the subscribed capital of a bank; you mean the paid-up capital?—I should not quibble over details of that sort. The subscribed capital or paid-up capital is so very small in the average bank in comparison with its operations that the difference is very slight.

One other question follows on: We will take the disclosed secret reserves of the banks and will assume it is £1,000,000. You are going to distribute £500,000 the first year, then half every succeeding year until it "peters out." How is that going to increase? You said they would increase their share. Seeing that the amount is a diminishing quantity each year, how would it increase the purchasing-power of the people generally, or their interests in the community?—The first comment I should make on that is that I should not judge these proposals on the assumption that there is only £1,000,000.

Make the figure anything you like—£10,000,000?—If it is only a figure, then we will say £1,000,000. The answer is that if it is true, as I believe it to be true, that under the existing financial system the whole property of the country must inevitably pass into the possession of the banks either directly or by lien, then there is a constant stream of properties under these conditions passing into the hands of the banks, and that will keep up the strength. The whole of the property of the country will be handed to the banks, but the difference between the disclosed and the real reserves has already been distributed in the form of a financial lien on the property, so that the country will gain.

One other question I would like to ask: Does the volume of various classes of goods in existence determine the variation of price between those various commodities? There may be an alteration in prices between boots and clothing, for instance—an alteration in prices so that one becomes more valuable and the other less valuable in relation with one another?—The answer to that depends entirely on what you might call a question of relationship of cost and price. If you take the assumption of the existing financial system—that the price of an article is what it will fetch—then quite obviously it is true to say that the price of an article varies with the quantity produced, and directly there is a scarcity the price is raised.

Following on that, then, the money and quantity factors determine the general level of prices for everything?—Not necessarily; the general level of prices can be varied, not according to the absolute quantity of goods produced—that is correct; but by the application of correct methods it is possible to apply a creation of credit to a reduction of price.

In your opinion, what percentage of the money or credit which we have and can use in the community originates by way of bank loans in one form or another?—I think that is a matter which is capable of very easy statistical proof. There is only one form of money which is not bank loan, and that is currency, absolute legal tender, and the ratio of legal tender in Great Britain (I am quoting very loosely from memory) is somewhere in the neighbourhood of £350,000,000 all told, and the bank credit of Great Britain per annum is round about £39,000,000,000. These figures are, of course, subject to correction, and are not exact, and the figures require intelligent interpretation.

I was coming to that point. Seeing that wool has gone up in price in New Zealand I do not know whether I am right in this contention. Assuming that a Japanese buyer wants to buy wool; he sells £10,000 worth of goods in London and gets credit there. He sells that credit to one of the New Zealand banks guaranteed by our Government. Then he has a credit of £10,000, but he wants to buy wool in New Zealand. He is able to buy £12,500 of wool owing to our 25 per cent. exchange

rate. If I am his buyer, I land in New Zealand with a letter of credit indicating that I am to purchase that amount of wool at any price I like to give for it per pound. There has been no goods or money sent to New Zealand, then who provides the money for the price that has been paid for the increase in the price of wool in New Zealand?—That is really outside the scheme I have put to you this morning; I could give you a snap answer; if you want a serious answer I will need notice. The orthodox answer is that his firm establishes a credit in New Zealand which exchanges with the credit in London.

It is admitted by bankers themselves or by anybody who studies the banking question that bankers do create money and that they destroy money, and it is the destruction of the money that is the cause of a great many of our difficulties to-day?—I thi k that particular way of putting the matter, while very important, has been overrated. The fundamental factor—I am asking for the indulgence of the Chairman for going outside my brief—is the fact that the actual creation of the money takes place at a point, as you might say, which is not that of the creation of the goods, and the creation of the money is regarded exactly as a creation of wealth is regarded on the opposite side of the ledger, and therefore when a bank issues this money and lends it, it claims that thereby wealth is created. It is quite true that the actual purchasing-power subsequently is destroyed, but the fact is that it creates a thing which at any rate in the eyes of the public is equivalent to actual wealth, and it is creating that at a point which is not the same as the point where the actual wealth it claims to represent is created, so that you have what is in effect a double-entry system which should in that conception be only a single entry. For instance, as I have very often given as a very simple illustration, if I own a railway company and some one entirely unconnected with me sets up a ticket office and sells tickets which will be accepted as good tickets for the seats on my railway, then quite obviously for all practical purposes, for the purpose of controlling the transportation on that railway, and for every other purpose, it is the ticket office which has got control of the railway. That is exactly the position of the monetary system in regard to general business; an actual service which is a physical system of actually turning something into something else. The ticket or monetary system is something else again, and it is plainly the rightful property of the people who produce the services which can be obtained by tickets, and that is, I think, proved beyond discussion from the fact that the creators of money make their claim to repayment on the ground that you can get real value with their tickets.

In other words, they are getting money wealth, but no values are produced?—Certainly, if we did not agree that that was the scheme under which we were to pay.

Mr. Schramm.] How would the wage-earner, under the scheme suggested, get the preference or debenture shares?—He gets those on their being allotted to him on his application, and paid for out of the fund which is created by Suspense Account No. 1 derived from the hidden reserves.

And if there were no funds credited to this Suspense Account, he would not get the shares?—I think you might safely leave that question until you discovered what the reserves were.

But if there were no reserves?—You would get no shares.

If there were reserves, you would have a provision whereby all those wage-earners would get preference shares?—Or debentures, yes. Perhaps it would clarify in your minds what I have in mind if I explained further.

What I am really interested in is: If a scheme can operate for any banking company in the world whereby the wage-earner can go along and out of the Suspense Account be allotted shares for which he has not paid?—He has paid, but not in money.

You mean the Suspense Account has paid?—The Suspense Account has paid for the shares in money, but he has or his predecessors have paid by creating the values to which these shares refer to.

I suppose your scheme would apply to all banks functioning? Would you outline the scheme governing the issue of the shares; what sort of a legal effect would it have, governing the issue of these preference shares to workers whereby they themselves would be paid the value?—I do not see anything in that question which is not provided for in this scheme.

The present banking system is governed by the present banking laws; you would have to alter them so as to allow them to get these preference shares?—You would simple carry out the proposals which are laid down in that scheme.

You would have to alter the present banking law, which makes no provision whereby preference shares can be allotted to workers and payment made out of a Suspense Account?—You have to create a Suspense Account in the same way as you have to limit dividends to 6 per cent. That is provided for in the scheme; there is nothing in that which traverses the existing financial system as a system.

I do not see how you can do it, seeing these banks are governed by regulations. You would have to come to Parliament and have a special law passed altering the provisions governing these various banks before you can issue those shares to workers?—You would quite obviously have to apply some supreme authority to the banks which would insist that these provisions be carried out. I am not suggesting that you immediately put that into operation, but presumably you want to get something done.

You would have a tremendous rumpus with the banking authorities if you put the scheme into operation?—I am suggesting that this is a way to have that rumpus.

To give the workers the shares out of the Suspense Account?—Yes.

There are 75,000 unemployed in New Zealand. Can you tell the Committee in what way those 75,000 unemployed would reap any material immediate benefit from your present scheme?—Yes, they would reap this benefit from this present scheme: That a large number of business concerns which are now on the verge of bankruptcy as a direct result of having overdrafts and having to pay large sums of interest on these overdrafts would be prevented from going into bankruptcy and would be

able to carry on, and would see their way to carry on still better, and, as a result, they would probably provide more employment, and in that way some proportion of the 75,000 unemployed would become employed. You clearly understand that it is not in my opinion the direct objective of the industrial system to provide employment. The proper objective of the industrial system is to provide boots and clothing, but this scheme is simply based on the existing ideas of the financial system and to the extent that it is possible under the existing financial system to benefit all sections of the community I believe it does. To say that it does not completely deal with the situation is entirely true. What I say is, that the only way to deal completely with that situation is to traverse the tenets of the existing financial system.

Would you allow the present banking system of private ownership and control to carry on, subject to what you put forward ?—Subject to the putting into operation of this particular scheme ?

Yes ?—I have very little doubt that the putting into operation of this particular scheme would disclose the necessity of acting further. It would be action upon lines which would disclose the necessity of going forward, but in my opinion, however far you go, does not necessarily involve interference with the existing administration of business, either of banking business or of any form of productive business. The only thing which will force the necessity of that, in my opinion, my own considered opinion, is that the administrators of existing business go outside their proper functions and interfere with the conditions under which the product which they produce and the administration and production of which they are in control, is distributed. The actual administration under private ownership of existing business, in my opinion, is at least equal to that under so-called public ownership. The question of the distribution of what is produced is an entirely separate problem, and is almost purely a financial and not an administrative question.

You do not agree that the banking system is breaking down ?—Yes, I do.

Well, if it is breaking down, there must be something wrong in it ?—There is.

If there is something wrong in it, seeing that finance and banking are the core of the system, you should alter and change it completely ?—I do not agree. I should suggest that the actual production system with its administration has produced wealth. There is nothing in the existing production system to suggest that it has failed to produce wealth. On the contrary, in practically every country in the world except Russia there is a surplus of actual wealth which is being exhibited in the form of unutilized productive capacity and many other phenomena of that description. As a producing system the system has been admirably successful. What is breaking down is the method by which the things which the producing system can and does produce get over to the public who have a need for them ; that is entirely a question of distribution, and distribution is entirely a question of finance and has nothing to do with administration.

That is your opinion ?—Yes.

In connection with the shares in the bank : There will be nothing to stop any one trading or dealing with their shares, or putting them on the Stock Exchange ?—There is a clause in the scheme to prevent that—*i.e.*, the flotation of additional shares.

The ordinary shares ?—Not the ordinary banking shares.

Under the present scheme of yours, is there anything to stop the ordinary holders of shares in banks dealing with them ?—Nothing whatever.

And they are guaranteed at 6 per cent. ?—Well, no, they are not guaranteed at 6 per cent., but limited to 6 per cent.

Is there anything to stop private individuals who have shares from being allotted shares ?—There should be nothing to stop them. I do not know what the capital of the New Zealand banks is, but the total capital of the British banks is comparatively very small. Of course, as I need hardly tell a Committee of this kind, a bank hardly needs to have any capital at all.

Mr. Munro.] I have only one question, Mr. Chairman. Presuming the scheme outlined by Major Douglas to-day was introduced at once—I mean with the present low price-level for shares in banking and so on—there would be very little in excess of the original share value. What benefit would it be ? What I mean is this : With the present competitive prices, the undisclosed wealth of these particular banks and insurance companies, the possibility is that to-day if that was capitalized by value as suggested in your scheme there would be very little for distribution directly or indirectly to the public ?—I think that if the valuation is properly carried out that is most unlikely to be the case.

You mention, of course, buildings and assets of the banking companies, presumably shares, and all that sort of thing. All these things are at a very low price-level to-day, and you think that there would be very little difference on that account in the scheme as proposed here ?—I do not think it would make any considerable difference to the scheme. I am confident that banks as operated at the present time either make very large disclosed profits or make a very large undisclosed profit, and by having both ends of the stick you are bound to get hold of a very large profit some time. I have no doubt whatever that by dealing with both the dividend and the undisclosed reserves you will have something very considerable to distribute.

Mr. Murdoch.] I take it from your remarks that you lay all the troubles of the world at the door of the banks and insurance companies ?—I regard the banks and insurance companies as being the main mechanisms of the financial system. I lay a very large amount—I should not like to say what percentage, but certainly a preponderating amount—of the trouble in the world at the present time at the door of the financial system and nowhere else.

You say that the banks are mainly responsible ?—I should like to keep to the form of the preceding answer that the banks and insurance companies are the chief mechanisms in the existing financial system, and I lay most of the trouble in the world at the present time at the door of the financial system.

You think it is a fair thing to dip into the reserves and profits of these banks and in a sense confiscate them ?—I do not think it is a question of confiscation at all. There is a Spanish proverb which says, " He who robs a robber earns a hundred years' remission," and I regard these undisclosed assets and many other assets as being quite unjustifiable.

Do you favour or object to the institution of the Reserve Bank ?—You would like my frank opinion ?

Yes ?—I regard the prime objective of the institution of the Reserve Bank in New Zealand or anywhere else as being one move in a project to take the control of finance from out of the hands of the Government of the country in which it is carried on and to link it up with international financial systems.

Do I understand that these proposals are applicable to New Zealand only, or would you apply them to England ?—No ; I should apply much more far-reaching proposals to England.

Have you put a proposal such as this before the authorities in England ?—Not in that form.

Or any other countries ? Have you tried them anywhere else ?—Do you mind if I suggest that that would be dealing with questions outside the present meeting.

You have very clear views on the monetary system, could you briefly expound them ?—You want a general sort of idea ?

Yes ?—The idea which underlies the whole of my contentions is that a correct monetary system should be a reflection of facts, of physical facts—that is to say, that wealth does not consist in monetary tokens, and cannot under any conditions exist in monetary tokens. A monetary system can powerfully and does powerfully affect either the production of wealth or the distribution of wealth, and impedes it, because of the assumption that the production of wealth is conditioned by the accounting of it, so that if you have a condition of affairs such as you have at the present time you can have the condition which we consider does exist, for which we have any amount of evidence in various ways, that you may have a world which is actually very wealthy from a physical point of view, but you may have people who are so possessed by an erroneous idea of things that they will say the world is very poor and that only economies are possible ; it is the only policy which can be pursued. From our viewpoint that is an obvious contradiction, and we should say that it does not point to the fact that the world is poor, but points to the fact that the accounting system does not reflect the facts. The first objective of anything in view is to make the accounting system reflect the facts. When it does reflect the facts we then say it is quite a legitimate object, or subject, for the exercise of sovereign policy as now normally exercised through the Government of the country as to what disposal shall be made of the ascertained wealth or the rate of production, which is a more accurate description of what goes on, but while you have a condition of affairs in which you have an accounting system which suggests poverty and stringency, while you have a physical system which contradicts that statement, you cannot get any further.

Hon. Mr. Downie Stewart.] I am interested in the philosophy behind this proposal, and I gather from what you said just now that you think the scheme justified because you are, as you say, robbing the robbers ?—Perhaps I should prefer to say that circumstances have put these organizations into a position in which, whether they have a conscious desire or not, they are in fact in the position of being the unjustifiable recipients of wealth.

Have you not accepted in your own writing the fundamental principles of British and New Zealand systems of society—namely, that you do not dispossess a man of his property without compensation ?—I am not proposing to dispossess any man.

Well, assuming that a small tradesman, a working-man, or a widow bought a few shares at the present market prices based on the present dividend in the Bank of New Zealand. You are cutting their capital down by half, are you not, by cutting down the present dividend of, say, 15 per cent. to 6 per cent. ?—As things are going on at present there is no possibility whatever of the present banking system continuing for any considerable length of time, even three, four, or five years, without a complete catastrophe—complete breakdown of the existing system—and in that case I am not taking away anything from that man ; I am preserving half of his capital from ruin.

That is on the assumption that your view as to the future of the banks is correct ?—The whole thing is based on my assumption of what really would happen to the banking system.

Then, in effect, that means confiscation whether you approve of the present system or not ?—No, it does not from my point of view. It will be quite possible for him to receive only 6 per cent. instead of 15 per cent., and if the price-level were to fall by a proportionate amount he would be just as rich as he was before.

Take it from another angle. Are you aware that the banks in New Zealand on either their subscribed capital or paid-up capital do not pay more than 6 or 7 per cent. now and their dividends are made up from the income from their reserves ?—If they do not pay more than 6 per cent. or 7 per cent. on the average now, the shareholders are not hit and they cannot have any objection to disclosing their reserves.

Then no benefit accrues to the overdraft owners, or the people who are holding the overdraft. If, in point of fact, the dividend on shareholders' capital is not more than the amount, how are you going to limit it ?—If there are no undisclosed reserves——

You are not touching the dividends earned on the reserves at all ?—I am going to distribute the reserves, the undisclosed reserves.

The limitation of the dividend is 6 per cent. If it is at that rate now on capital (excluding reserves) the scheme falls to the ground before it starts ?—No, I cannot permit that. The undisclosed reserves of the banks are appropriated to the reduction of the overdraft and in the main to producers—that is to say, farmers—to a very large extent.

But I am dealing with the dividend now. You limit the dividend to 6 per cent. Then you do not touch that part of the dividend which the shareholders received from the reserves at all as a

dividend ?—Yes, I do, most certainly. They have now in England a provision which is part of the company law that you only distribute as dividends earned profits. If they are distributing dividends which are from concealed reserve they are breaking the law.

The object of the limitation of the dividend to 6 per cent. is to prevent the banks from paying 12½ per cent. or 15 per cent., or whatever they are paying at present ?—May I rephrase what you are saying for the purpose of answering ? That the profits of banks are partly distributed in the form of actual money dividends, and they are partly put to disclosed and undisclosed reserves which are not represented by any money at all. They are represented by either correct or incorrect price values which are not represented in any way by money. You can monetize those price values at any time you like, particularly through the mechanism of the banks.

I am sorry to say I am speaking specifically on the proposal to limit the dividend to 6 per cent., but, in point of fact, you are not limiting that part of the dividend that makes up the present dividend which the public consider excessive. You are limiting that dividend to what should be paid out in respect of the subscribed capital. If, in point of fact, only half the dividend is paid from that source so far as the limitation of the dividend is concerned, you have not touched the main point. If only half of it is paid the other half comes from the reserves, and those reserves are the essential features of the banks' system ?—Well, in other words, you say that the amount earned by the charges made for overdrafts represents only half of the banks' dividend approximately, and the rest is monetization by the methods of the banking system, of the price values held by them as reserves.

It arises as an ordinary investment. The banks, in order to be secure, claim that they must have reserves about equal to the capital ?—Then, what you are saying really means that in order to pay half the dividend of the bank the bank creates money to the extent of half the dividend on the basis of its disclosed or undisclosed reserves and pays that away as a dividend.

That is your way of putting it; the popular way of putting it is that a bank earns half its dividends from the ordinary business and half from the reserves ?—Yes; but I am really wanting to establish a question of fact.

Well, mine is a plain statement of fact ?—Half the dividend of the banks is the creation of new money on the basis of disclosed and undisclosed reserves.

Well, that opens up the whole question of your theory as to banking, does it not ? I do not want to do that at this stage. You say it does not make any difference whether it is on the subscribed capital or the paid-up capital ?—No, but I think the question is very much wider than that. I am prepared to give you either you like.

You are aware, of course, that a great number of men trade on an overdraft for their own convenience, because they can make better use of the money—wealthy men—they would share in this reduction the same as any one else ?—I have no objection. This is not in any sense a class question. In my opinion everybody is almost equally hit by the present banking system, except the banker.

Assuming the case put by one member of the Committee that that amount that you are going to transfer to the Suspense Account is £1,000,000. Would it surprise you if you were told that it would not make a difference or more than 1 per cent. reduction in the overdraft altogether ?—That statement does not at the moment convey any very clear impression to my mind.

It is a question of fact; it depends on what the overdrafts in New Zealand are and what the reserves are ?—I defer to your superior knowledge of the actual situation. I should think it is extremely difficult for any person to say what the undisclosed reserves of the banks are.

Take this further question. You are appropriating the difference between their book values and the market values as marketed under ordinary business conditions. What if the banks write up their assets to the market value, then there is nothing to appropriate ?—In that case they will have to show a dividend of several hundred per cent. which will immediately be appropriated. The writing-up of your reserves will increase your profits.

No, why should it ?—They will put something to their assets in a given year which was not in the assets the year before.

You have no objection to writing up their values to what you call their market value ?—Not if one appropriates the difference between 6 per cent. and the value of what it ought to be.

It is not the dividend you are appropriating, it is the capital ?—Yes, but any increase of capital which is obtained from trading should be shown in the balance-sheet as between the 31st December, 1933, and the 30th December, 1934, as profit.

Do you mean to say that if your premises in Lambton Quay, instead of appearing in the balance-sheet as, say, £1,000, as they may have been written down to, appeared at £20,000 that they increased their earning-capacity ?—Not at all, but if you show that in the balance-sheet you would have a net profit of £19,000 in that year.

No ?—Then I am afraid I do not understand the meaning of a balance-sheet.

You say that this is a method of securing for the general public the property of the banks ?—No. May I make a more clear distinction on that point. I do not want to take the property of the banks or any one else, so far as the administration is concerned. What I do want is to provide the public with the purchasing-power which will enable them to use the production of those undertakings, and in taking away the purchasing-power from the banks I am not taking away their property.

No, but in explaining your scheme you suggested that this is part of a scheme for securing the property belonging to the public to the general public. When you were making your verbal statement I wrote down these words, " This is the property of the general public " ?—The property of the public, which is the only property it has, is in consumable goods, together with the right, in my opinion, to so direct the general assets of the community that they shall be supplied with the consumable goods that they require and which can be produced. That is not the same thing as taking away from the administrators of the capital assets of the country their powers of administration. What I am con-

cerned with is that they shall so administer this property that the general public can get the goods which they produce.

My point was that you are purporting to secure to the general public, but in point of fact you are only giving it to those people who happen to have an overdraft at that bank which is fluctuating. You are not securing it to the general public, except in a very indirect way ?—In order to secure it for the general public it is necessary to take steps which go considerably beyond these. Those steps have to be based on the acceptance of propositions which do traverse the accepted propositions of the existing banking system. These proposals are specifically said not to go as far as, in my opinion, one ought to go ; they are preliminary proposals.

I find it difficult to come to grips on the question because of the statements you are now making. When you referred to it before you spoke of securing the property of the general public to the public and writing off the overdraft to the general community ?—Quite obviously every one of these phrases requires definition and my definition of the property of the general public might possibly not agree with the orthodox accepted statement, and I should have to establish that and the way that I should want to establish it, if I were in a position to do so, would be that it is the way which will enable you to make the most practical use of those facilities which do physically exist.

Well, there is one other point : Dealing with insurance companies, I am not clear why this scheme is limited to banks and insurance companies. Take all the firms who take deposits from the public and who deal in credit which is drawn from the banks for the use of the public—the stock and station agents, for instance—they go free do they ?—Is that a local phrase ?

They finance the farmers and make advances to them and generally they conduct a banking business within their own boundary ?—Where do they get their money from ?

From the banks mostly ?—So that they are really agents for the banks ?

They are an enormous feature in New Zealand's economic life ?—As agents for the banks ?

Well, in so far as they are dependent on the banks. They are not touched by this scheme at all ?—Well, the scheme as put forward is a scheme in outline only. If it was generally considered that the people you mention ought to be brought within the range of the scheme I should have no objection.

You know the saying, " A true test of every reformer is to make him reduce his proposals to the clauses of the Bill." I am trying to see how it would appear if it were put into a Bill. Take this question of insurance companies, you suggest that they should rediscount their reserves with the Reserve Bank. What is the actual effect of that ? Assuming they have their money invested in mortgages due years and years hence, would it be proper business for the Reserve Bank to take every one of these more-or-less fixed securities over a long period in order to enable this dividend to be paid ?—Well, there are always two ways of approaching these things, perhaps three. The first is, " Has it been done ? " ; the second, " Can it be done ? " ; and the third, " Is it desirable that it should be done ? "

Mr. Lye.] Should not the third one come first ?—I think, " Can it be done ? " should come first, perhaps " Is it desirable ? " second, and " Has it been done " third. I think the answer in this case to all three is, " Yes." It can be done, obviously.

Hon. Mr. Downie Stewart.] It is not the usual business for a bank to do ?—It has been done and is being done in the United States at the present time, which is what is referred to as liquidating frozen assets and it is desirable that it should be done in order to give more purchasing-power to the public.

Perhaps I should say that it is the major policy of the banks not to tie up their funds more than necessary, to keep them as liquid as possible, and if you load on to them all these long-term securities of the insurance companies that is a new feature of business altogether ?—You see, one is always met with these difficulties in regard to this matter that the banking system at the present time seems to oscillate between the suggestion that it is an ordinary business concern with the sole object of making profits and that it is not an ordinary business concern, but is identified with the general interests of the whole community. Now, if you take the second point of view, with which fundamentally I would agree, that it cannot be considered at all as an ordinary business simply concerned with making profits, the answer to your question is that it is desirable in the general interests that it should take on that business.

Yes, but take the question of mutual insurance where the profits are distributed amongst the shareholders. Why should those profits be appropriated for the benefit of other people ?—Even those concerns which are mutual and distributing their money profits do not distribute sufficient money from the fact that they have undisclosed reserves to monetize the whole of their value. This question is not a question of distributing actual physical property so much as providing sufficient purchasing-power to enable that property to function as a producing concern.

Some businesses have accretions which will not be distributed for fifty years. Their business would be shot to pieces under this scheme ?—In saying that you force me to break entirely fresh grounds. The whole idea of setting up reserves or even creating debts in completely unscientific. There is absolutely nothing in the physical circumstances under which the present world is worked which can be remotely associated with the word " debt " or the word " reserve." The two ideas are completely separate. I began my remarks by saying that what we have to do in order to get out of this jam is to get the financial and accounting system to form a fairly close connection with the physical facts, and the questions that you are bringing up really traverse the whole of that idea.

Let us suggest that, going back to the banks again where they operate in other countries, there has got to be a proportion of allowance for external business ; do you anticipate any difficulty in segregating the operations and assets of a bank which is operating in both Australia and New Zealand ?—I do not think it is an insuperable difficulty by any means ; it is not a difficulty which is out of proportion to the results obtained.

I only mentioned it because in assessing it for income-tax we have found it so difficult to get a true distinction between the local earnings and the Australian branches. We may be able to assess on their capital without regard to any attempt to segregate the assets ?—That I think is very largely because, as somebody more or less connected with banking described it, " A bank is an institution which publishes a fraudulent balance-sheet at the end of each year."

The general principle underlying this is that the banks and insurance companies are in a peculiar position, but if it is that there are other agencies in New Zealand using what we will call social credit, would the same principle apply to them all round ?—Where any institution directly affects the actual amount of monetary tokens or purchasing-power at the disposal of the community, most certainly. The answer is " Yes."

You would not in any way compensate all those people who lose half their value in the operation of this scheme ; I mean the shares of the banks in New Zealand are held very widely by hundreds of people ?—Yes ; I gave you, I think, two or three answers to the bank question, and I think could give you two or three more, as a matter of fact, quite easily ; but the question really does go deeper than that, and that is, that at the moment we are discussing the question of altering or dealing with the monetary tokens which are involved in the existing financial system. Now, it is perfectly true, and I accept it at once, that this is only dealing with half a question. The other half, and probably the more important half, is the question of price, and the question of price of shares which you are discussing comes in there, too. But to deal with the question of price traverses the orthodox financial system, and anything I say about that would simply be met by possibly a flat denial on the part of others, so that I think it comes into the proceedings at a later stage.

How are those native-born New-Zealanders selected for the purpose of giving them the right to those new shares ?—On the basis of passport, over the age of twenty-one.

But I am assuming that there are hundreds of thousands of native-born New-Zealanders ; it would be a long while before every man had his share, would it not ?—That is so. You have involved in that proposal the opportunity to exercise a certain discretion. You may have an issue of preference shares in some undertaking, and a man says, " Oh, no, I do not think so well of that," and he does not apply for them, and will apply for the next issue, and so forth.

But assuming 20,000 people applied and there were only 10,000 shares to be issued ?—I should reduce the value of the shares and issue more shares.

To whatever number of applicants there were ?—If there were originally £10 shares, I should probably make them £1, so as to have sufficient shares to distribute.

Mr. Massey.] Following upon the Hon. Mr. Downie Stewart's question, in your opinion do the banks and insurance companies of New Zealand have a monopoly of credit in New Zealand ?—The complete answer to that, I think, would require a knowledge of the exact relationship between the banks not trading solely in New Zealand and the other banks and Treasury of New Zealand. That knowledge I do not wholly possess, and anything that I should say in reply to that would have to be conditioned by want of knowledge as to the actual facts.

Under your proposals you say that you would value the assets and reserves of the banks and of the insurance companies : how would they be valued ?—They would be valued where there are parallel assets at the value which is set against parallel assets, by which I mean, where you have 100 shares in A stock, those would be valued at the price which would be obtained for somebody else's 100 shares in A stock, assuming that large blocks of property are not thrown on the market at the same time.

Then, under your proposals, you would hand to the public 50 per cent. of the value of the assets ?—No. Evidently this is a matter which is not clear to you. You would hand to the public purchasing-power equal to, in this case, 50 per cent. of the unmonetized value of those assets. It is not handing over those assets to the public ; it is increasing the amount of money which the public have at their disposal by the amount of an undisclosed reserve which is under that condition only represented by a price value and not by purchasing-power.

When it comes to the question of valuation, in view of the fact that we are an exporting country and actually are compelled to accept the price-level of the world for what we export, do you not consider the price-level should have a direct bearing on valuation ?—Obviously.

I just want to follow that up, and ask what the immediate effect would be, if your proposals were adopted, on the wage-earner of the country and the producer of the country ?—Taking these particular proposals as they stand, it would have a tendency to raise the price-level, and so far as the wage-earner is concerned it would have a tendency to increase employment, and also it would put him in a more favourable position to buy what is available. In so far as the rise in the price-level was reflected in consumable goods (which in the first place it would probably not be), it would make it clear that proposals in regard to dealing with prices were also necessary.

Under your proposals do you actually distribute the reserves created by the mutual insurance companies ?—No, sir ; I am sorry that it seems so difficult to make this point clear to you. If you say that the power of creating money to correspond with existing price-levels resides in the owners of those reserves, then what you say is correct ; but you are making an extremely momentous statement if you make that statement. What I am saying is that I would put at the disposal of the public the purchasing-power represented by the difference between those two price values, which is something quite different.

May I repeat another question : What would be the immediate effect if your proposals were put into operation on the dairy-farmer, if you take into consideration the fact that approximately 80 per cent. of the dairy-produce in New Zealand is sold in the markets of the world ?—The effect would be immediate on the producer in so far as the producer is overdrawn. It would decrease his overdraft and would therefore release to him additional money which is partly required for the purpose of reducing the overdraft on many occasions, and further would mean that he would be charged less

interest on what overdraft remained, so that it would be of direct benefit to him, and, because it puts him in a stronger position, it obviously improves employment.

I am afraid I am not quite clear: If you take up to-day's paper you will find, according to the cables, that New Zealand butter is sold on the London market at 73s. per hundredweight; would your proposals have any effect on that price-level?—No proposals I am making at the present time deal with the price-level as I think it should be dealt with, but in order to do that I have to traverse the tenets of the existing financial system; that I am not doing. The answer to your question so far as it is confined to these particular proposals before you is that it would tend if anything to slightly increase the general price-level in this country, in my opinion largely in regard to consumers' products, and not secondary products, and that by releasing the producer from financial embarrassment it would enable him, in his turn, to provide more employment.

Yes; you will admit that approximately 80 per cent. of the dairy-produce is sold in the world's markets?—Yes.

Under your proposals you say it would tend to increase the price-level in this country?—Obviously not in regard to an article like butter, which, as you quite correctly say, is governed by a world price-level. That can quite easily be dealt with by proposals which do traverse the tenets of the existing financial system which we are not discussing at the present time, but the whole of the price-level in this country is not made up from butter.

Very well; we will take wool. Approximately 90 per cent. or 95 per cent. of wool is sold overseas: What is the effect on that?—The price of wool has risen so high, you do not need to bother about it.

You say that really, under these conditions, the banking system has no effect at the present time?—The banking system, to pursue a tangent at the moment, is obviously producing the conditions to which are due the rise in price, but I should not like to say that that was an advantage of the banking system.

The same argument applies to meat?—Yes, I said to the Chairman some time ago that one of the reasons why general fundamental principles would require a different application to that in Europe is that your produce is unquestionably unbalanced, and is governed by world prices at the present time, and to that extent the rise in price-level which would normally be produced by proposals of this kind would be less than normal. I do not regard it as an advantage that prices should rise, but this policy would tend to produce a rise in price-levels. To the extent it does not produce a rise in price-levels the ordinary wage-earner is affected.

If your scheme were only applied to New Zealand, it would not have a great effect on the present conditions?—These specific proposals are suggestions made to this honourable Committee which can be put into operation without traversing the existing financial system, and I think they would produce highly beneficial results, but they would not go to the root of the whole problem, as I think I have made plain.

It is admitted that we export the greater proportion of the primary produce from New Zealand and we accept the world's price-level?—You are not obliged to accept the world's price-level. You can put an export bounty on at the present time, or do anything you like of that kind. That is not accepting the world's price-level.

The initial money would actually be found by the people?—On the contrary, that is exactly the difference between a subsidy and a creation of credit. The primary trouble is that there is a great deal of unmonetized wealth in the country; these proposals are simply proposals for monetizing that wealth, and not taking it from an already insufficient amount of money for any specific purpose.

Very well, you get right back to the original question: How would you value the assets of the country? I think it has been made clear that we export the bulk of the primary produce, and that must have an effect on the valuation of the assets which are held by the banks and by the insurance companies?—That is really, if I understand the question rightly, an extremely involved question, because if you deal with this subject only from the purchasing-power end and leave the price end alone, proposals of this sort are going to affect the prices to some extent and therefore valuations are undoubtedly going to be affected accordingly. For instance, if you have by these proposals, as I firmly believe you would, a very general improvement in business, then quite obviously the value of businesses concerned would rise. The value of business concerns which cannot operate for lack of purchasing-power is nil. It is something else again if the business can operate. If that is suggested as an objective, I should say that is an argument for dealing with both the price end of the system and the money-issue end, but to deal with the price end you have to traverse the existing financial system.

Very well. I will put one direct question as a dairy-farmer of New Zealand: It is admitted that we export approximately 80 per cent. of the milk-products which are produced in New Zealand and we sell them overseas and accept the world's price-levels for those products; how much better will my position be if we accept your proposals?—Your position will be this much better, that I should assume if you are a dairy-farmer, you must be almost unique if you have not got an overdraft.

Unfortunately I have not that privilege?—You are not unique in that way?

Many dairy-farmers cannot arrange for overdrafts, but are financed by the dairy factories?—The only difference is that one is a fixed overdraft and the other is a fluctuating one. In this case you would be benefited by having your liabilities decreased.

By making some one else pay them?—Not at all; by creating something that was not there before.

One more question: In your opinion is it desirable to produce goods at a loss?—That entirely depends upon your definition of a loss.

Take a dairy-farmer's cost of production: The bulk of the dairy-farmers in New Zealand are producing dairy-produce and selling it at a loss?—Selling it at a financial loss, but you would not suggest that the production of those dairy-products is a loss to the world.

So far as dairy-produce is concerned, the value of dairy-produce is determined, I think, by consumption in other parts of the world ?—The value of it is determined, or should be determined, by what is the result of producing that produce, and by its being used by the population. The fact that you produce it at a financial loss whereas in fact it is a benefit to the general population is simply an illustration of the fact that the financial situation does not reflect the actual facts.

In effect, you suggest that the rest of the community in New Zealand should subsidize in some form or other the dairy-farmers of New Zealand ?—Not at all; if you ask the rest of the population of New Zealand to subsidize the dairy-farmers you are taking from the rest of the population of New Zealand part of an already insufficient amount of purchasing-power; but if you create by any method at all an additional amount of purchasing-power, which enables you to sell your produce and not to make a loss on it, then you are not taking it from the rest of the population.

Can we in New Zealand assist the people of Great Britain in finding additional purchasing-power in order that they in turn can purchase the produce ?—Yes, you could do it in two ways. We will attend to one part of it in Great Britain with a certain amount of luck, and you assist them directly by selling in Great Britain at a lower price. When you sell your produce in Great Britain it does not mean you have to receive a lower price, but when you sell in Great Britain at a lower price you assist the consumer to get more for his money.

I have already stated that the dairy-farmers of New Zealand are producing dairy-produce at a loss and selling the great bulk of it in the world's market. Do you suggest that the remedy is to keep on selling and producing more and selling at a lower price ?—What I say is that the remedy is to adopt methods by which you can sell at a low price and not make a financial loss.

Mr. Lye.] Will you agree, in the first instance, that we have no perfect system of banking and finance throughout the world ?—Certainly.

Very well, will you agree that the system of banking and finance is undergoing constant change, inasmuch as recently we had the establishment of a central Reserve Bank and that the change is for the betterment of the people as a whole ?—No.

You do not agree ?—No.

These proposals have been advanced by you not as a cure, I understand, of the ills from which we are suffering, but to assist in some degree in a more equal distribution of what you may term community created wealth. Is that right ?—Yes, I think I should be inclined to agree with that.

The next question is this: Under your proposals which have been submitted this morning you propose to limit, in the first instance, the earning-capacity of capital, and it is the reserves, disclosed or undisclosed, you propose to distribute, the profits over and above the amount that would be required to pay a 6 per cent. dividend on the invested capital in the bank ?—Before I could possibly answer that question I would want a definition from you as to what you call capital.

My definition of capital is the money employed in running the institution. Money that is required to carry on the business of banking and finance ?—The money employed to carry on the institution is got by the banks themselves.

Well, say the assets and securities of the bank ?—At the moment I do not follow that.

Will you agree that if the reserves of the banks do not provide sufficient to pay more than 6 per cent. there would not be any justification for this proposal ?—That appears to be obvious.

Supposing there is a distribution that has to go to the customers of the bank in reduction of their bank overdrafts ?—To one of the suspense accounts, yes.

It might possibly go to individuals, non-shareholders, who had taken no risks—there is a risk in finance and banking—carried no responsibility. What I want to make clear is this: Would all individuals have the same right under the distribution of profits from the Suspense Account No. 2 ? Would a person with no family responsibilities be placed in the same category or treated the same exactly as a man who had family responsibilities ?—It is for every New-Zealander, irrespective of station.

If the present system is responsible for many of our failures, you do not claim that your proposals submitted before the Committee this morning go the whole way in getting us out of our difficulties ?—No.

While it may or may not be admitted that the proposals which you have submitted will provide a more equal distribution of the community created wealth, the question I want to ask is this: Is it not a fact that the real wealth of the Dominion is largely dependent upon the exchange value in the markets of the world of our produce, of what we export, for we are an exporting country and not a manufacturing country, and that our real wealth is largely dependent upon the exchange value of our goods in the markets of the world ?—Not fundamentally. The answer to that is really very largely the same sort of answer as to the question, "Did the hen or the egg come first in the world" ? The exchange value of your products in the markets of the world is almost entirely governed by the conditions under which they are exchanged. Under the present financial system, and again I am being strictly orthodox, it is necessary for practically every country to establish what is called a favourable balance of trade—that is to say, it must compete for exports. The value of your exports under the existing financial system is mainly governed by the stringency of the competition, and it is the conditions under which you export rather than the actual facts of the exportation which govern the value of your exports.

Will you deny that the purchasing-power of the producer in New Zealand is governed by the exchange value of his goods overseas ?—It is not necessarily governed.

I do not like the qualifying word "necessarily." Is it at the present time ?—Unquestionably, even within the confines of the existing financial system.

Under the present financial system ?—It would not necessarily be under perfectly orthodox finance. It is powerfully affected by such things as import or export quotas and tariffs and bonuses, and so on.

Is not the question of the velocity of circulation, which in our present circumstances has largely been slowed down through the small margin between cost of production and the selling-price, an important factor in our troubles to-day ?—No ; I confess I do not quite see what is the connection between the velocity of circulation and the present question. The velocity of circulation has almost nothing to do with it.

Then you would say that velocity of circulation is not a matter of very great importance. Would it be a question of the quantity of currency and credit in the country rather than the turnover of goods and services ?—Absolutely, because the modern production system is not an exchange for goods and services ; it is a draft by the population upon the central pool of wealth.

This, I might say, appears to be a very important question, and I think it is of sufficient importance that we should have clarity. When I use the term " velocity of circulation " I do not necessarily mean the exchange of money for money ; but I mean the exchange of credits, the exchange of goods and services taking the place of credits in the banks, and the exchange of credits from one individual to another, and I was going to submit that that is a matter of very great importance in any scheme of finance ?—I quite agree with that.

You do not attach a very great deal of importance, unless I have misunderstood you, to this question of velocity of circulation—the exchange of credits from person to person ?—I attach a great deal of importance to the understanding of it, but not to the statement that velocity of circulation in itself is important.

Many of us have given this question a great deal of consideration, and I believe that the people of New Zealand would be grateful to receive something more than what we can get to-day. Of course, your time is limited, we recognize that, but could you, before leaving New Zealand, supply us with additional information showing us how purchasing-power can be made to equate to production ?—Well, the general principles by which purchasing-power can be made to equate production are available in quite a large number of books, simply as principles, and I do not think, personally, that I have got very much to add to what there is available in those books as to general principles. What I would repeat is that my services are at the disposal of the Committee to any extent and for any length of time, but I have quite definitely no available time between now and the 6th March, when I will leave from Auckland. I should even change that if I were not definitely committed to two Government Committees in another country, and that I cannot obviously interfere with. Still, there is the post.

Would you agree with the statement which I now make that whilst there are many books, as you have stated, dealing with the principles, there is not one book that I know of that lays down a definite plan for putting the theories into actual practice ?—No, I should not agree with that. I should say that there are in existence plans which require remodelling in various respects for particular circumstances, but it would be a very unwise thing to proceed further than I have proceeded at the present time with a final plan for New Zealand without going into close consultation with Ministers of the Crown and many other people before the thing was embodied in an Act of Parliament. Quite obviously, action along these lines, if possible, should be arrived at by reasonable negotiations, so long as the principles are kept in mind. That is a general answer.

So you think there are plans which require remodelling to suit particular circumstances. Do you know of any plan that is foolproof or perfect that can be put into operation with advantage to the people of this country ?—I should say that with very slight modifications which would suggest themselves to any one who dealt with it, this plan of mine could be put into operation and then built upon and proceeded further with.

I think it is right to say that the banks are trading banks or institutions ?—I am never quite sure whether it is right to say that or not, because at one time I am told that the banks are purely trading institutions and at various other times I am told that they are vitally connected with industry, that they have the interests of the public at heart, that they are practically identified with the country, that they are New Zealand, and that any attack upon them is an attack on New Zealand and so forth. I therefore find it very difficult to make up my mind as to what the banks themselves say they are.

Leaving New Zealand out of the question, would you say that the banks, generally speaking, are trading concerns ?—I think there can be no doubt about that, as a fact.

I agree with that entirely. If your proposals submitted this morning are sound in every particular, following upon the suggestion made by the Hon. Mr. Downie Stewart, is it not reasonable to suppose that these proposals must not stop at dealing with trading banks alone, but they must embrace practically every trading company, and particularly the Farmers' Trading Institution and the stock and station agents, who both accept money on deposit. They both lend money to the producers of this country. If these proposals are put into operation, would you raise any objection and would you agree that the other trading concerns of the Dominion would provide a profitable ground for an extension of the proposals which you have submitted this morning ?—If there is a very clear distinction. These proposals are directed to provide a means for increasing the monetization of wealth which is produced or is available. So far as I am aware, there may be local practices in New Zealand which come within what I am proposing. Do these concerns to which you refer increase or decrease deposits in the Dominion which are drawable upon by cheque ?

Yes ?—Then to the extent that they create those deposits they come within the scope of these proposals.

Mr. Clinkard.] A great deal of what I have to ask has been covered by previous speakers. I would, however, like to be clear on this point : Does your proposal cover both disclosed and undisclosed profits—that is to say, all reserves ?—Yes.

Banks were established in New Zealand unquestionably for profit the same as other institutions were, and they were closely allied with the public interests of the country. Shares have been transferred from time to time. The values of those shares have depended largely on the amount of their accumulated reserves ?—Quite.

Any proposal to annex those reserves and divide them for the benefit of any other persons, however worthy, would be an unjustifiable deprivation of those people who bought those shares, would it not ?—That involves the same question that I am so unable to make clear. The thing which is going to be divided under these proposals is the monetization of those reserves, not the reserves themselves. If you claim that you are taking away from those institutions the power of monetizing those reserves for their own benefit you are claiming that the owners of those reserves have the power of creating what, in effect, is currency. It is, I believe, an accepted fact of statesmanship that the power of creating currency, or that which acts as currency, is a prerogative of the supreme authority, the Crown.

You mean legal tender ?—Yes. Those undisclosed reserves, so long as they are in the form of price values, are not in any sense purchasing-power or legal tender. What I am proposing to do is to monetize those undisclosed reserves and distribute them. Your objection is based on the assumption that the power of monetizing those reserves is the unique prerogative of the people who hold the reserves. I say it is not.

It would appear to me that in any case, whether you take it for monetizing purposes or whether you take it for any other purpose, you are depriving the present owners of the free right and use of their property ?—Supposing I make that clear by an illustration. Supposing you had no money at all in New Zealand and that, as is freely admitted, you cannot carry on modern business in a modern world by barter ?

That is admitted ?—If I were suddenly to monetize the whole of the real wealth of New Zealand by a process of writing figures in a book or printing bank-notes, if I created purchasing-power equal to the whole value of everything in New Zealand, would you say that that was my property ?

I think that is confusing the position. I understood you to say you would be surprised to hear that a bank was unable to pay more than 6 per cent ?—Yes.

Have you any experience of bank failures ?—Yes.

It is rather a painful experience ?—This is a very good instance of what I mean. No bank ever failed in the whole history of banks because it had not got real wealth at its disposal. Why it failed was because it could not meet its demands for liquid purchasing-power. That is exactly the position in the United States. The commonly accepted explanation of all the bank failures in the United States is that they were loaded up with frozen assets. All that was required to prevent those banks failing was that they should monetize these assets, and I am providing you with a method of monetizing them.

We are told that the banks do that now ?—Yes, but not many banks are in a position to monetize their assets to the extent that is required.

Are you in favour of controlling prices ?—Unquestionably, on properly thought-out lines.

That is a very important point. There is one other question I would like to ask. In view of the close connection between New Zealand——?—Might I just amend my last answer slightly. I am in favour of regulating price-levels, which is not quite the same thing.

In view of the close connection between New Zealand and the Motherland, do you consider it feasible for New Zealand to pursue a financial system diametrically at variance with that in Great Britain ?—Well, that really requires an answer as to the highly ethical standpoint of the bilateral bargain, if you are suggesting that New Zealand would be penalized.

I do not mean that ?—Then I should say it is quite technically possible for New Zealand to pursue a different principle.

You know Sir Arthur Salter's view on that subject, that our close connection makes it more difficult ?—I should still have my own opinion.

Captain Rushworth.] The term "price-level" has been used this morning. Is there any such thing as a world price-level ?—I should very much doubt it.

Are you familiar with the formula of Dr. Walter Rautenstrauch, of Columbia University, in which is set out the conditions in the United States that production is increasing ; production is excessive ?—I think I have that available here. I think I can say I am familiar with it. Naturally I did not know you were going to ask that question.

That formula related to the conditions in the United States. Generally speaking, would you say that that is applicable to the whole of Western civilization ?—Broadly speaking, I think it is applicable to the whole of Western civilization.

You were asked for a specific plan for New Zealand. From a newspaper report which I have seen you were asked a similar question in Australia—New South Wales—and you replied by referring to a bridge. You said that it was quite possible that you could prepare the plans and specification of a bridge, even putting in each individual rivet if necessary, but a great deal of work was involved and you found that after all the trouble had been taken it was decided that after all the bridge was not wanted. Is that idea applicable to New Zealand at all ?—Yes. I think I might, broadly speaking, answer that in the affirmative.

The question of trading banks was raised. Until quite recently we had six trading banks operating here and they have performed the function of manufacturing money. That function has now been transferred to a Reserve Bank. Were not those institutions in the same position as the Royal Mint ?—Not quite. The Royal Mint, so far as it manufactures metallic coinage, manufactures tokens of purchasing-power which circulate between individuals and are not destroyed, at any rate until they are worn out. The difference between that and the operations of a bank is that the bank does create purchasing-power, having exactly the same function as that of the Royal Mint, but it periodically destroys it at very much shorter intervals, therefore the cycle of circulation of the bank's money is very much shorter than that of Royal Mint money.

That is what I was coming to. When the money was metallic in Great Britain, not so very long ago, the Royal Mint had the sole right of making money. There were severe penalties on any one who

performed the function of the Royal Mint, and the Royal Mint was regarded as the most powerful instrument of Government. Under modern conditions, who is it, or what is it, that performs the function of the Royal Mint, seeing that we have not a metallic monetary system ?—The banking system.

So the banking system has taken over, to a large extent, the powers of the Royal Mint ?—It has taken over the powers of the Royal Mint unquestionably, but it does not function very satisfactorily in the orthodox point of view, because its cycle of creation and production of money and the subsequent destruction by payment of loans is very much shorter.

Following up that point for a moment. In olden times when the Royal Mint made golden money, sovereigns, the discoverers of gold could and did take the gold to the Mint and it was minted free of charge. The sovereigns were handed back to the possessor of the bullion and they were put into circulation, not as a loan but as a gift. They were in circulation permanently. When, through wear, they fell below the standardized weight they were returned to the Mint and reminted and made up to the original standard free of charge, or at a small charge ?—Entirely free of charge.

The modernized monetary system is different in that money is not put into permanent circulation in the same way ?—That is correct.

Whereas originally it was in permanent circulation, to-day it has a period and at the end of that period is cancelled out of existence. Is it correct to say that the cancellation, in almost every instance, is premature ?—It is certainly premature from the point of view which I have taken up this morning—that is, that an accounting system should represent the facts of the physical system. It does represent cancellation of items in the accounting system which is not justified by the actual physical disappearance of the assets.

Could we go a step further and say that the cancellation should not take place in any case unless there is a net wastage of assets ?—Absolutely.

If you had a progressive increase of national assets there should be no cancellation but a steady progressive proportionate increase of the money ?—That is so, unless you have what amounts to the same thing, a progressive decrease in prices which would increase the purchasing-power of the tokens.

Dr. Sutch.] Will you deny that there is or has been a world price-level for wheat ?—I assume that the question of world price-level is in the sense that the question was asked by Captain Rushworth. It is really mixed up with the question of whether there is such a thing as world currency.

May I quote you earlier in the discussion; you said something such as "Private initiative is admirably successful"; do you still agree ?—Yes.

And again: "Nationalization of insurance funds does not mean interference with the present system" ?—Did I say that ?

I believe that was the gist of your remarks ?—It may have been the gist of them.

You say the whole property of the country must go into the hands of the banks. Under that assumption how is it that tens of thousands of banks failed in the United States in the last few years ?—I simply repeat, the explanation is frozen assets.

You are familiar with the New Zealand banking system ?—Fairly, in that I assume it to be substantially similar to the British system.

You know what we mean by stock and station agents ?—I confess I did not know until this morning; I have gathered more or less from what has been said.

They extend intermediate credit to the farmers to a much greater extent than the trading banks. Would you say there was a monopoly of credit in New Zealand ?—Yes.

Would you say that an exporting or importing house does not sometimes extend credit ?—I should like to refer you again to my sharp distinction between institutions which can definitely increase or decrease deposits which are drawable upon by cheque.

That does not necessarily include some of the institutions I am referring to. In the depression a good number of farmers in this country have been "carried" by storekeepers. The storekeepers have let the farmers have the goods. They have been sold on credit so that there has been a substitution there, you see ?—They are intermediate agencies between the original sources of credit. It must mean something which would create deposits.

Not in this case; the original source of credit was the goods forwarded to the English market. The price realized in London would pay off the country storekeeper ?—To the extent that money came into the question at all. We were speaking about what is technically known as financial credit.

Were we ? I suppose it is a matter of definition ?—The commonly accepted definition of financial credit is something which creates deposits drawable upon by cheque.

Would you agree that the strength of banks and insurance companies ultimately depends upon their capital and reserves ?—I would like to know what you mean by capital.

In the sense you are using it; there may be uncalled capital, but there certainly will be assets which could be "marketed in the usual manner" ?—Do you mean the physical assets ?

Yes, if you include securities which are a claim on physical things ?—What is your question ?

Would you agree that the strength of the banks and insurance companies ultimately depends on the amount of their capital and reserves ?—What do you mean by the strength ?

I am afraid if you are going to ask me to define every simple word we will have to let the question go. By strength I mean the financial soundness of an institution—that it will not default when quite legal and usual demands are made upon it ?—I should say that ultimately the soundness of any institution of that kind depends upon its powers of liquefying its reserves.

Under the scheme you have here, do you not think that the soundest, the most well-run bank, the bank that has the greatest reserves, will have to pay out the most in reduction of overdrafts ?—That probably means that it has taken most from the community.

If it is an efficient concern, and has prudently managed its reserves, it will pay out more ?—I would not agree with that definition of efficiency.

Banks which were not run very well would not have to pay out or contribute so much because they have not very large reserves ?—They do not have to pay out anything at all ; any of them.

Under this system of reduction of overdrafts, the biggest business will get the biggest concessions ?—I am assuming that they have got their overdrafts on the basis of the size of their businesses.

Take a man who borrows extravagantly and a man who runs his business prudently, the man who borrows extravagantly will get better treatment than the man who has built his business up by other methods than borrowing from banks ?—I would say that the answer to that is that you can fairly well depend on the average bank not to lend more money than it is assured of getting back.

A very good answer, too. As to the difference between borrowers there is an adjustment made there ; some overdrafts are charged 7 per cent., some 6 per cent., and some 5 per cent. The ones who are paying 7 per cent. on overdraft get a greater reduction than those who pay 5 per cent. The shakiest accounts get the best reduction and the best accounts get less ?—The objective of the proposal is to put all things on a sounder basis ; therefore what you want to do is to stabilize the shaky ones.

I see ; you encourage the shaky ones to borrow heavily because they know they will get a good reduction ?—You can leave that safely to the banks, I think.

Assuming a mortgage investment company : with whom would you invest, a mortgage investment company or an ordinary insurance company or bank ? Would there not be differential treatment ? One is going to have something happen to its assets and its dividends and the other is not going to be treated in the same way. The investor will therefore put his money into the mortgage investment company which is not interfered with ?—All the time you are suggesting that I am proposing to take from two selected forms of institution something to which they have a right, the right of monetizing their frozen assets. The whole basis of your questions is an assumption that they ought to have that right. If so, then, of course, I am taking it from them. That is indisputable. The whole question as to whether I am taking anything from them at all turns on whether they do by legal or actual or any other right possess the power to monetize their own assets. If not, I am taking nothing from them.

I quite realize you are taking nothing from the insurance companies in the sense that you are issuing a piece of paper as a preference share ; but you are certainly taking some of their dividends. Say you have a balance-sheet value and a market value ; the difference is £1,000,000 the first year ; £1,000,000 is put to Suspense Account. In the next year will there be another million ?—I should think it is highly probable from the rate at which the assets of the community are in the hands of the banks and insurance companies.

So that next year, even though we have the same market value, there would be another million available ?—Yes.

Put that £1,000,000 into Insurance Account No. 1 : you have £500,000 paid out in one year to these "natural born" New-Zealanders. Assume there are half a million "natural born" New-Zealanders over twenty-one years, they get £1 share each ?—Yes, on these figures.

So that, if they get 5 per cent. on those shares, they are getting 1s. a year ?—Yes.

If you have a slightly falling price-level and the market value of your shares goes down next year, what is going to happen to your Suspense Account ?—Which Suspense Account ?

The insurance one—Suspense Account No. 1 ?—Well, anything might happen to it. If the actual assets coming into the possession of the institution are not increased, there will be a fall between the balance-sheet price value and the market price value.

Why do banks keep reserves ? Do you think it is just a bluff ?—Very largely to conceal their enormous profits.

What is the use of these profits stowed away ?—To maintain what you call "their financial soundness."

So that it is of no immediate use to the banks really, in that it might have been purchasing-power ?—It is every use to the banks ; it puts them in control of the country.

Would insurance companies include life, fire, accident, and mutual insurance ?—That has nothing to do with the assets of the banks.

In the insurance scheme, a mutual insurance company, of course, will have no share capital in the ordinary company sense, would it ?—No.

How are you going to divide up what corresponds to 6 per cent. of the share capital ?—On a limit basis.

Insurance payable by insurance companies does not in some cases become due for forty or fifty years ; some of these inner reserves are to be realized in the future. It would be folly, of course, for the companies to get rid of those reserves now ?—There is nothing to prevent them being treated by discounting.

I noticed the term "rediscounting of reserves" ; what do you mean by that ?—Taking an asset which you cannot discount in normal institutions and obtaining money from the Reserve Bank on a very small percentage.

You mean discounting, not rediscounting ?—Not necessarily ; a great many of the things discounted by the Reserve Bank have already been discounted.

I am aware of that, but the difference between the balance-sheet value of the reserves and their market-value is not discounted as a usual practice, so that the term "rediscounting" is inapplicable. We assume that you discount with the Reserve Bank ; in turn you are using the proceeds to give preference shares to the people of New Zealand—pieces of paper—but you would not need cash proceeds. The difference between the value and the market value : you discount it in some way, but you would not "monetize" it ? You do not increase purchasing-power, but only issue a piece of of paper which is non-transferable and not security for loan. Why go to the Reserve Bank when you do not need liquid funds ?—Would you rather go somewhere else ? I have no objection.

I do not see why the Reserve Bank comes into it ?—All purchasing-power which is required in return for those shares is based on the assets of the companies.

Your scheme means that you are not going to sell the land and property of the banks and insurance companies, but there is a difference between the market value and balance-sheet value. This difference you are going to issue by way of shares so that you will pay dividends on the private assets of the community. You are basing these preference shares on existing assets; could not the scheme be extended to all the existing assets of the country?—It will in time.

So that you can have all the land and assets of the country and issue debenture shares on that?—That depends on how much you require purchasing-power.

Assume that I require two or three times more than I have?—The only fundamental question is, can it be provided out of the resources of the country?

You value your assets and get your scheme into operation; if prices rise, the value of those assets would rise?—I said that if a business was transformed from practically a dead business to one which was selling, by any process whatever, rise in prices or otherwise, obviously the value of the business does rise.

You assume that if the market price of the product rises, the market value of land would rise?—That depends on a lot of other things.

If the price of a product derived from land rises, then would not the land itself tend to rise in value?—Yes.

So you have a greater basis for preference shares and dividends?—That would be so.

Assuming your scheme increases the purchasing-power of the people, the value of all producing assets goes up?—If you do not deal with prices at all, it does.

Therefore you can issue more preference shares which will claim dividends?—I should not like to proceed as fast as that, but it sounds quite moderate.

You would like to equate the purchasing-power of the community to the goods available for consumption?—That is not involved in this scheme.

I am talking of your social credit schemes. You would like also to equate purchasing-power with all the second-hand goods in the community?—Yes.

Goods, and services also, should have purchasing-power equated to them?—Yes.

We will assume that a lecturer is holding a meeting in the Town Hall and charging 1s. for admission: what purchasing-power would you equate for his services?—What it costs.

We will assume a thousand people at the lecture; you would not assume that that was the cost of the lecturer? How would you arrive at the value of the lecturer?—It is not at all necessary to arrive at the value of a lecturer. I do not want to take up your time or mine by answering hypothetical questions.

You said you would equate the purchasing-power necessary for a lecturer by what it cost?—His cost is the part of the compensation of the community for that space of time.

How do you know whether the community is going to assume the cost at one thousand shillings or not?—What I can do is to find out quite easily to all practical purposes what is the average——

If Bernard Shaw comes to New Zealand there may not be enough purchasing-power available to hear him?—All you will do under a condition of affairs like that is to transfer one set of tickets from a certain number of people in the community to Mr. Bernard Shaw. That does not increase purchasing-power.

So that some of the smaller, not so popular, lecturers will suffer, so that purchasing-power has not been equated to services available?—That depends on the lecturer.

Let us take another illustration: locally there is a glut in tomatoes, and growers cannot cover costs. If by means of social credit consumers obtain more claims to wealth, would the tomato-grower now cover his costs?—Yes, he would recover his costs in prices.

And if good weather brings another glut?—That is outside the scheme under discussion.

One thing here: you say that any observed defects in the industrial system arise, under the hypothesis we have assumed, from the maldistribution of sufficient quantity of purchasing-power?—Did I say that?

Yes, in paragraph 2 of your covering letter of the 21st February covering your proposals: "Any observed defects in the industrial, social, and economic systems are, under this hypothesis, due to maldistribution of a sufficient quantity of purchasing-power"?—Yes, under this hypothetical system.

So that, under this hypothesis, the sole thing that is wrong with the world is maldistribution of purchasing-power?—You are misquoting me. I said, "I am therefore attaching certain proposals in outline, based upon the working of the monetary system in its present form which for these purposes is assumed (without admitting such to be the case), to be self-liquidating. This involves the assumption that sufficient purchasing-power exists at any time to buy the goods which are for sale, at prices which are reasonably remunerative to those concerned in their production and sale. Any observed defects in the industrial, social, and economic systems are, under this hypothesis, due to maldistribution of a sufficient quantity of purchasing-power." Would you mind quoting exactly what I say when you quote.

But I have quoted your exact words from paragraph 2. Would you say that there are no other causes than the financial system for the low prices existing in the country to-day?—I should not say that the low prices are due to any other fact.

Would you say that tariffs had anything to do with the problem?—Only to the extent that they affect the distribution of industry.

A technical change of industry; do you think that would have anything to do with it?—That would have everything to do with it.

Do technological changes make for low prices under the hypothesis on which your scheme is based?—Yes.

If we could have something like the Douglas Credit Scheme working, would we have better prices for dairy products?—You could.

Costs, of course, would be included in deciding on the price ?—Yes.

If you had a high price, then would some costs rise ?—Possibly.

If you got a good price for dairy-produce would rents rise ?—Not necessarily.

Would they be greater than now ?—Only so far as the amount of rent was a cost and was adjusted in accordance with the general principle of adjusting costs.

If you assume that system in New Zealand and put 80 per cent. of butter into foreign markets, what is the local farmer going to do ? He is faced with high prices here and low prices in London : where will he send his produce ? Would it not swamp the local market ?—If he exports it he is going to get a high price for the whole of the butter he produces under a scheme by which prices are regulated, adjusting this scheme.

Would they be fixed prices ?—No. I would crave the indulgence of the Chairman. We have been discussing the scheme suggested by me and then discussing banking, both of which I am pleased to discuss ; but we are now discussing something else quite apart from those.

Very well, then, I will leave that side of it. The discussion with the previous questioner, Captain Rushworth, was also on lines extraneous to the scheme under discussion. I would ask one further question : If we can assume that the purchasing-power is slightly increased by the proposals you have here, is there any reason for assuming that we will buy butter or meat ? Perhaps we will prefer radios or motor-cars ?—I cannot give any information as to the tastes of the New Zealand public.

Mr. Ashwin.] I have had the benefit of hearing the previous discussion, and probably many of the points which had occurred to me have been discussed. There are, however, one or two things I should like to ask. Your scheme, of course, is unorthodox, and would raise some questions of equity ; but I do not want to labour this now. I want to get on to questions of economic significance. The first point in that respect is this : Would not your proposal, which you admit can only be an instalment, undermine the psychological factor of confidence and make things a lot worse than they are now ? The world over, it is generally agreed that one of the things which has aggravated the difficulties, whatever their basic cause, is this shattering of confidence—of business confidence, in particular. Would not your proposals here outlined, partly owing to the fact that they would run entirely counter to the ideas in New Zealand, and partly owing to the fear of what was going to happen next, would they not undermine business confidence still further ?—The answer is fairly obvious. If you can assume that the world will recover from its present malaise by the process of restoring confidence, then of course your contention is perfectly right. If you assume, as I assume, that the difficulties in the world are due to radical defects in the financial system, restoring confidence is no good, and you are simply wasting time.

In other words, you think things are going to be worse before they are better ?—No ; I think you have to do something within a short period of time, but in any case no question of merely restoring confidence in something not worthy of confidence is going to be of much use.

I think you are not so much restoring confidence as destroying it. Business is on a more or less hand-to-mouth basis ; if you make it worse, are you not in danger of facilitating a breakdown ?—If you assume that by merely not examining the position with respect of the present crisis, and taking such steps as you can to remove the cause of the present crisis, things will greatly improve for any considerable time, yes ; but the whole of my contentions are based on the assumption that we are heading for a worse breakdown.

On that assumption, it does not matter if you do anything or not ?—It is simply a question of whether you are doing more by taking action to the removal of the cause of the breakdown, or whether you think that a fool's paradise is the best scheme.

That, of course, is dependent upon whether I agree with your contention ?—If you assume that there is nothing at all the matter with the world, that it is just contrariness, and that shortly things will be quite all right, it is obvious that confidence should be restored, but otherwise I think that restoring confidence is not necessary.

You intimated in certain of the remarks that these proposals will only show the necessity of going further, and on that point I was somewhat struck by the similarity of your proposals to your well-known scheme for Scotland. When it comes to the future steps, are you proposing to proceed on an application of that scheme ?—I think, as far as New Zealand is concerned, quite a lot of what would appear on the surface would be a considerable modification of that.

It would be necessary. I was at first at a loss to follow your basis of working in putting this scheme forward, but in the light of your remarks and in looking up your scheme, I find it is in principle very similar ?—The fundamental principles of what requires to be done are quite, as you might say, universal.

And they are the same as are underlying this scheme ?—This proposal I am putting forward to you is certainly much less far-reaching.

Admittedly ; it is only an instalment. I was just wondering whether—— ?—The proposal is designed for the purpose of enabling goods to be bought and at the same time to provide for the fact that the use of power and machinery is displacing labour.

I do not want to take you into opening up a broader scheme, but you will realize that from my point of view, as this is only an instalment of the scheme, I want to know how far to apply that instalment. I want to have some idea as to what the procedure will be ?—Quite so. The direction is along the lines that I suggested this morning, that we want to get a reflection in the actual financial system of the actual accounting facts, and take account of those facts in designing the scheme. That scheme is designed on the assumption that the facts are as they are stated to be.

From a practical point of view, can I assume that with modifications the future steps that would follow this proposal would be along those lines—the permanent steps you would take I mean ?—I think the actual form of anything I would suggest that you should adopt would take a great deal more detailed consideration. It would appear on the surface to be widely different to that scheme,

but there would be no radical difference of the principle involved. The difference would be based on the fact that New Zealand is a potentially rich and largely undeveloped country and that you have to pay a good deal more attention to development than, say, in Great Britain.

That really only affects our form of institutions rather than the question of trading. It affects pretty well all productive institutions in the same way as you are proposing to do here with insurance companies ?—No, I am afraid that is not correct.

However, you realize that the point is vital to me. When you are dealing with an instalment of a scheme, before you can give due consideration to the instalment you must know where you are heading ?—This proposal was not put forward as the instalment of a scheme, but as a scheme which does not traverse any accepted principles of finance. I think, as an expression of opinion, that it would enable you to see the necessity of going further, but it is not put forward as an instalment of a scheme at all. I think you will probably find that it is a thing on which you can build, but that would be entirely a matter for your own country.

You said that this banking proposal is to take the undisclosed reserves; that they represent the physical basis for the creation of credit. I cannot follow that, except on the basis of your other statement, where you say that the property of the country will pass into the hands of the bankers. To be quite frank, I cannot follow that. From a superficial point of view, the banks have been in operation for a long time, and have not acquired much of the outside property yet ?—In Great Britain 90 per cent. is in the hands of the bankers.

It all depends on what you mean by "in the hands of the banks." Do you mean by that that a lot of property has been used as security for loans from banks ?—Yes, either those loans have to be paid back—they never can be in the aggregate—or the property becomes the actual physical property of the banks.

Your statement did not mean that the banks acquired the freehold in fee-simple ?—Well, that involves a great step. Banks do not want to acquire the fee-simple; they would prefer to leave it in the hands of some one else to manage.

Again, you say that a great deal of this property has been put up as security for loans which can never be repaid. The question of whether they can be paid off depends on whether a business is successful or not ?—The question as to whether a business is successful is dependent on how many loans are paid off. The definition of success in business is more that you get money than property in any real sense of the word; that you have more money at the end of the year than at the beginning. Before you can do that the question arises as to how many loans you can pay back. I am speaking in the aggregate.

Coming down to a single business, if a business is soundly based and efficiently managed, and normally most of them are—you have your failures from many causes—but, taking the normal business man, it is carried on successfully. In other words, the proprietors of the concerns make sufficient out of them—their assets increase sufficiently—to provide them with a livelihood ?—That is because of the outstanding loans of the bank.

Any successful business is continually paying its loans off—a successful business can liquidate its liability to the bank. I cannot see how the liquidation of the asset places it in the hands of the bank ?—What an ordinary business man does when he carries on business is that he competes with other business people for a definite amount of monetary purchasing-power. The amount of monetary purchasing-power in the country is beyond all question simply controlled by the banks—that is admitted not merely by economists of any standing, but also by the heads of the great banks themselves, so that when business men are competing for a monetary profit they are competing for something over which they have no control whatever in the aggregate. They cannot themselves make any money with which to make a profit, so that if the amount of money in the country is stationary then one set of producers can only make a profit by another set of producers paying it. The only condition under which they can all make profits is that the amount of monetary tokens in the country is continuously increasing in order to provide the amount of the profit. If suddenly, at any moment, action from outside is taken to decrease the amount of those monetary tokens, every one of them will make a loss.

I do not agree with that. The basis of business is not juggling with monetary tokens at all; it is in the exchange of goods ?—You reckon the success of your business in money. Now, at the end of the year you consider that you have made a profit, you have more money at the end than at the beginning. Supposing there is less money for every one to have, how can you all have more money at the end than at the beginning ?

I do not agree with you. Are you not confusing money in the shape of tickets to facilitate exchange with money as a common denominator of value ?—No, but I think you are. You can create a lot more price values, quite obviously.

What I mean to say is that a person can have a profit at the end of the year. We will assume that the amount of cash at the start was £100 and at the end only £50, he can have the profits in the goods ?—No. When you are assessed for income-tax on those profits, do you pay in goods or money ?

You pay in money, but that does not invalidate my argument ?—It does not represent goods unless there is enough money to buy the goods. You are carrying on business for the purpose of increasing your credit with the bank.

No. I say you are carrying on business to accumulate money to get sufficient food for yourself and family ?—You get that by drawing cheques on the banks.

You get it by making butter and exchanging it for boots and clothing. Another point was that, even assuming we put your scheme into operation, it would appear to me that the economic effect is going to be inequitable. Having once taken the amount of the undisclosed reserves, whatever it might be, and distributing, say, 50 per cent. in the first year and a decreasing proportion in succeeding

years, I cannot see that that is going to have any appreciable economic effect at all if every £1,000,000 in New Zealand only represents 1 per cent. of the overdrafts ?—I do not agree with the figure of £1,000,000, but I should be inclined to put it this way, that if it makes so little difference, then why not try it and see.

That opens up a lot of questions of principle and equity. I could not follow you when you said there would be a constant flow into the Suspense Account ?—One of two things would happen. Either they would pay off all overdrafts, in which case you do not want a flow, or there would be a constant number of overdrafts which would not be liquidated and which would be called in, and would be satisfied by assets which would go into the hands of the banks, into the Suspense Account.

If the assets were worth more than the amount of the overdraft, presumably the owner of them could have disposed of them and paid off his overdraft ?—That is not the point. The question is not what the overdrafts have been taken in return for, but what is the price at which they are held in the balance-sheet of the bank when they are taken over.

You say, having acquired the assets they are going to create further credits, reserves, by writing down their assets out of profits so that you can take that away from them. They will hardly do that ?—Then we should have very large disclosed profits of the banks.

Your second point about the disclosed profits largely removes the possibility of making them by, in the first place, taking away a portion of their capital assets ?—You cannot have it both ways. Either they do take over the assets and write them down or they do not write them down, in which case they make a profit.

That, again, I do not think follows, because the profits are made up by the difference between what they are required to pay for money and the amount they lend it at ?—No ; they are made by actually creating the means of payment by banking processes.

In regard to the insurance proposals. It was not made quite clear as to why you brought insurance companies inside the proposal. They are not yet part of the monetary system. I cannot see why you should take insurance companies and not investment trusts or breweries ?—But the insurance companies are part of the monetary system. A great many of the undisclosed assets of the banks are in the insurance companies.

You say banks have their assets in insurance companies ?—I think it would take us too far to follow that up, but I think you can take it from me that there is a very close connection between the insurance companies and the banks.

I cannot see any closer connection than between the banks and breweries ?—Perhaps you will take it from me as a statement, not necessarily true, that there is a closer connection.

You put forward the assumption that the existing financial system does not operate successfully. If your assumption is incorrect, then would you admit that it would not be necessary to put your scheme into operation ?—I do not, in any case, assume that the existing system is successful. I should think that it was a matter of common observation that it was not. So, what I say is that there can only be two possible theories as to why it is unsuccessful, one is that there is a definite lack, a deficiency, in the total amount of purchasing-power available, which is my theory ; and the other is the orthodox theory that there is no deficiency in purchasing-power, which means that there is maldistribution. If we admit the second theory is true, then we proceed to deal with maldistribution where it occurs in the greatest obvious degree.

Then I can take it that it is really your belief that our economic troubles are caused by the defects in the monetary system ?—Yes, but that is not admitted, and, therefore, I will not press it.

Notwithstanding the other fundamental factors, such as are set out in great wealth of statistics in such publications as are put forth by the League of Nations, where they trace a tremendous number of factors, such as lack of balance, and disorganization in the production system ?—I should call them symptoms, not causes.

It is not the other way round ?—I say that the monetary system is the cause and those other things are the symptoms.

There was a point raised by Mr. Massey regarding which I should like to ask a question. As you are aware, New Zealand economics are based largely on export trade in primary products and it will be generally admitted that the depression came to New Zealand through the heavy fall in those prices. New Zealand has undoubtedly suffered from a contraction in real purchasing-power in the sense that a larger quantity of wool, butter, &c., is now required to cover our overseas debt charges, and owing to the fact that prices of goods we sell abroad have fallen considerably more than prices of the goods we buy abroad we are now able to buy only half the quantity of imports we could buy in 1929. Those are basic factors generally admitted here ?—I should admit them at once.

Having regard to those facts, this contraction of real purchasing-power is undoubtedly a vital factor in our present troubles. Now, what I want to ask is—bearing all those facts in mind, that the whole key of the situation is based on them—in what way can this proposal of yours, or your larger proposal which you have not elaborated here, be applied in New Zealand to overcome that loss ?—The only real purchasing-power you have lost is in regard to the things which have not been produced which could have been produced, and those which are in the form of exports.

Assuming that we are producing to capacity in regard to primary production ; where we have lost is that we have to give away more pounds of butter, more bales of wool, to get the same quantity of goods, and so the real purchasing-power of our actual production has gone ?—It has gone by a great many other things than that.

Can this scheme or any other scheme for alteration in the monetary system in New Zealand overcome that defect ?—I can tell you how to get more purchasing-power ; put your pound up to the parity of sterling.

We would not be any better off then ?—Why ?

Is it not a fact that the question of the exchange is entirely an internal question ?—You would not suggest that the mathematical and exact rate of exchange is 25 per cent. below sterling. You would not suggest that the mathematically ascertained purchasing-power of your New Zealand pound is really 25 per cent. of the pound sterling. May I shorten it by saying that what you have really done is to put an export bounty on sterling prices.

Quite so, but that is quite apart from the question. What I am getting at is that in the London market where we go to exchange our goods on a barter basis we get less than we were previously getting, and that is a vital factor in our present troubles, and I cannot see how that can be overcome by any juggling of the monetary system in New Zealand ?—Well, I am perfectly certain that the first step to improve your position in New Zealand is to increase your general purchasing-power, so as to broaden your general basis of production. By increasing your general purchasing-power you will ultimately tend to create a demand in New Zealand for things which can be produced in New Zealand. In other words, new industries would be started.

You are talking now of our internal industries, but what I am speaking of is the loss which we have suffered through a slump in the London market ?—It is only a monetary loss.

It is a real loss, we are so many pairs of boots less ?—We can go on like that for ever.

The Chairman.] Taking the value of bank shares originally purchased at par, a buyer goes along and buys them at, say, £4. You propose to allow a rate of interest at 6 per cent., does that mean that the person who buys the shares at £4 has to be satisfied with less ?—That is quite definitely one of those questions which come within the range of policy; it is not a matter of technique at all, if you feel that there is a question of equity involved.

Personally I feel that something should be done in regard to a matter of that kind ?—Where any question of hardship comes in I should certainly regard it as a case for compassionate compensation.

Many people in New Zealand have bank shares because they are their all, and they know that they are a very safe investment, and if there is a loss to them you would say that provision should be made to meet cases of that sort ?—I should think it would be highly desirable, but it is a matter of no difficulty whatever.

It might be a very serious matter for the Bank of New Zealand shares in regard to the profits which you propose to use ?—I do not think it is a serious matter at all, if you will recognize that what is intended is simply to increase the available amount of purchasing-power in the country. If a man has a share which is alleged to be worth £4, it only means he has something which has a price value.

He has paid for it ?—He has parted with purchasing-power to the extent of £4. If the amount of purchasing-power is sufficient in the country you can use some of the additional purchasing-power that you have created to compensate him. That is a matter of policy. Presumably if any one buys shares, unless they are speculators, they buy them for the return they get from them, and therefore if you cut his interest down on what he paid for the shares from 15 per cent. to 6 per cent., if that is a practical difficulty there is no difficulty whatever in creating sufficient purchasing-power to make up the capital difference between the price that he paid for the shares and the price which they will now fetch on the market. I gave two or three other points in regard to the matter in from the point of view that his shares so far from being worth £4 might, in two years' time, be worth only £2. I may say quite frankly that the whole of my propositions every time are with a view to changing over to a new state of affairs without shock, and it is my opinion that in changes of this kind, the interests which oppose them, if they do oppose them, should realize that there should be a change, but so far as this specific case is concerned, I can very easily make a proposition by which you can compensate the owners of these shares.

Another question: Assuming that action was taken on the lines laid down in your suggestions to the Committee, might not the banks limit their credit to their customers ?—You suggest that the banks would penalize the public as the result of these proposals. Well, it has happened before, in several well-known financial crises, by those means.

Another point: Assuming that the banks are paying 3½ per cent. and they find all of a sudden that certain moneys are to be taken by way of reducing interest and overdrafts, &c.—— ?—Certain moneys ?

Certain profits of the bank are to be utilized by your suggestion here to-day by way of reduction of overdraft and also by way of reduction of interest. Taking the fixed deposits, is it not possible they might reduce the rate for the fixed deposits ?—They have done that in England now—you only get 1 per cent. on fixed deposit.

But they have not adopted this scheme ?—Well, that is all the worse.

One other question: In regard to the insurance companies, you propose to use their frozen assets in the way suggested. This country is subject to earthquakes (fortunately we have not had one this morning) and these assets are held by the insurance companies against probable loss. Suppose we had a big upheaval in New Zealand and the companies were called upon to find the money, and it had been distributed in these shares ?—The physical assets of the country are the only basis for the existence of any monetary values at all. Money is of no value apart from physical assets; if there are no physical assets left in New Zealand, there ought to be no money in the hands of the public.

The Chairman: On behalf of the Committee, I should like to thank Major Douglas for the time he has given us.

AUCKLAND, MONDAY, 19TH MARCH, 1934.

Witness: COLONEL S. J. E. CLOSEY, M.C., V.D., on behalf of Douglas Credit Association.

Proposals of the Douglas Credit Movement submitted by Colonel S. J. E. Closey.

Assumptions :—

1. The science of production throughout the world, and here in New Zealand, has excelled its plan and is capable of indefinite increase.

2. The location of supplies and demand are sufficiently widespread and interlocked to prove that the troubles of the world are not due to its peoples being divided into classes who have and others who have not, but instead that the nations have no workable medium of exchange which can enable each producing group to trade its products with other groups.

3. This breakdown of the monetary system is manifested within the boundaries of New Zealand, where destitution prevails amidst unlimited stores of the essentials related to the provision of food, clothing, and shelter.

4. The external trade of New Zealand is the consignment of pastoral and other products in exchange for goods not economically capable of production here.

The foreign exchange value of these products has not materially declined in relation to the value of goods we import, and the tremendous increase in quantity has more than offset our increased foreign debt commitments.

In view of these facts the position emerges that if we could here in New Zealand contrive a controlled money system we should be able to accomplish these tasks :—

(*a*) The provision for our people of every reasonable material need in regard to food, clothing, and shelter:

(*b*) The preservation of the savings of the provident by steadying the token of value, and the restoration of creative industry by assuring a return for competent labour:

(*c*) A system of foreign exchange whereby the copious products of New Zealand shall be traded in quality and quantity with the world's goods, and the resultant value shall be transplanted into New Zealand currency for the recompense of the producer.

Intention :—

There shall be established in New Zealand a national credit authority with the sole right of note-issue. This authority shall be selected and elected, and shall be given the task of issuing money and credit to such an extent that purchasing-power equates with production, that the value of the monetary unit shall be regulated in terms of commodities and services, and that the shocks of foreign exchange movements shall be met by monetary adjustments, so that the effects are distributed throughout the entire national organization.

The first task requires that there shall be distributed in this Dominion an increased amount of purchasing-power to pass into consumption the accumulated supplies and to employ the powers of replacement.

Experience having proved that raising wages merely adds to prices charged, and therefore does not expand purchasing-power, the Douglas method of using credits to effect sales by means of the price-regulating factor shall be adopted.

A calculation will be made of the amount of consumption goods awaiting sale, and also a calculation of purchasing-power available. With allowances of depreciation and appreciation of national assets there will be declared a certain sum which is the shortage of purchasing-power, and this sum will be set down as a fixed and limited amount to be drawn against as a national credit.

The accuracy of the calculations will ensure that deflation is checked and that inflation is guarded against.

Just Price :—

As a main method of expanding purchasing-power, certain essential commodities will be declared subject to discount at a rate disclosed by the price-regulating factor. If this is assumed to be one-third, then such goods and necessaries as bread, clothing, boots, meat, bedding, vegetables, rent, domestic electricity, railway fares, coal, gas, shall be subject to this discount, and the rebates so given will be reimbursed to the retailer by the national credit authority from the sum previously ascertained and stated.

A first claim upon the above credit will be for a payment to all unemployed, pending the provision of normal employment.

In addition, the exporting primary producer will be compensated for the difference in level between local prices and those of the overseas places of sales to the extent that his reward for labour and capital shall be relative to that obtaining in other occupations in the Dominion.

The Chairman: We thank you for having responded to the invitation from this Committee to the Douglas Association, asking that some one should appear, and, while we have no set statement from you, I understand that you are going to refer to matters that were referred to by Major Douglas. So we would be very pleased now if you will speak in any way as to a formal statement or otherwise, but we will just leave it open to you.

Colonel Closey: Mr. Chairman and gentleman, I might say that, in accepting your invitation, the matter was somewhat difficult, as the presentation of our case must be somewhat different to the

ones you have had presented to you by others. I would like to tell you that there is here in New Zealand what we call the "Douglas Credit Movement" that consists largely of students of monetary reform, who are adherents of certain criticisms of the present monetary system by Major Douglas, which has taken the form of organized groups of study, and throughout New Zealand they have been linked together in what we term the "Douglas Social Credit Movement." Until Major Douglas arrived there was not much intention of having a definite plan here for New Zealand. The point is that Major Douglas during the war years put forward a most striking analysis of what he termed the defects of the monetary system. Now, those defects have come to be accepted more or less by ordinary or orthodox economists, but more particularly they have been accepted by this organization, which is supporting him in his proposals here in New Zealand. We have for many months been broadening this circle of study, and we were awaiting the arrival of Major Douglas to make something of a detailed plan to put before New Zealand. The coincidence of this inquiry and Major Douglas's visit made it desirable that Major Douglas should appear before you, and we are indebted to you for the opportunity of having his instalment plan made the subject of consideration. When we received your invitation to be present we were in this position: we were just forming our national executive, giving ourselves the necessary machinery for the propagation of this plan, and we had to improvise more or less in order to get this necessary authority. However, it appears that possibly my evidence before you to-day might be of particular value in view of the fact that we are now crystallizing our ideas with regard to the plan for New Zealand. I would like to put it to you that we are not bent upon asserting a concrete line of action so much as pursuing a line of investigation. We are a group of students who have fixed, more or less definitely, to our own satisfaction, that the cause of this depression lies in the monetary system. We are pursuing a cure along the lines set out by Major Douglas, but we are not in the least doctrinaire reformers, and I appeal to this Committee that possibly your deliberations may assist us in the final aspects of the cure. Now that, I think, is necessary to set out, because I may disappoint you in the fact that I cannot here and now set out those exact details which I could if I came before you as an individual with responsibility for those details. The position is that the movement is growing rapidly. It is growing along certain definite lines. One is that we must secure the support and interest of the people. We regard this matter of credit and money control as being one for the people themselves. I might say that we have felt that way almost from the inception of the movement, and it would appear that in America, too, they are beginning to find that that is the way the monetary system must be reformed by the intelligent interest of the people, and I repeat, therefore, that probably from your Committee's findings we might get great help. We are developing, as I say, on two lines. One is to get the people interested. It is their policy. And, secondly, to keep technically correct. I think that will explain, possibly, some of the difficulties which people have had in connection with analysing the Douglas movement. We have begun from elementary principles and it is those elementary principles which are the basis of gaining public support. The position, therefore, I put to you, Mr. Chairman and gentlemen, is this: If we are right, then we will expect the utmost support from your Committee, and since it is claimed on our behalf that the Douglas proposals will not merely cure the depression, but will give us a prosperity such as perhaps not one in this room has ever dreamed of. On the other hand, if it is wrong, if there is some error in the Douglas analysis and therefore in the cure, then I say it will be the most heartbreaking disappointment, possibly, the radicals in New Zealand have ever known. It is spreading so rapidly that I appeal to you, if it is to be disproved, let it be disproved as soon as possible. We are now at the outset of a vast scheme of propagation and I would like, if there are any discoveries of error to be made, let it be before that scheme gets under way, and I look to the findings of this Committee to be of value to us. Now, another point which possibly you may find difficult to understand, or rather to fit in with previous schemes put before you, is that we not only have a mathematical formula and certain proposals for remedy, but what I would like to impress upon you is the ideology, to me the nearest word I can find, the ideology of the Douglas movement, and that ideology must be understood. It is the feeling of the people that their efforts to produce wealth instead of having met with the success that material achievement should result in, has brought about frustration. Now, that explains the great grip this movement has taken upon the people, the conception being widely spread through the people here in New Zealand and throughout the world, that mankind has, for the first time in the history of civilization, solved the problem of supplying his material wants, and they look to some manifestation of that in their own material well-being, and they cannot find it. Now, that has extended to New Zealand and our rank and file have certain elementary ideas which they feel should be the basis of a new monetary system. It can be expressed this way: They realize that here within New Zealand all the elements for food, clothing, and shelter exist in the greatest possible abundance. There is, too, technical equipment and workers who are pathetically eager to work. In spite of that, there is destitution amongst a great number of our people. Now, so much for what I might term the consumption goods aspect. They feel that New Zealand could, within its boundaries, relieve everybody from want in the material sense, and they look to some system of organization to make that possible through employment, and they are distressed and disappointed that no success is being achieved in that direction. To give a concrete point, one can say during the last year that hides throughout New Zealand have been practically unsaleable. Farmers have been burying the beasts on account of the few pence they get for the hide. There is a wastage, tanners are under employed, bootmakers are idle, and last winter ten thousand unemployed in Auckland proved to the inquiry officer of the Labour Department that they could not afford to have their boots mended. Now, the average person considers that there should be a means of curing that within the circle of our own domestic economy. They fail to see why people should go badly shod when all the elements of boot-manufacture are contained within the economy of New Zealand. Now, so much, as I say, for the commodity side. Now, as far as investment is concerned, fixed capital possessions, we know that here within New Zealand we have all

the elements, shall we say, for making concrete roads, the cement rock in unlimited quantities, the necessary transport State owned. We have here in Auckland five complete concrete roadmaking plants of the utmost modernity. Not one is working. Not one has worked for two years, and the men who formed the skilled staffs of those plants are on unemployed relief, chipping weeds that they know will grow with the next shower. It appears, from their point of view, that there is something lacking when all those ingredients forming the basis of an increment to our national wealth should remain unworkable and unused. It appears, therefore, that we have two avenues for creating wealth, that which we should consume and that which should go towards furnishing us with securities. Now, if that road became constructed the natural result we can see is expenditure of energy which to-day is being wasted. When that task is completed we will find that we have a particularly valuable asset. The draught cost on a concrete road is one-eleventh that upon the present country road. We see, therefore, that the real physical cost of production would be saved. We find that is in conflict with present congested markets. Now, I mention those two instances because that furnishes what one might term the spirit of the rank and file. They request or demand that in some means these factors should be utilized, that the consumption of goods should be made available for those who are destitute, and that the nation should profit by this acquirement of fixed capital wealth. Now, when they come to inquire the reason why these tasks are not put into operation, they find that local bodies and parliamentary organizations are thoroughly aware of the great benefits that would accrue, but the inevitable question arises, "We have no money. Where is the money to come from?" Now, from that question, they proceed to find out why it is that money is in short supply, and that leads them on to an analysis of the money system. Now, I might say that I followed the examination you have made here from time to time, and what has distressed me particularly has been the conflict of opinion or the conflict of evidence with regard to what we consider basic facts concerning the monetary position. We have assumed that the monetary system is generally regarded as being deficient, and we found that it is not generally admitted here in New Zealand. There have been numerous inquiries throughout the world. In some cases the results have been dramatic, and in many cases have brought about the downfall of Governments; and it appears to me that there is hardly one spot where one can find the monetary system upheld, and that is what gave an additional difficulty to this task of coming before you with a concrete plan. We are, in effect, to borrow Major Douglas's simile, called upon to produce a design for a bridge. We thought that we were more or less in agreement that a river did require bridging, but we find that point is in doubt or dispute. We are faced with the position that many people do not recognize there is a river there, and that, I say, makes it most difficult, because the Douglas plan, to be effective, involves a recognition that the monetary system is patently defective. Now, I might say that the evidence put before you must be very disturbing indeed. We have the bankers' evidence put forward trenchantly, that they are not aware of any defect. They have disclaimed responsibility for the present depression, and they have quoted authorities in support. Now, I might say that if we are to grasp the ideology of the Douglas movement, and if you are to assist us in your deliberations, you must recognize what our ideology is. Then, I say that it is bound up with this conception of whether the money machine is discharging the functions which we have a right to expect of it. At this stage possibly we might feel that our own authorities are somewhat suspect. I know we are regarded as being very radical, but still we find that modern monetary theory has implicated the banking system to a very great degree. Perhaps the most influential authority was the Macmillan report, and we claim, and I claim, that that report gives a strong sub-foundation to work upon in the Douglas proposals. To our astonishment the banking organizations have put forward that report as a justification for the fact or for their contention that this depression is not admittedly due to monetary causes, and a quotation was read from the Macmillan report which I wish to take exception to. They read one paragraph and omitted four vital words from the beginning, those words being "On the other hand." That particular reference they made in which the monetary system was more or less excused made it appear that that was the balanced finding of the Committee, whereas it was the left-hand of the proposal "on the other hand." There was a preceding paragraph, No. 207, which blamed the monetary system, and paragraph 208 was to show what could be said for the monetary system; and since that Committee was composed very largely of bankers it was only to be expected that they would qualify their criticism, but the final finding expressed in the succeeding paragraph, 209, was this: That the depression is due to the falling price-level, and that the falling price-level was due to the failure of the monetary system to do its job—failure of the monetary system to oppose those non-monetary factors—and the conclusion is that the depression is due to the monetary system being incapable of dealing with the situation—in other words, guilty, but due to ignorance. Now that, I think, is a good sub-foundation for our proposals that the monetary system is deficient. We find it, too, brought forward through the various writers. Probably there is no one to-day whose reputation stands higher in our Empire than Mr. Keynes, and he has trenchantly criticized the monetary system in his last work in 1933 dealing with the prospects of recovery. He again stresses the fact that this price-level can only be raised by monetary action, since monetary action causes depression. Now, we claim therefore that we are faced here in New Zealand with this collective opinion that there is a body here who contest that declaration that the monetary system is responsible for the depression. If that is not established, obviously a monetary cure will fail in its power, and, since the Douglas proposals are definitely monetary proposals, that is a point which we would like cleared up, and your pronouncement in that contentious area would be of very great value to the movement. In regard to the other authorities I might say that it has been suggested——

Mr. Clinkard.] Might I ask you to formulate that question definitely in writing so that we can consider it in its exactitude?—Yes, I would like to put forward that all educated areas of monetary thought admit that the depression is due to monetary causes.

Mr. Langstone.] Sir Josiah Stamp in giving evidence before the Macmillan Commission said so definitely?—Yes, but those three paragraphs are the key to the Macmillan report. Paragraph 207

gives all that can be said for the banking side. It appears to me that the voice is the voice of Keynes and the excuses are the excuses of Gregory, but the third paragraph is a definite statement that the depression is due to the failure of the monetary system to overcome the non-monetary causes. It appears to me that we have there a collective opinion of some weight, and that the disturbing factor has been that, while here in New Zealand we are dependent upon the banking institutions for assistance and co-operation, it is most distressing to find out that they are not conscious of any guilt in the matter. It would have gone much further had those banking authorities pronounced upon the opinion asked by this Committee as to whether or not they were pursuing and had pursued a price-level policy as against an exchange policy, which, you remember, was withheld for consultation. There, again, we have the distressing fact that we are not aware of future intentions. However, I might say that we wish to make that point and as a sub-foundation it is necessary for our movement to be advised on that point. We would value your pronouncement on that. I might say we have no more biting and incisive declaration than President Roosevelt's presidential address, Kitson in his book, and Lord D'Abernon. I might mention that there was some challenge that for each authority we could quote there could be an author quoted in the opposite direction. That we challenge, and we consider that if you refer to the variety and number of authorities summoned before the Macmillan Commission it will be regarded as the focusing of competent opinion upon that point. Now, there are some very pungent references made by Keynes, more particularly in his "Economic Consequences of Mr. Churchill." The first offered was right where one might say the depression was first launched in its terrible effect upon the financial world, and there is more to be gathered from that. There is the fact that monetary policy is capable of restoring the price-level if pursued. Now, the World Conference was thought to accomplish that, and to every one's despair and disappointment they did nothing. It would appear that we have to wait if world movements cannot be inaugurated. There is nothing to be done, but here, again, if we follow a policy of drift there may be even worse consequences in store for us. That is a point which I found disturbing in the evidence of the banking authorities. It was to the effect that things are on the upward grade—in other words, that if they pursued this policy of ghastly inactivity things would right themselves. I was very interested in that opinion, and I made a point of asking fairly high banking officials in Wellington if that represented the viewpoint of the banking world in New Zealand, and I heard that it is definitely so. I was surprised, because the latest pronouncement of the League of Nations Secretariat is that there is no sign of international recovery, and that I consider is necessary in formulating a monetary principle of having a long view and an authoritative view. It is quite true, as this report added, that certain nations have acquired from other nations a certain portion of their trade. Britain has robbed America of its car export; Belgium of its steel and glass; Germany of its shipping; but for the slight gain in certain areas there is a very terrible loss in other areas. Therefore, the point we make is this: That the monetary system is responsible for the depression, and therefore nothing but monetary action in a drastic shape will bring about a remedy. It will not cure itself automatically. That, I think, should embolden this Committee in pressing for some drastic action or some clear thought upon the topic which you are investigating; it is not merely a matter of allowing drift. The last pronouncement of Keynes in a letter to the *Times* was, I think, typically representative of his opinion. He says, "The mists are lifting and are displaying the gulf ahead to which we are drifting." So there, apparently, is Keynes's opinion, and that, I think, is his last pronouncement upon the topic. If that is so, it is encumbent upon this nation to investigate its monetary defect more closely, because I think it is becoming more urgent every month. That, then, is the basis of the Douglas movement, that our troubles are due to monetary causes; that if we are not careful the policy of drift will lead to greater possible failures. Now, in connection with that reference made during the hearing of evidence, that we can find authorities in conflict, there was reference made to the books of Mr. G. D. H. Cole. I might say that is a subject of great astonishment to find that quotation brought forward, because it is quite true that selections from Mr. Cole's writings can be brought against the Douglas proposals, but Mr. Cole is definitely of the opinion that nothing can save the present system.

Dr. Sutch.] The economic system: Cole is a Socialist?—Cole says, I am definitely for socialism. He says the present system with the profit basis cannot be carried on. Now, I might say that we are not opposed to Mr. Cole. We fear that if we are not successful we may have to accept his reasoning, but we are rather bewildered when a man professing to be a Socialist is yet a Communist and is used in support of the present system. The attitude of the Douglas people is that we are not inherently radical; we feel we are defending the present system in a degree; we feel that the present system with its individualism and its efficiency can be preserved if only the medium of exchange can be run on fair and workable lines. To that extent we consider we are defending the present system with such aspects of that system as we value. I say, further, that these contradictions that have been brought forward are really extracted from the economic left or taken from those people who consider we are not going far enough, and we feel that possibly they may be right, because we realize that apart altogether from our scheme there is the time element. We think that if we delay too long, unless some strong action is taken, we may indeed have to abandon our present system based upon profit; but we feel that, as a limited objective, we can make the present system work. The point has been raised that these references and these authorities are possibly of no value. I thought they were not necessary. I thought this Committee, constituted for the special purpose of discussing monetary matters, would have been in that frame of mind and of that opinion that very drastic alterations were needed, and I want to stress these to show, as I have said, what is the ideology behind the Douglas movement, and to grasp that and to understand exactly what we are striving for and perhaps be sympathetic with our enthusiasm and zeal one has to understand the various stages which are building up our movement. That point, I say, we would appreciate a ruling upon considerably. Now, the second is: If it is proved inefficient, the monetary system, wherein has it failed? Here again, I think we find a certain sympathy or certain focusing of opinion on those writers who belong to the radical school. It appears there is a

deficiency of purchasing-power. I realize this is a point upon which you possibly cannot quote authorities, and one has only to go back a few years to find authorities whose point of view has changed very materially; but, at the same time, I think it can be said that at the present time those who are keenest on reform have admitted that there is a deficiency of purchasing-power in the hands of the people. Now, that is a point upon which quite a controversy rages, more upon the definition than the principle. What forms purchasing-power? Our banking authorities before this Committee contended that the credit powers they possessed could be issued as purchasing-power. It is quite true possibly that a selected few in our community could receive credit and purchase all the food, goods, and clothing that New Zealand has to sell; but that, I think, would be a distortion of the real definition of purchasing-power. Purchasing-power is the ability to buy in the possession of those who wish to buy, who need to buy; and that definition must, I think, be clearly adhered to. Now it is recognized, I think, by those people who are suffering from deficiency of purchasing-power and it is of very great interest to the Douglas supporters in New Zealand that in America we have our ideas developing stage by stage and we are often called upon at times to predict the next turn those reforms will take. One sees that the latest development is that purchasing-power is not being released in sufficient quantities, and that at the present time there is a scheme being operated whereby wages will be increased, employment will be multiplied, in order that necessary purchasing can be generated. If I may express the thing broadly, the Roosevelt plan is a mixture between the New Zealand Seddon plan and Douglas and the Seddon aspect is becoming less and less manifest as months go by. That is a striking aspect, which we like to raise, that wages do not distribute purchasing-power in regard to things being bought. Wages have to be recovered in costs and as we know the housewife who receives an increase in wages, going out to buy, finds out that the cost of the things to be bought has increased and she can buy no more than previously. That discovery has been made in America as here in New Zealand. We claim, therefore, that the purchasing-power must be increased in the aggregate and, referring again to references, Cole has dealt with some on the Roosevelt lines. He has recommended increased expansion of credit for projecting new industries—in fact, all those things which have been put forward to you at such great length this last few weeks and many other schemes which your yourselves have been considering in parliamentary process—that is, putting in hand some project to restore unemployed workers to their jobs. Here we find Cole stating that the credit policy is only the accompaniment or should be the accompaniment of a policy of increasing demand for goods. The volume of credit should be sufficient to employ all our resources and, further, it must be added to in order that extra production can be dealt with. As we follow those lines along it will narrow down to the various methods whereby there can be purchasing-power issued which will not be purely an addition to prices. I might say that you have had before you many schemes, and I think the answer or the frustration of each one will be: Where will the money come from; and here again we come to the foundation portion of the Douglas proposals. How and by whom is money issued. I am afraid that this topic may, by now, be somewhat wearying to members of the Committee, and while I feel that it has not been definitely settled and that we are to take that aspect as being disturbing—the fact that our banking authorities do not recognize these principles—then I think we must make it again one of the points which go to the support of the Douglas movement. We definitely declare that money, as we know it, is created by the banks. We refer to and quote those authorities which you have heard so many times before: the declaration of the Chairman of the Midland Bank and various others, and the odd thing is that that was controverted by the banking authorities. They said, in effect, that he had been misrepresented and that there was a qualification, that qualification being that banks are not limited purely by their own credit-creating instincts. It is suggested there is some automatic regulation. They quote authorities in support. Now, the point is that those authorities they quoted were not in contradiction; they were merely in explanation—for example, we do not contend that one individual bank can create credit without restriction. I think that is set forth most clearly by Keynes in his "Treatise on Money." He says that so long as banks advance step by step there is no limit to the amount of credit they can create. That is in a closed economy. Further on he points out that each bank-manager sitting in his parlour watches his cash resources, watches his deposits, and imagines that he is dealing with outside forces, whereas what he is dealing with is merely a series of decisions made by other bank-managers sitting in other bank parlours. What we have said is that our argument with regard to the banking system is not intended to apply to an individual bank. They have said, If it is true that banks can create credit, how can banks fail? The point is that banks, if they get out of step, can be called upon to honour their obligations by other banks, and can fail. The declaration we make is that the banking system operating can carry on steadily manufacturing money and, as Keynes says in his chapter on remedies, "the bankers who look to their reserves are looking to the effect of their lending, instead of the foundation." It is the effects they are concerned with. I will make the point, therefore, that we consider that is the correct answer to that challenge. When we put forward our schemes for advancement, you will find that the answer comes back, "Where is the money to come from?" Our answer is, "Where money comes from now." Then, instead of having merely an elaborate system of control upon certain resources, the nation will be called upon to arrange those resources itself. Now, I am not quite sure how far that point is accepted by members of this Committee. I feel, and I think with reason, that the great majority of this Committee have accepted it, that, with certain minor reservations, there is practically no limit to the amount of money the banks can create.

Mr. Clinkard.] Do you agree with the Central Banking proposal?—Well, the Central Bank, I think, is a move in the direction of more efficient banking, but, unfortunately, it is one step in the right direction and possibly five steps in a direction wherein great danger lies. That, I think, will be determined more or less by the influence which this Committee possibly can exert upon Parliament's monetary education. However, this point, as I say, is one upon which some doubt exists as to

whether or not it is accepted. It has been put to me by various observers of the work of this Committee that possibly you would accept them, providing certain obligations in the price-level are observed, that the banks could be released from this clumsy restriction upon credit, and base it upon something more technical. Now, this is the implication there. If I can get that admission, if this Committee can admit that the banks do create credit, and that they have merely responsibilities to one another and possibly to the nation in the direction of preserving the price-level, I would not require anything more to justify the Douglas proposal, because it is a curious thing that that aspect of banking has not yet been woven into monetary theory. When this is worked into the banking structure it will disclose that Douglas is right. However, that will be more difficult for me to prove than to bring along these plans which I am putting before you to-day. I would say that if that could be universally recognized, that this creation of money is an issue of representative money being built entirely upon an internal credit structure, that, carried back through the various definitions of monetary theory, will prove Douglas to be right. I might say that events have largely supported me. There is probably no more graphic picture drawn than that book "Christianity in the Crisis," which has brought the whole of the Churches in Auckland to our support, in which the Dean of Canterbury, who has attended Douglas lectures first in the capacity of a critic, has written, "Those who heard Douglas lecture in the early days have seen how entirely correct he has proved in all his predictions, and must admit that he has stumbled upon something which hitherto had been missed." That is a wonderful book, and one that has brought the whole of the Churches in Auckland to our support. Now, apart from that, if we can establish this theoretical basis of money, Douglas will have been proved to be correct in his analysis, because if you can create money, and you are seeking for a basis, you will discover this: That that source from which money is created will ultimately own the whole of civilization, if they are allowed to go on creating money. However, as I say, that is a more difficult point to establish than making a particular statement of the plan we propose to put forward. I will just say at this stage that we must build upon that, assuming that the banks can and do create credit, that they are limited only by certain obligations to one another, to their Central Bank, and should be related to the stability of the price-level. Now, if we have that basis, we then find out that we are not linked to a certain rare yellow metal in the amount of money that is available. To my mind, history will be very severe upon this generation, not merely on the economists nor yet upon our Parliamentarians, but I think upon the average people who believe that we are dependent for the abundance of our living upon a certain metal which is dug out of the ground in one part of the globe and put back into another hole in another part of the globe with a bank on top of it. And to say that because that is the basis of our currency in New Zealand we should have children suffering from malnutrition, we should have people going ill-shod, and we should have a young pioneering nation putting its young men to work in purely wasteful occupations—that I think will be the pronouncement that history will have upon this generation. It appears to me of very great importance that we must establish that principle of where this money originated, and what should be the basis of its relative creation and control. We claim that it should be issued in relation to production and consumption. Now, that has excited an amount of criticism of a most hostile nature from those economists who oppose us. I make no apology for quoting Keynes, because it is quite possible that the Keynes plan, or some variations of it, may be a future Imperial project put before the Dominions. Now, he said in his "Treatise on Money" that, except with regard to the bringing into relationship of the power of production and the power of consumption, nothing in world economics has any significance. From a man in his position, I think we could not expect stronger words. When, therefore, we find the Douglas movement consisting of a great number of the population who want to bring into relationship the power of production and the power of consumption, we see that we have expressed in our own way exactly what Keynes said. He said that nothing in world economics has any significance, except the relation of these two factors, and yet we have been criticized most offensively by economists who have pretended to be readers and admirers of Keynes because we demand that money should be so created and so regulated as to bring into relationship consumption and production. Now, that might be said to be the beginning and the end of the Douglas theory.

Mr. Clinkard: Is money the only factor?—Well, there are two factors, production and consumption. Money is the link, the relationship between these two. It is not a factor. I might say that possibly the greatest trouble we have in discussing monetary matters is the loose use of definitions. Money is a commodity; it is a factor; it is a lubricant; and so on. I have a preference for that particular word used by Dr. Walter Leaf in describing money as a lubricant. I think it is probably the nearest definition we can get, and coming from one of our opponents, a man who is mentioned by Keynes as being the most conservative and practical of bankers, it should be regarded as not exactly a support, but a willingness to be fair. He declares that credit and money is a lubricant. If so, it is not a factor. The factors are, as Keynes says, production and consumption. Money is the lubricant which brings these two into proper relationship. Now, then, if I may carry on that point, that matter of the definition of money being a factor, I should like to make use of Dr. Walter Leaf's simile of it being a lubricant, and so it is. The Douglas proposal is to ensure that that lubricant will be always present where needed in exactly the right quantity. We could say, perhaps, taking Leaf's analogy further, that the Douglas proposals would be like the oil-gauge on a motor-car, which shows by an indicator the pressure of oil. We would like to have such a system here in New Zealand, which would tell us what our pressure is, so that at all times the different factors of production and consumption will move easily and smoothly. If we can evolve such a formula, I believe that all the extravagant claims which have been made for our system—I say extravagant because no doubt they are regarded so—I say that the most extravagant claims will be found not to have been too strongly worded, if we can evolve that issue of the correct lubricant. However, that is by way of stating that it is the use of these inaccurate words and faulty analogies which are responsible, I think, for a great deal of the ill-feeling which exists among monetary reformers and

those who disagree with them, and I just mention in passing that we do not regard money as a factor in that particular sense. Now, one of the favourite expressions of the Douglas movement is that given expression to by the Governor of N.S.W., who said that the task of bringing consumption and production into proper relationship was a difficult, but not an impossible, task, and coming from one who is not by any means a radical (one might possibly say the reverse) it means a good deal. He has said that we have got to evolve a new economy—an economy of abundance—to replace the old economy—the evil economy of scarcity. I might say at this stage that I have been surprised by some expressions of opinion that the old system is carrying along quite satisfactorily. I remember reading an address made by a prominent financial authority here in New Zealand, a Minister of Finance, addressing the students at a college in the South Island, who said to them that the world had the choice of two ways: One was the old way, one was the new; and I was surprised to find out later on that there exists in high quarters a belief that the old way is good enough. I might say that it is a subject of some distress to me to find out that there is a belief that we can idle along in this way and avoid catastrophe. If it is so, I think it is contravention of all those who are educated in a monetary sense, for the old system will not carry on. There is that terrible pronouncement made by one of the leading economists that production is increasing as the square of time, that the use of the machine is increasing as the cube of the increment of time, and debt is increasing at the rate of the fourth dimension of the increment of time. If those figures are incorrect, it appears that however much we can regard that as being picturesque and not accurate, at least it must bring us to this: That we cannot possibly wander along the old paths, otherwise disaster will overtake us. Now this, by the way, was more or less to explain the underlying enthusiasm for our movement which is held by ever expanding numbers, who adhere to it. I said that the monetary system seemed to exhibit this particular failing. There is not sufficient purchasing-power being distributed. Now that, curiously enough, has been discussed by many authorities. Keynes has suggested that in England the cure might take the form of vast reclamation work in the slums of London. The Thames in London is to be made beautiful, and new money is to be created for this purpose. Roosevelt, too, has adopted similar measures, but I would like to point out what has been overlooked, I think, that in the closing stages of the Hoover regime that plan had been carried to its limits. The teachings of Foster and Catchings, who very closely resemble Douglas, have been carried out with great enthusiasm, but it has failed to produce the result. I mention that because many look to us as being the radical leaders in Bolshevik doctrines. We are being followed, or at least we are being imitated on parliamentary lines, in many countries in the world to-day, and one of the most encouraging facts is that we have contemporary experiments being conducted throughout the world which keep us from time to time corrected as far as our ideas are concerned. Mexico, Japan, Sweden, America—they are all carrying out somewhat along our lines this move of introducing purchasing-power. They certainly did not realize perhaps the inherent defect that they are pursuing lines which we would regard as being very different from the point of view of an instalment. One of the most dramatic cures was, I think, put forward by Professor Bellerby, who is one of the witnesses called before the Macmillan Commission. His idea was that money should be distributed to the professional spendthrifts. Now, that point was reproduced throughout our cable news as being somewhat of a joke, but the point he was establishing was that money to be issued must not appear through production. It must be used to consume things, to buy, otherwise it would not be an addition to the purchasing-power. That, I think, has a strong bearing upon the evidence put forward by the banking authorities. The banking authorities said that if any man comes along with a good proposition, offering sufficient security and giving proof that it will be repayable as and when demanded, they have any amount of credit. That is a continuation of the statement made two years ago by the Chairman of the Bank of New Zealand, who said that they could advance money to any degree, providing the security was sound and stable. I think an addition to that is: That if they do not begin to issue credit soon, there will be nothing sound and stable in New Zealand to issue upon, if it goes on much longer. Now, that being so, it would appear that there must be some other means devised to issue purchasing-power without going through the ordinary channels. There have been a number of schemes put forward, and if we examine them we find they in some respects resemble the Douglas proposals very strongly. If we examine the controversy which rages throughout New Zealand against the Douglas proposals, we find that the points which are contested are those which have been more or less conceded in the older countries for a number of years. I might say that an historic debate was carried on in Birmingham between Douglas and R. G. Hawtrey (an authority who, I think, must command the respect of every one concerned in monetary matters) and he began by conceding certain points in order to bring the debate to a point clearly at issue. He said he would admit first of all, to save time, that the banks can and do create credit, consequently that the trouble was a deficiency of purchasing-power; and the whole of that debate concentrated on this: "Is this deficiency of purchasing-power the result of an inherent defect in the system?" That was the only point at issue between R. G. Hawtrey and Major Douglas. That was the debate carried on in July of last year, and the point I would like to commend to you is this: That if you accept Hawtrey as being an authority, one who has opposed Major Douglas repeatedly on the platform, you find that the point at issue between them, the stage at which Hawtrey refuses to accompany Douglas, is whether or not this deficiency of purchasing-power is due to an inherent defect. Now, it appears to me that if we accept that debate as being the battle-ground of the Douglas doctrine, I shall be prepared to say, "We will concede that possibly Hawtrey is right, and this deficiency of purchasing-power is only temporary. Let us, therefore, adopt the Douglas proposals for one year. At the end of a year we will have a recasting, and see if this deficiency of purchasing-power is inherent or whether it has been cured." That I think would place Hawtrey among our followers. We are prepared to admit those safeguards that

Hawtrey insists on, that Sir Basil Blackett insists on—that is, the stable behaviour of the price-level. We would recognize those safeguards, because we feel so confident they are not needed. However, as I say, personally I would concede all those safeguards if you would say, "Let us then try this injection of purchasing-power for a certain period." There was another debate, one which was broadcast by the B.B.C., between Professor Robertson and Major Douglas. Here again we find that all the economists who write here in New Zealand are opposing points which Robertson admitted. His declaration was, "I am prepared to agree with Major Douglas that in times of depression such as the present the nation or the Government should issue money free of cost to the people." He added this proviso, which in fairness I must add, that in times of prosperity he would recover it by taxation. There again, I would say we will admit that feature. Unfortunately, because we are advocating Douglas Credit in a period of chronic deflation, we are charged with being inflationists. If we were inflationists, it would be because our calculations were wrong. In times of inflation we would be exponents of deflation, because we want to have exactly the right amount of money available. We do not want an excess of purchasing-power over the amount of commodities. In that connection, I say that we adhere strongly and definitely to the definition of Professor Gustav Cassell—that the ratio that must be striven for is the ratio between the flow of purchasing-power and the flow of commodities coming on to the market. That is what Douglas Credit wishes to achieve. I might at this stage refer to what I said about the contention put before you as to where money originates. If we could achieve that objective of Professor Cassell, and that ratio between the flow of purchasing-power and the flow of commodities coming on to the market, if we found that there was an independent flow which enabled it to carry on, what would happen when that flow reverses? We would recognize that apparently there is a deduction, and that is where the contentious point comes into the Douglas doctrine—where that money is going to. I say that if we admit at the outset that money is created by the banks on loan, if that flow of purchasing-power is purely on hire, what will happen when it is returned to the hirer? It is a curious thing that economists a hundred years ago saw this position much more clearly than the economists of the present day. I think that in defence of modern economists we might say this: That the banking system has become so complex that they have lost sight of those safeguards which a hundred years ago they saw were necessary. One would say, judging by the current opinion, that it is only these last few years, probably since the declaration of Reginald McKenna in his "Post-War Banking," which, of course, is a reproduction of his report to his bank shareholders, that this definition or this claim that money is created by the banks had its origin at that time; but to those who are interested in finding out where we went wrong, I would recommend Professor Sidgwick, who wrote in 1886, and stated that this belief that the money in the bank represents the savings of the community is merely a convenient fiction. Now, we say that that convenient fiction has been allowed to carry on, and it has resulted in this anguish and loss throughout the world, because we were not aware of where our money was coming from. That is to show how, through the various stages, we would revert to that first contention, that money is the banks' creation and it fulfils a very necessary purpose. We admit that industry could not have carried on without it. The catastrophe is when that money is recalled. That, of course, is related to the cause of the depression. One of the things which has baffled every economist is explaining why this depression should have been so wide, so general, and so deep. They have imagined that it was purely an ordinary depression, and it appears to me that there is one economist who has not been given sufficient credit. That is Professor Gustav Cassell, who has challenged the accepted theory of how these cycles of trade movement occur. We have been told, and our economists preach this regularly, that there is a constant round, a period of expansion, a period of excitement, a period of prosperity, and then collapse. They have given certain technical reasons why that happens. We will perhaps excuse some of the economists who ascribed it to sunspots, influences of the moon, and so on. After all, it was so demoralizing that they were compelled to seek some other explanation. Cassell has pointed out that all these conceptions are wrong. If the idea of man gradually recovering confidence, of the dislocation between capital goods and consumption goods is correct, the curve of that cycle would be a gradual rising to a point of prosperity and a more gradual sinking down again to a period of depression; and he has challenged economists, and that challenge has not been accepted. He himself has brought forward a most complex explanation of why it occurs. Here is where the Douglas proposal comes as a relief. The Douglas proposal of the shortage of purchasing-power being made up by means of a bank loan explains why that curve decreases, that they are wrong that we have a period of employment, that there is a period of movement, a gradual rising to a period of prosperity, a period of boom, as they call it, and then a sudden collapse. The key to it lies in the Douglas analysis, that this purchasing-power comes from the bank. It comes out on hire. So long as it is out among the people circulating from hand to hand we carry on. Immediately the banks begin to withdraw that medium of exchange upon hire, there comes a complete catastrophe. It is only with very great difficulty that one can follow Cassell's explanation. The gap in that explanation is filled by the Douglas analysis. I just mention that point to show that this deficiency of purchasing-power is not so doubtful a factor as many people think. To those who have been bewildered by the fact that these prophecies in connection with the depression have been wrong, there is this consolation that in not one connection has the Douglas prediction turned out contrary to events. On the other hand, it is difficult indeed to find any economist who has not proved to be wrong, and I say that the co-ordination of these mistakes results in something valuable on these lines. Either the Douglas analysis is right that there is this deficiency between the power of production and the power of consumption, or else there is some other principle that is working in exactly the same way and which economists have not yet discovered. I point that out because we are brought into collision from time to time with the orthodox economists who challenge us that we have not in our ranks any professional economists.

I say that there is a reason for that. I have often discussed it with them, and their explanation, or their excuse, has been that we use our economists merely as instructors. They have neither the time nor the facilities for investigation, and they are faced with this problem: That if they expound anything which varies from orthodox practice they are involved in their occupation. I think there is a great deal to be said for that. I believe that possibly that explains why we have not got more support. We use them entirely as instructors and——

Dr. Sutch.] Are you speaking only of New Zealand economists?—Yes.

Not world economists?—Practically the same, but not in the same degree.

There are many world economists who do not do any instructing, but spend their time in thinking?—On the other hand, they still have obligations to their system.

Have Cole and Dobb an obligation to the system?—Yes. They have very strong obligations. If, for example, Cole had expressed in plain language what he has expressed in respectable language here in New Zealand, he would have been put in gaol. He has said that the one thing he wishes to guard against is half measures. Now, to that extent, I can say he is not a Socialist. We know that the Socialist is an evolutionary person. He believes that through controlling action we can accomplish certain rights.

Does he? Why not leave it to the Socialist to define what he is?—My point is this: That I am saying I know the Socialist point of view, and I know the Communist point of view. It is, of course, possible to allow a man to attach his own label; but I consider that as individuals we have no right to regard those labels. I say that we have men in gaol in New Zealand for having said in plain language what Cole has written in the concluding stages of one of his books, that we must press onward with every faculty, with no half measures, and no consenting to adjust the present system. The point is this: If you press onward, not regarding the present system, you will meet with resistance. And what form will that resistance take? If you are to overcome that resistance, what means will you adopt? I say this: You have put men in gaol in New Zealand for saying that in plain language, and therefore I say that the economist has an obligation to the social system. At least, it prevents his saying definitely what he would have said had he not had that obligation. I quite admit it does not apply quite so much to world economists as it does here in New Zealand, but here in New Zealand it does definitely exist.

You are making a very serious reflection on New Zealand economists?—I do not think so. If you will listen carefully, you will find that I am defending, or, at least, excusing the New Zealand economist. We are using them as teachers, as instructors, and if we ask them to pronounce upon some opinion which conflicts with those principles which they teach, which they themselves have been taught, and which they examine upon, then we are asking them to do something in the way of mental gymnastics, which perhaps is unfair. To me, asking professional economists in New Zealand what they think of the Douglas Credit is like asking a bus-driver what he thinks of the electric railway; or, more particularly, asking a barber what he thinks of the safety razor. If he pronounces an opinion favourable to this new idea, he attacks those very qualifications which enable him to earn a living; and apart altogether from the embarrassment, it seems to me a recognized thing, possibly more in New Zealand than outside, but certainly more in Australia, that there is no surer way to fame and economic security than writing a book attacking Douglas Credit. That is not a criticism of the economists so much as pointing out the difficulties of their position. There is at the present time an incident here in Auckland in regard to a Committee very much like this one which does show clearly the difficulties under which professional economists work. Probably this is understood by members of this Committee. Now, under those circumstances, I say that we must excuse the economists for having to stick loyally to the old system, and they are indeed putting up a gallant and astute battle to defend that system.

In the last example you quote, of this incident in Auckland, you have a professor who is prepared to investigate the present system, and how it is working, and certain interests are trying to stop him, but he is going ahead with his investigations?—Yes, and that is the point I wanted to raise. One can picture that man's embarrassment at having the results of his technical and professional services being brought against him in a personal investigation. It shows the difficulties, as I say, under which an economist works. However, I may say that, if I am to be resisted in my defence of these economists, that I have no affection for them. I think that really they are the most blameworthy of all sections of our community. I say this: That the banking system is limited by its instructions. The banker has done his best with his system which works for the shareholders. If you will look through that prospectus sent by the bankers, it is pointed out that no banking official dare do anything inimical to the interests of his shareholders, which I think is fair. As far as Parliamentarians are concerned, this is not their job; it is a job for specialists, and they have an excuse in the contradictory views expressed by various economists.

We do not ask for excuses?—It appears to me that of all sections of the community who will find it most difficult to defend themselves, the economists will be in the forefront. It seems to me that the justification for their identity, for their occupation, is advising the community that these economic movements are against national welfare. I say it should not be necessary for the people to open these books to investigate these proposals when we have economists who should have been doing it. Perhaps it might be said in their defence that they were too busily engaged. Now, that is just by way of setting out where we stand with regard to our investigations. It does explain why there is such sharp antagonism between the Douglas movement and the professional economists. We feel that we are not treated as we should be. We have been like children, led across the seas by a gang of incompetent desperadoes; we are now grown up, and we are now turning upon these desperadoes, and will not be led by them. My argument is that an economist should be a skilled man. I say that our task here in New Zealand has been to prove to the people what those economists in the world have said. That

has been brought forward not voluntarily—It is just to say what might later on be brought up. We feel that we are not being given the support which we should be by that particular section of the professional world, who should help us. We might perhaps use this simile: We are in the position of a householder who has had the plumber working for him for weeks, and when finally he leaves us we find that he has not done his job properly. He says that we are not competent to criticize, and we say to the plumber; that in the drawing-room our gas-taps are spouting water; in the bath-room our taps are on fire. Do you say that the system is right? Do you say that you have screwed up our taps correctly? I believe we are justified in saying that this particular tradesman or this particular professional man has not done his job. I just mention that to give some explanation of why we appear to be so aggressive in our criticism, and why we are not at this stage particularly easy of government by those in authority in the economic world. However, I have made full use of economists, and I will say this: That if one were to traverse the whole of the reports of recent authorities, we would find that they are trying to help us in the right direction, but unfortunately many years too late. That is our particular grievance: That they are too late. Now, the point which I made was that there is a deficiency in purchasing-power. I have said that out object is, in the words of Professor Gustav Cassell, to secure this co-relation between the flow of purchasing-power and the flow of goods coming on to the market. It seems curious that while we are charged with the utmost radicalism, bolshevism, we are reverting to orthodox economists who widely claim that in their investigations they have unearthed what you might term the grand principles of economics, but unfortunately they are so distorted by the misuse that many parts have been put to. At this stage one might state I have set forward something which you might refer to as the ideology of the Douglas movement, and what I hope is this: That it will be a means of enlisting your sympathy with the Douglas movement, and if you take it in the stages we have gone, I will say that we will accept your findings upon these points we have put forward. That is the basis for the great, nation-wide, world-wide movement which is represented in this Douglas Social Credit Movement here in New Zealand. You might say, then, how do we propose to implement this ideology? I will set out what is the tentative plan for New Zealand, to what extent we intend to traverse the present system. In the first place we have advocated that this injury, this great frustration of the nation's will, has arisen from the fact that the people have lost control of their money system. We feel that had this dislocation been traced back to Parliament alone we would have been sympathetic; we would have realized the great distortions that have taken place in the war years, and we would have been prepared to allow some large amount of shortcoming if it were done by the people's representatives. Now, that does not exist at the present time, and I think I can find the majority of economists supporting me when I say that there must be some measure of independent control for the money system apart from profit-making. In the Macmillan Report there is an addendum by Messrs. Allen and Bevin which I think is very valuable, and they have expressed very strongly what appears to be indicated somewhat in the main report, that is, that the control of money must be placed outside the group of people who are interested. On that main point I would like to make this very clear: We have no effective, no great objection to shareholders' profits. I may say that has often been brought into the front of the stage more than we would desire. If the money system had been handled efficiently, I think that the community generally would have allowed a rake-off to those who administer. Our complaint is more that it does not run efficiently than that those who handle it have taken an excess profit. We consider than an organization should be set up: We call it the "National Credit Authority." We suggest that that should be selected and elected. Here again your suggestions on this point might be of value. A tentative outline might be that this power or authority would be constituted of representatives of Parliament, trade-unions, the chamber of commerce, the universities, and so on. The point is that the sanctity of money is as much the concern of the poorest member of the community as the wealthiest, or more so. We consider that the charwoman who receives a few shillings a week is more concerned with the purchasing-power of that money than the man with vast deposits, because it purchases more of the good things of life. It affects her happiness more, and we consider that this national credit authority should not be, as put forward so offensively by our banking experts here, representative of all classes but the improvident. We consider possibly the improvident or unfortunate might too have a share in the control of the monetary system, particularly with regard to the stability and purchasing-power of that community. This national credit authority would be selected and elected upon those lines and would be given control of the money system. I remember that, when that point was deliberated at great length here before you, there appeared to be a confusion of opinion that we could have either parliamentary control or a private company, and I was surprised to find that those two were regarded as the only alternatives. That is not so. One does not need to bring in a private working institution as a direct alternative to parliamentary committees. We have many institutions which fulfil all the requirements which we would desire of this credit authority. We suggest our Supreme Court Bench, for example. That is not a profit-making concern nor subject to political interference, but possibly a better simile would be the Institute of France.

Mr. Langstone.] But they cannot create laws in the Supreme Court?—No; but this national credit authority make laws.

Yes; but they create money as the Supreme Court administers justice in accordance with the laws laid down by Parliament?—This would accomplish our objective of the people's representatives setting out a policy to be adopted for the national credit authority to administer. There is one rather ironical distinction made in various financial publications—the differentiation between the words political and parliamentary. Sir Otto Neimeyer in his report, when calling for £1,000,000, said that was parliamentary help, but he is very keen to prevent any political interference and seems to me to follow very much the lines of chamber of commerce remits: when they are asking for something for themselves it is parliamentary assistance, and when it is for some one else it is political

interference. Parliament must control the money system. Here is the point: It has been said that you cannot trust Parliament with handling its money system. A most amusing declaration was made by our Workers' Educational Association in its organized attack upon Douglas Credit. It reviews our plan and says, "Yes, very plausible, very attractive; but history has shown that the people are not able to control their money system." From the Workers' Educational Association which is striving to prove that the workers can not only control their material lives but also their ethical and cultural lives: It says the people cannot control their money system. Parliament can make war and can make peace; it can send our own men away to be killed and can alter our contractual relationships as it has done in the Mortgagors Relief Act. It can affect our property, and can do everything therewith, and we are willing to acknowledge it, and if there is any common notion throughout the world to-day, it is this: That human effort must be brought more or less under the control of parliamentary influence. It would appear therefore that the control of our monetary system lies apart from all other human activities. I may say therefore that that is a challenge, if not an insult, to our parliamentary organizations, and we declare on behalf of Parliament that no other organization must control our monetary policy. If we can accomplish that, I would say we would put up with our shortcomings with more resignation, if we felt it was being done to the very best of our representatives' ability. We say that there must be set up an authority, and, having set up that authority, there must be a law given to it by Parliament. I can think of nothing better than that declaration of Professor Cassell that co-ordination of flow of purchasing-power with the flow of consumption goods coming on the market. It is an amusing thing how we are attacked for giving that definition. The particular wording we are fond of, and one which I think originated with Major Douglas is the equation of production and consumption, and it is curious that we should have been condemned so savagely, because, as I have shown you, all authorities have put forward that same ideal though not in the same words. The commonest expression is a stable price-level, which is the proof that equation has been accomplished, and to those people who follow Fisher, Soddy, or other schemes we would say: Very well, let us adopt the Douglas proposals and we will accept your safeguard of a stable price-level. We are as much opposed to inflation as deflation, but unfortunately our present task is to attack deflation, and when we find ourselves being frustrated by people who say to you, as the Workers' Educational Association says, Yes, you will oppose this process of deflation and go hurtling into inflation. We say that is unfair. It is as if we have here, say, a man suffering from a heart attack. We recommend a dose of brandy, the correct medical application. They say, Yes, it will cure this man of his heart attack and probably later on he will become addicted to drink, will become a drunkard, and for that reason we cannot give him brandy. Can we not recall the flow of money in such a way as to produce this equation? That must be in our plan, the establishment of a national credit authority and the implement of this would be the passing of a policy that can be expressed in many ways, but we suggest our own way is satisfactory, an equation of production and consumption, which I claim has the true authoritative support of the economist who understands his job. Now, then, this question arises: How can that be done? Here is where we must leave the reasoning of those orthodox economists. I may say some years ago it was indeed difficult to convince people that the Douglas proposals were the most promising way. One would imagine a public-works plan. You have had some attractive proposals put before you in the course of your investigations. There are many more attractive proposals put forward in Germany, in the United States; most attractive of all, in Mexico, where, by carrying out a policy of public works, you can distribute wages. These expended upon fixed capital investment will provide the necessary purchasing-power to buy consumption goods. Translating that into a national affair, we might say if we were to carry on with the construction of concrete roads, if we were to carry on with the construction of overhead bridges to avoid that monthly toll of life which takes place on our level crossings, it would indeed be a cure. We would set our men and women to work on various tasks. We would have construction works, these overhead bridges at the level crossings, these concrete roads, these one hundred and thirty bridges declared to be unsafe in the Auckland Province. All these things would have been done, and the wages so distributed would give us the purchasing-power to buy the goods, fuel, clothing, and food which our unemployed are so much in need of. Do you remember that when the United Party came into power they tried that in railway construction, and that was in a limited manner the Roosevelt plan, but it did not result in that gain and left us with a terrific burden of debt. We can express it here again in local terms, and we can see it operating in the Douglas proposals. While we were completing the Auckland Railway-station, the Arapuni Hydro-electric works, and the East Coast Railway, those wages enabled the Queen Street shopkeeper to pay his rent, and it is suggested that in order to enable the Queen Street shopkeeper to again pay his rent we must build another railway-station, another Arapuni, another East Coast Railway, and we will pass on to our successors another national debt. I might mention that our abhorrence of such a plan for public works is probably the strongest feature of our movement. It has been alleged that we are getting something for nothing: we are going to take advantage of a monetary juggle and pass the debt on to our descendants. There is one fixed determination in the Douglas movement which begins from a sense of shame that the country we inherited from the last generation is being passed on to the next generation with a colossal public debt. We are ashamed of it: we feel that we cannot escape that responsibility, and if we were to be confronted with a scheme that would involve the increasing of that debt we would shrink from it with loathing. The only scheme at the present time which offers any chance of success under our present system is the Keynes plan, whereunder the stronger creditor countries will lend to the weak debtor countries. They are strong because they lend, and we are weak because we borrow. I say, therefore, that we will not contemplate any suggestion that we can, through a public-works policy, distribute purchasing-power which will enable these consumption goods to be purchased. We would have nothing to do with it. If there is

anything we are opposed to it is that particular form of solution. We say, therefore, that we are prevented from following the lines which have been set out in the various proposals put before you.

Hon. Mr. Downie Stewart.] Does the Keynes plan of creditor nations lending to debtor nations meet with your approval?—No. I certainly say that the Douglas movement abhors the suggestion that we should borrow to provide purchasing-power.

I thought that you said you agreed with Keynes?—There is one aspect of the Keynes plan which I may say we are attracted to. It may be that in our movement we have a certain impish sense of humour, but the idea of a gold certificate which will come out here and be regarded as gold—it requires a Lewis Carroll to describe it correctly. If there is any chance of these certificates being described truthfully, it will at least be an educational movement. If we turn out our constabulary to receive that certificate and shackle it to some strong building and regard it as a metal reserve; for Keynes says it must be regarded in every respect as the equivalent of a gold reserve. Although we cannot examine that carefully, there is something in that proposal which is valuable to the Douglas movement in its educational capacity, because it would appear that if we can get some document, some written expression of the ability and the willingness to redeem, that is a substitute for this yellow metal which we laboriously pursue in the distant corners of the earth. That is more or less what we extract from the Keynes proposal. It is related more to his criticism of the past era of things rather than to his advocacy of something new. I repeat that any suggestion of borrowing again in order to provide that purchasing-power would meet not only with the disapproval of the Douglas movement but with its rigid hostility. We feel that is the cause of our trouble. Now we have reached this point, the national credit authority would be given this task of securing that equation, that balance of consumption goods and purchasing-power, and it would be prohibited from undertaking any foreign borrowing. That is held over, something like the sword of Damocles, by our economists' report presented last year—to my mind a most wonderful document. We had the Macmillan Report concentrating upon this point: there is only one hope for the world—recontinuance of foreign lending. We have the economists report telling us we are forced inevitably to stop foreign borrowing. It appears to me that there is a contradiction there, even worse than the one which occurred between Douglas and the economists. If the only way to prosperity and of raising world price-levels consists in the recontinuance of foreign borrowing and lending, how then are we to overcome the economists' report which says we must stop? That is one of the problems we encounter when we seek for some solution other than this put forward by Major Douglas. We have tried them. I can say definitely that every leader in Auckland entered the Douglas movement through setting out to convince them that they were wrong and there were many other better ways. Each one has returned from these by-ways to the fact that Douglas is the only one who puts forward a workable and acceptable plan. In considering these various alternatives, we cannot lose sight of the fact that the initial one—the one which appears to be hovering on the horizon—is from Great Britain, a recontinuance of foreign lending, and our own accredited economic representatives have said we cannot carry on without it. I think we speak with the support of the great majority of the people of New Zealand when I say we are opposed to the restarting of foreign borrowing. How can we reinject purchasing-power if we are not to start a system of public works? That, I might say, is probably the greatest rival we have. The plan put forward by various men in England of various projects, I think, has had quite an amount of support in New Zealand until lately; the raising of loans in one way or another and the spending of these on consumable goods which would enable the stocks to be moved. We have claimed, as I say, that this is not a cure. We must evolve something new, and we find we have support from these men like Professor Robertson, Cole, and others, who might be considered the extreme left-wing of the economic body, who say there is now this deficiency of purchasing-power which cannot be overcome by the old methods. Here is where we begin to enter upon controversial ground, to say the least. In order to get any support or any sympathy, we have got to make good the claims I have put forward, which is that these various aspects of our monetary machine are correct, that money does issue in the way we say. It is very desirable to hear at this stage technical evidence before the Committee which opposes it. It throws us back upon this elementary ground, but I would like to point out what was the focus of evidence given by the bankers with regard to the issue of money. They could issue as much as we require if the things offered them were sound and suitable, and if they had a chance of repayment. The Government raising loans from them—that, indeed was acceptable; they could write figures in a book and could issue the equivalent of, say, £400,000; that is quite orthodox and satisfactory. But any suggestion that it can be issued in any way other than through the banks meets with their horror. It would appear, therefore, that money issued through the banking system represents prosperity, money issued from the Government loans through the banks represents statesmanship, but money issued from the Douglas proposals represents inflation. Those apparently are the three definitions of money. We say that the medium of exchange should emerge upon certain properly situated loans, and provided we do not affect our price-level to the damage of the economic structure, we are authorized in carrying out works with a system of money related to the flow of goods, compensated of course by this deduction for fixed capital investments. That being so, I should say that we are now able to go still further in this plan without danger of a rearguard or flank attack from our orthodox opponents, and we find we have this task set in presenting our policy of the national credit authority: Money must be issued in such a way that the price-level will not be distorted. The particular machinery we advocate therefore is this: We must be technically efficient not only in our production but in our control of money, and we suggest there should be set up here in New Zealand this interior machinery, a Controller of Currency. He will be a technical head controlling three divisions: First, an Issue Division, which will be the actual group putting money into circulation. There will be a second division, the Securities Valuation Division. (We are following here banking technique.) They will

be concerned with any movement, any distortion of the price-level; it will be their responsibility to represent any unwise or unsatisfactory movement in the price-level. The third division will be an Exchange, Sale, and Purchase Division. These three divisions will be a complete control over our monetary system under the direct supervision of the Controller of Currency. All the things which are threatened by the use of money in the way we suggest will be reflected and reported by these three authorities.

Mr. Clinkard.] What are the functions of the third division?—They will be responsible for the balancing of exchange and overseas trade; for the relationship of our New Zealand money to the money of overseas countries. I may say we are on those lines following established banking technique, and we think it is desirable because those three separate divisions will be direct channels of report of information which may be handed on to this national credit authority. That authority could, in its monthly or quarterly reports, see at once if inflation is beginning.

Mr. Langstone.] Would that third division be in London like we have in New Zealand?—No, it is under our Controller of Currency, and their interior report would be available to the national credit authority. We think this of great importance, for I might say we view with serious misgivings this linking-up of our currency system with overseas. We feel that not only are we out of sympathy with the monetary system of the United Kingdom—I should make that statement quite clear—not only are we possibly at times out of sympathy with the United Kingdom monetary system, but we will be in the majority of instances opposed to it. We are a pastoral, debtor, partly developed country; we are linking ourselves with a fully developed, manufacturing, creditor country. It would appear, therefore, that it would be extraordinary if our price policies were to correspond; the indications are that they will be constantly in opposition, and we view with very serious misgiving any proposal to place either definitely or indefinitely the control of our monetary system outside New Zealand.

The mechanical part of it, the handling of it, the transferring of the credit in London for the buying in London?—The machinery would be here. We consider that these three subdivisions should, as far as we know, go in technical subdivision; they would surely control all currency, would secure a co-ordinated system which would not only plan it but which would report its oscillations to the national credit authority. Having set up this machinery with sufficient detail to enable our plan to be understood, there then occurs the particular task of how they would implement it. We have said that the task given to the national credit authority is this equation of the powers of production and consumption. The first task then of this national credit authority would be to have taken here in New Zealand an economic survey that would be to arraign all those moving elements which are necessary in order to find out the amount of money we need. We find out that it would come under the heading which is launched against us as a criticism of having a managed currency. I think you will admit from the evidence put before you by the banking representatives that it is in substitution of mismanaged currency. When you cross-examined those banking officials as to what constituted inflation, a most confused position arose. Apparently they were not prepared to admit that the price-level was an inflation. There was a difference from that authority in whom we place the greatest possible confidence, the central-bank authority, Sir Basil Blackett. It has been suggested that some of the world bankers have differed from him in his radical opinion. I say it has enhanced his prestige; the conditions he foretold have come to pass. He says, "the criterion by which a banking policy should be judged is its ability to pursue a policy of stable price-level." Not only was it disclosed before you here, but it has long been recognized that our banking authorities have never at any time recognized their responsibility to the price-level. Moreover, in the new central-bank developments there will be no recognition of the price-level. We are moving from a metallic basis to a sterling-balance basis, and again the control of our price-level will pass into other hands. That being so, I wish to make a point that the formation of our central bank does not in any way meet the requirements of the Douglas Social Credit plans. We want this equation to be pursued, and I say that Sir Basil Blackett's conception, Mr. Keynes', Professor Cassel's—their ideal of a stable price-level is the proof that our conception has been realized. Now, when they are given this task, they are faced with these various proposals put forward, which I admit are palliatives, that is to say, the building, the construction of such things as do not come on the market in order that the wages so distributed will buy the things which are on the market. That, I think, reaches the utmost limit of what one might call the old economics can provide for us in this vicious form. It takes this particular phase: Not only do they intend to employ these idle workers in making fixed capital goods in order that their wages might buy the consumption goods, but they are actually destroying the consumption goods in order that there will be a vacancy which they can set upon to fill. Now, at this stage, I would like to bring in another point, which may be regarded as irrelevant, and yet on the grounds of my appeal to you to understand the motives and the enthusiasm, the spirit of the Douglas movement, I consider that it is right and feasible that you should know it. It is this: We claim that the destruction of foodstuffs and raw materials being undertaken throughout the world is a crime against humanity. And I say this: That although that might be taken as a matter of sentiment this is not so generally held inside the movement. In fact, I believe that it is only held by one or two, but I feel that this will appeal to the Committee, especially those whom I know have read fairly widely. It is more than a matter of a crime against humanity. It is a crime against political economy that some day we may have to pay for. The western nations have a unique position, as we own the food-supplies and the mineral-supplies of the world. So long as we act in the capacity of trustees and trade freely, we may be left in possession of those supplies. But I say this, and I claim to be perhaps an authority on this point: If we take steps to abuse that position and the ownership of materials and food-supplies, we may be called upon to justify our ownership with the bayonet, and within a measurable time, perhaps not this generation, but a succeeding generation. And I say that that is one of what one might term the zealots' support of the Douglas movement. We feel that we are playing with fire when we allow this measure to be adopted and destroy the supplies of food for this

weirdly involved line of reasoning, to destroy these mountains of goods in order that the necessity for those goods might cause the price-level to rise in order that the making of more goods may become profitable and thereby the unemployed might be called back to get wages to buy them. We go round in a circle, and at each stage we stumble and blunder. Now, that I put forward as explaining the the extreme reluctance of the Douglas Credit movement to adopt any other plan but this provision of purchasing-power. We see these goods which have been made, which have been grown, which have been hewn from the ground. Let them be purchased and let them go into consumption, and we think that by so doing we not only relieve our own want but we are perhaps unravelling an international knot which later on might bring the whole civilization down in ruins. I feel that I cannot let that point go past, because I know, and I think we all feel, that we are attacked as being visionaries, idealists. We are regarded as being somewhat of a people with heads in the clouds. I think perhaps we are above the cloud-level. It may be that we are looking above those mists which Keynes has said are obstructing the view of the people, but, however, I think that the Committee cannot fairly judge the ideology of the Douglas movement without realizing the breadth of our conceptions, our misgivings, and it is more interwoven with this idea of international stability than our critics would give us credit for. In fact, speaking personally, I believe that I have become more convinced of the Douglas plan being the only way out by a reading of history. There is one book which I would like members of the Committee to read, "Why War with Germany is Inevitable," written by Professor Cromb, Professor of History of Cambridge University in 1913. He has shown in remarkable language how the war was indeed caused by this inability of nations to sell their surplus products. Sir Philip Game, in the remarks I have quoted previously, made use of this expression, "I think we are wrong in attributing our troubles to the war. These manifestations were in evidence before the war. In fact, some of us believe they caused the war." I agree. I think these principles did cause the war, and I believe it will cause the next war unless we can evolve some means of ridding our surplus production. Now, I would like to labour this point, because we are on the eve of having plans put before us, and you, as a Monetary Committee, will be called upon, I think, to adjudicate upon their rightness and their wisdom, and one serious development appears to me to be this: Our quota proposals which have been hanging above our heads like the sword of Damocles, those proposals have been withdrawn, and there is an expression of relief to New Zealand. It seems to me to be a death warrant. The plans to raise the price of butter have failed because the quota proposals failed in regard to meat. Therefore, the price-levels must be left low, and there is to be a subsidy paid to the English farmer. It is a recognition of defeat, that the restriction of supplies will not raise prices. Now, if that is so, those counter proposals to Douglas, this idea of in some way wrecking industry to create a shortage in order that profits might re-emerge from the raising of prices, we find will not work. Roosevelt has discovered it will not work; but England tried it in 1931 and discovered they could not raise the price-level. They adopted a terrific injection of money through the ordinary channels, a phenomenal sum of money through the ordinary channels, the channels which will be submitted to you and have been submitted now in the Douglas proposals. It was put forward by Mr. McKenna, Keynes, the Brains Trust, which existed in England in conjunction with Montague Norman, and I think to his credit he acquiesced, but it would not work. We cannot issue purchasing-power through ordinary channels with the idea of raising the price-level. We cannot contemplate it purely from the empirical discovery that it will not work. I say, therefore, that we are forced back again.

Mr. Clinkard.] Where is the difference, then, between that injection and your proposal?—Because we are not issuing it as a debt to the bank. It is not to be repaid. We say that throughout history this borrowing of purchasing-power has only worked for a time. Coming back again to the local example I gave, while we were building Arapuni, the railway-station, and the East Coast railway, it did work so far as Queen Street was concerned, but now when we are trying to pay it back, or, to be strictly correct, while we are hoping to pay it back, we cannot circulate the purchasing-power to buy goods. It only works while it is flowing out. It cripples us when it is flowing back. I am glad that point has been raised, because stage by stage this is why we have to abandon every sidetrack which has been taken and which will be taken to discover some way of giving the people purchasing-power apart from wages and apart from loans, and we come back to the Robertson plan, to the Bellerby plan. Possibly, we are leaving the Keynes plan, if you exclude those wonderful gold certificates, those Santa Claus bequests of paper which represent wealth. As I say, we come back again, and perhaps here we are spared those blunders if we will realize how completely they have failed. I say, therefore, that when this credit authority, with its machinery, is given the task of equating this balance and flow between two factors, we find that it must abjure all those experiments which have been carried on in other lands. We find that it must distribute purchasing-power, not in wages, and it must not be borrowed. Now how, then, can it be done? I say that one can reverse all the schemes. I might say that some which have appeared many times have appealed to me in substitution of the Douglas plan. I think possibly the one put forward by General Calles, of Mexico, might suit us, not that it is more scientific, but it is easier to explain, that is, of making one area of New Zealand subject to free credit. I would recommend that to the study of those who are interested, where the primary producers for two years are given the first claim upon free credits. It is blunt, it is crude, but I believe we can explain it more easily than we find it to explain the Douglas proposal, but still we are concerned with our Douglas plan, and the proposal we put to this credit authority is this: They must have this economic survey made, they must take into account all those factors which are put forward to distract us and which I can see, from the pencils working round here, will be brought up to distract me. All these interests will be undertaken. It will be the job of our technicians to do that, but when they have done that there will emerge a figure. That figure will be the deficiency in purchasing-power here in New Zealand. Many of our supporters have said to me, Can you get the Secretariat of this Monetary Committee to undertake that survey if it is only in a crude way? I dare say, Mr. Chairman, if you can do it it will be a wonderful benefit,

as it is the first step in our plan, and I submit to you, realizing that you will have many problems to discuss, if you could evolve that deficiency. Now, the point is this, and here is where we come to the key of the Douglas plan: This sum will be set aside as a definite amount. One can imagine it as being a sum applied in the English banking practice to the Ways and Means Account. You can imagine it in a commercial concern being a discovery that the proprietor has not drawn the whole of his salary for some years past. However you regard it, it is a fixed estimated sum which is put to the credit of New Zealand. Here we have New Zealand Limited discovering that his salary has not been fully drawn. Then that sum is set apart. Now we would allow our technicians to express all their doubts, all their conservatism, upon that subject, because we say this: The productive capacity of New Zealand, our real-wealth capacity, is so great, it is so vastly in excess of the style of our living at the present day, that we can, within that margin, make many blunders. Errors will be made, many of them will be errors in computation, but those errors will be compensatory. Now these technicians will evolve a certain definite sum. This is the answer to the charge that we are heading for inflation, that we are going to follow Germany after the war, or we are going to follow France after the Revolution, or Bechuanaland after the Flood, or all those periods that they warn us we are going to follow. It appears to me that one of the assets resulting from the war has been that slogan that they can afford to fling at reformers, "We will be like Germany after the war," and so on. I consider that expression should not be used by a competent economic authority. Germany after the war was faced with this position—an utter dearth of commodities, these consumption goods which is the factor of our equation. For four years every productive element in Germany had been directed to war work. On the other hand their monetary machine had been going at full speed rewarding soldiers and munition workers, and they were faced with this position—a complete absence of consumption goods and an overwhelming mountain of the medium of exchange. Here in New Zealand I say we are faced with the reverse, and throughout the world we are faced with the reverse. Therefore, I say that position not only will not arise, it cannot arise. But, more particularly, we are not concerned with that. We will have a definite sum set to the credit of New Zealand, and the credit authority will not be authorized to exceed that by one pound. But there it stands. Now then, you will say, what is the basis for that money? You are going to go headlong to inflation. We say that every authority in the world to-day expects as the basis of money-issue a flow of consumption goods. How, then, can we be heading for inflation if we base our money on the flow of consumption goods. Inflation cannot occur if our arithmetic is correct. This sum will emerge. Now, shall we say that sum here in New Zealand is £7,000,000. That money of account represents the deficiency in purchasing-power as against the flow of consumption goods. We see it in our crowded warehouses, we see it in our idle machines and our unemployed. It has been said again that perhaps we are too ready to declare there is this reserve of wealth. I might say that that does not impress us. We find it easier to convince the more drastically a man is brought face to face with the economic situation. To the unemployed, they go through our streets, they see in our warehouses the goods which they and their comrades helped to make, they know that until those goods are sold there is no hope of them getting their jobs back; and when they speak to the shopkeeper they know that until they get their job back and their wages are restored those goods will not be sold. There is a deadlock, and that is why we feel constrained to say that we should not be on the defensive. We say that the present monetary system should be in the dock to-day explaining why it is that our vast resources are idle, and people and machines. We are compelled to live the lives of the peasantry of a hundred years ago, and that explains our reluctance to have to parade our plans and have it to the very finest detail, allowing for every possible disability, when we are surrounded with such mismanagement. However, I say that this particular figure will be as correct as arithmetic can make it, being the figure arrived at according to the basis recognized throughout the monetary world. It cannot lead to inflation. We realize, though, that possibly our technicians will require a margin, but what we claim is this: That within that margin we can improve our lot so that the abundance of our living will exceed that which is hoped for by any man in this room to-day. I say that from a knowledge of our pastoral and our industrial technique, its wonderful power of replacing those stores which will be expended. However, whether that may be right or wrong, the fact remains that if figures can mean anything those figures will be a complete safeguard against inflation. Now, the position might arise here, we are attacked on another ground. If you bring about this injection of money there will be idleness. That may occur. We may perhaps, following a sudden lifting of this gloom, become hilarious, we might have frequency of race meetings, and so on, and there may be idleness. Supposing that did occur, what would happen? The first readjustment made by the monetary authority would disclose this fact. You have, in the preceding period, consumed these consumption goods. You have exhausted your supplies. There is disorderedness; you have not brought about the replacement. You have exhausted your goods. There is no amount available for further distribution. We will accept that cheerfully, we will accept destitution if it is unavoidable. It is this accumulated store which is cumbering the earth alongside destitution which is enraging the people, and which is causing them to break down more than the monetary institution, which is causing them to remake social institutions which we think should be left standing. Now, this is a point I feel I am bound to challenge. You are possibly aware, in fact, you must be, that there are numerous challenges that our facts are wrong. They say that there is not an accumulation. They say that owing to the slowing-down of production there is, in fact, a dearth. It is amazing how flimsily they will bring up facts to attack Douglas and how precariously and how laboriously we have to bring up facts to support him. If you wish to doubt that, I would refer you to that Bulletin No. 102, issued by the Chamber of Commerce, Canterbury School of Economics. We might, perhaps, be charged with going to the enemy for information. That is to prove our sportsmanship, or it may be that the Scripture often quotes the devil. However, it is got up by economists and printed by New Zealand Newspapers, Ltd., and it sets out there that on an average there is two years and a half supply of raw materials in hand in July, 1933. That is to say,

that the world could, for two years and a half, have a holiday, and only then would the equation be brought about. Now, I mention that to show the margin in which these technicians can work.

Mr. Langstone.] Did not the war prove that too?—Yes, it did. I might say that Salter, who has been quoted here, and has been read widely by many members of the Committee, has said definitely that one of the striking things of modern science has been the amazing way in which the wastage of the war have been made good. Using the word in its technical sense, saving—that is to say, the amount left over for investment after having satisfied current needs—he says that savings increased at a more prodigious rate than the world has ever seen, in the years following the war. Now that, I say, has been criticized. It has been criticized in letters to the press, and I might mention, if any one wishes to achieve notoriety as a press correspondent he has only got to attack Douglas and he will be given the first place in the correspondence column, no matter how unworldly, how pathetic, his sentiments may be. A declaration has been made that there is a dearth of supplies throughout the world, yet the 1931 rubber crop was completely destroyed, the equivalent of last year's coffee crop was destroyed, and here in New Zealand our city paper has put forward a recipe for for making artificial coffee by burning bran, and so on. They are retiring in America nearly 100,000,000 acres of agricultural land. They have destroyed 10,000,000 acres of cotton, and here in New Zealand we are wrestling with this grim destiny of the quota. Now, under those conditions, we say that within this margin there is room for our technicians to make a big error and yet give to humanity a standard of living in excess of what it has hitherto enjoyed; and I say that we are supported there out of the mouths of economists in our statement. Now when, therefore, we are confronted with this, I say that it is possible to arrive at the sum, and within that sum to put our unemployed back to work. I have said that there would be a great benefit, but what I think has not been sufficiently understood in New Zealand is the enormous wastage which we are undergoing. I have mentioned those items which no doubt you are weary of the recital of, the destruction throughout the world of physical materials. I say this: That those things are trivial compared with the destruction which is going on in the social sense here in New Zealand—the destruction of tradesmanship, the destruction of our moral standards. You are concerned with the destruction of faith in Parliaments. We are the last democracy in the world, and here in New Zealand we are the last bulwark of that democracy. What a thought to bring in a country where Seddon exercised control so long. This is the position we are facing, and the particular wastage I would like to commend to you is the waste of tradesmanship which gives us that impatience. Here we have twenty-one civil engineers turned out last year. Not one of them employed. We have on our relief works here chipping footpaths, our tradesmen, our professional men. You will find three men, a solicitor, a civil engineer, and a carpenter, armed with a shovel, each attacking a dock leaf from different sides. We have lost the Government stroke and acquired the unemployed gesture. That is what is happening on the other side of the ledger, besides this material we are wasting. This margin of gain is so vast that we should go forward boldly into it, if it is only to salvage our unemployed. But I say this: That the restoration of our tradesmanship to its proper sphere, the re-employment of our apprentices, is a gain, I will not say trivial, but unimportant, compared with our idle machines. Machines do not tire, and I would like to see our machines working throughout the day and night. I would like to see these concrete roadmaking plants going three shifts a day and men getting the leisure, the abundance of living, that comes from that employment. So we see that, apart from our accumulated stores, behind that there is the gain of putting our men back to their proper tasks; behind that again is the wonderful machine; and again I must run the risk of being termed a visionary by saying that behind that machine there are machines which are not yet built, not yet brought to light, merely existing in the minds of men. Now that, I think, should have bombarded any criticism that any error in these figures would lead to inflation. It is established that some £7,000,000 or £8,000,000 is the declared deficiency in our purchasing-power. Within that sum New Zealand can work. Having established that fact, I think we have put forward a sufficient safeguard and a sufficient rebuttal to the charge that we are heading for inflation. We cannot exceed that amount; we will not exceed it; and the policy given by Parliament to the credit authority will be to see that that is not exceeded until further surveys are undertaken. Then we will be confronted with the task of how will that be issued. I might say that when the Bellerby plan was cabled out to New Zealand, money to be distributed to the professional spendthrifts, we were met by the declaration that it was not necessary to advertise for fast spenders in New Zealand. We were met with the opinion that the wives of professional men in Auckland would be the most rapid spenders we could evolve. However, we consider that application of the rule of the most rapid spender would not need to be gone into. I believe that Parliament, through its social services, would find numerous ways in which this money could be expended through urgent works.

Mr. Clinkard.] Would that not have the same effect as public works?—If this money is issued without loan it does not need to be repaid. It is a costless credit fitted into the accounts of the Government.

Mr. Langstone.] By national superannuation and pensions?—Yes. What I was leading up to was what I think is a flagrant example of how Parliament has been frustrated. There is no project, I think, which deserves and received better public support than our dental clinics. It is economically and officially proved to the public of New Zealand that the early attention to teeth was its most striking physical economy, and now we have restricted that economy because we must economize. I mention that to show the importance of what one might call the utilitarian section of our plan.

That would be given to the dentists?—No. This would be charged to the national credit authority. Finding that taxation has reached its limit, finding that the people have nothing more to spare from their wages, you call upon that determined amount, and that is used for the basis of expansion, for pensions, for dental clinics, or for anything which is a truly national gain. Now, I mention that

to show how you have been defeated in your economies by what is a measure of economy. If that is not sufficiently clear, I can relate others. There has been great declared economy effected here in connection with the Auckland Railway-station. They have cut out eleven telephones in order to save money, but the Post and Telegraph Department are losing £55 a year. That sort of thing has been going on, and I could quote numerous cases where so-called economies are not really economies. This is a means whereby there will be placed at your disposal a sum of money which has not been extracted from the wages of the people, and I have mentioned to you various improvements which will occur to you. I am not quite sure that I am wise in doing so, because it appears to me you may draw upon the whole of it. However, so long as this money comes into circulation without appearing as a debt we would be resigned to it. We feel that social service has a prior claim and in our plan—if you do adopt it, if you say we will do so, and will find all the avenues to distribute the money—we feel that the unemployed man has the first claim. We say they are the casualties of this clumsy, costly, monetary system. We say that if the Government were to be empowered to utilize this, that those men should be the first claim upon this costless credit, but the point is that we do not wish to use the Douglas proposals or the Douglas plan as a kind of first-aid outfit. We feel that this project has something deeper in it than merely the preservation of economic vitality. We think there is a basis for a new economic thought, and I think we are justified in it. Douglas evolved this at a time when every one referred to him as a lunatic, because it was in a period of expanding purchasing-power and the people did not like the idea of, shall we say, examining the machine to see if the lubricating-oil was running low. He said that there would come a time when the engines would clash and that you must inject the oil at a point, every 500 miles, if you are to keep your engine running smoothly. People did not like to be told that there was a leak in the differential. People did not like the idea of a man predicting that the oil-supply would run out and need to be reinforced every 500 miles. That is what caused the initial antagonism which we have not yet lived down. Here is the position: There must be a supply of oil at a given point, 500 miles is the ratio put forward by your technicians. Now, then, the Government should lubricate all these points that are squealing, lubricate the unemployed and restore to them something of what life has robbed them or what the monetary system has robbed them of. I say we are not doctrinaire in our particular application. We are not so much concerned with the channels which you use to get this money out. I know there is a strong body of opinion here in New Zealand that pensions and the public works should be used, perhaps, to begin with. That might be all right, but we are afraid of becoming involved; we are afraid that possibly it might lead to lack of the ultimate ratio of production, and we want to guard against that. We want to keep our production machine going at the very limit of efficiency. We do not know what kind of life we want to live, some of our supporters think this will achieve leisure, but it might, on the other hand, lead us to wider and deeper phases of living, but if I want to preserve your respect I know I must not indulge in anything else but figures. I say that we are prepared to admit in the actual acceptance of this plan all the proposals which you possibly, being more widely drawn than our movement, are more competent to put forward, and, being our elected representatives, perhaps would have more authority to put forward. We say we will concede that, but what we want is, in some means or other, to put it into the industrial machine to allow it to function. I have admitted that possibly pensions might take a claim as suggested by one member; it may be that the public works would have a big claim——

I meant all social services?—Yes, help them too. We admit all their claims, but we want to put this forward as a new policy, as the only way of regarding the economic machine. We have said that Douglas discovered the flaw in the monetary machine. I think that by making use of that expression we have perhaps drawn a great deal more antagonism than we need have done. From reading back to the earlier economists I think it was more correct to say that Douglas discovered an inadequacy, and this inadequacy is not in the monetary machine. It lies between the monetary machine and the industrial machine. I think it is best expressed in his opening remarks to the Macmillan Commission, when he said the industrial machine has two functions. He said, "There were two things needed: One is to provide us with the things we need, the other is to distribute enough purchasing-power to buy them." If he had said there was required a midway organization that, I think, would perhaps have side-stepped a great deal of the antagonism that we have inherited. I like that point of view, because it appeals to this Committee. If there is this inadequacy between the monetary organization and the industrial organization the personnel of this Committee is best able to say "Yes, it is a deficiency." It is not that the monetary machine has not done its job; it has done it as well as it could; it is not that the industrial system has not done its job. They have had to give profits, to be responsible to their shareholders. That being so, there is an inadequacy which you can fill, and that inadequacy is to build up some balanced organization which will secure this equity. I wish I could give you a formula which would combine all these slogans—all these shibboleths—all those representations put forward by the economists which are expressed by the Douglas people as being the equation between consumption and production that always draw fire; and sometimes I have wished we could borrow Cassell's term, except that is a disloyalty, and perhaps affects our determination to go on. However, perhaps this Committee can evolve a term which is the objective to strive for. This objective will be an equation for production and consumption, and it will be reflected in a stable price-level. I have made the admission that we are prepared to withdraw into the background many of our methods of distributing purchasing-power if Parliament gave palliatives, social services, rescues to the unemployed, and support to the exporter of primary production. Admitted that there is this reserve in credit, we know of many more worthy purposes to which it may be used besides the ones put forward by the Douglas plan. We admit that. If you issue that money not as a loan; if you equate the industrial process, we will say, Give it to the

unemployed, the exporting primary producers, and to those people whose lack of purchasing-power is breaking them down. However, I say we are not content with this application of embrocation. We want to set forward a workable thesis which will for all time give us a monetary basis, and we must press on to set out how this purchasing-power, this deficiency, can be fitted back into the machine to achieve the results we are striving for. One thing which excites the most animosity, which is the happy hunting-ground of our opponents, is the just-price formula. I said that wages had been discovered by empirical research to result always in a rise of prices. As I say, Roosevelt is rediscovering what Seddon discovered.

Have prices not gone up first and wages followed ?—Yes, that is true ; except that I believe that is a stark definition, and I have been seeking to present the economists' point of view. I regard myself as being in an arena and I want to anchor my facts as near as possible to those economists who provide the ammunition. I know that through better organization, through the operation of a closely linked system prices do rise in anticipation. They speak of replacement values and so on, but the Blue Eagle has not succeeded in pecking that out of the Roosevelt plan.

In New Zealand they had to prove that the cost of living had gone up before they got an increase in wages ?—Yes, fundamentally and empirically it does, but theoretically one would assume that those wages do not bring in the higher price until they have been charged in costs. It is perhaps idealistic, and I know that what you say is probably correct in practice, but still if we are to work on theoretical lines it is impossible for those wages to emerge anywhere but in prices.

It must be reflected in the cost ?—So that the bootmaker who has to pay increased wages would be justified in later charging increased prices for his boots ; we cannot escape it.

Can you prove this, that experience having shown that rising wages merely raise prices, the fact of increased wages being paid does not expand purchasing-power ?—Yes ; purchasing-power is not merely money. It is the ability of money to get goods. If, therefore, wages rise and the prices rise, too, that money has no greater purchasing-power. Say a man has his wages increased from £4 to £6. If his wife, when buying goods, can buy no more goods with the £6 than she could with £4, then the purchasing-power has not increased ; but what I want to set out is this : That while I admit that the point raised by Mr. Langstone is correct, nevertheless it may be contested ; but what I do say is inescapable ; that an increase in wages must and ethically can be recovered in the prices charged for products. We cannot resist ; we cannot deny ; and, I think, cannot object to that. Therefore, the task is, as outlined in the proposals, to issue this money apart from wages. When we are working on this just-price formula, it should appear that, since prices are pushed upward by wages and experience throughout the world as reaffirmed that, we have to somehow make the money in people's possession buy more. That is the only real explanation of purchasing-power. The next process is to evolve a formula, this formula being the ratio by which purchasing-power will be expanded to secure this balance. Now, we are here saying that we have met the demands, onslaughts, or desires of Parliament with regard to this fund, and we have a certain sum left ; this sum to be somehow paid out to the people to enable them to buy the things awaiting purchase without causing prices to advance beyond their reach, and the suggestion is that it should be done by the just-price formula. Supposing the amount in round numbers, to make the thing workable, discloses that we are one-third short of purchasing-power ; that the amount of consumption goods or, perhaps, to resist any criticism later, the flow of consumption goods coming on the market exceeds the flow of purchasing-power being released, then it must be augmented to that extent. Now, the proposal put forward by Douglas which is unique, and being unique is therefore strongly criticized, is that retail prices be marked down to that fraction. It is bringing the price down to the reach of the people's income. Take a concrete example as an illustration : a pair of boots sold at 15s. worth 15s., but the people have only two-thirds enought money to buy consumption goods. They, therefore, are entitled to buy those boots at 10s. The other 5s. is paid to the retailer by the national credit authority. Now, that wants careful examination or you will find yourself sliding in the fashionable by-ways of increasing purchasing-power. It is not a bonus, it is not assistance to production, which so often leads production into unprofitable or uneconomic channels. It is a gain to the consumer ; it is a net gain to the people as consumers. If, therefore, we meet with this attack that here is something for nothing, at least we will begin by saying that it is something which is given to the people in their identity as consumers which is the widest possible identity we can contrive. Now, the bootseller sells at the same price as formerly. The gain to the retailer is that he made a sale where otherwise he would not have done. Instead of selling two pairs and having one left on the shelf he sells the lot. Professor Copland suggested that such a plan would involve multiplication of production to a colossal extent and works out with an air of versimilitude that it would result in thousands and thousands of pairs being added every week. One would assume that under Douglas we would become centipedes. Why should production be accelerated because the producer has found a market ; why should the seller become mentally unbalanced because he has found a sale ? He might perhaps have a delirium of satisfaction by seeing profits rise. As for causing inflation, which was added to that criticism, if the following week the bootmaker rose the price of the boots to £1 10s., will the housewife pay £1 10s. instead of 10s. ? No, she will buy more shrewdly.

Why stop at 33⅓ per cent. ?—If I get away with one-third I will consider myself a very lucky man. I say that this point, then, must be conceded ; that there is no distortion of the production system. With all its faults, with all its difficulties, it is left working, I resist the defence that our monetary system has served us so well and so long, I do not know what is the criterion if it has served us well. Professor Cassel says that it has led to the greatest tragedy in recorded history. However, I will say this in defence of the production system : That it has done its job. I admit that it is open to improvement—no one will deny that—but still we claim that it has done its job. We want to get rid of this production, and this means issuing this pre-determined amount of purchasing-

power. That leaves it still working as we understand it, as those in charge understand it, and as its technicians understand it. We alter the least possible in order to get possession of the trades products. This might incite criticism—something for nothing, at any rate. Granted that the consumer gets it, where does he get it from. The housewife gets possession of goods which formerly she could not afford. The boot retailer effects a sale which hitherto he could not have done. He calls upon the wholesaler, who calls upon the manufacturer, who calls upon the tanner. The unemployed go back to their tasks; the farmer receives a cheque for hides where hitherto he was denied; raw materials are salvaged and brought to the production machine. We find that production, in this procession, takes one step forward, stocks are replaced and no one has lost anything. When we put that into concrete form people say it is too good to be true, that I can buy one-third more goods under this system than previously, and what they are resisting is merely what industry was meant to do. That is not Douglas, it is Ruskin. The supreme aim of production is consumption. We have lost sight of it. Nothing has any significance in economics unless it is related to this simple passage that from the hides of the farmers emerge their purchasing-power. Why should we have to fight and struggle to put that across the people; why should we be called all these disparaging names because we suggest that industry should be allowed to fulfil its ordinary function to which men gave their brains and to which men now give their energies. I claim, therefore, that the Douglas plan would give you something which plans, first of all, to hold on to our civilization; secondly, it means to utilize our salvaged materials, our salvaged trades, our salvaged energies, and by passing it on through the machine it emerges as the finished product and with its finished product New Zealand must be able to buy what New Zealand has made. I think at this point I should put over the point that here within New Zealand if we had a closed economy we should be able to so manipulate our services that New Zealand could avail itself of those elements of food, clothing, and shelter which it has in so great abundance. Reverting to shelter, there is 5,000,000 ft. of timber held by one timber firm in Hamilton, and in this connection I might mention that there was a house condemned last week containing three families living in five rooms and two of those families were builders' families. It appears that the shame is beginning to pass from economists to every one of us. I admit that possibly now we are treading on dangerous or difficult ground. It can be said that perhaps by juggling with the monetary system you may be able to enable us to live here consuming our goods, but you will resolve yourself into a nation living on itself.

Mr. Clinkard.] Take in one another's washing?—I say it may be better in the end to take in one another's washing than to allow this malefactor to step in and steal our washing overnight.

We do that now so far as we render service to one another?—The only thing is that there is a bag wash that we want to use. It should at this stage be stated that here within our national economy we could alleviate, I should say, nine-tenths of the trouble which this nation is suffering from. Now, one might consider that beyond our boundaries we encounter difficulties with international exchange. I say this: That this plan will settle our overseas trouble. I say that we will be able to live amongst nations as we would be able to live amongst ourselves, each nation doing that which in the world economy it is best able to do.

Dr. Sutch.] That is assuming that other nations do the same as we do?—Not in the least. That is assuming that here in New Zealand this Committee will bring down a recommendation that the Douglas proposals are to be at once adopted. We could carry on and our trade relationships would not suffer in any way. I will say that all our economists have in their favour is a profundity of knowledge with regard to international exchange that can be used, and I say this Douglas plan will bring about a state of international trade even more beneficial than what I think can be constituted here in New Zealand. We must get down to fundamentals again, which I think are recognized that the trade throughout the world is one of barter, that each nation sends abroad its surplus products or its internationally desired products and receives in exchange the products of other nations and the degree to which it can specialize, the degree to which it can give value and volume, to that degree we are going to receive back volume and value from other nations. Past obligations are the fly in the ointment, except that the fly is rather huge, so we will say the nigger in the woodpile. In spite of that nigger we can still make what I have suggested, the prospect of a balanced international economy. If we accept that proposal, or rather that truism, that trade between nations consists purely of commodities exchanged in value and volume with values and volume of the commodities of other nations, that gives us an escape from those money-lenders. We are then faced with this: That they say to you, "If you tinker with your money-machine, if you make your people happy and contented, you will have to sever your relationship with the world." I say, we will be judged by the world on this fact: Is our butter good, is our wool, meat, and cheese good? Are they in sufficient quantity to give you a return of what you need? If the answer is in the affirmative, then there is no difficulty. This I will say in broad lines, and I realize there is conflict impending, that our overseas exchange to-day is better than in any previous time in value and volume. Now, here again I purposely refrain from quoting our supporters. I will go back again to circular 102, issued by the Canterbury School of Economics, in which is set out the movement of price-levels, and there it shows that New Zealand should really congratulate itself upon world price-levels, figures showing the collapse that has taken place through the world in similar price-levels. The average price-level goes down from 80 to 40. There is a return, equally inspiring, in the *Economist* of 30th January. We find that the movement downwards of the index figures consists of this: 93 in foodstuffs, 81 in textiles, 83 in metals. We find, therefore, that those particular goods which we desire, which we cannot manufacture economically, have not merely lowered in price, they have collapsed. The world cannot get rid of them, and there is no shortage of supply, as I can prove to you. All that is required, therefore, is for New Zealand to get possession of them; but New Zealand is in an unfortunate position. She is like the wife of the relief worker who attends a bargain sale, sees wonderful things to be bought, and has no money to buy them. It takes all our increase of value and volume expressed in the monetary system

to pay our overseas debt. There is very little left to get these things, and, unfortunately, those things we are compelled to buy are those particular lines controlled in the manner indicated by Mr. Langstone, controlled by trusts who have managed to hold up the price-level. We have an example of that monumental achievement in the rise in the price of tea. After destroying the equivalent of the whole Indian crop, the price of tea has been raised 7d., all because of these organizations. I hold that to some extent that has happened, and I believe that this will have to be brought under review later, but still in the items for which we have possibly the greatest demand at the present time we could exchange in value and volume on better terms than ever before. Reverting again to concrete examples, those 130 bridges which the Automobile Association say are dangerous in the Auckland Province, you can now buy mild steel at one-third the price when butter was up. Our butter will buy more steel, more of the things we want, but here is the point which I think our economists have not brought sufficiently to the front. We have increased the volume of our pastoral products and the farmer should be four times and a quarter better off than he was in 1914 and the farmer to-day is collapsing in your arms like a pauper and wanting relief, to be given a chance to live, and yet by his production on world levels he should be enjoying four times and a quarter the standard of living he had in 1914, and he is prevented from doing that by our monetary system which some declare has served us so long and so well. I realize that here is where we join battle, but I will quote authorities and am prepared to substantiate this from the ranks of the enemy. I am not sure whether we will have to accept any surrender or whether there will be increased animosity due to my remarks to-day, but I say we will quote only those specialists in investigation to distinguish them from the economists who are trying to save the old system. We will quote from the economists as far as their investigations and the profundity of their knowledge serves to show that this is the position that our production in quality and quantity should entitle New Zealand to such a high level of living as probably exceeds the conception of any person here to-day, and I have to-day received a circular from the Waikato Show Association which tells us New Zealand must learn to do without pleasures, that we must have simpler pleasures which we can afford, and the farmer must rely upon his yearly visit to the show as being that which is within his reasonable ability to buy or afford. Now, in the bald statement of exchange I realize that probably we are faced with various evidence upon which we can be attacked. It may be stated of course, that our production is varying, that sometimes butter will rise, sometimes it will come down. Various methods have been put forward. I admit they are called forth possibly as movements to salvage one section of our farming community, but that is merely a palliative. If we are to get New Zealand economically sound, we must not proceed with those avenues of production or occupation which are not of world-wide economic soundness, and the Douglas proposal, in having an Exchange, Sale, and Purchase Division, which would deal with these, will be a safeguard against one branch of the economic structure being saved at the expense of the others. They would be able to regulate exchange in such a manner as would preserve the even stability of the price-level. Now, that is not so experimental as our critics have made out. It has been carried on to a very marked degree in various parts of the world. It is said that if you distribute this purchasing-power, it will help only those who come to have it in their possession—that it will not help the sale of our butter overseas. If the New Zealand farmer is recompensed in terms of value and volume of what we export, and more particularly what we import, he will be many times better off; but more than this, if we can import it will hold butter prices. Now, that is a controversial point, and in order perhaps to take refuge for a time within the ranks of our enemies, I would quote Mr. Davidson, of the Bank of New South Wales. In his pamphlet he set out that if we can enhance purchasing-power—I may say that he was referring particularly to Australia, and I assume he was speaking in defence of his high-exchange proposal, but that does not prevent us embodying any reference which may apply to ourselves—he said that if we can expand purchasing-power here within Australia, it will help the exporter to sell his goods on the foreign market. That, I think, is a truism; if we sell our butter, it is only by way of and through the medium of those debits in London caused by imports. If we do not import we cannot export. That I think has been condensed in that truism of Professor Taussig who, I think, is regarded as the highest authority on international exchange. He says that, over a period, exports and imports revert to equilibrium; in other words, if we persist, or rather, if we are prevented from importing, if we follow this economic policy to its absurd conclusion, the price of our butter and wool will descend down and down until it finally goes to zero, because they cannot buy if we will not buy.

Mr. Langstone.] That will create an unemployment problem there?—Yes. I just mentioned that as an absurd continuance of the system of exchange—that is to say, that our very poverty, driving us from importing, is by reason of the deficiency of debits in London causing embarrassment to the merchants. It may be of interest to this Committee to know that the difficulty in selling our butter in the North of England is not due to lack of advertisement, nor to lack of appreciation, but it is due to the channels of monetary exchange lying in the South and West of England.

Mr. Murdoch.] Does not Danish butter sell more largely in the North than New Zealand?—It sells because the channel of exchange is in the South and West of England. I believe that the preference for Danish butter in the North is brought about, not by the wishes of the people, because in 1905 there was inaugurated a campaign to persuade them to take New Zealand butter, but it was discovered that there were certain financial features which prevented the North of England butter-buyer operating on exchange. I mention that as an example to show how these exchange movements affect our ability to sell our products. I put that forward for your investigation, as it lies more within your scope than it lies within our own. I stick to this contention, supported by Mr. Davidson, who is not of our army. He says that this extension of purchasing-power within the country will help our exporters to sell their produce by reason of the goods we take and there is that added gain referred to by Mr. Langstone that there will be increased employment. Now that, I say, is a truism expressed by Taussig, and is endorsed by our own foremost orthodox figure, Keynes, who made an appeal for buying and selling. He

made a broadcast appeal to offset this economy, showing that by economizing we are crippling trade. He said, "It is true that a nation cannot spend more than it earns"; therein you have the present accepted public economy of New Zealand. He added to that "Also it is true that a nation cannot earn more than it spends." New Zealand cannot earn more that it spends in London. That then, is a picturesque and typically Keynes way of expressing the Douglas objective—that balance between consumption and production. I say, therefore, that we can safely trust to our analysis, and that there is a workable, sound, and democratic method in the Douglas Credit proposals.

The Chairman: I think we shall have to adjourn. I just want to mention this: When we wrote you in Wellington, we received a reply that you were coming before us to explain further the proposals that were submitted by Major Douglas. We again wrote you on 9th March, asking that you might also discuss the Douglas Social Credit. Well, we have no reply to that, but you have been good enough to bring it this afternoon. Although it is late, we would like to have it the same as we have had the other plans or proposals submitted to the Committee in advance. However, we are very glad to get them.

Colonel Closey: May I say, Mr. Chairman, that I have arranged this particularly to gain your help, and I feel that your advice at this preliminary stage will help us in our plans; but I am prepared to put forward the Douglas plan and to fit into this an instalment or machinery plan, and then we will gain your help and the value of criticism in showing how far you are prepared to go.

AUCKLAND, TUESDAY, 20TH MARCH, 1934.

Witness: COLONEL CLOSEY, further examined.

The Chairman.] Have you anything fresh that you want to add?—Just that instalment plan of Major Douglas. Do you desire that put before you?

Yes, I think we had better hear that?—I think you all have copies of that plan. I would like just to state in what connection that appears, and also to explain why it is so limited in scope. You will remember yesterday that I think the plan appeared quite complete to you, except for one phase of it which I could see was regarded with some uncertainty—that was, how this shortage of purchasing-power would be arrived at. I mentioned a sum, which, of course, was quite tentative, and I feel sure that the Committee must have thought that therein lay some difficulty, how to assess this sum, which was to be placed to the credit of the national authority, and you will remember that in order to arrive at that sum there was to be undertaken an economic survey. I might say that we have taken steps to approach that sum as accurately as we can, and in the course of our investigations we came across certain difficulties which I cannot describe otherwise than as being most serious. I think that not only are those conditions serious for the presentation of our scheme for reform, but I believe they are of very grave national importance, and the position is, in our minds, something like this: This loss of purchasing-power which has produced this crisis, admittedly upon the authorities I have quoted, we find here in New Zealand is largely, in fact mainly, due to the action of our banks in withdrawing loans and also in transferring to reserve and secret profits huge sums of money which were part of our equipment as the medium of exchange, and it is that particular loss, in our opinion, which is the implement of the depression, mainly as far as New Zealand is concerned. Now, another point, too, was that we have discovered that such monetary measures as have been taken in the past, such as the raising of the exchange, did not achieve what was expected of them, and there again this power of absorption of money which the banks possess, was, in our opinion, responsible for that frustration. We see, too, that in the United States similar measures were defeated through the ability and the instinct of the banks to acquire the medium of exchange and consolidate it in what they term frozen assets. It was so important, that we found out that nearly all our figures were subject to very wide margins of error, and we were convinced that nothing in the nature of an economic survey can be made with sufficient correctness to be valuable unless we first find out what those secret reserves are, and also to what extent their assets are correctly represented. Now, that is the importance of this survey, as far as our own plans were concerned, but in seeking for this information we discovered something which possibly this Committee might regard as being of still greater seriousness. It is this: That as far as our investigations go, the control of the greater part of New Zealand's industry has passed into the hands of the banking institution. There are some areas where the whole of the farms are in the possession of the banks, together with collateral. Now, the seriousness of the bank control is that it comprises a blanket mortgage. It would appear that no purchasing-power, no fluidity of asset, can result in that particular area and with those particular farms until the bank declares exactly what its attitude is. Much of this has been discovered in more or less irregular manner, but our discoveries made the position more and more disturbing. We have, for example, the declaration of various firms that even with the return of prosperity they doubt whether they will be able to extricate themselves from the control of the banks. Now, there are many other conflicting areas of investigation, too. It is the extent to which that collateral form of security extends. Often the particular security or real wealth submitted to the bank has been extended until it would appear that all future operations for that individual or that firm will be directed by the bank. We know that in Germany bank finance is linked with control, that they are equipped with technicians and can carry on efficiently. Here in New Zealand we have not that system of technical advice to the banks, and it would appear as a third development that, should we issue money as purchasing-power, we could not guarantee that that fund would be replaced. You will remember that when we set aside this amount, being the deficiency of purchasing-power, it is on the understanding that, should that be expended, a further survey would inevitably disclose another balance forthcoming on account of the engines of production having been restarted. Now, with this new aspect of the bank

control of industry, we have not that feeling of assurance. Altogether, therefore, there appear to be three disturbing factors which would affect the successful carrying-out of the Douglas plan as outlined to you yesterday in tentative form. The first is the lack of information in regard to the assets held by the banks. The second is the degree of security, the degree of access they have to the reserves which are nominally supposed to be free. It is very distressing when one finds a company, such as happened a year ago, with associated capital approaching a third of a million, to go into liquidation, and discover that nearly a quarter of a million is a debt to the banks. There are other more sinister rumours with regard to stock and station agents, the moving-picture business, hardware and drapery generally, and I would suggest that possibly a most fruitful and beneficial scope of activity for this Committee would be to investigate this aspect, and either give us assurance or give us more definite information, but we find that we cannot put forward a satisfactory plan, one which we claim would work without injury to all classes, until this sinister position of our financial assets is properly cleared up. Now, with that objective, and working within the four corners of the system as at present in operation, Major Douglas decided to put forward a scheme which would have the particular objectives I have set out. The first would be to force an independent audit of the banks' assets. That, I have pointed out, is essential to our economic survey. I believe it is essential for nearly all the measures that you might see fit to recommend. The second one is one of great material urgency. We are impressed that we are rapidly approaching a crisis, if not in the actual position of assets here in New Zealand, at least in their ability to reconstruct if times should recover. In order to correct that, Douglas has evolved a means whereby this passing of our liquid assets, of our medium of exchange, into fixed or immovable wealth should be stopped and reversed, and certainly we think that the very fact of curtailing this control which the banks have over property will release the business world to a very great extent from the dominant hand of finance, and one can see that appears to be the trouble throughout the world. With those objectives in view, Major Douglas put forward this scheme before you. You will observe that it is very much restricted and bears little of the larger aspects of the proposal I put before you yesterday. Paragraph I is a restriction of interest to 6 per cent. I might say that we attach very little importance to that, although most monetary reformers concentrate upon the matter of interest. The Douglas proposals are not in the least resentful of people acquiring wealth.

Mr. Langstone.] On that point would it be possible to have two forms of money in existence—that is, a free money, and a money earning interest?—I doubt it.

Because I might put this suggestion, that, seeing you have got one class of money earning interest and another class which is non-interest bearing, those who are in possession of the non-interest bearing will want to trade for the interest-bearing money, and the result is that it will force up the price of the interest-bearing money?—Yes. I doubt whether that differentiation could be done. In any case, we do not wish to attempt it. This proposal is what I might term a reconnaissance in force, and we do not think that this strikes at any fundamental changes in the money system. I say that paragraph I, restricting the amount of interest to 6 per cent., is one to which we do not attach any great importance. The particular code of the Douglas proposal is that we think there is any amount of wealth for the whole lot of us, and we are not concerned over one individual getting what might appear at the present time to be an unfair share. Therefore, we would suggest that the amount of interest could be such as the governing body in its wisdom thought fit. Now, paragraph II:—

> No bank shall increase its capital in such a manner as to affect the gross amount of dividend distributed in respect to business carried on in New Zealand, except with the consent and through the agency of a legal enactment of the Dominion Legislature. Within three months from the enactment of these proposals, every bank operating in New Zealand shall make an exact return of its assets, specifying in particular all stocks, shares, and debentures purchased by the bank, the prices paid, and the prices at which such stocks, shares, and debentures are held on the books of the bank for the purpose of the annual balance-sheet. The same procedure shall be adopted in regard to all real estate, buildings, and all other immovable property together with furniture, fittings, and appliances in the banks' ownership, &c.

Now that, I say, is to disclose exactly what are the assets of the bank, and I might say that the seriousness of that is disclosed by such publications as *Jobson's Digest*, which shows that the building figures of the New Zealand banks are not merely unfair, they are absurd. I have often discussed that with bank officials, and that admission is made, and their only defence is this: That the value of bank premises can only be estimated in terms of its function as a bank, that if they were to throw those buildings on the market, if no banks were required, their value would slump. I think that is absolutely untenable. If that were allowed in any balance-sheet, we would find that the particular premises of any firm could be written down on similar lines. I think that is not a defence, and I might say that in the July number of *Jobson's Digest* he takes strong exception to the fact that banks have repeatedly written down premises 10 per cent. per annum until their low valuation has made their balance-sheet a farce. The particular examples here in New Zealand, I think, are the facts of the Bank of New Zealand valuation. Over thirty years the absurdly small increase in their building values, I think, does not represent the increase in the real estate value in Auckland City. Another point is the valuation of the National Bank. I think that their total valuation is barely double the amount of their Shortland Street building. I would like to point out, too, that the erection of that building, which was over £250,000 in cost, shows very slightly in their balance-sheet for buildings.

Mr. Langstone.] Do you know the extra premises that have been erected over the last thirty years?—Yes. I remember your quotation. Very striking. I think the point brought before the Committee at an earlier cross-examination by Mr. Langstone, showing the respective balance-sheets for 1904 and 1934, is a striking example. I think that that increase put forward by Mr. Langstone, £61,000, would not cover the cost of the plumbing in these new buildings. Now, that, I think, should not be permitted in a scheme of national economy, that mutilation of assets ordinarily

considered to be a matter of fact and accurate balance-sheet, but more particularly is its effect upon our own figures. That represents completely demonetized assets; the medium of exchange upon which the nation relies to utilize goods and services is being withdrawn. It is being cancelled, and to that extent either new issues are necessary on loan or business is correspondingly reduced and handicapped. I feel sure that no one can object to that paragraph which demands that the banks should, in the interests of a correct survey of our national economy, give correct balance-sheets showing their building possessions. Paragraph III:—

Where it is found that the figure at which such assets are held on the books of the bank for balance-sheet purposes is lower than the market value as obtained by the sworn valuation, an amount equal to such difference shall be transferred to an account to be known as "Suspense Account No. 1." Where the bank in question operates in other countries than New Zealand, a complete return shall be rendered and a proportionate allowance for external business shall be made.

Now that is leading up to this position: That since we ascribe one of the greatest injuries to this system of the bank withdrawing the medium of exchange and consolidating it in a manner which is neither available to us nor available for audit purposes, we consider that there should be an immediate movement to put that back again, to restore it to those people and to those areas from which it was taken. Paragraph IV:—

All profits earned by the bank from any source over and above the amount necessary to pay a dividend of 6 per cent. shall be transferred to an account to be known as "Suspense Account No. 2."

That, again, is in fulfilment of this limited proposal of reversing this mechanism, to which we ascribe so much of our injury, which shall restore to the people, and particularly to those people from whom it is drawn, that money, that purchasing-power of which they have been deprived, and, more particularly, of which New Zealand has been deprived. Paragraph V:—

Six months from the enactment of these proposals an amount equal to 50 per cent. of the amount standing to the credit of Suspense Account No. 1 shall be applied to a reduction of the overdrafts debited to the customers of the bank, such appropriations being made *pro rata* on the basis of the average overdraft of the banks' customers for a period of three years preceding the date of the enactment of these proposals, and such appropriation of half the balance of this account shall be made annually thereafter.

That is the execution of this plan for restoring to those particular customers that of which they have been deprived.

Mr. Langstone.] Of course, that would be a diminishing return, would it not?—Yes.

Major Douglas says that it would not, but I think when you begin to consider the matter that it must be, because nobody would transfer to secret reserves once they had been monetized in that form?—It would diminish to a certain point, but I do not think it would diminish to zero. It would depend on the effect of this restored money in the business world.

They would not bother any more about it?—Paragraph VI:—

One month after the publication of the annual balance-sheet of any bank an amount equal to 75 per cent. of the amount standing to the credit of Suspense Account No. 2 shall be applied to the reduction or reimbursement of interest paid on overdrafts by the banks' customers, such reduction or reimbursement being made upon the same *pro rata* basis as that laid down in paragraph V.

Paragraph VII:—

A similar procedure to that laid down in the preceding paragraphs shall be applied to the accounts and assets of all insurance companies operating in the Dominion, with the exception that the funds required for (Insurance) Suspense Account No. 1 shall be provided by rediscounting the disclosed reserve with the New Zealand Reserve Bank, and that the disposition of the funds so provided shall be as in the following paragraph:—

Fifty per cent. of the amount to the credit of (Insurance) Suspense Account No. 1 shall be applied annually to pay for preference shares or debenture stocks applied for by any natural-born New Zealand subject over twenty-one years of age, to the extent that applications for shares to be paid for by this fund can be met. Such shares shall be allotted *pro rata* to the applicants without charge, and shall be registered as non-transferable and as not good security for loans. On the death of a holder, or his permanent residence outside the Dominion, such shares shall be cancelled.

That is applying to insurance companies and their reserves the same policy as that for the banks. Paragraph VIII:—

(Insurance) Suspense Account No. 2 shall be retained as a dividend equalization fund to ensure that the dividend on all preference and debenture stocks allotted under the preceding clause shall receive a dividend at the agreed rates. Should this fund increase at a rate exceeding 5 per cent. per annum, such excess shall be allotted to a *pro rata* increase in the dividend on such shares as have been subscribed for under clause VII.

This is a most important paragraph, because it places these proposals in the light of the discussion we had yesterday. These proposals were put forward on the understanding which we are pleased to learn has later been amended that this Committee was not prepared to bring under review the present monetary system. Under those conditions it appeared inevitable that such proposals as were brought forward would need to fit in with the present monetary system. We put them forward now in conjunction with our general plan as a means of achieving those three objectives I set out in my earlier remarks: to find out information which is essential for our economic survey, to reverse at once this dangerous demonetization of our liquid assets, and to make sure that industry is handed back to its rightful, its technical control.

Mr. Clinkard.] You suggest that at one period this Committee was restricted in the scope of discussion; that was not so?—That was amended later.

Dr. Sutch.] No; in the correspondence we had with Major Douglas it was definitely indicated that the Committee were going to examine the present system and would put every facility in the way of any one who wanted to examine the monetary system, and would call in other experts to this end. Major Douglas was definitely informed of this before he put those proposals before the Committee.

I may add that this was also sent with the letters to the Douglas Credit Association, of which you are a member ?—It was quite late when we received that information, and it was not until after Major Douglas had left that we in the movement were aware that banking authorities were to be brought before the Committee. I may say that we are very pleased that such has eventuated, but we still consider that these plans should be put forward by reason of their very urgency. Whatever your recommendations may be, we feel that any alterations in the present system will be clumsy, and we consider that these preliminary investigations and preliminary acts are necessary to avoid what threatens to be serious trouble and to furnish us with the basis for our later and proper scheme.

Mr. Lye.] I presume that in approaching the examination to any of the monetary systems which are being advocated by people throughout the Dominion, difference of opinion should not at any time justify abuse, should it ?—No.

I want to ask this question : Are the papers which are circulating and printed in New Zealand advocating Douglas Social Credit, officially recognized by the Douglas Social Credit movement ?—No.

I am glad to have that statement, for this reason : That every member of this Committee yesterday received a paper, one advocating very strongly indeed the Douglas Social Credit movement, and it would appear to me that it does not exercise ordinary discretion when it prints letters couched in grossly insulting terms in referring to "smug politicians." I want to ask you if you have any complaint as far as the members of Parliament are concerned with facilitating this inquiry into the monetary system ?—No ; in point of fact, I am agreeably surprised, if not delighted, at the proposal that one member of this Committee made—a most helpful one—the member of the Committee who I thought would be most opposed, and I feel quite pleased to find his helpful suggestion which prehaps later on might be the form in which we appeal to this Committee, but before we pass that point I attempted to get the interest of the Committee by starting with the ideology of the movement, to give you some idea of the enthusiasm, indeed the passion, which is underlying this monetary reform, and I feel sure that, having that, you will be prepared to make allowances.

You definitely say that, as far as members of Parliament are concerned, they have done everything possible to facilitate an inquiry being held into the present monetary system and alternative schemes thereto ?—Yes, we were delighted with their recommendation.

Yesterday, for an hour and a quarter, you took the line (I think I am right in saying this) of playing off the opinions of Keynes, Blackett, Cassell, and G. D. H. Cole and others against the orthodox economists that we have in New Zealand. Do you mean to suggest, for you certainly inferred, that the economists within New Zealand were not intellectually honest enough and courageous enough to preach a newly discovered truth—to wit, the Douglas Social Credit proposals ?—Hardly that. The case I put was that there are a great many professional economists who lend themselves to a campaign of attack upon the Douglas proposals, and we consider that, apart from their correctness, the analysis and the keenness for research of the Douglas movement should be commended by every one, but more particularly do I attack them upon these grounds that the arguments they have raised against Douglas Credit are in contradiction to those advanced thinkers in the economic world in Europe and with world-wide reputations.

Dr. Sutch.] Could you supply us with a list of their opinions that are in contradiction in New Zealand with Douglas Credit—not now, but later ?—Yes.

Mr. Lye.] Did you not suggest yesterday that the economists in New Zealand who examined these proposals and found that they were sound really feared to preach the gospel or doctrine of the Douglas Social Credit movement because they feared they would lose their job or be penalized in some way by those who employ them ?—You will remember that in order to make that point clear I used a metaphor : I said that to ask a teaching economist what he thinks of the Douglas Credit proposals is like asking a bus-driver what he thinks of the electric railway. For a bus-driver to advocate the electric railway does not mean he would lose his job ; it is that his job would lose prestige and importance in the national function, and it is quite clear that if the text-books of the University are to be revised to fulfil the requirements of new economics, those older-trained teachers must find their reputation and prestige somewhat affected.

Yesterday you stated that the banks had advanced the opinion that the factors which had largely brought about the present depression were non-monetary factors, and you complained that certain words had been left out at the commencement of paragraph 208, "on the other hand." You then proceeded to state that the following paragraph, No. 209 in the Macmillan report, cleared up the position definitely, and showed clearly that it was monetary factors which had caused the depression ?—The expression I used, summarizing it, was "Guilty through ignorance"—that is to say, it was the failure of the monetary machine to react to non-monetary factors and keep the price-level up.

That is very important. It is a short paragraph and I would like to place it on record : Paragraph 209 of the Macmillan report, referred to by Colonel Closey :—

> Our view is, therefore, that the price-level is the outcome of interaction between monetary and non-monetary factors, and that the recent world-wide fall of prices is best described as a monetary phenomenon which has occurred as the result of the monetary system failing to solve successfully a problem of unprecedented difficulty and complexity set it by a conjunction of highly intractable non-monetary phenomena. Whether the international monetary system *could* have solved its problem is a matter on which we should hesitate to express a dogmatic opinion. It is probable that the difficulty of our national problem was much increased by the relative overvaluation of the pound sterling, and undervaluation of many other currencies. But the satisfactory handling of the international problem, even if it was theoretically practicable, might have required a degree of knowledge, experience, and prescience which no one in fact possessed, or could have been expected to possess.

Now, I think that goes to support the previous paragraph ; I put it to you that it does go to support paragraph 208 that non-monetary factors were largely the contributing causes of the depression, and that the monetary defects were a reflection or the outcome of those difficulties which were non-monetary ?

—I think that, stripped of its verbiage, that paragraph is sufficiently clear. It blamed the monetary machine for not being able to deal with non-monetary factors. I might say that the particular reference I made was that "the blame was the blame of Keynes, but the excuse was the excuse of Gregory." It appears as if that can be translated into housewife's economy: "No, I cannot keep my family, because I have not enough money, because things are so dear and families so hard to maintain."

You say that there shall be established in New Zealand a national credit authority with the sole right of note-issue. Under our new central Reserve Bank Act, the note-issue is in future to be controlled by the central Reserve Bank; can the central Reserve Bank properly administered not fulfil the functions, although under a different name, of this suggested national credit authority?—No. To begin with, the basis of its money-issue is sterling balances.

I see; and what is the basis of the money of the national credit authority?—To quote Cassell, which expression might meet with the least resistance, it is the balancing of the flow of purchasing-power with the flow of consumption goods coming on the market.

Do you think that the general public will understand that definition?—Perhaps not; but I say we can elect a Credit Board which would understand that definition.

You say that this authority shall be selected and elected; how and by whom?—There again that is a machinery clause. The suggestion I have made to you was that they should be selected from as wide an area as possible—Parliament, trades-unions, unemployed, the Universities, and so on. I mentioned the importance of having all walks of life represented.

And by whom would they be elected?—That, I think, is not important. I mentioned the matter of our Supreme Court Judges with regard to their functions, but more particularly I thought the Institute of France was a more suitable model. That is a repository of certain authorities, decorations, and honours which is somewhat in the same category of being responsible to the people, somewhat directed by Parliament, but not subject to political interference.

Would the method of election and selection of those who are to be the national credit authority be on similar lines to the method employed now in the selection and election of the directors of the central Reserve Bank?—No, they have that shareholding qualification; and I wish to disagree with the fact that those who have money to invest must necessarily be in command of our money policy.

Are you prepared to admit that the setting-up of a central Reserve Bank of New Zealand is a distinct advance on the system that we have had until recently?—I think it has strengthened the interior machinery; on the other hand, I am afraid it has strengthened also our contact with outside forces.

Have you any suggestion to make; the banks to-day are not regulated by law in respect to the volume of deposits that they may be able to attract, but the banks are to-day regulated in respect of their note-issue. I think you have that fairly clear, that to-day the banks can attract and accept any volume of deposits without any restriction, but they have been restricted in the matter of note-issue. Have you any comment or suggestion to make for greater elasticity over the right to issue more notes as conditions warrant or demand?—No; unfortunately those regulations concerning the note-issue are becoming of less and less importance with regard to furnishing total purchasing-power, and, that being so, the regulation does not have the effect you desire. On the other hand, that aspect you mention of attracting deposits (which are of course loans returning) has an accelerating action, and it causes this pendulum swing which is not desirable in the interests of the nation.

Then, the statement that appears in the Macmillan report, that what is required is greater elasticity in meeting the changed conditions, but that it should not be accounted against the present system that the banks have too great a power in varying the volume of deposits; you do not agree with that statement contained in the Macmillan report?—Yes, I do. You will observe that the power of this national credit authority will not merely be to gain elasticity, but to actually give it precision. That claim is for the banks to be allowed to adjust their issue of credit to meet the requirements of the business world and of the nation. Under this national credit authority they not only will be able to do that; they will be enjoined to do it; they must at all times equip the nation with the right amount.

Do you consider that the public have an understanding of how you are going to make available to the people the additional purchasing-power that is advocated and that is required; have the public a realization of how the Douglas proposals will make that purchasing-power available?—In order to make that clear was why I spent so much time yesterday on what I term the ideology of the movement. The Douglas supporter realizes that there is available all the materials for his needs and he wants the handiest, most complete way of gaining access. The credit authority has only got to put forward a plan, and we feel sure that the public have sufficient intelligence, and possibly cupidity, to avail themselves of it without any possible delay.

Would you say that New Zealand to-day is wealthier than ever?—Most certainly.

Would you disagree with the statement that has been frequently made by responsible people in New Zealand that the purchasing-power of the people of the Dominion is largely dependent upon the margin between the cost of purchasing the goods and the selling-price?—I would disagree.

Then you disagree that the exchange value of our goods and services that we have is not a determining factor in the prosperity of the people?—It is a determining factor in one area; those primary producers who sell their produce overseas on one scale of money-values and are compelled to buy and incur their expenses on another scale of money values in New Zealand.

Do you claim that it is necessary to have at any one time, or all the time, sufficient money in circulation to equate with production?—No. You will observe that in order to meet this question I made particular use of that term "The flow of purchasing-power to balance with the flow of consumption goods."

What is your answer if I say that prominent Douglas advocates have stated that it is necessary to have, at any one time or all the time, a sufficient volume of credit or currency in circulation

to equate the production ?—It is a matter of definition, and I might say that not only Douglas Credit supporters have alternative definitions. That is a particular reason why I chose the definition used by economists, because I gathered that that would be the base of criticism, but I think the Douglas movement is clearly of the opinion that this equation is the one I have just set out, the words of Professor Cassel.

In view of the fact that you say that it is not necessary at any one time or all the time to have an equation between credit and currency in circulation and the volume of production, would you say that the velocity of circulation of currency, or credit, is a very important factor ?—Without meaning any offence, I would like to point out that you have used alternatives, three words—purchasing-power, money, and currency. I realize what you mean, and I quite understand your question, but that is an example of how carelessly we use these words. With regard to velocity of circulation, we attach no importance whatever, for this reason : That the term " purchasing-power " might mean either a large volume of currency at a low velocity or a small amount of currency at a high velocity. But, putting that entirely to one side and referring to purchasing-power, we avoid all that controversy. I am glad you raised this, and I would like to crave the indulgence of the Chairman to point out how your question was greeted by the bankers. They applauded that sentiment that we have not given sufficient account to the velocity of circulation, and they gave an example of accelerating the sale of a match-box. I would like to repeat that, not because it assists you in your question, but because it shows you how profoundly we are misunderstood by the bankers.

Dr. Sutch.] They were merely using that as a definition of purchasing-power ?—They were using it to show how ignorant the people of the Douglas movement are.

Mr. Lye.] You say " not to assist me in my question " ; I want you to understand we are examining certain proposals and seeking for information. I am not in any way biased at all ; I wanted to give you the same opportunity. As a matter of fact, I asked the same question of Major Douglas ?—Exactly. This may not be necessary ; you may think it redundant, but I crave your indulgence to show why the banks regard us with such hostility. They think we are working on paper money ; they think we have no knowledge of the velocity of circulation, and in order to expand this and to discomfit the Douglas people, they put references in front of you with regard to the buying and selling of matches. This is the point to which I would like to draw attention ; it will give you the key to this animosity between the banks and the Douglas people : Douglas says the match-factory cannot sell the whole of its output owing to lack of purchasing-power. What value is it to the match-factory that those two officials were exchanging a box of matches ? That was further accentuated by a member of the Committee in a more touching manner ; he went into the matter of bottles of beer. The point we wish to stress is this : It is the ability of industry to sell its turnover which is the demand upon purchasing-power, not the frittering and exchange of groups amongst one another. I would like to stress that, because, if you examine that carefully, you will see exactly the basis of this profound misunderstanding and criticism of our proposals.

You say that it would be necessary to have an economic survey made which would indicate a certain sum total after that economic survey had been made ?—Yes.

Would that represent what may be called community-created wealth ?—Not exactly.

Not unearned increment on land ?—No. Reverting again to my definition, it would be the deficiency in the flow of purchasing-power as against the flow of consumption goods coming on the market.

Seeing that you propose to monetize the undisclosed reserves of the banks, has the movement given any consideration to a distribution of the unearned increment or the community-created wealth which is considerable from time to time ?—Yes, that would appear in the balance-sheet ; but it would not be the beneficence that some people think it should be. It would be the basis upon which we calculate our money-issue. However, that stage, I think, is very far from our calculations in regard to New Zealand. In point of fact, we are disturbed at the manner in which debt is overwhelming our equity.

Well, then, you have arrived at a definite shortage in purchasing-power. How would you proceed, apart from the just-price factor, to distribute the purchasing-power which you say we are short of ?—Well, there are two main channels of distribution, of which I gave examples yesterday. One is to stimulate the consumption of those commodities, to get rid of the stocks which the retailers are so pathetically anxious to sell. Another channel is fixed capital investment—roads, bridges, &c., and the national credit authority would have to make two series of decisions. The first would be the amount of money to be distributed ; the second would be the partition between the consumption of goods and the creation of real wealth.

Another point I want to clear up is this : I understood you to say yesterday that the price of mild steel and other commodities was heavily down in value. Was that right ?—Yes.

So is our butterfat and all primary products in New Zealand. Yet you say it is impossible to exchange our butter or primary products for those things which we require. The question I want to clear up is this : If the things we require have fallen in price, how is it that we cannot exchange our primary products for the things which we cannot produce ourselves, if they also have fallen in price and the fall is correspondingly the same ?—The point is that we have no purchasing-power in New Zealand to buy that steel, those textile goods, that crockery, and so on.

Let us come back to that question. You say there is a definite shortage of purchasing-power in New Zealand. The Douglas proposal is to inject into circulation an amount equal to that which, as the result of an economic survey, you have discovered to be necessary. Is that right ?—Yes.

That has cleared up that point. Now, then, do you consider that the exchange-rate on London, or taking New Zealand currency as linked with sterling—do you consider that a material factor ?—

Yes; the exchange-rate is a symptom of different price-levels. That exchange barrier is assisting in the prevention of our imports.

Under your proposals you would stabilize the exchange to prevent movement?—No; on the other hand, I would stabilize prices, and allow the exchange to take up the slack in the adjustment.

I see. In the *Kaipara and Waitemata Echo* of 25th May, 1933, you are reported to have said, in answer to a question asked at a meeting in Helensville about the exchange-rate, that the Swedish exchange-rate had not varied. Now, in view of the fact that the Swedish exchange-rate has varied both in relation to gold and sterling, how do you reconcile your statement with facts? The reason I asked whether you would prevent fluctuations in the exchange from time to time was in view of your comment on the Swedish system?—A ghost from the past rising. Well, I might say, of course, that is a condensed account of my remarks on the Swedish position, and I say the Swedish position is one of the most interesting and one of the most surprising developments of applied economics. That was where the Swedish Government, under the guidance of Professor Gustav Cassell, pursued a policy of price-fixation. I said that if we adopted a policy of price-fixation we would need to allow the exchange to swing as a corrective. It is one of the curiosities of economic science that when the Swedes fixed their price-levels they were prepared for an exchange swing, but to their astonishment the exchange did not move, and the explanation that I put forward to that meeting was that economists are agreed that it was the policy of forward buying which kept the exchanges stable. That position is one of the curiosities where a price-level was fixed, of great benefit to the people, and, instead of the ensuing exchange fluctuations, it remained steady.

Dr. Sutch.] But the point of Mr. Lye's remark was that the exchange-rate did swing?—It did not swing for nine months.

That was not included in your remark just now. Mr. Lye's remark was that the exchange-rate in Sweden has changed?—Not until nine months had elapsed. I put it forward, therefore, that it is possible, though extremely improbable, that you can adjust your price-levels and not have an exchange movement.

Mr. Lye.] For a period?—That is mentioned as an exception. We must be prepared to have exchange adjustment if we vary our price-level.

We will pass that for a moment?—Only for a moment?

I do not think it is a case for levity?—I cannot say. Is that point not satisfactory? Have you not accepted my explanation?

That is not what I meant at all. I meant that, as far as I am concerned, I am leaving that point. What I actually meant was that no doubt that question will be taken up by other members of the Committee. I want to pass on to something else. Major Douglas, speaking in Wellington, said that his proposals were based on ascertained fact. He went on to make a statement regarding the Bank of England, and in his evidence before the Committee he referred to the Bank of England dividend as 6 per cent., and mentioned that as a well-known precedent for the 6-per-cent. dividend proposed in respect of the Bank of New Zealand. Well, as a matter of fact, I have it on authority that the Bank of England dividend rate is 12 per cent. How does that square with the contention that the evidence he was giving was based on ascertained fact?—I might say that that remark was an incidental one, and appeared in the press in parenthesis. It is amazing that, in all these momentous proposals put forward, critics have fixed upon that remark which appeared in qualification.

Dr. Sutch.] It was also made in his Auckland speech?—I do not think so.

Mr. Lye.] I think I am right in saying that Dr. Sutch interjected at the time he made that statement that the Bank of England rate was 12 per cent., not 6 per cent.?—We do not propose to bring the Bank of England under this scheme.

But, of course, people who are accepting very largely the Douglas proposals, which you say are based on ascertained fact are accepting that his statement is reasonably correct?—I do not think it is a matter of major importance. I say the amount of interest has always been held lightly by the Douglas movement. We consider that there are such vast reserves of wealth that we do not need to worry about what people get as interest.

I have attended a number of lectures and addresses delivered by advocates of the Douglas Social Credit movement, and I have always noticed that they have conveyed the impression that here was a means of getting something for nothing. Now, it is not your intention to get supporters by offering them something for nothing?—Well, I might say that I am prepared to justify what I have said. I am called also upon to justify what Major Douglas has said. It will be difficult if I have to justify what others have said that we have said.

I quite admit that. I am just asking whether it was part of the Douglas programme to hold out a prospect of getting something for nothing?—No, it is not a beneficent society.

Exactly. Major Douglas is reported to have said in Sydney on 9th February of this year that all over the world Communists were linking up with the Douglas Credit organization. You would not take that as an invitation that they should come into the movement?—On the other hand, there is antagonism.

I know there is. I suppose it is not much use pursuing what newspapers and periodicals have printed about the movement, but it is sometimes useful to clear up these things, because you are the accredited representative of the Douglas Social Credit movement. I have seen a periodical published by the Douglas Social Credit people (and it can be purchased at any bookstall) which states that the Prince of Wales approves the principles of the Douglas organization. Is that correct?—The Prince of Wales made use of an expression in July, 1931, when he said that the great task before humanity was to bring about a correlation between the force of production and the power of consumption—a difficult, but not an impossible task.

You cannot say that is an advocacy of your proposals?—And yet the fulfilment of that would satisfy Douglas Social Credit.

Did you say yesterday that you would ask that your proposals be tried out for a year ?—No ; a member of the Committee (one in whose ability, I think, the nation has confidence) put that forward. But I would like to say that if that could take proper form, it would be received with very great appreciation by the movement. Perhaps, however, that member would do that individually.

Would you support the statement that is reported in the *Morrinsville Post* of 3rd August, 1933, to have been made by Mr. A. E. Robinson, the Secretary of the Farmers' Union. He is reported to have said that, even if the A and B theory were wrong, they should be tried out. Is Mr. Robinson a member of and spokesman for the Douglas Social Credit organization ?—I am afraid there are no physical or national forces to control Mr. Robinson. He must answer for himself.

Are you aware of the fact that the first signatory to each of the petitions presented to Parliament has had a special invitation to give evidence before the Committee ?—I was not aware of that.

Well, for your information, I might mention that the first signatory of all petitions presented to Parliament was invited to take this opportunity of coming before the Committee to advance proposals and show why there should be a change ?—Do you accept that position on the list as an indication of competency on currency matters ?

No ; but it is usual in acknowledging petitions to communicate with the first signatory of the petition. It is the usual practice ?—We are very pleased to have that information.

I think that is all, Mr. Chairman.

Mr. Langstone.] The science of government, I take it, is to govern the country and the people in the best interests of all the people. I suppose that is the principle we operate on ?—Yes ; we recognize that.

Now, in the system that we have had operating for a long time, the motive power behind production has been a profit-making motive ?—Yes.

And it is impossible, directly we start to monetize our wealth in the form of production, for some people in the community to make profits unless others make losses ?—Yes ; except that I think there is a certain emergence of what one might call the services of management and profit. That is where I think your statement is not quite so——

I am taking all that into consideration. I say that profit is that portion over and above all the charges in the industry, all depreciation and management and all those things in the cost of running. The other is the surplus that has been taken away out of industry for which no actual compensatory return has been given. Is that not so ?—No ; I am afraid I cannot agree with you. One might call that profit the reward of risk.

If the banks take up that attitude, and say it is the reward of risk, or any insurance company, or any business, then that makes it justifiable ?—We would rather not enter that realm of social reform. Our particular objection to the banks' secret profits is the fact that they are a deduction from the people's medium of exchange. I would rather not accompany you upon these social reforms. I would like to stick purely to the monetary aspect of these moneys not being available for use.

Of course. The wage system is wrong. The wage system presupposes a profit. It presupposes that there will be paid out in wages a certain amount which will never buy back the amount of commodities produced under the system. Therefore it leaves a surplus. That surplus cannot be bought. There is a void between the two ?—Well, that is where there is a division between the Socialist and the Douglas proposals. It is not merely that we differ ; it is just that we do not go so far. We would be prepared to say that so long as a man spends his profit in buying things, and so long as the nation's medium of exchange is maintained, such other reforms as are necessary are the concern of other groups, and not of the Douglas Credit movement.

I do not suppose there is anything to suggest a natural price-level ?—No, nor has there ever been.

And the income of New Zealand or any other country comes from within that country, not from without ?—Yes.

Purely domestic income. Now, at one period we get money in sufficient quantity to sustain a certain price-level. Then something happens, and prices fall. Where has the money gone to ? I do not suppose money ever leaves a country ?—No.

If there was money in the country at one period, and it never leaves the country, what happens to the money that was formerly in circulation ?—For nearly a century our real money has had its place taken by representative money, and when that money goes back to the banks it disappears and is destroyed.

By real money I presume you mean gold money ?—That is real money.

But it is only representative money ?—It was the means of getting things.

That is the distinction between our cheque system and a metallic currency. It represents the same thing. I suppose you agree with McKenna that the amount of money in operation or circulation varies only with the action of the banks ?—Yes.

That all of our money system originates with the banks ?—Yes.

That is the origin of it ?—When we talk of joint-stock firms accepting money on deposit, and that sort of thing, it is not just the position, because the joint-stock companies bank with the banks.

Dr. Sutch : You mean stock and station agents ?

Mr. Langstone.] The stock and station agents bank with the bank, but you have never heard of a bank banking with a stock and station agent, have you ?—No. I think it is difficult to say where one stops and the other commences nowadays.

I want to quote from page 34 of the Macmillan report, where a statement is made that if a person puts £1,000 in the bank (cash—that is, their form of cash) that it becomes the base for a credit structure of £10,000—that is, they evidently assume, according to the figures, that 10 per cent. is sufficient to keep in actual cash reserve to meet the ordinary outgoings or money that was called upon. I suppose, as a matter of fact, that if the people wanted their money it simply is not in existence ?—That was

disclosed very distinctly in a special letter sent by the Babson Institute. They say that it is the foundation of the destruction of contracts in the United States of America. The commodities cannot be bought.

Have you read Foster and Catchings, Colonel Closey ?—Yes.

You will notice that in their work they figure something like this : Say, £100,000 is in production, £90,000 is in wages or salaries, there is £90,000 in sales, therefore there is £90,000 in consumption. That means a circle, and their contention is that if production is £100,000, payment should be £100,000, sales should be £100,000, and consumption £100,000. That would balance the whole thing. That is how they arrive at it mathematically ?—Yes. I might mention that system was adopted by President Hoover in the closing months of his reign in office.

I put forward that contention the other day. I want your opinion on it. I tried to visualize that we are going to do a certain work in Auckland. You touched on it yesterday with regard to Arapuni and the Auckland Railway-station, and those works. Suppose we started off and said it was necessary to have a bridge over Auckland Harbour. It will cost £4,000,000, but is going to take four years to erect. Therefore we have to put into circulation £1,000,000 a year on the average. I assume that half of it goes in wages and supervision, and the other half in materials, and that the outgoing is just on £20,000 a week. That goes on for four years. It means that there is increased purchasing-power in the community, but at the end of that period, when the bridge is constructed, that income ceases, that spending-power—that purchasing-power or whatever you call it—ceases ; but, in addition to that, the bridge, now transformed out of all sorts of materials, labour, steel, concrete, crystallizes in the form of a bridge which has to earn 5 per cent. on the £4,000,000 which has been spent. That means that there is nearly £4,000 a week in interest, so that you get £20,000 per week less purchasing-power, plus an exaction from that circulation of another £4,000 going on week after week. Now, there is a void there ?—That is a practical and useful illustration of Douglas Credit.

There is £24,000 going out, and simply because we have got more wealth from the energies of the people, and because the people have created that wealth, they have to face poverty ?—Exactly.

And that goes on with almost every capital expenditure that we have right throughout the nation ?—Exactly.

Now, you desire to inject purchasing-power in the form of giving a discount, a just-price system, and you mention 33⅓ per cent. on boots costing 15s., which you would sell for 10s. Why stop at 33⅓ per cent. ?—Well, because I mentioned that that is the figure set out by the national credit authority governed by the economic survey. It may rise ; it may fall ; it depends upon how efficiently the nation responds to the new impulse of production.

Therefore you see, of course, that every bankruptcy that takes place is a discount. If I go bankrupt for £10,000, it means that I owe somebody £10,000. That means a discount, and the goods are assigned and possibly bought at 6s. 8d. or 5s. in the pound. That means a discount has been given by somebody in the community ?—Yes.

There is really nothing new in the matter. It is only looking at it from the other side. According to your statement yesterday, you believe that that transferring of goods and services can best be done through the instrument, the money instrument, if it is properly adjusted ?—Yes.

Well, you are going to give 33⅓ per cent. without a money instrument ?—But we are using the money instrument to return to the shopkeeper that proportion of his sales through the national credit authority.

I admit that, but that purchasing-power need not be in the hands of the community that was using it ?—The wage-receiver would find that he could purchase one-half more.

I admit that readily. But from my diagnosis of the position I should say that if we fix the price-level and put money in to sustain that price-level, and if the people in the community have got sufficient money to pay the price, then why the need for a discount ?—Well, if you inject money without any State control it would lead to inflation. There would be an excess of investment.

Let us go one step further. If you fix a price-level, it cannot rise. There certainly would be profit. But if you had a Government that taxed those profits in order to distribute them among people who are not producers—I am talking now of people retired in the form of national superannuation, of our education system, which is not a profiteering institution—and if you had a price-level based upon goods and services, then, sustaining the price-level, with the incidence of taxation to bring it back into the common pool for redistribution, would not that be a test of whether there would be sufficient money at any particular time in circulation or not ?—Well, that point of view is the one put forward by Professor Robertson, and the difficulty I can see is not a great one. Possibly it would mean that the Government would be the instrument of issuing that money and recalling it. Where the State has undertaken so many enterprises it might mean a loss of efficiency. It would practically give the Government control over surplus purchasing-power ; and, though I uphold the rights of Parliament, it may not be advantageous to have, at this stage, this flow of money handled by the State authority.

Do you think that a good deal of the difficulty that has arisen is simply because of the break in the power of Parliament as a pre-emptive authority relegating that to a bank, and the bank then saying it is a matter for the Government or Parliament, and Parliament saying that it is a matter for the banks, and therefore you get to a period where it is at a standstill ?—Exactly. That is why I was disappointed because we could not get that answer from the bank officials as to whether they are pursuing a price-level policy.

Dr. Sutch.] That answer was promised to you. They said that they would give it in writing ?—Unfortunately, it is not available for our attitude to-day.

That was not the point you made to Mr. Langstone ?—I say that there is the passing of responsibility from one organization to another.

Mr. Langstone.] Neville Chamberlain who, I presume, as Chancellor of the Exchequer in Great Britain, has all the information available on these points, in giving evidence before the World Economic Monetary Commission, said, "The inevitable result of the economic conditions that actually prevailed was to bring about a progressive appreciation of the value of gold, or, in other words, a fall in the price of commodities." That actually happens, does it not?—I think it was helped considerably by artificial manipulation too.

Of course, you remember that Sir Josiah Stamp reckoned that the appreciation of gold was because during the war-time all the countries had been off the gold standard; then they coming on almost simultaneously with the demand for gold, it set up a huge demand for gold. That was his theory, but he further says that when they were talking of trying to raise the price-level at Home as a result of Ottawa they determined upon a rising of wholesale prices. That has never eventuated, and, in regard to their excuse for that, he says that in order to attain the object of a recovery in prices action is also necessary in the monetary sphere. The fundamental monetary condition of the recovery of prices is that credit should be available by a policy of cheap money, and that such credit should be actively employed. This, together with the revival of business confidence, must form the indispensable background of trade recovery. He further goes on to say that the control of monetary policy is largely in the hands of the central banks, and the practical steps to give effect to the requisite monetary policy have to be taken by them; and, in particular, by those of the most important financial centres. So that we have the position of the Government trying to do something and saying that they cannot do it without the banks, and the banks saying it is not their responsibility; it is the responsibility of the Government?—Exactly.

That brings us then to the point where there must be continuity of control between the Parliament of the country and the monetary policy of the country. This is slightly different from what the Judges are, because a Judge does not make the law. He certainly interprets and administers it—a good many of them differ too—but he is slightly different?—I mentioned that as possibly the nearest we could find in New Zealand.

I quite agree with this: That in the administration of our judiciary we would not allow any Judge to be a member of any legal firm who may be appearing for a plaintiff or a defendant; but it is possible for a person to be a controller of finance—on the directorate—and also be connected with other commercial concerns where it may be possible for his own particular position and his own bias to get undue advantage that no other person in the community could have?—Yes.

Therefore, it is to avoid that that we must have the people who are controlling our banks just as immune from that sort of thing as our judiciary are?—Yes.

Do you think that with proper organization, our Treasury and the Bank of New Zealand combined, together with our other State Departments, could have been made to function in a comprehensive and even in a detailed way to much better advantage to the people of New Zealand, both regarding our external and internal trade, than what the central bank can do?—Yes, but it would be breaking new ground to set up such an organization.

You have to break new ground, do you not?—Yes.

It is absolutely essential that we break new ground?—Yes.

Now I come to this point: You have stated, and correctly too, that the information you require is not available and will be very difficult even for this Committee to get—I am talking now of the tentative proposal put forward by Major Douglas and elaborated further by yourself yesterday; but if we take just the round figures of the wealth of New Zealand and the debt of New Zealand—I do not mean just to deal with banks and insurance companies, but all the wealth in New Zealand—we will find, according to the *Official Year-book*, that the wealth of New Zealand is nearly £900,000,000. I presume that is found out by the various returns that are sent in—not made up by the Government Statistician. It is the result of the returns sent in, and most people when sending in a return, particularly if they are going to be taxed on it, do not make it any bigger than it need be, and we have the evidence of the banks that in thirty years there were a hundred more premises throughout the country, but only £60 up in their valuation, so that £900,000,000 would not be overestimated. If we take our obligations, our national debt, at £280,000,000, and our private mortgage debt—which is very difficult to get at because some are on table mortgage and you may have borrowed £1,000 twenty-five years ago on a table mortgage of thirty years and it is now almost paid off, but in the figures of that Department it is still £1,000 until it is paid off and the last payment made—at £200,000,000 (we are near enough to the mark there, I think), and if we put down a local-body indebtedness at £70,000,000, we have a total of £550,000,000. If we take that £550,000,000 from the £900,000,000 we have £350,000,000 of ample security, of real tangible wealth, as the basis for our monetary reform. Is that not the position in New Zealand?—Yes; but I am not taken with that line of reasoning at present. It appears to me that that is the basis for bank advances, because they want the power of redeeming wealth. With our New Zealand wealth it appears to me that the power of redemption is not so important as its power to release wealth, and that, I think, is governed by the price-level, so I would not consider the backing so much as its effectiveness as a means of exchange.

I mean those people who have the assets?—Yes, that is working from the present conception. I agree that it is possibly a good line to take.

And the mere fact of getting the detailed information would not alter the general figures so very much. It might make them a little bigger. Therefore, the great problem that we have to meet is putting that money into circulation, but also putting it into the right pockets as well?—Yes, exactly.

The man who is getting a fairly good income to-day, so far as purchasing-power is concerned, does not want any more, but the relief worker, the old-age pensioner, and others, who are very essential in our community, can do with a very big increase in purchasing-power, and that purchasing-power having effective buying-power would create a demand for things. That demand would automatically bring into being, supply. Supply does not create demand, but demand does create supply?—Yes.

You mentioned about 5,000,000 ft. of timber lying in one of the Hamilton timber-yards. There is any amount of timber but the demand is lacking ?—Effective demand.

The demand is here but not effective ?—Yes.

So if we make the demand effective and that timber was taken out of the yard and made into homes, then the nation is so much wealthier ?—Yes.

And the homes are badly needed to-day ?—We are three thousand houses short in Auckland.

And yet we have a lot of houses empty, because they will not take a relief worker as a tenant because he cannot pay his rent ?—Yes.

It is not a very sound system is it ?—No. I am glad you raised that point, because perhaps it might be taken in conjunction with points raised by an early speaker in regard to our excessive enthusiasm regarding the indignation people are feeling.

I notice Sir Josiah Stamp in giving evidence before the Macmillan Commission said in answer to the question, " How far are our difficulties due to monetary causes ? " " I cannot quantify, except in the broadest way, but I should say if you take the international monetary and internal monetary and physical causes affected by money, they are responsible for the greater part, three-quarters or four-fifths of the trouble." That is question No. 3712 of the evidence, page 238. That is the statement made by Sir Josiah Stamp, who is a very eminent orthodox banker ?—And railway magnate, too.

He is a director on the Bank of England to-day. He goes on further and in answer to question No. 3714, which is, " Some of which are purely monetary, others non-monetary, and some are a combination ? " He said, " Yes ; that the preponderance is purely monetary. The non-monetary causes that are not affected at all by money causes are quite a small figure in my judgment." So that the problem that the world is faced with to-day is a question of a monetary system, a monetary policy, that will fit our economic life ?—Yes.

To-day with science and invention and increased production there is ample for every one. There is no need to fear that you will take it away from some one to give it to some one else. It means a redistribution of the wealth that is sterilized, non-monetized, through a faulty financial system, and the sooner we wake up to this fact the better it will be for the community as a whole ?—Yes.

Otherwise we may be faced with a possible umbrage from the people, so much so that dictatorship and other forms of administration would arise that would not be conducive to the welfare of our people ?—I think that is a grave danger.

While we could amble along that was just sufficient, but this sudden jolt of reduced income has begun to awaken the people to their duties and responsibilities ?—I think it is a grave danger for the nation and this Dominion.

The central bank, evidently being a bankers' bank similar to the Bank of England, just slightly different, is not going to be a means of improving the present trade position ?—Not materially.

If it was such an instrument, then the Reserve Bank of America and the Bank of England and other central banks in the European countries would have avoided this trouble, so we are justified in coming to the conclusion that as they failed there our central bank is bound to fail so far as a fundamental change in things is concerned in this country ?—I think so.

Is shareholder capital essential to banking ?—No.

A bank is a kind of repository where people place their goods and then take them back again at times and pay for the taking of them back again. A grocer would be in a good position if people put tins of jam in his shop and when they wanted them back again they would pay for them. That is like our banking system, is it not ?—Yes.

It is just a question of monetizing the credit or wealth that is created by the people to facilitate trade ; that is all a money system can do ?—In a great proportion.

Money in itself should not be a commodity as we understand a commodity, bought and sold ?—Quite.

Therefore you come to the position that there is no interest for money ?—To the extent that money is a replica of real wealth it could be contended that wealth is worthy of hire and, as money, I agree.

If there is no interest for money you cannot capitalize it, can you ?—That is quite clear.

When we are dealing with money, finance as we know it to-day has been the pauperization of industry ?—Yes.

Certificates are sold and the amount of interest or profit earned determines the value of those certificates ?—Yes, that is quite clear.

Now, if money can be brought down to what we call the zero level, where there is no interest for it, then how are you going to capitalize it ? You capitalize between the different rates of interest. You have a security bringing in 5 per cent. and I have a security bringing in 10 per cent., both of us want to sell our securities on the Auckland Stock Exchange. I will get twice as much for my security as you will get for yours ?—Yes.

That is capitalization ?—Yes.

If you get money for nothing you cannot capitalize. It has no interest ; it represents goods ; it is a medium purely for the exchange of goods and services, but it ceases to be a commodity—that is, that it may be bought and sold in the market ?—I think it would be more correct to say that it is used as a medium of exchange, and not as a store of value and to that extent the issuing authority would have to be careful that it did not issue it in too large a quantity and depreciate real wealth.

It is fundamental in this way : If my analysis is correct, we come to that point where we are going to use free money, with the capitalist system as we understand it to-day, then this production for profit has gone ?—I am not prepared to follow you so far. This free money is free to the issuing authority and free to those organizations who can qualify for it, but it would not be free to the person in the street, nor would it become a competitor for real wealth.

Let us assume it this way: You have your official authority operating here, your Credits Board, operating the way you want it. I am a mortgagor owing £3,000 on my farm, and I am not able to meet my commitments owing to the low prices, therefore the mortgagee forecloses. At one stage of the game that value must have been there or the mortgagee would not have lent the £3,000. At a certain price-level that value was there. Well, owing to the fall in prices, I am not able to meet my commitments and the mortgagee forecloses, but under the system now brought into vogue prices will rise and the security will be restored back to that point. All securities will be restored as soon as you restore the prices?—Perhaps not so far, but there will be a tendency that way.

I am foreclosed unless I can get some one to assist me. If I can go to this National Credits Board and pledge this security of £3,000 and let the National Credits Board become the mortgagee instead of a bank or insurance company, or a private person, and they are prepared to give me accommodation to assist in production, based upon that production, the same as they would give to the Government for carrying out Railway works or anything else—that is practically free money—what is the mortgagee who now gets paid back his £3,000 going to do with it?—I agree that there is a very great deal in what you say, but it is beyond the scope of the Douglas Credit proposals, because the point is that the fixing of the price-level must take into account the least injustice to debtor and creditor, and that is why this national credit authority would need to be supported by its Valuation Department, but it is quite obvious that whatever action is taken and whatever price-level is fixed as being fair, there will be above and below that great injustices—a legacy from our old system which cannot be avoided. I agree with what you have stated; it does represent the position and it appears to me that all we can do is to obviate that injury as far as possible.

Does it matter where you fix your price-level?—Yes, I think it does.

If you put the money into industry whether it is 90, 100, or 110, it is purely a point, and I agree with your contention that we should fix that point so that we should not incur any of those injustices—that is, that we should rehabilitate the position of the mortgagee and mortgagor. As prices fell the mortgagee gained and the mortgagor lost until such time as the mortgagor could pay nothing, then the mortgagee lost as well?—Yes.

But if we fix that, and sustain it with the necessary monetary factor or instrument, what does it matter as long as we regulate everything to it?—Above and below that would be debtors and creditors who have been injured. I cannot see how it can be avoided. I cannot see how we can bridge it, except that, with this releasing of real wealth and the power of making concession, we could be much kinder than we are now able to be.

I can visualize something in the very near future being done on these lines, but the point I want to get at is this: We will assume that I am a mortgagor who is going to be forced off his land. If I can go to the National Credits Board and get cheaper credit, then the mortgagee has to come down to that level whatever it is, or otherwise there is no market for his money?—I might say that has been put forward by many economists who have not followed it along as deeply and as far as you have done. They say interest must come down by a graduated scale, but they never follow it down to zero.

Is there any particular virtue in interest for money?—I think so. I think it is a regulation of our national life. I am not prepared to defend it naturally, but I think at this stage we require it as a regulating factor, if nothing else.

Does the interest for the money make the security any better or worse?—No, but in regulating applications for the loan of wealth I think an interest-rate has an effect in controlling them, more particularly between these consumption goods balances and the fixed capital investment.

But we have such an overplus of goods to-day. We do not want to lend them, we want to consume them?—Yes, consumption goods. To show you how your policy might lead to injustice I will say that if the Credit Board issued free credit for house-building in Auckland and Auckland became equipped with its three thousand modern houses, what would happen to those people who had money invested in houses? They might be injured by the depreciation of their investment.

Under any progressive system we will use more up-to-date methods; we will increase wealth by mechanical processes to a much greater extent than in the past. That will mean throwing a lot of our employed workers on the scrap-heap. In New Zealand in 1922–23 the total manifest tonnage handled at all New Zealand ports was 6,555,193 tons, and the number of men regularly employed as waterside workers for the twelve months was 6,416. In 1928–29, despite an increase in the manifest tonnage to over 8,000,000 the number of men employed had decreased by over 1,200 to 5,200; but the decrease is actually 3,000, since 8,000 men would have been given employment by the methods used in 1922. Similarly, when the ferry boats the "Wahine" and the "Maori" plying between Wellington and Lyttelton were converted from coal-burning to oil-burning, there was a loss in man-hours of 60,272 per annum. By the change-over from coal-burning to oil-burning and by the use of internal combustion engines in twenty-four vessels trading regularly to New Zealand ports, it is estimated that the man-hours required for refuelling have decreased from 300,000 to 6,000 per annum. We cannot put those people in a lethal chamber and get rid of them that way. We have to pay for them?—Yes. One prominent shipping office reckons that by rationalization of waterside work it could be reduced by one-third again.

We could go on that way rationalizing our farms and everything and we could reduce the amount of employment possibly 50 per cent.?—Yes.

So that there will have to be some ways and means of increasing the income of the people?—Apart from wages. That is exactly the Douglas thesis, that more and more methods must be sought out of creating purchasing-power apart from the wages system.

But there is this—this is where that comes in, if I may revert again to a former question: If, by the process of taxation, after once putting it into circulation, giving people first the income, because once you have fixed your price-level you will know the income that is necessary to pay the people;

credit is measured in goods now, not in sterling or gold; it is measured in goods, and you will know, if you give that and it comes back again, and then is redistributed by national superannuation and old-age pensions and those things, you are doing it in a consecutive way, but if you try and arrange a just price by a discount factor you are bringing into it a new element, a communistic element—that is, they will say, 33⅓ per cent.—make it 66⅔ per cent.—make it 100 per cent. If you can go to 33⅓ per cent. by way of a discount, you can go all the way by a discount, and you do not need a money economy at all?—I think so. I think that for the purpose of this survey, and for the purpose of regulating these two flows, I think that the money required must remain. I agree that the proposal you have put forward would not rectify this shortage of purchasing-power, but the danger I see is that it would make the State the adjudicatory authority with regard to whether that money should be spent.

The question is: Is the State thoroughly representative of the people? We have no particular interest biasing the opinion of the people. If it was truly representative would there be anything wrong in the State doing it?—I think it is recognized that when the State enters into industry, large-scale industry lends itself to it, but smaller-scale industry is liable to have inefficiency creep in, and I think that nationalization of industry should go on slowly and gradually as the people get that necessary State conscience to make it a success.

Do you think that there has been less inefficiency in private enterprise than there has been in Government enterprise?—No; not to the extent most people believe. For example, the Dairy Industry of New Zealand is the crowning apex of inefficiency, but I think that for such things as bridge-construction and small contracting the Public Works Department is an expensive means of construction.

More so than others?—Yes.

Well, often we will be faced with this, when a contractor has taken a job on often the State has had to come in and take the job over because it has not been profit-earning so far as he is concerned. We have had numberless instances of that?—On account of its greater resources?

Yes. But you would not see a State standing for two or three railway-lines running alongside of each other, would you?—No. On the other hand, it is a fact that road taxation has been heavily increased for the purpose of making the railways pay, and there is the difficulty, where one has State enterprise running alongside private.

No; the road-tax has been to make the roads better, to make them less costly. The better you make the roads the more you reduce running-costs. So, though they may be putting a 10d. per gallon tax on benzine, in having less mechanical work done in the garages on their cars and the less wear-and-tear on tires and the less wear-and-tear on the machine, really whatever they are paying out in one direction they are getting corresponding benefit in the other direction?—I think that sentiment must be two years old. Latterly that money raised in taxation has not gone back on the roads.

Only £500,000. But, anyhow, I do not think that there is any justification for earmarking taxation?—I do not mean to make a definite point. It is just this, that I feel that for the State to take over the whole of the enterprise of production will probably lead to inefficiency if done too rapidly. I am not prepared to contest that. I realize that the State must take more and more of our national functions over. It is like this: The point you are trying to get to really depends on the mass intelligence of the people. If you raise the mass intelligence of the people, then in State and private enterprise you get more efficiency.

Exactly. I agree with you on everything?—It is not a matter of State control.

Yes. The two must advance together, the interest of the people in their own affairs and the amount of affairs that are passed over to them?—I quite agree to a very large extent, but there are some things, such as post-offices and railways and banking, and that sort of thing, which, by their very character, it seems to me should be controlled by the people on behalf of the people, and there are other things, like barbers' shops, which are more personal, and can be done better by a private individual.

We have got to decide the lines?—That is so. I would not like to follow that discussion, because I do not wish to express disapproval. It is just that we are limited to our scheme of monetary reform, and we have no doubt that many of the things you bring forward will have to take their places in the ensuing years.

Mr. Clinkard.] You told us last night that the world's trade was one of barter. Why entirely blame the financial system for the difficulty of exchange. You told us last evening that the world trade was one of barter, with which I very largely agree. What I want to know is: Why, if this is so, do you so entirely blame the financial system as applied to New Zealand for the failure of our barter system?—Again using Dr. Walter Leaf's simile, money is the lubricant of this system, and it is due to the lack of this lubricant that the machinery of the barter system is slowing down and threatening to stop.

If I take your simile a little further, then, you suggest that because the lubricant through the machine as a whole is not working as it should do, by injecting more oil into one particular part or rubbing it with a local grease, you get over the difficulty of the lubrication?—Well, there is one particular point which is critical, which is holding up all the other efforts, and that critical point is purchasing-power, the ability of the man without money to get the things which are of his selection.

Do you not consider that among the factors that we are suffering from are such things as national debts, war debts, reparations, and the one-way trade which has taken place during the war between the east and the west of the globe?—Not only do I not contest that, but I say that is the foundation of our plan, that the economy of the world could not carry on under this old system. I mentioned yesterday that that was my particular approach to the Douglas Credit system.

My point is: How are your proposals going to overcome that difficulty? I cannot see that they do?—What is the particular deadlock you can see which our proposals do not affect?

For one thing, you propose, and I do not say that I entirely disagree with you, that we should have an economy internally quite apart, allowing exchange to go, quite apart from that outside, whereas

I am inclined to think that what is really required for the ultimate solution is a measure of values the world over ?—That measure of values is part of our plan. With regard to your one-way trade and those debts, the reason why nations have difficulty in paying their debts is that each nation is striving to cure its unemployment by making them work for low wages.

Quite so. By a policy of nationalism which you are advocating here ?—No. I realize that we are under criticism as to whether or not it will work within New Zealand, and I say that within New New Zealand we could resolve nine-tenths of our problems, but I would not for one moment advocate that we should restrict ourselves to purely a national economy. In fact, you will remember that when it was suggested that we were taking in one another's washing I suggested that we should make use of the steam laundry—that is make use of the world economy.

I have noticed that on several occasions the question of what really constitutes inflation is raised. Now, I would ask you this question : When prices in Britain in 1920 rose from 100 to 325 and again in France in 1927 when they rose from 100 to 836 would you say that in those two instances there was inflation ?—Violent inflation.

Now, yesterday you told us that in time of inflation we would be deflationists ?—Quite so. We would be correctionists.

The term you used was, deflationists—that is to say, you would have pursued the very course that was pursued in those two countries in order to bring about a more reasonable adjustment of the financial machine ?—No. The point is, there are various moving factors by which it can be created. You will observe that our objective is the flow of consumption power against the flow of consumption goods. Now, either of those two factors can be altered. If we were faced, as Germany was at its most acute stage of inflation, with the task of——

I think, perhaps, Germany is such an extreme case that we had better stick to France and England ?—Whichever you prefer. Had the Douglas Credit system been in operation there, this national credit authority would have discovered that the stream of purchasing-power had, by a great proportion, outstripped the flow of consumption goods, and it would have had to either bring the supply of goods up to balance or restrict the flow of power of consumption.

And so, in order to do that, they restricted the supply of purchasing-power ?—We would have been cancelling the money as rapidly as the national economy would permit, and accelerating the production of goods as rapidly as they could.

Not so much that. Was it not that they reverted from the paper currency back to the metallic standard ?—I might say that that was not done with the idea of conferring any benefit upon the national economy. It was done by those people who were the procurers and agents for that yellow metal.

I think I would take another view, that it was done in an effort to bring about a world measure of values ?—I think that is most trenchantly dealt with by Keynes in his " Economic Consequences of the Peace."

Yes, I have read that ?—And it is the attempt of those countries to restore world trade.

Quite so, and that is exactly my point. And in order to restore world trade they were endeavouring to secure a common measure of values as between their interchange of goods and services ?—I think that was only incidental. I think that their purpose was to get that export trade which Britain required.

Well, we can only conjecture as to their motives ?—Yes.

I agree with you. I suppose you are aware that at the World Conference when the question of raising prices by inflationary methods was advocated, that all those countries which had tried it, including Germany, France, Austria, Slovakia, and the rest, were all most emphatic in refusing absolutely, after their experience, to entertain any suggestion of raising prices by an inflationary method ?—We are brought back now to the definition of what is inflation.

Quite so ?—The point is, that at their lower price-level they could compete for the world's markets and they were afraid of the price-level being so raised that they would lose that value, and the crash of the Conference was brought about by the United States insisting upon this opportunity to bring money down. That is not the question of the welfare of the people so much, as this fight for overseas markets.

I am afraid we are experiencing the fact that we have to fight for overseas markets, too ?—That is quite so, and we propose to compensate that lower world level and adjust our New Zealand price-level.

For instance, you suggest, or you contend, that the difficulty that we are suffering from is the failure in our opportunities for making purchases. Is that not so ?—Our facilities for making purchases.

That is, our medium of exchange ?—Our purchasing-power.

Well, then, in view of the fact that from 1925 our external trade dropped from £104,000,000 in 1925 to £57,000,000 in 1931 and rose slightly in 1933 to £61,000,000, would you not consider that that was the cause of our internal disruption ?—That would mean that our sterling funds in London would be down by that amount. It would buy that less amount of goods which we require in New Zealand.

Yes, but then there was another difficulty. According to our Economy Committee that sat about a year back, we had to exchange 60 per cent. more of our goods in order to secure a given quantity of the manufactured goods in the market of the world ?—Except for that last expression, I agree. But here is where there is a conflict of figures. The economists compile those lists, but those wholesale rates are New Zealand and the figures I quoted yesterday are the world's wholesale figures, and those food prices have gone down less by 10 points than the great majority of the things we buy. Those figures quoted by the Economists' Committee were to show the position of the primary producer, and it is a fact that that vast difference has occurred between what the primary producer receives and what he has to pay, but he buys in New Zealand and sells in London.

But that was based on their exchange at the other end, not on their prices here ?—We claim that is not so. The point is that our wholesale level carries with it many charges. Some are invisible and some unknown. The only fair position of exchange is mid-ocean exchange, where each product carries its own share and we declare that we are better off on mid-ocean exchange than we were in 1913. It is quite true that the price-level has gone down, but the volume has increased so tremendously.

But, notwithstanding that fact, that would disrupt our monetary system here, would it not ? Even assuming that our outflow is measured in less monetary terms and our inflow by a like reduction in monetary terms, that would upset our monetary adjustment at this end, would it not ?—That is exactly what has happened, because one section of our community has borne the full brunt of that monetary movement.

And when we raised the exchange you would say that that was a correct thing, because it brought those who were suffering the brunt of that change more into line with their fellows ?—No. The intention was to do that, but it was not accomplished. When you erect an exchange barrier it prevents our people from importing, and, unfortunately, that exchange gain to the primary producer went in the liquidation of debt.

It does not prevent. It discourages ?—Well, it had the effect of preventing, practically. We will not quarrel over that. It did practically cancel all alternative importations. Now, the effect of that was that here in New Zealand the farmer did not get the extra purchasing-power. The imports not coming forward resulted in less administrative handling here and there was not the result, so that exchange movement we had a right to expect if we had injected purchasing-power here to that extent at 25 per cent., then we would have had a real gain.

But we have done so ?—Unfortunately, it did not.

Yes ?—I know that it is declared that it was so.

It cannot be otherwise. You take the export producer. He sends out £30,000,000 worth of exports, and instead of being credited with £30,000,000 he is credited here with £37,500,000. If you take the 25 per cent. addition that allows him at once to draw cheques and to make purchases and to circulate £7,500,000 more than he would have done if it had been at par ?—There is one qualification which alters that considerably. That remittance comes to the banks and they take their share of overdraft and advance to dairy companies. The dairy companies receive it and they take those various assignments upon the farmer's cheque and the residue reaches the farmer, and I doubt if it was 10 per cent. of the exchange which reached the farmer in the form of purchasing-power.

Even so ; if you admit that, you admit that the additional amount was put into circulation, whether it was taken for the payment or used to pay off an indebtedness, it does not follow, I know that it is said that when it is paid to the bank it is cancelled out till a fresh advance is made, but when it is paid to other individuals they again pass that on even if the farmer does not ?—That cancelling of an indebtedness on a declining market I think can be taken definitely. It does not issue as purshasing-power. My opinion is that only 10 per cent. probably emerges as purchasing-power, and against that there was the extra taxation due to the hardware people throwing men out on unemployed relief, so I consider that the exchange movement did not increase purchasing-power in New Zealand.

Well, we can agree to differ. I am quoting here Mr. Cole's book on " What Everybody wants to know about Money " :—

> Presumably when Major Douglas speaks of the money as " returning to the banks " this curtailment of production is precisely what is envisaged. But does the money, in fact, return to the banks ? It is, indeed, the case that individual loans are continually being repaid and overdrafts diminished. But the question, it must be emphatically stated, is not whether particular loans are repaid, but whether on balance the total volume of bank credit in use by industry is continually tending to diminish. Only if this is the case can we accept the view that there is a permanent tendency towards a deficiency. Major Douglas, in that part of the analysis which we have so far pursued, advances no arguments in support of this view. Most economists, at the same time, would accept the opinion explained elsewhere in this book that at certain times there is such a tendency for a decline in the volume of credit. But they would hasten to add, what Major Douglas does not appear to concede, that at other times there is a tendency for the volume of credit to increase and for a surplus to take the place of a deficiency.

Now, in looking up the New Zealand figures, I think it is rather interesting to note that there was no general tendency for a decline in advances here. These are the figures of advances from 1926 onwards : 1926, £48,000,000 ; 1927, £50,000,000 ; 1928, £46,000,000 ; 1929, £46,000,000 ; 1930, £53,000,000 ; 1931, £54,000,000 ; 1932, £50,000,000 ; 1933, £48,000,000. So that approximately the advances have been continuous, and though one advance may be wiped out another one is established. Is that not so ?—Yes. Will I take those points in the order in which you raise them ?

Yes ?—Well, first I might say that Cole is a competitor in monetary respects, as I mentioned yesterday. He is an advanced Socialist. He declares that we are tinkering with the present system, which must be destroyed. In his book, " The Guide through Chaos " I find these references, " Credit policy is only the accompaniment of a policy of increasing demand for goods." Now when he refers to bank credits remaining constant, not disclosing a shortage, I would like to point out he has not understood what Douglas is driving at. If the world consisted of people manufacturing spades and digging in gardens, it would be sufficient to keep everybody employed, providing the supply of spades was right.

The actual writer of this particular portion to which I refer was H. T. N. Gaitskell. As you know, it is a composite publication, though edited by Cole ?—Does Cole endorse it ?

It is under his editing ?—Well, I take it that as he puts it forward it represents his point of view. I would like to point out that Cole has, in his book, admitted as much as we want to support Douglas, but that particular phase that is brought forward is of great interest, and I would like to concentrate upon it. It shows again the inability of the people to understand what Douglas is trying to say. Now, if the volume of credit issuing from the bank is the same as it was last year, the contention is that therefore there would be no lack of purchasing-power, but this is the point :

The money that was issued last year built a machine. That machine sacked fifty men. That machine has the output of five hundred men, and the wages are less. So we find out that to be correct the volume of credit issuing from the bank must be in proportion to the amount to which the multiplication of production has been advanced. The same amount of credit will not suffice in a machine age as it did in a spade age, or it is not sufficient to say that the amount of credit coming out from the bank is on a balance.

But the argument I was taking was the statement that when money returns to the bank it is cancelled out?—It is cancelled out?

It is cancelled out in one instance and duplicated in another?—If it re-emerges it must not only be in the same quantity. It must be multiplied credit for multiplied means of industry.

I understand your argument that it should be increased, but I am not on that point now. I am combating the statement that if I pay off a mortgage, that advance, it is true, disappears, but I say that it is continued, according to the evidence we have of our banking returns, it is continued by a fresh advance to another individual?—Not necessarily, nor inevitably. It is quite a fresh transaction.

Quite so. But it is, in fact, established by the figures of our trading returns?—It is that another mortgage can emerge.

And does?—And quite a different cycle of production. And we have authorities who tell us that the banks will never restrict advances because of the want of security, because it is to their interest to increase their advances in order to make revenue. Have I made that point quite clear, that the fact that loans may emerge in the same proportion in which they went in will not prevent the need of us supplying that money.

That is another point?—You have let that point go, have you?

Yes. That is another argument. My point is, I am combating the statement that if that money is paid in to the bank it necessarily disappears from the economic system. I say that it has only gone back to the source from which it has sprung and is available for reissue, and in the normal course of events does reissue to a fresh holder?—I think you are giving money a physical existence. In that case we contend that that first mortgage is cancelled and disappears and the new one takes its place, but I believe that I am right when I say that that quotation was meant to disprove Douglas's contention that there is a chronic and inherent deficiency of purchasing-power, and that declaration that so long as bank loans remain constant that industry can function, that that is not true.

I noticed that you began your discussion yesterday by assuming a deficiency in purchasing-power. I think you established your reasoning on that assumption?—I quoted it from Hawtrey.

Quite so; and you assumed for the sake of argument that that was established?—Yes.

You established that on the principle of the A plus B?—No; upon our own personal experience; we are all short of purchasing-power.

Would you sustain the reasoning under the A plus B?—On the contrary, it is the foundation for the whole of the policy.

And then, if we take it that that is the foundation, I may assume that if that foundation were abandoned, in effect your superstructure built thereon would fall to the ground?—May I assume you withdraw this point raised by my quotation which declares that so long as loans remain constant, there is no diminution of purchasing-power?

I do not withdraw that at all?—I must say definitely that loans must increase with the increase in the need for it; otherwise industry will be crippled.

That is another issue. The contention is that so long as the aggregate remains the same there has been no withdrawal. I think you must admit that that is so?—I claim that if a loan is cancelled it is only by a new proposition and new securities that a new loan emerges.

We must agree to differ?—The last qualification I would like to make is this: You refer to New Zealand loans remaining constant; I would like to draw attention to a most serious development that is taking place in banking practice where a man who cannot pay interest has that interest capitalized. It appears in the books as though that man has paid interest and has had his advance increased, and it is being carried on on a wider scale than people know. That is one of the serious disclosures that would be made if we had this inquiry.

It may be considerable, but it could not very materially affect the position?—You realize its seriousness, though?

Oh, yes. I want more light on this theory of the A plus B. I understand it is a theory, not a system, which is established. Major Douglas' proposals are based on a theory, and not upon a system?—Yes, it is built upon a theory of observation that industry in general does not circulate enough purchasing-power to buy its products.

Quite so?—You admit that?

I understand that is your contention. You are aware that the A plus B theory has been denied by many prominent authorities?—I think "denied" is a mild word.

You can use a more forcible one if you feel disposed to do so. At any rate there are many authorities who are not in agreement with it?—Yes.

You have already said that you do not pay much attention to the contents of Cole's book?—No; as a matter of fact, I am a great admirer of Cole; I feel that, if Douglas fails, we will have to revert to Cole.

Well, there are some diagrams in this book which very clearly prove that the B payments referred to by Major Douglas have inevitably at some form of production been A payments?—Quite true.

And that consequently the argument that the A payments are insufficient to purchase the products of industry is fallacious?—Yes, that is the word.

Very well, then. Your explanation of that is, I understand—or, rather, the explanation of the Douglas exponents—that those payments having been expended in the past are no longer available for purchase, and consequently the shortage exists ?—Quite true.

That is your answer ?—Yes.

As an individual student, it appears to me that Major Douglas has fallen into one error in two particular points. That error is isolation. He isolates an industry—I think he almost invariably takes boots ; I notice you quoted boots yesterday, and another thing I noticed was matches. That was the bankers' metaphor. One particular industry is taken in isolation from all other industries and one period of time. This is the second point of isolation, as taken in isolation from all other periods of time in production. You say for instance, that because the previous A payments have been exceeded by purchase, they are no longer available, but we have a going concern and just as there were A payments which were exceeded, there are to-day A payments on articles in course of production equal in amount to these which have been discharged and which are consequently available for purchasing ? —You want me to take up that point ?

If you are able ?—This is another argument brought against Douglas Credit.

And a very effective one ?—I admit that that would be correct if our economy was the working with spades and the digging of gardens. That would mean that the man making spades would be unable to buy the produce of that garden. To that extent, the economists are right. Here is where it is wrong : It is the key of the machine ; the man who is making the machine to-day can buy the production of the machine made a year ago, but when that new machine's production goes on the market it is the production of four hundred men.

Are you not raising another issue—not a monetary one, but an industrial one ?—It is the key to the Douglas proposals, the mechanization of industry.

I think it needs a lot of keys ?—If you can work in that mechanization, you have got the key, you are on the way. If the flow of production was correspondingly balanced, there would be no repayments.

We will go on to your proposals ?—Have we finished with that one point ?

You may have done it to your satisfaction, but not to mine ?—Could we relieve Douglas of working in isolation, and take the world position ?

Major Douglas does not take a world position, but takes an isolated industry to make his point ?—Douglas takes whatever a man wishes to pursue. I think the world condition is very clearly a part of the Douglas proposals.

We are not dealing with world proposals ?—I thought you wanted me to.

It is impossible for us to deal with world proposals. How can we in New Zealand affect the world monetary system ?—You do not blame Douglas for isolating one industry ?

I say that this isolation of a particular industry in order to establish a principle fails in bringing out the result. It reminds me of the old philosophy, when a man isolated himself and by introspection attempted to determine what was the source and cause of all human action. That philosophy has been abandoned years and years ago, because it was found that different men had different motives. Consequently, that system of isolation failed. This system of isolation of an industry and the period of that industry can never establish the facts in connection with the economic system. That is my contention ?—I am prepared to take an individual industry, a nation, or the world, and prove that in every case the Douglas proposals are the only explanation for the muddle.

That may be the only explanation, and at the same time not the right one. Would you be prepared to agree with me that not only is it not one cause, but many causes that are disturbing our human factors ?—But I think the main one is this : Failure of the monetary machine to reflect the true position of the world to-day.

A little while ago you said it was the only one ?—I think they are centred in that monetary machine. These troubles which have arisen, war debts and so on, are centred in the faulty working of the monetary machine.

Or, rather, have set up the faulty working of the machine ?—The other way, I think.

Surely you would not say it was working as effectively in 1914 as it has been doing since the war ?—By taking a period of history, Douglas contentions are more and more clearly proved. I quoted yesterday that history book " Why War with Germany is inevitable." I would recommend that as one of the books approaching the Douglas proposal.

I notice you were very severe yesterday on economists. I am never severe on any one. I am prepared to believe that men of different views are honest in their convictions and prepared to make very severe personal sacrifices in order to establish the truth. I think you were rather severe on our New Zealand economists ?—I think you must remember it was retaliation.

Retaliation should never come into argument. Because one man is unjust there is no justification for another man to be so ?—On the other hand, we cannot establish our case unless we disprove these grave charges against us.

That is a different thing to disparaging those who differ with one. That is purely an expression of opinion. We will pass on. Dr. A. G. B. Fisher, a Professor of the Cambridge University and now Professor of Economics at Otago University, in speaking with reference to the Douglas proposals, said : " The main reason why, in common with many other heretical schemes, they have been given so little prominence in ordinary teaching, is that the economists usually believe that Douglas theoretical foundations are not only vague and obscure, but also erroneous and misleading, while the practical proposals based upon them are dangerous and incapable of bringing about the admirable results at which Major Douglas aims " ?—Is that in furtherance of your claim that you are not severe upon any one ?

I do not think it is severe ; I do not see anything severe in that ?—May I just add one little item of information. When you related the various qualifications of Professor Fisher, would you add that he is adviser-economist to the Bank of New South Wales ?

He may be so ; that would not affect the validity of his arguments or his opinions ; that is only a suggestion of bias ?—I add that as information.

And I have noticed that a tendency which some debaters have is to attempt to discredit those who disagree with them. I suppose I shall be discredited later on ?—One recognizes that what is stated there is that we are playing upon human credulity ; that our foundations are erroneous.

That is not what is stated. I have stated that in my opinion, by isolation, Major Douglas in the foundations of his theory is incorrect. That is not stated because I suspect his integrity, or honesty, or goodwill, or intentions. I think that Fisher in his criticism says, " that would not bring about the admirable results at which Major Douglas aims." He does not suggest any impropriety or anything of that kind ?—There is offensive argument in that extract you have read, and to my mind an Instructor of Economics should commend the investigations.

I cannot see it. When Major Douglas was before the Macmillan Committee, question 4389, he was asked by the Chairman, " We have all read your diagnosis of the position, but I confess I should like to take advantage of your being here to-day to hear from you what is your practical remedy. We as a Committee have to make practical recommendations." The answer was : " Well, I am afraid my training and experience as an engineer makes me want to hedge on that point." That is correct, is it not ?—Yes. I think that is the crowning triumph of our opponents, and it shows a lack of knowledge of human nature. If a man admits he is going to hedge, it is clear proof of sincerity.

That may be so, but it is not a proof of well-founded conclusions ?—I think it is. He puts forward an analysis and a theory, not a plan.

But it is developing into a plan ?—We have developed it into a plan, and I put it before you yesterday.

Then the plan which you have put forward is not Major Douglas ?—It is built upon the Douglas theory ; the Douglas analysis adapted to our New Zealand conditions.

Major Douglas, when he came before us, in his communications said : " It is necessary to establish the facts of the situation before proceeding at any length to put forward proposals ? " That is right ?—Yes.

If he was clear as to the soundness of his theory, even though we might not have been so, is there any reason why he could not put forward his complete proposals ?—Yes, because the facts he wants are those facts which should be available here in New Zealand with regard to the economic survey, the necessary prerequisites of a plan. Those facts cannot be got, and I am appealing to this Committee to help us in securing those facts through this instalment plan.

It appears to me that the proposals which you put forward in connection with this monetizing the reserves of the banks and so on, would have no material effect on our economic condition. The effect could not be very great. I should benefit just slightly with the reduction of my overdraft, and there are a few, perhaps, in the audience who might get a free share in the central bank from which they might draw revenue, perhaps, of 1s. a year ; but I cannot see that it would have any material effect on our social conditions ?—You think, then, that being so slight, the Committee might advocate their adoption ?

I do not, because it might set up a pernicious precedent ?—It has set up a most pernicious row with the banks.

I am not saying that I entirely disagree with you, but we have to take opposite sides, otherwise there is no argument ?—We have branches throughout your various districts.

There are two methods which were at a later stage proposed by Major Douglas. One is cited by Mr. Watt, who quoted from the evidence taken on the Macmillan Commission, and according to that it was suggested, I think, by Major Douglas, that £25 should be returned. It is on much the same lines as your proposal in connection with the boots ; in fact, I think it is identical. The main points taken—questions 4438–4446—may be stated as follows : A consumer buys a car for £100, and pays £100 to the seller. The consumer would take the receipt to the bank which would credit his account with £25. The bank collects £25 from the Treasury or from the central authority. The Treasury then gets credit from the Bank of England, thereby creating fresh credits for the purchase, and fresh currency notes are issued as required. That is almost identical with your proposals in connection with the boots ?—Yes.

On another occasion, when Major Douglas was before the Canadian Commission, I think, he suggested there again to take motor-cars, that one-half of the purchase-money might be paid by the State. Now, I just ran out the other day a few figures on the assumption, we will say, that it was announced that this method would come into operation to-morrow. Assuming that the population started out with a couple of millions to spend ; they know the good thing could not last very long so they would get in early to avoid the rush. They go out and spend, say, £1,000,000. The State would have to subsidize that, or pay back £250,000. The next day they go out ; that would increase the amount that would be paid out. If the first man went out with £1,000 and spent it, he would get a dividend of £250—a rebate. The man with only £100 could only get £25 rebate ; the man who had only £5 would get £1 5s., and the man with nothing would get nothing. That is how it would work out ?—That, however, is not the plan I put forward yesterday. Yesterday, I said that this would be a predetermined amount set to the credit of the national credit authority, and the first claim on that was for the sustenance of the unemployed. With regard to that, it could not be rushed in the early stages, except at the closing-down of the scheme. If that amount is exceeded within the period, there would be no more money issued.

First come, first served ?—Until that money is in circulation. I think you will admit that there are a good few finalities to be made out before that would be a workable system. It is not

a benevolent society scheme ; it is to get purchasing-power into the hands of the people. I thought you were going to finish that quotation from Douglas : " I would hedge on that point." I think if you had read the concluding portion, you would have altered your opinion : " I should say that what I should first want to do would be to examine the situation very closely." Is that unreasonable ?

I do not know that it is unreasonable. But it was assumed that he on the spot in Great Britain would surely have at his disposal all the facts sufficiently clarified to enable him to establish the means of getting over that A plus B difficulty ?—Here we in New Zealand do not know what bank premises are worth.

The amount to which they can possibly extend would not, under the proposals that are put before this Committee, materially affect the financial position of the people of New Zealand ?—Could you persuade the bankers that ?

But that is another matter. What may be important to an institution may be only comparatively a small matter when it comes to be distributed over one and a half millions. This is a quotation from page 4 of " Banking Policy and Price-level " by — Robertson, M.A., Lecturer on Economics at Cambridge University : would you agree with this : He said, " I believe firmly in a policy of credit control as contrasted with a policy of free trade and monetary force " ? That is your point, I take it ?—Yes.

Would you agree with the latter part of it, when he says, " I conjecture that for a long time to come credit control may prove a more difficult matter than some of these more ardent advocates would lead us to suppose, and that it may have to be investigated ultimately not as an independent panacea, but as one ingredient in a much more arduous and comprehensive programme of stabilization." Would you agree with that ?—Quite likely. Our particular objective is the monetary aspect. Mr. Langstone would do the remainder !

Dr. Sutch.] You suggested that we might get out some figures to arrive at this alleged deficiency of purchasing-power : I am willing to go into that as much as in my power. Could you give me the exact things you require, with definitions of them, so that we can get them in statistical form. For example—money, currency, capital values, all that kind of thing, so that we can get statistics ?—I would like to submit to you the opening phrases in Keynes' second volume, where he sets out what he is proposing to do—to take bank money and by adjusting finance circulation find the level of our income. I think if you took that in New Zealand conditions, you could with a reasonable margin of accuracy give us the figures we want.

You were talking about the just-price factor. There is not much use conjecturing that it will be one-third or a half until we find some figures on which we can base this fraction, and you suggested we might get them. I would like to obtain the figures for national appreciation and national depreciation. In so far as these can be statistically formulated I will try to arrive at your just-price factor ; could you give me information later ?—Yes. Thank you ; I would like your help particularly on that point.

I do not say I will be able to arrive at anything, but I will endeavour to do everything that can be done ?—You agree though that the margin of error may be a wide one ?

I cannot say what result there would be, but you cannot arrive at any definite fraction in statistical work on which you can base future assumptions with exactitude ?—Yes, with the quarterly revisions, perhaps.

More than that may be necessary. You quoted tea as an example of restriction raising prices, but earlier in your speech you stated that the restriction could not raise prices ; how do you reconcile those two statements ?—When did I say that restriction did not raise prices ?

In the course of your preliminary speech ?—It appears to me that one must say definitely that there is a slack between consumption and production. Until that slack is taken up, demand will not cause the prices to rise. In the case of tea, I quoted that as an isolated example where instead of a world glut and a collapse of prices, you eliminated competition and formed a syndicate to limit production, and the price of tea was raised to an exorbitant amount.

I agree with that, but at the same time you stated that restriction of quantities was of no use in raising prices. That is why I raised the point ?—I recited various efforts which have been tried and failed—wheat, tea, coffee, and cotton ; in all these cases they have failed because they did not have that necessary protection, that organization to fix those prices later.

That is a much better statement, but it was your general remark I was questioning. About the Macmillan report you stated that the verdict on the monetary system was, in effect, " Guilty, but due to ignorance." Do you think that that is a correct summing-up of what has been read out here. I will read out a fraction of what Mr. Lye read : " But the satisfactory handling of the international problem, even if it was theoretically practicable, might have required a degree of knowledge, experience, and prescience which no one in fact possessed, or could have been expected to possess " ? — No one in the banking structure possessed.

" No one in fact possessed, or could have been expected to possess." They did not mention banking structure, and I might add this was signed by Keynes ?—Those in charge of the monetary system find that answer faulty.

That is not necessarily what these gentlemen say ; it is your interpretation of it ?—My interpretation was of the earlier part of the paragraph, which blames the monetary machine for its failure to keep up the price-level.

I just wanted to point out that you selected one part of the paragraph for your conclusion ; I think yours is rather a sweeping summary of the Macmillan report ?—It is difficult to condense such a technically worded paragraph, but that is as near as I could get.

Here is another statement you made : " All educated areas of monetary thought say that the depression is due to the monetary system " ?—I suppose that term " educated " is subject to revision by whoever uses it.

There are a lot of definitions needed there. I have come in contact with many men in different parts of the world educated in the monetary sense, but they would not say that the depression was entirely due to the monetary system. I suppose you would say they were orthodox, not educated. It would be difficult to verify scientifically some of these general remarks which you made in your speech ?—Yes, but one, of course, must make points.

Oh, I see, you are making a point. But this is not a political arena, you know ?—Is it not ?

Not with this Committee. Your speech savoured of the political platform, and I think you would do very well in politics.—Is that an insult ?

Not at all. But that is not the type of thing we want—we want exact statements ?—That certainly was the defence put up, but since we are concerned with monetary matters, I have mobilized all the charges against the monetary machine, and I think they have made their case.

That is a slightly different expression of it. You chide us with quoting Cole. When Cole writes, he writes of the present economic and financial system and its weaknesses, and the fact that he is a Socialist does not detract from his intellectual honesty and clarity. He is quoted as a thinker, and not as a Socialist. I just wanted to make that clear, because you are inferring that this Committee was quoting a Left Wing thinker, and that therefore he should be discredited ?—Not exactly that. Perhaps I should have been clearer, but I did not want to be personal ; but he was quoted by one member who has, I think, a national reputation for conservatism, and his quotation rather shocked me. I say that I admire Cole, and we may relapse into his philosophy if we fail.

There is another term that you used rather loosely—that gold is the basis of our monetary system in New Zealand. Now, you will accept the fact that it is not, and has never been, even when we were circulating sovereigns ?—Yes, that is quite true. You will remember that when those banking authorities were before you they gave the most vague explanation of that. They held that gold here——

I am not worrying about what the banks said ?—I think we must in this Committee accept what has been put forward, and my particular task is to rebut what has been put forward by these banking officials.

Do you think the banks said that the monetary system of New Zealand was founded on a gold basis ?—They gave a most elaborate explanation of their gold reserves.

Do you think it was founded on a gold basis ?—No.

Well, you said it was founded on a gold basis in your speech. That is just the point I want to get at ?—The point is that the banks declare that their holding of gold constitutes the limit of the amount of money they can issue, and they used that in defence of our charge that they can create money. I took it that the Committee was more or less accepting it.

You know very well that we are not accepting it, because you followed this Committee very closely, and at the same time the banks would accept very largely that article published in the *Economic Record* showing that the deposits and advances in New Zealand followed very closely the variations in sterling exchange held overseas ?—That point has been developed particularly by your confrère, but it appeared to me that it was not accepted on the surface in this Committee. But I do agree that the banks continually work upon sterling balances instead of their gold holdings.

That is what I wanted. Would you say that Professor Bellerby was an advocate of Douglasism ?—No, I said that his advocacy of the distribution of money by way of bequests, corresponding somewhat to Mr. Langstone's idea, was a crude form of issuing purchasing-power apart from wages. That is perhaps the kernel of the Douglas movement.

The reason for my asking was that a friend of mine once asked Professor Bellerby what he thought about Major Douglas, and he said he had never heard of him. Now, you quote with approval Professor Gustav Cassel. He has advocated for a very long time the founding of our credit system on the production of gold. He has said that the increase in gold production has in the past and should in the future vary to such an extent that its increase will correspond with the increase in production. Now, I am not saying that I agree with Cassel, but when he holds these opinions I do query your quoting him so much in support of your arguments ?—Well, of course, Cassel is identified with that Gold Inquiry of the League of Nations. Cassel holds that world trade has increased almost exactly as the gold-production has increased.

I am not objecting to that for the past, but he wants it for the future ?—He appears to think that, and he is more or less identified with that opinion, that since world trade has not exceeded gold-production, then it is reasonable to assume that it will be able to carry on.

You quote him as an underconsumption theorist who would take up many of your proposals, but on the other hand he is one who wants to tie everything to gold ?—Where did he write that ?

He has expressed it in several of his works ?—I think that during the last two years he has changed, since the Swedish monetary system has gone off gold.

Quite possibly. Now, you accept the fact that conditions rise to a boom, then collapse. That is a quotation from your speech. Well, the Douglas theory is that there is a chronic deficiency of purchasing-power. How do you reconcile that statement with that made in your speech that we rise to a boom, and then collapse ?—Not only do I reconcile it, but it appears to me as one of the wonderful proofs, one of the points wherein Douglas is reverting to Cassel. Cassel was the man who challenged that the common explanation of the boom curve is correct.

It is not only Cassel who challenged it. Many economists have challenged it ; there are many explanations of booms and slumps ?—Keynes says that the common explanation of a boom is a period of activity, a gradual swelling of production rising to a height of excitement, and then collapsing. Cassel has shown very distinctly, and I think he is the highest authority, that if their contentions were true we should have this period of activity, of production swelling to activity, rising to a point of prosperity, and then beginning to run down again gradually. I think his own explanation is too involved to explain, but the Douglas theory explains that correctly. We have tried this process. We have the

machine-makers' wages buying what the machines were making. We had these issues of money from the bank until we reached the peak, and then suddenly the banks tried to call in their money.

Where is the agreement between Cassel and Douglas?—It is the only explanation which will satisfactorily describe that curve. When it has reached the apex, the banks start to call in what was their own issue and cancel it.

Assuming there is a cycle, I would not like to say that there was any one explanation. Wesley Mitchell of Columbia University, New York, has made a study of this, and has written two huge volumes on the subject of the credit cycle, and has not reconciled all these theories?—His final recommendation was that it was the disproportion between manufactured and consumption goods and fixed capital investment.

His conclusions were not as simple as that; however, many authorities have stressed this disproportion. Sismonde said that before Karl Marx. It is hardly new?—No; but I think the Douglas theory, to my mind, is the most satisfactory explanation of that phenomenon.

I know it is a satisfactory explanation to your mind. You mention a stable price-level as a proof (this is also a quotation from your speech) that the equation of production and consumption has been achieved. Now, in the United States of America up to 1929 there was a stable price-level, and yet all your economists, orthodox and unorthodox, whom you quote with approval, were agreed that facts proved that there was maladjustment and real inflation. You will agree with that?—Well, there, again, I have to take the banks' definition.

It does not help to go back to the banks' evidence?—I must, otherwise their evidence remains unchallenged. They are definite in their opinion that where money is issued in an irregular form there is inflation; and a member of this Committee tried to bind them down that a rise in prices was inflation, and the answer was "Yes."

I cannot agree: the banks said that a rise in prices was not necessarily inflation and that there might still be inflation with a steady price-level?—You refer to the definition of inflation. The one I accept is the one by Reginald McKenna.

Another definition of inflation—this time not the banks' one?—It is the one which I think is correct—that is, that the amount of money issued does not cause inflation until it exceeds the amount of business to be done. That is the evidence of the balance; a stable price-level.

The stable price-level occurred in the United States—the business to be done did not come into it. However, we will leave that point in the meantime. I should like to continue this, but there are other questions. Now, sir, our link with sterling does not necessarily link us to British credit policy?—It does.

You say in your scheme you would let the exchange-rate be adjusted with sterling. We in New Zealand have linked our exchange-rate to it. At the same time, British credit policy might not affect our price-level in the same way as it does the British price-level. It might not affect our export commodities—wool, butter, meat might rise in price, whereas the British price-level may be stable?—Yes, that is quite true; but, on the other hand, it might have that effect.

That is a different matter?—It could be effected then.

Possibly, but not necessarily. We in New Zealand could take all the necessary steps with the system working now to help control the internal situation, and the central bank will enable us to do it a little more easily?—By means of the exchange-rate?

That is one means. You say that every authority in the world to-day recognizes that credit should be issued on the flow of consumption goods. What about Soviet Russia?—Well, here again I consider that the Soviet Russian financial programme is one of the wonderful supports of the Douglas theory. There they have the isolation of two groups of money. One issue is by the Prom Bank for capital investment, which must not be repaid. The other, through the Gos Bank, makes issues which are for the production and consumption of goods. That is the Douglas A plus B theorum, but it took them ten years of bitter anguish before they realized that there were two series of payments. The Prom Bank issues money for the construction of buildings, railways, &c. When these loans are repaid, they must be immediately reissued in order to keep up the flow of purchasing-power.

In Soviet Russia they are not using the A plus B analysis nor the Douglas theory?—I consider that their differentiation between two classes of payments must be regarded as a support of Douglas.

They are not regulating the two classes of payments?—They are distinguishing between the two. They say that if there is a loan paid back, on what we call our local-body sinking funds—if one of our local bodies were to pay £10,000, they would be obliged to reissue that immediately, because the diminution by that repayment would leave us short of purchasing-power.

Not in Soviet Russia any more than in Great Britain?—In Russia that is exactly what happens. They are obliged to reissue any loan which is returned before the consumption of the article.

I am afraid, like Mr. Clinkard, I shall have to differ from you about Soviet Russia. I contend that the A plus B analysis of Major Douglas is not put into force there?—The point is that they have drawn the distinction.

Many people have drawn the distinction between investment in capital production and consumption?—No, it is more than that. It is a fact that if they attempt to pay back debts out of our medium of exchange, there will be a deficiency of purchasing-power. Douglas suggests that we cannot help it, and therefore we must do something to check this taking place. The Prom Bank in Russia sees that this money is sent out again when it is repaid. That appears to me to be a confirmation of the Douglas analysis following fifteen years later.

I am afraid we must still agree to differ. In every country money is relent when it is repaid—that is, if industry is progressing in a normal way. You mention Sweden, Japan, Egypt, Greece, and Mexico as countries who have partial applications of free credit. Is that right?—Not free credit, but adaptations of our proposals.

But you said Mexico had free credit, is that so ?—Mexico has a two-year monopoly of free credit for primary producers.

I think the Committee would be interested in the relevant details, and I should like you to lay them before the Committee ?—Yes, I shall be pleased to do that.

You know the quotation about the Devil—I do not mean the one about the Devil citing Scripture for his purpose or " When the Devil was ill, the Devil a saint would be ; when the Devil was well the devil a saint was he," but I suppose you are trying to dispel in this country the attitude of " Better the devil you know than the devil you do not know " ?—No, I think it is a saint that has appeared on the horizon.

You think a saint has appeared. That makes me think, conversely, of corruption. Douglas, in " Monopoly of Credit," says that Foster and Catchings are among the few economists who are uncorrupted by banking influence. Can we take Foster and Catchings as an authority free of banking influence ?—And a few others only.

Yes, there are probably one or two others ?—I say Foster and Catchings have made the nearest approach, and I know that many of our supporters were prepared to accept these two.

You mentioned that yesterday. I am only asking if we can accept Foster and Catchings ?—Yes

Well, Foster and Catchings do not accept the A plus B theorum. In fact, they devote a little space to criticizing it. You also say that the Reserve Bank has strengthened our contact with outside forces. Now, can you substantiate that ? We had before six banks with head offices outside New Zealand, or five of them had. We had not our control in New Zealand. Now, for the first time we have. Control is in the hands of New-Zealanders in the Reserve Bank. For the first time in our history we are doing it. Now, I admit our control was outside New Zealand, but it is not now, and you say that the Reserve Bank has strengthened our contact with outside forces ?—I did not say definitely that the control had passed. It has strengthened if for this reason, that our medium of exchange, our purchasing-power, our credit policy, is now built upon sterling balances. Those sterling balances are dependent upon the London price-level.

But it was based on sterling balances before ?—Not compulsorily.

Not compulsorily, but in effect it was ?—In practice it was the same, but now we are bound to it.

Not necessarily. We can have gold, and we can hold exchange in other gold exchange countries. We can back our demand liabilities with three things, but at the same time we have control within New Zealand. We have the power to alter conditions much more than before ?—Well, it can be acquired more easily.

You say that the Douglas monetary system is going to solve all our economic problems. Now, we have seen a change-over from wool to artificial silk in the past few years. That presents a problem that cannot be solved by a monetary system. You have wool being displaced by changes in tastes and new inventions in the artificial-silk line. People wear less wool and more artificial silk. You have here a complete change in the economic structure. How can a monetary system bring it about that the maladjustments that there occur can be corrected ?—I admit it cannot do that. Technologically, it cannot be effected by monetary action.

Take the farming change in the United States. They have there a huge area devoted to wheat-growing. When horses were superseded by machines, they had an even bigger area available for grain. Do you think a monetary system could adjust that maladjustment ?—Yes, by reason of the fact that if the United States can produce more by means of that technological improvement, then if we can find purchasing-power to balance it so that it passes into consumption, by so much is the nation better off.

But that wheat is sold abroad. Its price-level is determined by the price-level abroad ?—That is when the wheat price-level falls below the price-level of other nations.

In fact, there should be thousands of farmers in the United States right off the land ?—Yes, I agree that where one particular product of a nation falls below world price-level, that a reduction in production should be made.

So that you cannot fix that by monetary adjustment ?—No. You can merely distribute it amongst the other members of the community.

Also, in the States we have a change in tastes. People are no longer eating so much bread. They are going over to lighter foods—more salads and different kinds of cereals. Hence there has been a definite falling-off in the demand for wheat. Can a monetary system adjust that ?—I think a monetary system can adjust that by making labour more fluid. I agree that fundamentally it cannot effect that. Will you add that there are many people who are not eating bread because they cannot afford it ? That is the humanitarian side.

I quite agree with that, Colonel Closey ; You may take it for granted that this Committee is actuated by the highest humanitarian motives, and is trying to bring in a report that will ease conditions ?—Thank you.

You may take that for granted. Also, would you say that a big proportion of the troubles of economic society begins with the lack of knowledge on the part of industry as to how the consumer will spend his purchasing-power ?—Yes.

So that a monetary system cannot cure that ?—That is an acute problem.

It probably is acute, but the monetary system cannot cure it ?—That is the fringe, but I admit that.

It is not only the fringe ?—I think it is. I think the great dearth to-day is from those poor people who cannot buy. They will change their tastes, no doubt. But that, I think, is not serious ; it does not affect human welfare.

Now, industry in the United States had such a huge assembly of capital equipment, and was producing in such abundance, that it cleared up the whole demand. They were in a position to

put radios, electric washing-machines, and frigidaires on to the market, which was saturated even at prosperity. Would you say that a monetary system can cure that?—No. I admit it could not. That is Mr. Langstone's point.

You use the word "sinister" in regard to banking operations in New Zealand. Do not you think that an ill-advised word?—No. I do not think so.

Douglas himself in his speech said he had the highest regard for the integrity of the banking officials in New Zealand?—Sinister does not mean the motive of the banks. I think it is sinister the way the control of industry has passed into the hands of the banking system.

You think that purchasing-power, once released, can be controlled?—Yes. Your figures, I think, will help us there.

Will it come into industry as uncontrolled capital?—In this case, you will observe, it is paid to the consumer, and he is the one to determine where that purchasing-power will go.

But at the same time a country could have a stock-exchange boom. That happened in America. It happened in London, too. Nearly 50 per cent. of the money invested in London in 1928 was absolutely wasted, because of speculative activity. Now, could the money-control in your scheme affect that?—I agree that all the money-control hitherto has had that drawback, and the only scheme I know of that has not is the Douglas proposal.

The Douglas proposal will stop speculation?—The Douglas proposal would be to place in the hands of those people who are deficient in purchasing-power the extra power to buy those commodities, and the only way that could accomplish a stock-exchange boom would be if Woolworth's and all the other suppliers were to combine to produce one.

But at the same time you will have the banks extending credits to people. You are not going to interfere with the freedom of an individual to go to the bank and borrow, are you?—No; again Cole is very authoritative on that.

Eighty-six per cent. of the credit that was issued in the six years prior to the boom in the United States did not go in the processes of industry, but went in speculation on the New York Stock Exchange. You cannot very well control what an individual does with the money he borrows from the bank?—We can direct the channels into which his money is introduced.

That is a different thing. You are starting now to direct channels. You are starting to get a greater hold on the economic system, and are telling the individual what he must do with the money he borrows?—No, we are just suggesting that if you can buy boots at one-third discount we advise you to buy them.

But you have just told me you would direct the money into different channels?—If this discount is applied to various articles, I think it is only fair to assume they will buy them.

The flax industry in New Zealand has been pretty well wiped out of existence, and so has the kauri-gum. It was wiped out by something that was non-monetary, and had nothing to do with New Zealand's monetary system. Will a monetary system adjust that?—Well, I am afraid we are at cross purposes with regard to what caused that. Was it not rather a clumsy attempt at rationalization which caused the kauri-gum industry to collapse?

Not necessarily. But will a monetary system fix it?—We could export these products and profit by them if they did not collapse lower than the comparative price-level outside.

If they collapsed lower than this point, our monetary system in New Zealand could not help it?—I believe that flax and kauri-gum can again be exported.

I think so, too. But I do not think it is going to be due to the New Zealand monetary system?—I think the monetary system might restart it.

In calculating your price factor, you are calculating on something that has happened in the past. You will admit that, therefore, it must always be out. It is going to be used for something in the future; it is calculated on last year; so that it can never be exact?—I think it is as exact as anything in life can be.

Well, that definitely is a defect in your system?—I think that defect applies to everything.

Arriving at this price factor, Onakaka iron is an example of something with potential value. Would this be something which would be included in the figure which was to give your price factor?—Yes, it would.

Despite the fact that, even if costs were reduced, Onakaka iron will not necessarily be able to sell in New Zealand?—It would be according to the proportion.

What proportion?—The proportion to which the world price-level had come down. I do not think that Onakaka iron would ever be payable.

I do not think it will, either, on its present scale of operations. But you have told me you are going to include it in your calculations for the price factor?—If it were of sufficient importance to make your price-levels worth while, then it would be.

You may not necessarily alter price-levels, you are cutting an individual price below what it was?—Let me particularize upon that point. This is how we would approach it. You cannot produce Onakaka iron paying 15s. a day when the Madras iron-fields pay 5d. You cannot produce iron while the Lithgow works are under a State subsidy in New South Wales.

I might agree with everything there, but my point is this: How is your monetary system going to adjust that?—I say you cannot, unless by an adjustment in electrical power you can make an electric furnace available down there. Otherwise, this iron cannot be put on the market at a price which will make it worth while for New-Zealanders to work.

That is interesting. I wanted to arrive at that. You have a world price-level to be taken into account. Look at the world price-level for butterfat—6d. or 7d. per pound. Can our butter industry be carried on under those conditions? Is that to be included in you calculations? How could it be calculated?—I think it can be done. I think we have a pre-eminent capacity to turn out high-grade butter.

So do I. But you just told me you were going to judge all this by the world price-level ?—Yes, and if we find that Onakaka iron cannot sell at the world price-level and recompense us, we would not pursue it, and would not regard it as an asset.

And butter is not the same ?—Well, I think that butter, taking into consideration the cost of production, quality, and what it commands on the world's markets, is indeed our most profitable industry.

Now you are leading a little more to planning. We can plan everything, as in Soviet Russia, or must we leave production planless ?—I do not think so. I think those are not the two alternatives.

Without planning and control, butter will always be subject to fluctuations of the market ?—I think that the nation needs progressive vocational planning for its people.

Planning—yes ; that is what I thought you would have to come to—economic as well as monetary planning ?—You will find it cannot possibly act without controls coming in. Well, that is not our concern. I say, and I have said repeatedly, that that undoubtedly will come into the forefront when we have got our monetary problems solved.

Is that part of the Douglas plan, then ?—No. You yourself say something must be done. Here is the very system to put that into effect. In future, we must plan.

Is that put before the Douglas Credit people ?—Yes. In fact, many of our supporters have other policies of reform besides monetary ones.

So that to bring your scheme into working-order you would have to do a lot more planning ?—Yes.

Mr. McKenna has said, " In America a relatively small part of the additional money provided by the Reserve Banks in the period 1921–28 was used in trade and industry. Much more was employed in speculation which was notoriously carried to an extreme." You are still going to have that trouble ?—I do not think so. Again, I think that applies to all the schemes you have considered except the Douglas one, which is injecting at a point where the money is needed.

You are going to leave lending institutions free to lend their money ?—That will come under Mr. Langstone's control later on.

You see where you are leading to ?—We limit our objective to secure control of the people's credit and I think beyond that at the moment we consider we are justified in limiting our efforts to control the money-machine.

Under your system you can still have individual choice. People can do what they like with their money. You can have all this kind of thing the Bond-issuing Commission is investigating ; you can have stock-exchange speculation and so on unless you get to the controlled socialistic situation that Mr. Langstone wants ?—I think you will find that the governing factor in all this wild speculation has been this desperate search for something safe to invest in and to do away with the uncertainty as to what the future will hold.

Your scheme is only one alternative of the Douglas plan. Douglas has also suggested a national dividend and putting out a quantity of purchasing-power quite apart from the price factor. You are not adopting that ?—The point is that we may have to adopt that. If we were a completely settled, well-balanced community with the country in good order we may find that the only way to distribute purchasing-power is by a national dividend. We might find that we would have to start it quite quickly, but as far as New Zealand is concerned we feel that there is enough work to employ every man and woman, and we have a long way to go.

In assessing the price factor it is the net investment over a period that you want to arrive at ?—Yes, to arrive at the reduction factor.

But the net investment of a country is greatest at the top of a boom, when we are more prosperous ; so what you are going to do is to inject this purchasing-power—to use a term of yours—at the top of boom, and in a depression when the net investment is nil or very low you are not going to inject it because you have no investments ?—The point is that that apex of the boom will not occur under Douglas credit.

That is an obvious reply. We are at the bottom of a depression now ?—When you are at the top of a depression people begin wondering whether it is safe, and they look around for investment in net capital projects. Under Douglas this sudden depletion of purchasing-power would not happen. There would be a constant demand for goods and there would be no insecurity in the business world as to whether things were safe or not.

But come back to my point. We are at the moment at the bottom of a depression. We are going to calculate the price factor and we may find there was no net investment in New Zealand in the past year, that, in fact, national appreciation might be less than national depreciation, so that our price factor will be 1 and the price will remain the same ?—I agree. In these figures that you are going to get for us they will vary probably over a long time.

If the fraction is 1 you are not going to reduce prices at all, and we must get out of the depression by some other means ?—You must allow for other considerations and not make that zero.

I am making the fraction 1, that is, the ratio of appreciation to depreciation is unity. Now, if the price factor is one-third, then that much purchasing-power is freed. That would be applied to buying other goods ?—Yes.

Those goods are in the warehouses, they are bought, there are no more immediately handy. They will have to be produced and orders sent in, then prices will rise ?—Until those replacements came in there would be a tendency for prices to rise.

That would happen ?—You would cut them down by one-third, and your quarterly balance-sheet would show the fact that the price-level is rising—until commodities had been restored, and you would slow down the purchasing-power ?

You admit, then, that inflation would develop, but it is not so easy to stop it ? This is the position : you cut prices by one-third and release that much purchasing-power which is applied to other goods. Their price rises and they are cut down by one-third, thus releasing some more purchasing-power which

is applied to other goods and so on *ad infinitum*. Is that the process?—You are assuming that prices will rise in direct proportion to the amount of purchasing-power issued.

No?—I consider that this purchasing-power issued would be just enough to take in the slack, and that there would not be a rise in prices, and from what I know of the manufacturers of New Zealand I would say that there is any amount of facility and willingness to replace stocks.

Your price factor is calculated on the net investment in the past year, and yet you say it is sufficient to take up the slack at present. Those are two different unrelated things?—I think they are, but that is my rough calculation that the amount of purchasing-power would have the effect of taking up the slack. That, of course, would be governed by your figures.

I have not looked through your proposals very closely. Every other witness has had to submit his scheme in advance for us to study, even members of Parliament have had to submit their proposals ahead. You have been privileged in bringing your proposal along with you when we were prepared to discuss what Douglas put forward?—Privileged or astute.

Privileged. Do you think that physical cost, apart from financial cost, of production comes into it?—Very strongly.

It does?—Yes.

So that the monetary factor cannot solve everything?—The financial aspect is the reflection of the physical, or should be; it is an indication.

So that if we are physically able to produce something, that should be the basis of the credit we are going to issue?—Exactly.

We can physically produce bananas on Stewart Island—that is an extreme instance, I know—would you take that ability to produce bananas on Stewart Island in glass-houses as a basis of credit?—No, because we can purchase those bananas from Fiji so much cheaper.

You miss my point. That is what we do, but, when it gets to something like Onakaka iron, the cost of production of which is a bit closer to the price at which we can buy it outside, then your problem arises?—If the thing is developed gradually and scientifically we would reach this position: That we are doing all the things we can do efficiently and we have a superabundance of labour. We will put those men to work upon work which can be more efficiently done here than elsewhere, or we will let them remain with more leisure.

That is more planning?—Yes for leisure or for production.

You say we have no workable medium of international exchange. If exchange-rates were stable, would we have a workable medium of exchange?—What do you call stable—a reflection of the true price-level?

Fixed. Stable in terms of 125 New Zealand pounds equal £100 sterling. We stand at 125 with sterling?—But the depression has fixed the exchange-level.

That is not my point. If we had these fixed rates would that be an international means of exchange? If we had a sterling bloc with the rates on sterling fixed would that be a medium of exchange between those groups?—No. The third division of that plan is foreign sale and purchase of exchange, which would regulate that contact with sterling.

You say we have no workable medium of exchange. I say that we may have a sterling group with fixed rates on sterling. There you have a workable medium of exchange?—Reverting to your previous point that our physical production should be the basis of our financial system, why should we be linked to a sterling group as our standard of exchange?

But we have a workable medium of exchange; I am not at the moment worying about whether we should be linked to sterling?—Supposing a sterling position, I suggest you must control your credit, and as we look around we say this is the price for credit. That would mean an equation between our New Zealand policy and sterling policy.

I am afraid we will have to leave that point since you are not disposed to answer it. Talking of foreign exchanges, you say that our imports have fallen in price as much as our exports. We will not discuss that, but leave it to the figures we are going to get out later, but even if import prices have fallen we still have a problem; we have a fixed body of interest payments in London; we have probably fixed shipping-rates (which you have not taken into consideration in your mid-ocean exchange). Those are fixed sums that have not fallen or fallen only slightly, so we have a smaller proportion of sterling exchange to pay for imports; and even if our imports fall as low in price as our exports we still cannot import as much as before?—We have the mid-ocean exchange allowing for shipping, but at the same time I do agree that this is a problem we cannot solve—our foreign indebtedness. I think it is a question of political ethics, possibly, as to whether we will be paying back a certain ratio of money to goods, but I do agree that that is a problem which lies outside our monetary cure.

It lies outside, perhaps, but it affects our situation so greatly that we cannot claim that any monetary cure in New Zealand is going to ease that situation. In connection with increases, we now have to send one ship in three to pay our debt, whereas formerly it was one in six?—Still our production has increased. I think we can overcome it, but I agree that it is a serious point.

Mr. Langstone.] The total production of New Zealand, less than 10 per cent. is taken in payment of debts overseas?—Yes.

Dr. Sutch.] If our exports fall in value to the extent they do under the situation I have just outlined, would you agree that that was lowering our national wealth?—If our imports fall.

If imports and exports fall in price together, would you say that the net result was a lowering of our national wealth?—No. So long as we receive back in exchange for our exports goods in equal utility and value we have not gone down in national wealth.

But we receive for our exports debt payments, shipping, and other things, and also imports?—I thought we agreed on that point. I believe those debt payments are an unscaleable load.

The fall in prices of our primary products has reduced the real income of New Zealand to a great extent because of the rigidity of our debt commitments; that is true. You say "experience having

shown that raising wages merely adds to prices." Prices have risen and fallen for many years but wages have increased. I do not accept your contention that because wages rise prices must rise?—I think that from the point of view of our contention of purchasing-power that is inevitable, that is to say, that if a bootmaker raises his workmen's wages 10 per cent. he will add that 10 per cent. on to his price. I think it is to be assumed that increased wages will not increase purchasing-power.

But there are other factors in industry besides wages. A 10-per-cent. rise in wages might mean a 2-per-cent. increase in price or no increase at all. Henry Ford has increased wages and not raised the price of his cars?—Yes, there is that question. It is not mentioned. One cannot express in one pamphlet all the applications of finance.

Your pamphlet statement is a very definite one?—You say increasing wages is not a means of increasing purchasing-power?

Sorry; I did not. That is a different point. With your price factor you would have a blanket reduction of one-third, for some things you would have one-half, some one-fifth, one-quarter, one-sixth, one-twelfth, and others nothing?—I agree, but it is most difficult to explain. What I suggest is that since we are vendors of electricity and transport they could be weighted. We would give a bigger discount on domestic electricity and take a little off others.

That means planning again? I am glad you appreciate the wide ramifications of this scheme. I see that it means taking every price in the community and assessing some fraction of it. Some of these fractions come to one-third, but each individual fraction is not one-third?—Yes. If the ultimate advantage is worth while a variation will be brought in.

That is quite clear. Major Douglas said that, as well as equating purchasing-power and consumable goods to all goods in the community, he would equate purchasing-power to the second-hand goods as well. Are you going to do that?—That would come within the survey. Obviously that would come into the project if the goods are for sale.

That does not come into the question. They were second-hand goods and he included them?—I cannot see how that can be avoided. How can you distinguish between a second-hand article and a reconditioned article?

I am not proposing to distinguish them?—They cannot be separate. One of the great flows of goods come from the time-payment people as returns; they must go in as the flow of consumption goods awaiting sale.

I have a piano at home which can be regarded as second-hand goods for the purposes of this discussion. That piano is not necessarily going on the market?—Then it does not come into the calculation.

What you are going to do is to go around and say, Are you going to sell that or not? This piano is second hand, do you want to keep it? It is just the ramifications of this plan I want to get at?—We are not bent upon securing a sale. We are bent on introducing into New Zealand £7,000,000 of purchasing-power.

You said that was only a tentative amount?—Our objective is not to sell the goods; the objective of the Douglas proposals is to get £7,000,000 into the possession of the people as purchasing-power.

But you stated that you were going to assess the things that were going to come in as second hand?—It does not want a detailed analysis for that.

When we put your plan into operation, assuming that we do, a detailed summary would be necessary?—I do not think it affects the formula to any great extent. I think the margin of error will allow for that.

You cannot establish a ratio between two things until you get them priced in a market. If you have some legs of mutton you want to sell you do not know what they are going to sell at until you have the money units already given. Without a given supply of money and goods there can be no price. You cannot equate money and goods because there is no common scale on which to equate them?—It is relative, but you must do it otherwise there is no means of calculation.

You would fix a price; until the goods come into the market that price does not arise?—The goods are on the market. They have their fixed prices—that is, the first detail you work from your calculation is the money to provide those.

Can you tell me the value of a ton of butter?—The amount of physical support which it will give to a man with a family.

So that the value of a ton of butter is not determined at all by cost of production or demand; it is going to be determined by what you have just confessed to me. I think it is important—another solution of the problem of value?—The point is that neither of us have the mentality to follow that to the conclusion. We cannot find any common denominator of value; we can only get a sense of values.

But you have given me a standard, a somewhat vague one, which you are going to apply in this Douglas credit?—I just give it to you as purely an abstract basis to work from.

But you must have some basis. You are valuing a ton of butter on its power to sustain a family. That, theoretically, is how you are going to proceed. That is all I wanted to get at. Is it necessary that consumers should have enough money to pay for the immediate costs of producing consumption goods?—No.

It is not necessary?—No.

In Great Britain, payments between producers are roughly nine times as great as payments to consumers. In the United States of America the figure is 11—that is, 1,100 per cent. The resultant disorganization of industry caused by issuing an amount of credit equal to this total of A and B payments would surely lead to chaos?—No, because our calculation is not based upon the differentiation between A and B payments. We would want those figures that you have offered to help us with. There are other factors, the time and destination of the money. Deficiency of purchasing-power will be the determining factor in calculating what are A and B payments.

Do not you accept the A plus B theorem ?—As an analysis of the deficiency of our purchasing-power I think it is the discovery of several centuries.

You accept the A plus B theorem and I have given you some figures which indicate that the B payments are eleven times the A payments. To make up the deficiency you would have to increase the A payments 1,100 per cent. ?—That is not true ; they have misread what are B payments.

Even if you accept the A plus B theorem, do you say that in the A plus B you have a cure for it. In reality your cure is based on the net amount of investment ?—No. The amount of goods awaiting purchase here in New Zealand. The amount by which that exceeds the purchasing-power is the basis of the A plus B theorem.

I can see no correlation ?—The A plus B theorem has been brought into the foreground because it is the happy hunting-ground of our economists.

You told us yesterday the just-price factor was the happy hunting-ground ?—This morning it is the A plus B theorem. If the result of that analysis is deficiency of purchasing-power it is disclosed in the economic balance of national economic survey.

You have already agreed that the deficiency of purchasing-power is represented by the balance of net investment ?—The amount available for net investment.

Not at all. It cannot be available ; it was spent last year. You are going to base the estimates for 1934 on the 1933 figures ?—Has that disclosed deficiency of purchasing-power ?

Anything that is disclosed can only be so disclosed by what has been done in 1933 ?—That is not sufficiently clear for our purposes.

Previously you agreed that those figures would be sufficiently clear for your purposes. I do not want to go into the A plus B theorem, but does Douglas mean that total A payments tend to fall below not the A plus B payments of the whole system but the A plus B costs of the retailer ?—It is the retail point where the valuations are made.

Does that answer my question, " Does Douglas mean that total A payments tend to fall below not the A plus B payments of the whole system, but the A plus B costs of the retailer " ?—The A plus B of the wholesale system ?

No, the whole production system. Does he mean that ?—There is where your figures are beginning to multiply ; you have forgotten the time factor.

I have no figures ; I am discussing Douglas theory ?—You must have one or two to strike a balance. You cannot take one point. You have to trace that system through the manufacturer and find out in periods of time where those A payments went to.

My question is still unanswered, but your reply envisages some more planning and control and investigation of every stage of production here and abroad, and it applies differentially from firm to firm and factory to factory ?—I will give our favourite attack—if you brought all the industries into one room the A plus B theory would vanish. It is the time factor which explains that.

If you can explain to me the answer to my question as to what Douglas meant I shall be very happy.

There is another question in connection with the price factor that I did not ask. This is just for the purpose of further clarity. Services are one of the major things for which we exchange money. Would you apply the price factor to services also ?—Those services which are directly connected with the production of consumption goods.

So that the services of an actor, a lawyer, a doctor—they would not have a price factor applied to them ?—No.

They would still be just as expensive as ever ?—Yes.

That is interesting. And when you are calculating your price factor, do you include services in the calculation ?—You will observe that those items I submitted were those which would cover roughly necessaries of life, and they would be varied, of course, by the national credit authority, and they would, as I said before, be variously weighted.

Yes. I know you would weight them, but in calculating this national appreciation and depreciation would you include the values of services ?—You would have to qualify that with regard to the immediate utility of those services. For example, our unemployed would have to be very seriously written down. We could not say that they are directly standing by, ready to produce new goods. That would be a matter of technical, shall we say, conjecture, the degree to which they would be immediately available.

Your reply is not very clear. You also say that a true indication of the amount of purchasing-power is always the goods awaiting sale ?—Yes.

Is not that a somewhat different definition of purchasing-power from what you used earlier this morning ?—No. We have the flow of purchasing-power, the flow of consumption goods coming on the market. If they are coming on the market they are awaiting sale.

And that is your flow of purchasing-power ?—Yes.

Whatever the value of those commodities to the people is not a factor ?—You mean what their real physical value would be ?

I do not think you could define the physical value of any commodity ?—I agree.

What I mean is : There are the goods. Whether the people are going to buy them at a certain price or not does not come into the question in your scheme ?—No. The current physical needs of the people in consumption goods would be the nearest description we can get to that term, the flow of consumption goods coming on the market.

What I am getting at is the difficulty of valuing something that has not had a value put on it by entering the market ?—Yes. I agree that there would be room for error there, but I think the errors would be compensating. I think it would be for the Government to make an economic survey.

There is another point, and that is : The remark has been made that our national income has gone down from so-much in 1929 to a certain amount this year. There is a difference of £50,000,000 in the national income. The question is this : Where has this money gone ? Perhaps you can tell us ?—That is what we are trying to find out.

This is a question I am putting to you ?—The slowing-down of services, the non-utilization of services, the destruction of the various processes which ordinarily provided us with income.

So, as a matter of fact, it is not really the destruction of money ?—Are you speaking of the financial income or the real income ?

I am speaking of the favourite quotation of speakers in this country. The national income is something that is computed not exactly, but it is an estimate, and it is certainly not real wealth, whatever you mean by that. It is a money calculation ?—Yes. It is a money calculation but a physical return.

Well, there are services in it as well as physical things ?—Yes. It has been brought to a slowing-down process by reason of the lack of the medium of exchange.

It does not mean that £50,000,000 of money has disappeared ?—It would mean that that amount of the medium of exchange has indeed ceased to operate, and as far as the incidence of it is concerned it has disappeared.

That amount of the medium of exchange was probably never in existence in New Zealand. Now, getting back to the Douglas proposals when he met this Committee. What does he mean by the statement that his proposals do not traverse the existing system ?—He means that it does not involve any readjustment or any criticism of the present system, assuming that you are satisfied, as indeed he did.

Assuming that—— ?—You do not propose to make any rearrangement of the present financial system.

It was not a matter of what we proposed to do or what we assumed. It was what his language meant. He said that his scheme did not traverse the existing canons of finance. This word "traverse" was used by you differently in your speech. I merely wanted to get at his meaning of it ?—I think his meaning of it was that it would not move across. It would not in any way be in opposition to what are termed now the canons of sound finance.

You will realize that there are one or two involved things in this statement that have not yet been cleared up. For instance, there is this one that has been picked out. What did he mean in paragraph VIII of his proposals when he said that, "The dividend on all preference and debenture stocks allotted under the preceding clause was to receive a dividend at the agreed rates" ?—I take it that it is a guarantee that this dividend shall be paid on the shares which have been acquired.

But the reading in short is this: "The dividend shall receive a dividend at the agreed rates." That is what in effect, it says ?—I think the meaning is clear. The implied meaning is that it is to make sure that those dividends are paid out to the recipients.

The language is certainly not exact ?—I think the intention of that clause is fairly distinct.

There is another thing I would like cleared up. He used the term "preference shares" and "debenture stocks." Why did he choose those two terms when he meant one thing, which was neither of these phrases ?—As this will be something quite unique, I suppose he thought that there was some doubt as to what was the exact term to use. I know of nothing in present-day practice which would be the equivalent to this distribution of practically what one might call gift stock.

There are one or two other things like that, that occurred to me in reading it through. For instance, his use of the word "natural-born." He meant "native-born" surely ?—Yes.

And another statement that Douglas made was this: "This creation of credit needs only a physical basis." It was the word "only" that worried me. Can you explain that ?—I think he is trying to discount this feeling of worship for a metallic basis.

But that is a bald bare statement is it not ? "The creation of credit needs only a physical basis" ?—Yes. Still, I think that it is not ambiguous.

No. It is not ambiguous, certainly ?—It could have been expressed better, perhaps, but I think he means that so long as we have those tangible assets that credit can be created. Where does that occur, by the way ?

That is in his replies to questions—not in his actual letter. In connection with this monetization of assets, I have looked into some figures in the United States to see what would happen. Could I read some of these out, Mr. Chairman ?

The Chairman: Yes.

Dr. Sutch.]

The following table sets forth some figures estimated for the continental United States:—

1. Date.	2. Wealth.	3. Income.	4. Transactions.	5. Money.	6. Wealth: Money.	7. Income: Money.	8. Transactions: Money.
1900	88,517	17,965	194,000	5,620	15·7	3·2	34·5
1904	107,104	..	256,000	7,130	15·0	..	35·9
1910	..	30,530	415,000	8,920	..	3·4	46·5
1912	186,300	..	474,000	9,880	18·8	..	47·8
1922	320,804	65,500	..	21,700	14·8	3·0	..

Columns 2, 3, 4, and 5 are expressed in millions of dollars.

Column 2 is derived from the United States census.

Column 3 is taken from W. I. King's "Wealth and Income of the People of the United States," which is based on the United States census.

Column 4 is taken from I. Fisher's "Purchasing-power of Money" and refers to the money value at current prices of all monetary transactions in the United States of America.

Column 5 is taken from the same work, and refers to the sum of all means of payment in the United States of America—coin, bank-notes, and bank deposits liable to be drawn on by cheque.

Columns 6, 7, and 8 are derived by dividing the figure of column 5 into those of columns 2, 3, and 4 respectively.

It is thus seen that the amount of money in use in the United States of America between 1900 and 1912 was between one-fifteenth and one-twentieth of the total wealth of the country, less than one-third of its income, and between one-thirtieth and one-fiftieth of the money value of the transactions that it effected. You follow that?—Yes.

Well, I do not suggest that this applies to any particular proposals. Perhaps it may apply to what has been said elsewhere:—

> Let us consider the effect of applying the proposals of the monetary reformers to a country in which the amount of money in use is one-fifteenth of the money value at current prices of its aggregate wealth. All wealth which is not already pledged to the banks is taken to the central institute and "discounted" for notes or checkable bank deposits. The volume of money is increased fifteen-fold. Prices would rise correspondingly and the money value of wealth would consequently appreciate. It might not appreciate proportionately to the increase in the quantity of money, but it would probably rise to at least ten times its former money value. Thus only one-tenth of its new value would have money issued against it, leaving nine-tenths of its new value available as a basis for the further omission of money. This would raise prices still higher and leave a further unpledged equity to be "discounted." In this way a cumulative inflation would be set up, ending in a complete collapse of rational monetary accounting, as in France at the time of the assignats or in Germany during the years 1920–1923.

Now, I take it that the kind of thing that I envisage there is not what Major Douglas means by "discounting" assets?—No.

He does not mean that?—No.

I wanted to make sure of that point. In creating the Suspense Account I take it there will be different amounts from different banks. I am referring to writing up the value of bank assets in his scheme?—What section is that?

Banks Suspense Account No. 1, paragraph III?—I have not it with me.

Shall I read it?—Yes.

"Where it is found that the figure at which such assets are held on the books of the bank for balance-sheet purposes is lower than the market value as obtained by the sworn valuation, an amount equal to such difference shall be transferred to an account to be known as 'Suspense Account No. 1.' Where the bank in question operates in other countries than New Zealand, a complete return shall be rendered and a proportionate allowance for external business shall be made." I take it that each bank would keep that Suspense Account?—Yes.

At that rate there would be a different proportion applied to the reduction in overdrafts for different banks?—That is true.

That is, there will be differential treatment of borrowers?—Yes. I cannot see how that could be avoided.

I take it that you would agree that the present tendency of any of the banks is inflationary, is to advance more credit?—They would if they had the opportunity.

You would not say that the normal policy of a bank was deflationary?—Not at this time.

Do you think they would inflate if they had the opportunity?—I think that cause and effect are linked. They have told us here that if they saw something safe and stable to invest in and there was a certainty of repayment that they would be prepared to advance.

And if not, they will not?—Yes. And unfortunately, speaking objectively, until they make that advance there will be nothing safe and stable to invest in, and there will be no likelihood of it being repaid, so that, although the individual attitude of banks is to restore credit, collectively the banking system prevents it.

It is deflationary in tendency?—Yes.

There is this other question that I raised before. Under this scheme of giving back money to borrowers, there will also be differential treatment of borrowers in so far as the best accounts will not get as big an absolute reduction as the second best accounts?—Yes. That, obviously, will occur.

In setting up Insurance Suspense Account No. 1 Major Douglas has a rather roundabout procedure for raising funds. You yourself have just told me that he does not mean to monetize the assets of the country in the direction I indicated in my quoted statement that debenture stocks against these assets would be given to people, but not for purchasing-power purposes. That was the general tendency was it not?—Yes.

Well, he says, in paragraph VII, that in setting up this Insurance Suspense Account the funds to be provided shall be provided by rediscounting the disclosed reserves with the New Zealand Reserve Bank, and the disposition of the funds so provided shall be as in the following paragraph. Now do you not think that is a very roundabout method for raising these funds. My point is this: That the procedure of rediscounting at the Reserve Bank is not only useless, but harmful, in that it needlessly issues funds, to use the Douglas term, for long-term purposes. The debenture stocks are certificates issued against insurance company reserves. No funds are necessary?—I agree, but the point is: That the particular process here was to reverse the present system of demonetization, and it has taken this particular form in order that this process shall be reversed in the direction and in the degree to which it has taken place previously.

But no funds are required. You are handing a certificate to these native-born New-Zealanders. That undisclosed reserve exists. You issue a certificate against that, or some central authority does it. That is all. That should be sufficient control?—Yes. That would secure the same result.

Well, why go to this circuitous way of doing things?—I think it is just to manifest that it is following the same channels in which it has gone in.

But there will not be any rediscounting necessary?—That point was raised, I think, with Major Douglas.

Yes. I raised it. His answer was, "What other way would you have me do it?" which was not an answer?—No. But I think that he inferred that if any shorter simpler way commended

itself he would accept it. He said, "Well, discount it any way you like." The point he raised in his conversation appeared to me to be that if there were any other way he would be prepared to accept it.

There is obviously a simpler way. I should say that Major Douglas should have picked it. He claims to be familiar with the banking system ?—I think he is, too. It is just this, that apparently he is not particularly attached to any one method, and so long as the results were achieved he would admit the alternative.

He says that his scheme did not traverse the existing canons of finance, but the practical result of that proposal was to provide a national dividend. Do you not think that traverses the existing canons of finance ?—I do not think so. We get dividends under the present system.

Not national dividends. People who have not invested anything ?—Some few do.

But this is an entirely novel plan. He said so himself ?—I think those two can be reconciled. The proposals that I put before you yesterday and the ones which are known as the Douglas Credit proposals do involve a reorganization of existing systems. Now this one——

Does not ?—The proposals of the Douglas Social Credit movement do involve reorganization.

The one that Douglas put forward to our Committee, he said, did not involve any reorganization, did not alter the system one whit ?—I say that the proposals I put before you do traverse them, do alter the present system, and then, in introducing these, he says that these do not traverse the present system, meaning that these could be applied by Parliament now without altering ownership and without altering the machinery, and I think that matter of the dividend being issued can be done, as he says, without traversing the present system.

I take it that Douglas was not going to distribute the undisclosed reserves of the insurance companies ?—No. Not physically. We now come to this definition of what we mean by monetization.

Major Douglas said, in answer to a question, that he was going to distribute the undisclosed reserves ?—I think in answer to another question, when you suggested confiscation he said monetization.

No. I did not suggest confiscation of insurance reserves. I think Major Douglas and I agreed that he was merely monetizing the insurance company reserves. I quite understand that ?—Major Douglas said that his proposals were designed to monetize these reserves, and not take the reserves themselves.

Only in respect of the insurance companies. Would you agree that the modern production system is an exchange for goods and services ?—Yes.

Major Douglas did not agree ?—I think so.

In answer to Mr. Lye he says it is not ?—Where is that.

I do not know whether you have it. Have you a full report there ?—What is the exact question and answer ?

The question was, "Is the modern production system an exchange for goods and services ?"—As far as that gold inquiry goes, I think it is so. It is hard to say exactly what was meant when it is taken away from the surrounding conversation, but I think that is fairly obvious.

Would you say that money and credit should not be cancelled unless there is a net wastage of assets ?—I think that is the theoretical basis of credit, that it should not be cancelled until the article which has called it into existence has fulfilled its term.

If we say, just for the purposes of this discussion, that £1,000,000 is the difference between the balance-sheet and the market value of a bank's assets, and this is transferred to Suspense Account No. 1, would there be another £1,000,000 similarly available next year ?—As a second reserve ?

Banks have reserves valued in their books at a certain amount. Now, they write them up and transfer the additional amount, which (quite arbitrarily) I am assuming to be £1,000,000, to the Suspense Account. Will there be another similar amount next year ?—No.

Could this scheme of monetizing assets be extended to all the existing assets of the country ?—No. It would produce too big a medium of exchange.

Douglas replied to that question of mine that he would do it in time ?—As the necessity arose ?

No; he did not add that. Assuming that the scheme increased the purchasing-power of the people, would the value of all producing assets go up ?—It depends on the flow of money released in that manner. I do not think it would involve the amount released from the bank's reserve.

I am assuming that the scheme increased the money in the hands of the people. Under that assumption, would the value of producing assets go up ?—I do not think so.

Under the Douglas scheme, would it affect the exchange-rate at all ?—You mean this monetization of reserves ?

Yes ?—I do not think so, because, you see, we are working in the dark until we know the extent of those profits and reserves. We are not able to say with any degree of certainty what is the amount. I will just put forward what a preliminary survey indicates, that those secret reserves are £26,000,000. We cannot say what effect it will have on the price-level until we know what figure we are working on.

I was thinking of the exchange-rate. Under this scheme would you say that we should make our exchange-rate go to parity ?—There are other conditions now. There is the condition of the import trade, the condition of the farmer. I would say that these alterations are now so interwoven with our present position that it would be very difficult to pronounce an opinion.

Would you say this, that we should get more purchasing-power by bringing the exchange back to parity ?—No. It appears that that is recovering from some intoxication, and it will be a painful one.

Do you suggest that in order to recover we have to come down to parity ? Do we have to deflate ?—No. Possibly not. It appears to me that moving the exchange up was a year late.

I am inclined to agree with you ?—It did not accomplish what it might have done, but, having now been moved up, there are certain readjustments which have taken place and it would require very grave thought and calculation to decide how that would be brought down again. I think it is beyond

the powers, possibly, of any man in New Zealand, not knowing how prices will move in the future, to say how that exchange could be adjusted. It is probably an empirical matter.

In the Douglas social schemes, books, and plans that I have read there seems to be no discussion of the maladjustment in the price returns in the last decade between agriculture and industry. You know that maladjustment exists ?—Yes. And is still taking place. I think, however, that since the points you raised earlier this morning as to whether or not the Douglas plan would give flexibility, and I claimed that it did, I believe that this technical change which you refer to can be better catered for under the Douglas plan than under the present lack of plan.

It is not necessarily a technical change. I am referring to this fact, that throughout the world, as a general statement, it can be said that agriculture has been depressed and has not obtained the return consonant with that obtained from manufacture. Throughout the world there is a maladjustment between the returns in these two branches of industry ?—I think it is of technical origin primarily, in the vast wheat production of the United Soviet States of Russia.

You do not think it is due to deficiency of purchasing-power ?—I thought you were discussing the distortion of the production system.

It is a distortion of the production system. It is a big distortion. But you do not think it is due to deficiency of purchasing-power ?—A deficiency of purchasing-power has brought the collapse of all prices.

Do you think this distortion itself has been brought about by deficiency of purchasing-power ?—The variation between manufactured goods and exported products ?

The phenomenon I have been talking about ?—No. I do not think it has affected one more than the other. The whole purchasing-power of the world has declined.

In Douglas's covering letter to his proposals he said that the covering letter should be read as part of his proposals ?—Yes ; 21st February.

Well, there he assumes certain hypotheses. Paragraph 2 : " I am therefore attaching " it begins. In that paragraph he states his hypotheses and under these conditions the defects in our industrial, social, and economic systems are due to maldistribution of purchasing-power. That is so, is it not ?—That is your point ?

No. Read the whole paragraph if you like. I think it is the first paragraph. " From your letter I gather that you regard the proposition put forward in paragraph 4 (*a*) of my letter of the same date as still *sub judice*, to which attitude I cannot, of course, take exception. It will, I feel sure, commend itself to you that it is necessary to establish the facts of the situation before proceeding at any length to put forward proposals which, to have any value, must be relevant to the facts. I should prefer, therefore, with your permission, to await the publication of your conclusions in regard to the existing financial system before taking up your time with the consideration of more far-reaching proposals which assume that fundamental defects have been exposed." It is assuming that the existing financial system is the correct one ?—Well, that is one way of putting it.

He attaches certain proposals in outline based on the working of the monetary system in its present form, which for these purposes it is assumed (without admitting such to be the case) to be self-liquidating ?—Could we say definitely that it is not self-liquidating ?

But we had to treat all these proposals with that assumption in mind ?—And that involves the assumption that sufficient purchasing-power exists at any time to buy the goods that are for sale.

That is a very difficult assumption to fit in with the previous one, unless we assume several Douglas Credit principles, but at the same time we will let that assumption go. Do you think he means by that paragraph that some of the national income goes to classes who do not spend it in consumables ?—No. The purpose of that paragraph is this : He wishes to put this plan before you and if we extract from the monetary system those frozen reserves which are there, if we can get them out, then the system should be self-liquidating.

But this maldistribution, that is the maldistribution to which he refers, is it ?—Yes. And if that maldistribution is corrected we should be able to say whether or not the present system is correctly balanced.

Suppose I am going to embark on some capital construction, how do the Douglas schemes help me ? Take the one you have here to-day—how does that help me ?—The one I submitted yesterday ?

Yes ?—In that case, the national credit authority would have the right to issue notes and credit.

Against what ?—Such assets as you put forward.

Assuming I am a contractor ?—You would do that through the commercial bank. It would operate through the credit authority as it would through the central bank.

If I am going to produce a raw product or intermediate product destined ultimately for consumable goods ; do I get any price discount ?—No, the discount is given to the consumer.

Just the consumer ?—Yes.

So that I may be producing something for export but I do not get help ?—I think you have missed the point. The help is not given to the seller. If it were so, it would become one of the production bonuses which cause such harm. As the seller of an intermediate product you would not be affected at all, one way or the other. The advantage is given to the consumer ; therefore you would not be affected. You would not be placed at a disadvantage to the seller of the initial goods.

The B payment trouble does not arise in the intermediate product ?—As I said, this just price would not be regulated by an indirect calculation of the B costs. It is calculated upon the amount discovered to exist in the country—that is, the deficiency of purchasing-power.

That was the point I made before : That the A plus B theorem was not related logically to the calculation of the just-price factor ?—It is the foundation of it, but the just price is calculated upon the total deficiency of purchasing-power within the country.

Coming back to Major Douglas's proposals : In his covering letter he gave a list of observed defects. The one numbered (*h*), which starts, " Competition for foreign export markets." In the observed

defects, he says, "Competition for foreign (export) markets to offset failure of home markets—*i.e.*, pressure to export real values for purchasing-power." You notice how he places the order—"failure of home markets and pressure on foreign markets." Is not the position with New Zealand, Australia, Canada, even Russia and the United States of America that the failure of the export market is the trouble, and that this becomes reflected later in the home market?—I think one cannot really fix the order of that occurrence. It is just that over a period of time the inability of a nation to buy its product makes that nation seek for an overseas market.

That is an inaccurate simplification. In the instances I mentioned, the first factor was the failure of foreign markets?—No. If you will observe, the competition for foreign markets was the effect of the failure of home markets.

Douglas says that, yes. He means that the home markets have fallen first; to offset that, they export abroad?—Exactly.

But in the case I quoted this morning, I mentioned it was the failure of the export market that was the trouble, and the home market failed later?—That is the third development of the cycle. Douglas has drawn very largely from historical experience, and that last paragraph gives you the key to his thought in that matter. I have referred repeatedly to these authorities and Professor Cramb says that is is that inability to buy within the boundaries of the country that has led to that struggle for overseas markets that has been the curse of trade for over a hundred years, and the last reason suggested has been this failure of the export market causing them to fall back on the home market.

The present depression has been caused in part by failure of export markets rather than home markets?—The failure of a remedy.

Douglas speaks in that same paragraph of a pressure to export real values for purchasing-power. Does he mean that this purchasing-power is necessary in order to sustain the sale of domestically produced goods in the home market?—No. It is to gain something from abroad which we cannot produce here, and we have been forced to send out real values, real wealth, in order to make good that necessary purchasing-power. I think that that has particular reference. The one which shows it in its most acute form is the case of Japan where they are throwing out their exports at any price whatever in order to make good their deficiences in raw materials.

They are not throwing out their exports at any price whatever?—Have you spoken with the Manufacturers' Association on that point?

I have had more than the evidence of the Manufacturers' Association on that point?—They have very bitter complaints over the Japanese goods.

I know that. That is a side issue at the moment?—It is the point, I think, which shows in its most acute form those two paragraphs.

Take the New Zealand situation: Would you say that our exports overseas are just in order to get purchasing-power to buy locally produced commodities?—No; I have often resented that suggestion of making one process dependent upon another. It is a chain of goods travelling overseas and coming back again and they are all linked, and I have objected to the opinion advanced that we export to pay for imports or anything else. It is a succession of operations which results in that overseas trading.

I did notice that your order yesterday was that it was the imports that came in that enabled us to pay for our exports?—I mentioned that quotation from A. C. Davidson in order to show that the distribution of purchasing-power here in New Zealand would help our exporters to sell their produce here or in London. I quoted him as saying that, by stimulating our purchasing-power and imports, we would help our foreign markets.

He was quoting that about Australia?—Yes.

The foreign market that New Zealand represents for British goods is very small. Are you suggesting that if we have a greater demand for goods and if we buy more British goods, we are going to improve the British market for buying our meat and butter?—Yes.

You think they are in direct relationship?—I am sure, and I quote, I think, the most well-known authority in the world, Professor Taussig. His final conclusion in his book on International Exchange is this: Over a period exports and imports tend to equilibrium. In other words, if you will not import, the price of your exports will tend to sag.

That is a slightly different matter; that is a matter of balance of payments over a very long period?—But the tendency is to amend them.

I substantially agree with that. My point is: If we buy more British goods in New Zealand we are not necessarily going to give the British consumer very much greater power to buy our butter and our meat?—What kind of goods are you buying here?

British manufactured goods?—I think we are.

We are giving him something, but not necessarily an amount which he would spend on imports, or bring an equivalent increase to the price of our goods in overseas markets?—I think it is an impulse and quite a strong impulse.

I think it is a fairly weak impulse. The price of our goods on the overseas market is not determined by the amount of goods we buy from England. There are many factors that enter into it. There is Danish butter, Australian butter, Irish butter, Home-produced butter; all those things are affecting the price of our butter?—I agree, but I still maintain that there is a strong impulse to support the price of our produce overseas when we are importing from that area.

As a long term, very general tendency, that may be true, but from year to year the balance of payments can swing millions against us, and it does not affect the immediate situation. There are so many other factors that come in. I think it is too bald a statement?—I agree that there are other factors, but I still maintain my point.

How long has this alleged deficiency of purchasing-power been a feature of the productive system ?—It began with the industrial development of England about the eighteenth century.

Would it also be a feature of, say, the Phœnecian civilization which had a fairly advanced development ?—It developed in the Roman Empire, but not to the extent it has developed since we have used industrial power.

What does Douglas mean by cost of production ?—Those physical units which are used by individual processes.

How does he get any cost attached to it at all ? He has got to enter it into a book ?—Yes. There, again, we are going back to a point that we have to start upon some relative line.

I know we are. How are you going to determine cost of production ?—I think the difficulty is one encountered by all economic surveys.

True, but he is basing his proposals on cost of production. We want to find out what the cost of production is ?—Expressed in money terms ?

Yes ?—Then we must estimate the actual physical wealth used in production and translate that into money terms which equate with the community consumption.

The cost of production of the dairy-farmers would cover the price paid for fertilizers, is that a price you can use ?—That price is not necessarily a value.

Does it not enter into the cost of producing a ton of butter ?—That price is arranged by manufacturing firms, and so on. Although it is a price, it is not necessarily a value.

We will say super is £4 a ton ; it is a farmer's cost which he wants returned to him. Would you go further back with it ?—No, you have merely fixed it at £4 a ton, it is not a value.

How would you fix its value if you did not have its selling-price at £4 a ton ?—The only satisfactory basis of value, I think, is that one developed by Irving Fisher, a composite commodity ; or possibly the League of Nations index figure. They are the only two lines which I know which one can accept.

Does economic rent come into cost of production ?—For what purpose ?

For calculating the value of a ton of butter ?—Round figures in those sixty-two articles.

Economic rent ?—Can be derived from that.

The economic rent enters into the cost of production of a pound of butter ?—Yes.

Is it your opinion that economic conditions will become worse ?—Yes.

If so, will business assets become less in value ?—What kind of business assets ?

Reserves, capital, equipment ?—It all depends on the degree of survival or flexibility we possess in New Zealand. I feel that as a nation producing foodstuffs we may maintain or even increase our relative position in the world.

You say economic conditions will become worse ?—I think there will be a crisis. I believe it may take the shape of war within twelve months, in which case the producers of foodstuffs will gain a greater power over other factors in the world.

If economic conditions become worse without this war which you envisage, it will be prudent for a business to value its assets at less than current market values, because things are going to become worse. Is it wise for them to do that ? In proposals V and VI of the Douglas plan he would discriminate when he writes up the market value of the banks' assets, and would weaken those institutions as economic concerns ?—You are assuming that value and price are synonymous.

No ; I am citing the Douglas plan. If things are going to become worse, it is wise for a man to write down his assets, to have a reserve for contingencies. If that is so, it is wise for a bank to do it, and these proposals would take that hidden reserve away, therefore it would perhaps be unwise to do this, seeing what the future holds ?—I cannot accept that. The greatest social and civic struggle which occurred in Europe during the war has resulted in the lifting of the price-level and just such items of human welfare as are touched upon here.

We are not assuming war ?—I was not talking of war ; I was thinking of political upheavals in Central Europe.

I am assuming that economic conditions are getting worse ?—The general effect of the deflation ?

Yes ?—I believe there is a limit to which this deflation can be carried. I cannot admit that price-levels are a reflex of the exact condition a country is in. There might be a rising price in times of revolution.

This proposal of Douglas contained in V and VI would discriminate in favour of business men who obtain working capital by means of overdraft as against those who finance by debentures or in other ways ; would discriminate against businesses with a high proportion of fixed capital, and in favour of weak businesses as against those sounder concerns ? Do you think that is justifiable economically ?—The point is this. You will remember that I have been subjected to attack because my monetary proposals involved something in the nature of a charitable bequest, because it is something for nothing. These proposals are returning directly to those who gave that money the money that was taken from them, without introducing anything humanitarian or beneficial. That being so, this should be removed from criticism.

There is no economic justification for it ?—There is, because the money came from those people.

It came from those various people I have mentioned ?—Those people who have had a long and heavy overdraft from the banks. That is where they draw their profits, and to that point it must be returned. That is making an automatic return. I thought that would have earned your commendation, as you did not like my humanitarian point of view.

I do not object to your humanitarian point of view at all. Would you agree that purchasing-power could not be increased under the present system until the banks grant additional purchasing-power to the amount of any overdraft cancelled ?—That if this overdraft were reduced they would have to increase it back again before the purchasing-power could be returned ?

Yes ?—That is the indirect way in which the people would benefit.

Say we have a bank's balance-sheet. On the liability side you have capital, reserves, deposits, and one or two other things. On the other side, the assets, you have advances and bank premises; generally speaking, one or two other items, too. They balance. If you write up bank premises, say, by £2,000,000 (I am just taking that figure) you would form a Suspense Account on the other side of another £2,000,000. Do you agree so far ?—Yes.

You then take £1,000,000 of that Suspense Account and use it in paying off advances; you agree ?—Yes.

So that your balance-sheet still balances. You have got capital, reserves, deposits, and 50 per cent. of your Suspense Account left on the liability side, and on the asset side you have advances reduced by £1,000,000 and bank premises written up by £2,000,000 ?—Yes.

So that the position is this: the bank premises are finally written up to market value and next year there is going to be very little to add on ?—Next year those people who have their overdrafts at a certain limit put forward their usual claim for more loan to equip them with further working capital with which to expand their premises or pay wages.

Where does that come in ?—If they have had £1,000 overdraft and by redistribution of profits they get a reduction to £900, they should be entitled to another £100 and certainly will apply for it.

As you have just said the banking policy at the present time is deflationary. The banks are not necessarily going to reissue even the same amount of credit because their reserves position has been weakened and they will tend to draw in their horns a little more under the scheme ?—The banking system is deflationary in operation, but the banks are looking for sound investment, and if they have advanced £1,000 as a good investment this year, they will make it £1,000 next year.

But some of these overdrafts have been carried on just because they know if they try to get them repaid they will drive the firms into bankruptcy, and they are not good investments ?—Is that very widely the position ?

I would not say it is widely the position, because I have not the figures to substantiate it ?—I was hoping you would admit it.

We get to this position, then, discussing Major Douglas's proposals, not your own. He is proposing to transfer purchasing-power from bank shareholders and insurance company share and policy holders to other individuals. The majority of these shareholders are not rich and Douglas said it was not a class question, anyway. If the right of private investment is accepted as one of the principles of our economic system, Major Douglas's proposal is quite arbitrary, unjust, and irrational. But what is more, the dividend transfer plan will aggravate the disease from which we are suffering. It will actually decrease purchasing-power. One-quarter of the amount that has been transferred to the Bank Suspense Account No. 2 will be sterilized, frozen, or whatever term you wish; but that twenty-five per cent. means a net decrease of purchasing-power. Under the insurance scheme the debenture stocks are not transferable, not security for loan, not purchasing-power, and cannot add to purchasing-power, but the dividend paid on them is purchasing-power. In so far as there is any amount remaining in the Insurance Suspense Account No. 2—that is, the Dividend Equalization Fund—this amount is by that much a decrease in purchasing-power. Douglas himself said that, in time, this scheme could be extended to all existing assets of the country. The more we extend this scheme, the more we destroy purchasing-power. The insurance scheme and its application to other institutions is therefore wholly deflationary in that it would pay out only a part of what would otherwise have been paid out. The transfer of bank dividends over 6 per cent. is similarly deflationary. It is also the Douglas contention—and you, Colonel Closey, have supported it—that the normal banking policy is deflationary. Therefore, even the reduction of overdrafts by writing up the book value of assets is not necessarily adding to purchasing-power, but probably decreasing it. The only logical conclusion from the proposals and evidence put forward by Major Douglas in New Zealand and by you is that—quite apart from their arbitrariness, their injustice, and irrationality—if put into effect, they would bring a net decrease of purchasing-power, and would add to the burden of unemployment and reduced incomes. And this is Major Douglas's scheme for New Zealand ?—I disagree with various assumptions. It is possible, as you say, that the banks having overdrafts reduced by means of this description would not agree to advance the overdraft again to the original limit. On the other hand, I cannot see why not; if it was safe for £1,000 now, they would extend it later on, and undoubtedly a great many firms would not have it so restored, but those which did have their overdrafts restored would find themselves in possession of extra funds with which to carry on their business, and that would be an increase in purchasing-power.

I think we dealt with that point and agreed that we could not get any figures on it. It is quite possible the banks would not advance any more because the position was more precarious ?—I challenge that assumption. I also say that, whatever our indebtedness may be, there is a limit to the amount this scheme can be carried to. It deals only with insurance companies and banks.

But Major Douglas said he would extend it in time; and the more it is extended the less purchasing-power is going to be available, because so much of it is sterilized in Suspense Accounts ?—If this plan is extended it will have to be in quite a different form. It cannot apply to any other than the banks and insurance companies.

Major Douglas said he would extend it to stock and station agents, and ultimately throughout the community ?—But it would not be extended under this scheme.

How do you know it would not be extended; Major Douglas said he would extend it ?—As I see it, its machinery would have to be changed.

But we must accept Major Douglas's statement at its face value ?—I think you are ignoring the opening paragraphs in which he stated he would not traverse the existing banking system. You are suggesting——

I am not suggesting at all. Major Douglas himself said he would bring in stock and station agents. In reply to me, he said he would extend the scheme further ?—How much do you think could be got from the secret profits of the stock and station agents—perhaps £1,000 ?

I am not suggesting anything. I am taking this scheme as handed to us by Major Douglas ?—You are misreading his statement. Probably he meant that this principle would be applied to others.

Even if the principle, it is the same result ?—This scheme cannot be enlarged beyond the particular institutions it is set down for.

He said something like, " In the degree to which they accept the deposits and create credits " ?—The point is we know that the number of stock and station agents who do this is very limited so that qualification I think was valueless, and I object to the manner in which it is misused by the members. " In the degree," that is the qualification.

We do not know exactly the number of stock and station agents that do take deposits and make advances. There are many more than one stock and station agent doing that. These big firms in New Zealand take deposits, make advances, and act as bankers ?—Does not that make Major Douglas's statement perfectly correct, cautious, and balanced ?

I am not saying it is incorrect. When I asked Major Douglas what were the limits of the extension of his scheme he replied that the fundamental question was whether it could be provided out of the resources of the country. He says " to the extent " ?—I say that this scheme cannot be extended. The principle of it can be, in which case we cannot discuss it here, because we do not know its machinery clauses.

Mr. Munro.] I have just one or two questions. The first question I want to ask—I hope you will not take it as personal because I think it is going to eliminate a certain amount of prejudice against your movement and I have met with it a lot—is this : In the protagonists of the Douglas Credit proposals we have quite a number of ex-military gentlemen ; Douglas is a major, you are a colonel, our esteemed friend on the Committee a captain. That seems to be creating in the public mind the idea that the members, ex-military members, who are propagating this proposal of Douglas are usurping the place or taking to themselves the knowledge that they are experts and that the expert or so-called economists are not experts. I take it that it is only coincidence ? — No ; it is more than coincidence. I think that there is quite a definite explanation for it, and I may say that I do not resent the question in the least. I think it may clear up the criticism that has been levelled against the movement. I say that there is no section in New Zealand to-day who have been so bitterly affected by this monetary question as the returned soldiers. We have heard a great deal during this discussion of the effect of moving price-levels. These moving price-levels have certainly brought about great loss and suffering. Professor Cassell described the deflation movement as having caused, intensified, and prolonged the greatest tragedy in recorded history ; and I think it does not apply to any section more than to the returned soldiers here in New Zealand. The position was that those men who left New Zealand for overseas made the usual provision with their belongings, and put money in the bank. For each twenty shillings they put into the bank for safe-keeping, there was restored to them when they came back 11s. 3d. in the shape of a deflated £1. They thought, as a great many people have thought, that that piece of paper was £1. Now, in the closing months of the war, an educational move was evolved to induce the returned soldier to become a citizen, a capitalist citizen, and the financial provisions made for him were widely advertised throughout the Forces. When he came back he was offered facilities to borrow £3,000, £4,000, or £5,000 to become possessed of a farm, or £1,200 to £1,400 to become possessed of a home ; and those mortgages accepted in 1919 and 1920 were effected on this deliberate policy, and that indebtedness which in the usual way was £3,000 was deliberately made equal to £5,400 when the financial authorities, raised the note to 19s. 8d. Under these circumstances, the returned soldier was absolutely betrayed. He could not possibly carry on. Now, then, the position developed that there had to be a reorganization. To show what effect that has had—I put this forward not as a matter of sentiment but as an economic thought which perhaps should be understood—this is the position here in Auckland : The returned soldiers are now between the ages of forty and fifty-five years, they are an even cross-section of New Zealand society ; they have settled back into their occupations better than any other ex-soldier organization in history. They have been helped magnificently by New Zealand to the very limit of her powers, and now two-thirds of the returned soldiers are unemployed—that is to say, two-thirds of those men here in Auckland have reached that stage of destitution which enables them to come and ask for relief work. I say this is the most pregnant economic fact that could possibly be disclosed to this Committee, and it is a responsibility that this nation cannot escape. When the returned soldiers, including myself, began to examine why this was so, we began to look for the blame. It was not the fault of the returned soldier ; it was not the fault of the Government or the people ; nor was it the fault of the schemes, which were well thought out. It was because New Zealand had no control over its money system, and a group of men in London have betrayed the returned soldier. Now, that point has been raised, and I appreciate it, because it will help in outlining again what I opened my address with—to give you an idea of the idcology of the movement. I say this is the strongest factor in the Douglas Credit movement, this feeling possessed by those returned soldiers that no matter what it costs them in time, labour, and sacrifice, another generation will never be betrayed as the returned soldiers have been betrayed.

I want to ask just another question. I think it was in answer to Mr. Langstone that you said your movement was not concerned about the question of interest ?—Not definitely. It is not one of our major points. I mention that because a great many monetary reformers can see nothing else but interest. We think that comes more in the realm of social reform.

I wanted to get at that point. So long as you are allowing interest up to 6 per cent., which was in the scheme that Major Douglas presented to the Committee, do not you think that the more money you have in circulation, the greater possibilities there are of people making more money out of it that

way ?—No ; we consider that if money is withdrawn from circulation in that way it will disclose a shortage at the next accountancy period, and it will be made good. As far as industry is concerned, we think that interest-rates have been maintained by the dire necessity of the borrower, who, in order to become capitalized, will pay high interest on loans. Now, by the degree that we can restore prosperity and make it possible for men to live contented and fruitful lives, by that degree will they be unwilling to pay a high interest. It does come within the scope of our reforms, but I do not attach to it the importance that others do.

Well, take it from another angle. The more money (cheap money) that goes into circulation, the more the rate of interest will tend to come down, will it not ?—Yes, that is so.

Then there may be another objection from another section of interests against these proposals, that you will flood the money-market until such time as interest will almost come down to zero ?—We know that that is a very strong objection indeed.

It will have that effect ?—Yes.

Hon. Mr. Downie Stewart.] There is only one point on which I want to ask a question or two. I would like to explain that my reason for confining myself to one point is that—I do not wish to be discourteous to Colonel Closey, because I have been interested in his very earnest and clear statement of the views he holds—in the first place, as Colonel Closey will recognize, this question has been in debate for, I suppose, ten years : 1922 or so it started ?—Not in a concrete form.

Well, at any rate, Douglas moved in the matter about ten years ago, and quite a lot of books have been published by him which are all available to the Committee, and replies and criticisms have been made by various authorities—of various schools of thoughts—all of which are familiar to Colonel Closey. Replies have also come from the Douglas movement, so that the whole ground has been canvassed and gone over again and again. All this is available to the Committee, and I think the Colonel will admit that every question he has been asked to-day has been very frequently asked before at some stage of the discussion. In order to save the time of the Committee and the other witnesses who are waiting to be heard, I shall ask, for my own information, only one or two questions on one point. There is a further motive I have, too ; that it seems difficult to ask questions without appearing to take sides. I have noticed several times, when members are asking questions, that the Colonel appears to assume that they are in an opposite school of economics, and he rightly asks that everybody should keep an open mind as much as possible. I am quite prepared to do that, and to look over what he has told us, in conjunction with the other information available. The point on which I wished to ask for information is purely this : At one stage of the discussion yesterday, Colonel Closey said, "Let us try an injection of purchasing-power for one year." Well, that interested me as a man who is engaged in practical politics. Will you tell me what is the smallest scale or community or group on which you could try out as an experiment the merits of your scheme ? I would like to amplify that question a little. I think it is common ground that your movement is a very powerful one, with a great deal of support, and, with its enormous support, it sprang to my mind that, to save these long years of controversy, if it is possible to apply it in a limited area, where its merits or demerits could be demonstrated without putting so much at stake, it seems to me that is the best thing the movement could do. But to put at stake the whole finances of New Zealand on a policy on which there is such grave difference of opinion between different schools of thought seems to me to be asking a great deal. I want to know, for example, would a community like an island in the Pacific, such as Fiji or Rarotonga, assuming you could make arrangements with the authorities to test out that scheme, with an indemnity against loss if it proved a failure, would that be within the range of your purview ?—No, I am afraid not. In the various authorities, it appears to be recognized that that particular area which is given a political entity is the one where a definite scheme should operate.

Well, you have a political entity say in Fiji, in Malta, in many Crown colonies belonging to the British Dominions ?—Well, unfortunately, the real source of the gain is the releasing of the powers of production which we possess here in New Zealand.

I want to put less at stake than New Zealand, if I can ?—I am disappointed, sir ; I thought you were suggesting that we should try it out here in New Zealand for twelve months.

No ; that was your suggestion. I say, let us try it out on a small scale first. I had hoped that you would give us a detailed plan for this twelve months. I am allowing you the full merit of your plan, and I am proceeding on the statements that have come from all schools of thought, that they regard it as leading inevitably to chaos. You do not agree with that, I know, and I want to get your point of view. You referred yesterday to that, and among the various economists who were quoted Cole's name came up prominently. Cole investigated this scheme in conjunction with such brilliant men as Sydney Webb, a number of English members of Parliament, Sir Leo Chiozza Money, and all these men agreed that it was theoretically unsound and unworkable in practice. You disagree with that ; but, when you follow the whole line of thought of the orthodox school, and they say that it will lead to inflation and loss, does not that raise any doubt in your mind as to the practicability of it ?—The point is that we are prepared to allow the safeguards which other schemes have demanded. For example, we would allow Cole's safeguards, and Blackett's too—that is, a stable price-level.

But, even assuming that, a matter of that sort very easily gets out of hand ?—Not where it is worked upon regular calculations. It could where no other safeguard is employed except a bare observation of price-levels ; but where you have a number determined, then it seems to me that we can go steadily and avoid any detrimental action.

Well, Colonel, my comment on that is this : Though you may set a limit to your scheme, we know that as a matter of practical politics, politics override arithmetical calculations, and under this control scheme pressure will occur to an extent far beyond what you intended. You do not apprehend any risk in that ?—It appears to me that it is not so dangerous or so formidable as what is looming up at present in our position of affairs.

Take it from another angle. The common complaint made against all socialistic experiments is that they are never content to try out their schemes on virgin soil. They always want to build on what the capitalistic system has gradually evolved in centuries of painful experience, and graft themselves on to it, and though they, in fact, may survive for a year or two, it is simply by living on the vitality of the tree they were hanging on to. If your movement is prepared to say, "Give us any place on a small scale where there are no great financial institutions at stake," do you not think you would make more progress ?—No, because this movement is not, as has sometimes been said, a plan for getting something for nothing through monetary adjustment. We are trying to release the inherent wealth in New Zealand, which we think is a colossal amount, and we think that in a simple island community there simply would not be that inherent wealth to release.

But would it not be better to try it out on a small scale first ? It is just like a man building an engine. He builds a model first, as you said yesterday, and then, finding that it works, he builds a bigger one. Would not that stop all these years of controversy ?—Well, it appears from our point of view that the experiments of this nature are being tried out in several countries. I am not sure whether you have received those charts which have come from New York; but it would appear that those experiments are being tried, and if we could get rapid data, we would see what is happening there. We are becoming quite mild reformers.

Would your movement work in a State, such as one of the American States, by itself ?—There is a suggestion that Alberta will probably be the first to try it out, but unfortunately, they have a disbalanced economy.

That is so ?—But they are worse, I think, than we are, because the wheat commodity has been made the subject of a great onslaught by the Russian people. They have a committee there—the Government is almost wholly in accord with the Douglas Credit proposals, and it may be tried there first.

Well, that should be valuable to you to demonstrate the principles of your proposals ?—Except that we have such very great trouble in transmitting to the people the results of these experiments. I wonder how many people in New Zealand know that this analysis sent out to the business men of Auckland says that if conditions in America continue as they are doing now, within twelve months the position will be a 100 per cent. inheritance-tax and no fortune over 5,000 dollars.

That may or may not be so, but the fact remains that as long as this matter goes on it is a matter of endless controversy that has never been put to the test ?—We think that if we grow in the next twelve months as we have in the last, we shall have to seek for the last man to be converted.

You may say that you win before you start, because you are offering a remedy, and the public wants some remedy, and so will grasp at anything. That may be quite possible. I am not disputing that. But the issues at stake are enormous for the future welfare of New Zealand. Assuming that by any remote chance you were wrong, what would you apprehend to be the result of a failure ?—We think the result would be this, as was found out by the Russians: The Russian figures were published up to 1931 and then they were discontinued, and I suspect that their calculations were wrong. There is inflation taking place in Russia. Here in New Zealand, if we began this injection of purchasing-power, the national credit authority might issue too much money. The result would be a rise in the price-level. You will remember that at Ottawa that was decided to be in every way desirable. It may be that the price-level would rise, and that would cause some disturbance in the relationship between creditor and debtor, but it seems to me that it could be checked very quickly. We are prepared to give those safeguards of price-level. In fact, we will do more than that. If there is a sign of this movement taking place at a more rapid rate than we intended, we will be prepared to concede that is a signal for slowing down.

Do you know that the moment people find prices rising, and you step in through your currency to stop it, there will be division as Foster says. Once they find things are running the way they want, nothing will stop them ?—It seems to me that if we cannot trust the people, the world is a hopeless place to live in.

It has been tried again and again, and the whole of history is strewed with the wrecks of such plans ?—You will remember the bank authorities quoted the assignats. Now, it is a curious thing that those bank authorities disclosed how in those days in France inflation did occur through issuing this paper money, but they forgot to mention that included in their monetary scheme were three revolutions.

I do not suggest that your scheme is under the same opprobrium as the assignats ?—No; we would not have the accompanying revolutions.

I want to find out what is the minimum size of the community in which it could be tested ? Could it be tested out in Auckland, without reference to the general economy of the whole Dominion ?—I am afraid not. Blackett says in his plan that action must be taken within the political area concerned, and I think it would have to be taken in that area subject to that political authority.

Well, you have a political area in the municipality of Auckland ?—Well, I am sure we will be very pleased to have the issuing of this surplus purchasing-power.

I want it tried out in Auckland before it is tried out in Dunedin ?—That may be used against you.

Well, it may be. Your people are very powerful down there, but it was one of your own colleagues in Dunedin—and I am not laying this at the door of the Douglas school at all, because it may not be a correct report—who said that the virtue of the scheme is that it can be tried out in a country, in a State, or in an industry. There is an easy task. Get an industry and give them an indemnity, and try it out. But you say that is not possible ?—I doubt it. I would not care to take the responsibility of disturbing our national economy by having a national survey, and then issuing money in one particular area.

What about a place that is a political entity like one of our Crown colonies ? Is there not enough manufacturing there, or what is the difficulty ?—It appears to me that the great trouble here

the cause of this disproportion, is the machine. There is no doubt it comes down to that, and the greater the mechanization of industry the more the Douglas analysis applies, so that if we were to have a simple rural people without this machine equipment, there would not be that inherent wealth to draw upon.

With the enormous backing your movement has, why not buy that machinery and try it out ?—Well, we will leave that.

I believe that is a decoy ?—I am sure Mr. Stewart would be pleased to give us the moon.

I am trying to be reasonable. I think you will agree that the best test of every movement is to solve it by experience, and when you find such writers as I have quoted, and you have quoted with approval, saying that they consider the matter is full of possibilities of chaos, it makes it necessary to try it out on a small scale ?—That report was drawn by a political organization who were rather concerned with the rival claim, and, I think, with the idea of reporting back to that political organization as to whether or not Douglas had an alternative.

Now, this morning somebody quoted an article by H. T. N. Gaitskell, a lecturer at the London School of Economics. You have read it, of course. You will agree that he is judicial and restrained. He tries to find whatever element of truth there is in it ?—Yes.

He says on page 372, " There can be no doubt that Major Douglas's proposals are inflationary, in a sense, and would lead to boom conditions if they could be put into operation without panic." There seems no reason to suppose that they would not also lead to collapse. As another point, he says they are not nearly so inflationary as the public suppose them to be. He is not so unjust as to say that, but if he sees the prospects of either inflation or collapse, would not you think it wise to limit it to the smallest community possible before you try it ?—I would sooner limit it on certain lines of issue. I think we must seek one political entity, and I would suggest that if our figures show that we are £12,000,000 deficient in purchasing-power, let us start with £5,000,000, and after two quarterly periods——

That is granting your premise ?—In that case, the premise we submit to you will be that of Keynes, who suggests that we should, by means of increasing work on the fixed capital investment, distribute the necessary purchasing-power.

But I understood you to say that you did not accept Keynes ?—Not on his borrowing-process. As I said, what appeals to me about Keynes is his idea of the gold certificate.

Well, has the matter been considered on the lines I am speaking of ?—Well, I assumed that, taking these debates which have occurred between R. G. Hawtrey and Douglas, that you accepted Hawtrey's conclusions.

I have great admiration for Hawtrey, but the point is this: As you perhaps know, in America when there is a new play to be produced, they do what they call " trying it on the dog." They go to one of the provincial towns and try it out there before taking it to New York. I want you to try out your proposals somewhere else than in New Zealand ?—I certainly have not thought of it along those lines. I doubt whether we could. I would prefer to carry out the Douglas proposals, and accord all the safeguards necessary. I feel so confident that they will not be called upon.

I have no doubt at all that you would have safeguards in mind, but I am looking at it from the practical point of view, that all safeguards are swept aside once the public appetite is started. I see great difficulty in any machinery stopping it once it has started. I may be wrong, but that is my view ?—Well, we must then devise some political scheme whereby the people are enabled to exercise this most important sovereign matter without that risk.

That is what I cannot solve, as a practical problem. But so long as it is under parliamentary control or popular vote, I apprehend the difficulties will be greater than I think you will allow ?—That is a point I would like to raise. The French philosopher Maurois said that in his opinion the New-Zealander had the highest developed sense of citizenship in the world. Now, if we have that moderation, that reserve (and I think we have an inherent sense of fairness), and if the people of the world are ever to have control of their currency, this is the place where it should be tried.

We can demonstrate that, I think. You will remember that when I tried to curtail borrowing, which is an evil in your view, I got it down gradually so that it would not be too sudden a shock to the people, and, as a result, I was thrown out of office. The public were clamouring for more money; they did not care where it came from, so long as it was available to keep prices and employment going. That is what happened as a matter of practical politics, yet it looks so easy, so simple ?—It appears to me that in that case they were suffering individual hardship in order that collective hardship might be avoided. In our case we would be asking the people to accept prosperity and happiness and not press on to inflation and ruin.

I admit they were suffering a hardship when they got rid of me. But you admit that political factor ?—It seems to me that bold action is necessary in the world to-day, and some nation must say that the people can be trusted with their monetary system; and if there is any nation that is justified, and has earned that right, I think it is the New Zealand nation. I think that the risk is not nearly so great as we took in 1914.

There is one question I am asking. I was not present this morning, but I understand that the scheme put forward by Major Douglas in Wellington is still submitted for approval ?—Yes, it is put forward as what I might term a reconnaissance in force, to procure the necessary information for our economic survey—that is, exactly what are the extent of the banks' resources and their secret profits.

I do not want to go over all that ground again. I do not know whether you happened to read the questions I asked Major Douglas. You agree with his answers ?—They are abbreviated in the news out of shape, but I think those points have been gone over several times.

You personally do not think there is any injustice or hardship in dispossessing people of property that they have been saving up to acquire under the existing system ?—The problem turns on whether we do dispossess them of these assets. We contend we do not; we demonetize them.

It is the same thing ?—We do not think so. Suppose, now, the National Bank here had a building which appears on the balance-sheet at £50,000 instead of its value of £150,000 or its cost of £250,000. If that is monetized and distributed to all the people who have overdrafts—I will try and work out a case where they could get possession of the physical assets. Suppose we went round all these men with overdrafts and collected this extra amount; we then may go and buy the building. We would then get possession of a physical asset.

That was not the question I had in mind. The question I put to the Major was this: A widow saves up an amount and her friends tell her the safest thing she can put here savings into is bank shares. The nominal value is £1 and the market value £4. The question I asked was: Did he not recognize the broad principle that you do not dispossess a person without compensation. That widow immediately finds her shares no longer worth £4 which she paid, but worth £2 or £1 10s. ?—He said that it was a case for special compensation, and I would agree. I would say that the widows, the whole three of them, should be specially considered.

I do not want to go over all those questions again, because, as they stand, the answers are there, and as long as you endorse the Major's answers I will not trouble you further. But there is a minor point that you have no doubt had put before you from time to time. In arriving at this just price, criticism has been raised; if you give a discount of 25 per cent. on a purchase, there is nothing to prevent fraud or collusion between the vendor of the article and the buyer who keeps on selling the thing until the buyer has four or five credit notes of 25 per cent. I have never seen an argument against that ?—That is a machinery defect, and I would say that that applies also to income-tax and sales-tax. It is quite true that people fall, and equally true that when they are found out they are deprived of privileges. The threat would be this: That if any firm were discovered having any connection with fraud, they would be denied that discount. I believe that would be a sufficient deterrent to avoid any fraud.

I think that was asked of the Major in Canada; he suggested he would stamp the article ?—I doubt whether that would be necessary. We have not found it necessary with the sales-tax. I think that difficulty exists in a far greater degree in the sales-tax.

Do you think there is any great truth in the contention that there would be enormous obligations in this process ?—No, I do not.

This writer we have quoted before (Cole) says, "One must add that the technical difficulties of any such price regulation would be enormous, owing to the difficulty of discovering how far the price reductions were or were not genuine, for since the prices considered are those of retail goods, the range and quantity would be colossal and far greater than those which are usually included in wholesale indices" ?—The point is this: You will observe that in my plan I have restricted it to those articles which are necessaries. If it was found, for example, that the discount on coal were likely to be abused, that should be struck out. The objective, I think, is very often lost sight of. We are not concerned with selling the articles, but concerned with getting into the possession of the buying public £7,000,000. We could simplify it.

If such goods are necessaries—such as bread, clothing, boots, vegetables, and so on—would that mean that every time a housewife goes out and buys some cabbages in the market, she gets a credit note for 25 per cent. ?—That would be a case where the bookkeeping would not be worth while. I have just given the range there; I suggest that some of them can be weighted, electricity and others, in order to get this purchasing-power out with a simple system.

I could understand it if it was on a truck of vegetables, but then that is no benefit to the housewife. She wants to get it on the actual purchase ?—The point would be that the month's receipts, stamped and possibly initialled by the vendor, would be presented to the national credit authority, and the retailer would be the recipient of 25 per cent.

You do not apprehend that with all these enormously detailed regulations it would mean—— ?—If we found that any particular line was giving trouble, just cancel it. The objective is to get the money into circulation. We chose those necessaries on account of their assistance to the general public, but if any were found to be a trouble, we would fire them out. We can apply it to very much fewer lines.

I do not want to go over that any more, but I would like you to consider and be able to tell us more clearly what would be the effect if the scheme failed. Do you consider that the recovery would take fifty years or a matter of twelve months ?—I would like to revert to the point of failures in the past. I challenge that there have been failures where there are not some other outside influences. I believe that we are a balanced community with a high sense of citizenship, and we are a slow-moving people politically. I believe we could put this through and hold the people on to a certain line, and the first development as predicted by our critics would be a rise in price-level. We would be so relieved at the recovery that we would cheerfully submit.

As soon as prices begin to rise, you stop the issue ?—Check it down.

Is not that exactly the same as the banks do; but to the extent to which you check it down, you stop the process ?—Yes. Suppose we reach a level of prosperity with all the unemployed back to work again and paying their rent, and when we are utilizing our resources fully, we may then have to call upon the people to retard a little of their prosperity. I think New Zealand is suffering quite a large amount of sacrifice willingly; I believe that if they were told that this increased prosperity must go at a slower rate, there would be nothing but complete and cheerful resignation.

Reference is made as to whether this would work all the time. You are a colonel and I am a lieutenant. How would it do if we started at Kawau to see how it works. You would be in charge ? I want an island to try it on.

Mr. Massey.] In addressing the Committee yesterday you made many statements, some of which have been answered by Dr. Sutch, but one or two have been left out. Probably the speech that you have delivered to this Committee yesterday has been delivered on previous occasions; is that correct ?—No; not on those lines.

Very well. I want to draw your particular attention to one statement you made: You mentioned a little while ago that as far as New Zealand is concerned, New Zealand will get further into the mire, or words to that effect, than what she is at the present time?—I would like to quote Mr. Downie Stewart when he returned from London. He said, "If the commodity price-level did not rise, New Zealand could not pay her way."

I am afraid that that is no answer. We are looking for information?—You do not accept my authority? Then I say, if this is satisfactory, that I consider New Zealand cannot pay her way on the present world prices of commodities, and I say there is no indication in the world to-day to show that the price-level will rise.

Dealing with the world price-level: The world price-level or the price-level of Great Britain has increased considerably during the last few months in respect to certain commodities which are exported from this country. Is that correct? Wool, meat; you mentioned one commodity yesterday when you said "farmers' hides" were unsaleable. I know you did not mean that term?—The local ones are too thick.

But you will admit that as far as cattle-hides are concerned, they have increased enormously during the last twelve months?—Exactly, since the Americans began to put the price up.

Nevertheless, the increase is there. There is an increase for lamb; just before Ottawa lamb was 4d. per pound; to-day it is about 7½d. The same thing applies to wool, only to a greater extent. I just want to bring you back to that point of the statement you made yesterday; you said you would inject further credit and further moneys into New Zealand industries. You mentioned public works. You gave us an illustration of just exactly what is occurring in Auckland. You said there are only five large concreting-plants in Auckland and they are all lying idle?—There are five complete roadmaking plants in Auckland.

And are all lying idle?—Yes.

Have you been along the Great South Road lately?—Yes.

Is there not one operating there?—There are still five which have not worked for two years.

The impression you created in the minds of the Committee yesterday was that none of these plants was operating?—How long has that one been going?

The fact remains that they are starting, and that we are gradually recovering?—I think I pointed out that Keynes said, "The mists are lifting, and disclosing the gulf ahead."

How long ago did Mr. Keynes write that article?—September, 1933. The League of Nations said six weeks ago that there was no indication of a rise in price-level. They pointed out that England's trade certainly is rising. She has stolen the South American steel trade from the United States; she has taken the motor-car export from the United States; she has also taken Belgian glass, Polish coal, and German ship-building, and this League of Nations report says that those nations have made a tremendously greater loss in their export business.

Are conditions in Great Britain improving to-day?—In the southern areas they are improving. In cotton they are hopeless. They have lost five-sevenths of their trade, and I think that within a few months their woollen trade will receive the back lash from Japan.

The back lash—how do you mean?—Japan took 3,000 bales of wool in 1930, and 639,000 bales this year. She is now making plans for the capture of the English woollen trade.

I notice there is some difference of opinion about the schemes submitted by Major Douglas to the Committee for consideration and the opinions you have expressed. You say, in effect, that money and credit is the most important item or factor in any industry?—It is, to-day. It is the key to our present depression and the key to our recovery.

Then you followed that up and made a statement that the planning of industry is very essential?—I did not make that as a primary statement, but I agree.

Now, Major Douglas when he landed in New Zealand said that planning was no solution?—I agree; we must have a monetary instrument before we can plan.

But I put it to you: Is not this monetary business only one factor?—The key factor.

Probably it may be the key factor, but what is the use of a key if you have not a door to put it in?—The doors are there, in the first paragraph of my series. "The science of production throughout the world has excelled its plan, but is crippled by a faulty monetary machine." You accept that, do you?

What is taking place in Germany and France to-day? Have they not got complete embargoes against the importation of milk-products?—What kind of products?

Milk-products?—That is to develop their internal husbandry. That is not confined to Germany, and it brings us back to your first point. The whole of the nations of the world are erecting walls to protect their peasantry, and that is the German plan.

This is the main point I am trying to make: You have already admitted that the planning of industry is very essential. That is entirely different from the opinion expressed by Major Douglas?—I do not think so.

He made a statement which was published in the press that the planning of industry was no solution?—Without a monetary plan.

Was no solution, and I am trying to draw your particular attention to the fact that there are other considerations which must be taken into account?—Would you recommend putting a wall round our peasantry?

Decidedly not, but I want to follow it up. Supposing the British Government were to suddenly place an embargo against the importation of milk-products from New Zealand; what would happen to New Zealand?—A general election.

But that is no answer to the question?—There are other things. There would, of course, be a complete paralysis here and there would have to be a reconstruction of all our import sources.

Perhaps it may not be so great a disaster as you might think. I think, if our goods are of sufficient quality and in the right volume, we can find markets somewhere.

Where do you suggest we would find those markets ?—Wherever we chose to purchase our wants.

Then the introduction of the quota system in connection with dairying products in New Zealand would not be so bad as the public seem to think ?—I think the quota system in New Zealand will mean the utter breakdown of our efforts to meet financial obligations, and I think this present system of a subsidy in London is probably as serious as the quota. It means that the price-level now will not rise.

I am very glad to get that admission ?—An admission ! It is a claim !

Exactly. I have made that claim already myself. That brings me to another point : In New Zealand we have a central banking Act which will be put into operation shortly. Under the provisions of that Act we will be able to control our own currency in our own country in our own way ; is that correct ?—No ; because you will observe that the powers of the Governor and Deputy Governor represent practically the administration and the control of the bank. The basis of the money is sterling balances, and those are dependent upon the United Kingdom price-level.

How are we paid for our exports to Great Britain ?—After a deduction for our financial commitments, we receive back the balance of imports.

Yes ; and the balance ?—That is the balance. After we have satisfied our commitments in London, the remainder we get back in imports.

We are actually paid on the balance in British sterling : Is that correct ? That is to say, we receive imports back for the balance ?—Yes.

Then there is a slight balance ?—A small one, yes.

We are paid in British sterling ?—Yes—that is to say, funds are realized by the sale of our produce and utilized to pay for imports into New Zealand.

Our products pay for goods ?—Yes.

You said that you would inject currency from certain avenues. Australia adopted a system some years ago of pegged exchange ; was that artificial or was it the correct value ?—It is a controversial point. The Bank of New South Wales said it was the natural exchange-rate.

It represented the natural exchange-rate ?—From the movement of funds to and from London.

As a result of the increased exchange, primary production increased enormously in Australia ?—I do not think that is cause and effect. It increased in New Zealand. It increased, too, in other nations where they had not such a barrier.

Nevertheless, the fact itself remains that primary products in Australia, more particularly butter, increased enormously during that particular period, and that butter was subsidized under the Paterson scheme ?—That increase in butter was at the expense of other products, but I yield that point—there was a big increase.

It was largely as a result of the increased price which was provided by the injection through pegged exchange of additional credit ?—Yes, I think so.

Coming to New Zealand, what is the position here ? When the New Zealand Government about eighteen months ago pegged exchange at 110, was it a direct value or an artificial value ?—Somewhere near the natural rate.

Are you certain it was not below ?—I would not be dogmatic about it, but the opinion was that it was somewhere round it.

I presume you have studied the subject ?—Yes, I have.

The question I am going to put to you is this : Is the present rate—the pegged rate in New Zealand—an artificial rate or not ?—Yes, it is.

In your opinion, should it go higher ?—No.

Seeing that we have given up borrowing in London ; seeing that our imports are increasing at the moment ?—Are they ? Not to my knowledge.

Very much so ?—They are nothing like they should be to preserve anything like a balance.

Seeing that we have given up borrowing, and seeing that the imports are increasing enormously, and seeing that you have studied the subject, do you not consider that the present rate of 125 is low ?—No ; because the proof of equilibrium is the fact that sterling balances should be zero. The fear of the importers is that it might move, but it is not a natural rate by reason of the disproportion of funds.

Do you not consider the easiest way of putting additional credit into the pockets of the people of New Zealand is by medium of that exchange-rate ?—No ; that does not place extra purchasing-power in the possession of the people of New Zealand. It enhances the New Zealand ratio of money which comes to New Zealand. The first people to get it are the bankers ; the next are the stock and station agents, and the residue reaches the farmer and through the farmer it goes to some one else who does not hold it very long. That represents a very small proportion of the money which comes from England. On the other hand, the importer has to face the full embargo of 25 per cent. The exchange-rate, to my mind, is a manifestation of the price movement, and should not be used to correct that difference.

Dr. Sutch.] Imports have not gone up 25 per cent. in price ?—They are yet a long way down from what one would expect.

Imports have increased enormously during the last two or three months. I have not the paper here at the moment, but the last issue of the *Abstract of Statistics* clearly shows that the amount of money lying on fixed deposit in the commercial banks has increased enormously during the last two years as compared with, say, 1928. Does not that go to prove that there is any amount of money there ? It is purely a question of getting it into circulation ?—There is more than money ; there is unlimited credit, but they want to have something safe and stable to lend on, and the prospect of immediate repayment.

And, in your opinion, if it were possible to plan industry in such a way—I presume you agree with the planning of industry ?—Yes.

So that we could lift the price-level for the commodities that are shipped overseas, it must have a decided effect on the taxpayers of the country, speaking in general terms ?—What is the project ?

To try and lift that overseas price-level ?—Unfortunately, we cannot. We have no influence whatever on the English price-level.

I admit the point, and a very decided point ; I quite agree. But we can work in co-operation with those who control Great Britain and as a result of the planning of industry, as a result of the agreements arrived at in Ottawa, the price-level for certain commodities increases enormously. You agree with that ?—What was it the result of ?

The Ottawa Agreement, the planning of industry ?—Do you attribute that to the Ottawa Agreement ?

Yes, partly. As far as Great Britain is concerned, she is placing quotas against foreign countries. I think you will agree that, so far as we in New Zealand are concerned, we must take notice of what is going on outside New Zealand ?—I wish more people would.

I quite agree with you ?—You think, then, that there is a prospect of the English and world price-level rising ?

I am putting questions to you ; we are here to judge ?—I was wondering what your intentions were. I have quoted the League of Nations' report showing that it sees no signs of recovery.

The cheques for New Zealand wool this year will be more than double ; the cheques for New Zealand lamb will be near enough to double. Probably the increase in the price-level in Great Britain will show that we will actually ship in meat and wool quantities which will provide possibly £10,000,000 more as compared with last year ; is that correct ?—Yes. Is that world recovery ?

I am talking about Great Britain ?—I have pointed out that Great Britain has made several raids upon foreign trade and to that extent she has benefited and we are benefiting as a result, but I cannot see any prospect of general world recovery.

Captain Rushworth.] The Hon. Mr. Downie Stewart was concerned about the risks of trying the experiment here in New Zealand. Do you know anything of the risks that President Roosevelt is taking in the United States ?—Yes.

They are very considerable risks, and he is going a great deal further than any suggestions that have been advanced by Major Douglas so far as this country is concerned ?—Incomparably so.

Forty-eight sovereign States, each with their own independent legislators, he is endeavouring to plan and monetize in a variety of ways ?

Hon. Mr. Downie Stewart : Let us see how he gets on before we risk it.

Captain Rushworth.] I was only suggesting that a degree of caution was being advised that was not justified by the circumstances at the moment. Reference has been made to the A plus B theorem. That was really the mathematical proof of a shortage of purchasing-power ?—That is so.

Is it seriously questioned that there is a shortage of purchasing-power ?—Apparently not ; but they are disturbed at the way in which it is put forward so accurately.

So the A plus B theory is a dead horse once it is recognized that there is a shortage of purchasing-power ?—Yes. I might say that the only thing it rests upon is whether after two years of prosperity the A plus B theorem will be proof of this gradual injection being necessary.

Another point was made as to the origin of the statement that the national income had fallen. The last Budget of the Hon. Mr. Downie Stewart was responsible for indicating that the national income had fallen according to the taxation returns from £150,000,000 to £90,000,000 ?—Yes.

That the fall in the national income was £60,000,000 a year. That is the origin of that statement which has been made ?—That is correct.

The impression was that that suggestion had been fabricated.

Dr. Sutch : Not at all. I knew where the statement had come from. I wanted to know where the money had gone to.

Captain Rushworth.] We have been asking that question for years. Columbia University has been referred to. Dr. Rauchenstrauch issued a formula some few months ago showing that in the United States the population is increasing as a square on the increment of time ; that production is increasing as a cube on the increment of time ; and that debt is increasing as the power of 4 of the increment of time. That was put to Major Douglas, and he agreed that that probably represented the ratio throughout the western civilization. Do you draw any deductions from the fact that debt is increasing so enormously ?—It is, in effect, that the monetary machine is not working correctly ; it is a sign that our purchasing-power is being derived as a loan from the monetary authorities. I might add that there was a further line which is that the employment of labour is decreasing as the square root of the increment of time, which brings about our unemployment problem, declared even here in New Zealand to be insoluble.

For some time past nations and individuals have been carrying on by an ever-increasing load of debt ?—That is proved by history.

What would be the effect on world affairs if an international loan of, say, £20,000,000,000 were to be floated on the moon and we were to shoot off all our surplus products to the moon ?—The need for Douglas Credit would be avoided.

That would be the only solution of the present system ?—I may say that Dr. Nicholas Butler made use of that expression, and said the world is bankrupt, and will not call the receiver in.

Reference was made to the fact that Major Douglas said that the Bank of England paid a dividend of 6 per cent. Dividends can be calculated on the nominal capital, the subscribed capital, the paid-up capital, or the market price of the shares. Each one would be different ?—Yes.

The suggestion advanced by Major Douglas was that the amount of profit by the banks should be limited to 6 per cent. You know that under the Reserve Bank of which we have heard a good deal lately the profits are limited to 5 per cent.—Yes.

On the question of that Reserve Bank, the bank, as established by law, has to operate on either gold or sterling balances ?—Yes.

So whoever controls the gold or sterling balances controls that bank ?—That is a serious point.

And the question of control is one to which you draw attention ?—Yes, as a danger.

You have studied the monetary question pretty widely ?—Yes.

You think that the Douglas analysis is the best diagnosis of the problem ?—I think that it is, and I believe it has cleared up more trouble in the financial investigation than any other discovery I know. It fits the case everywhere.

If you knew of any better explanation you would accept it ?—Undoubtedly.

The Chairman: I hope you will not think me discourteous in not asking questions, but we are short of time, and I must remember that another witness has been waiting here since 9.30 a.m. I want to point out that while questions have been fired both ways, I do not want you to go away with the idea that any of the members here are biased. When we sit here as a Monetary Committee we simply wish to get the views of other people, and it is only natural that the Committee should ask questions both for and against. I want to thank you for your contribution, and I would like to take the opportunity of congratulating you upon the way in which you have championed your cause and also for the ready way in which you have answered all the questions put to you.

Colonel Closey: I would like to make an explanation, too. Possibly I might have displayed a certain aggressiveness in answering questions, but it is a military rule that if you can upset the mental equilibrium of your enemy you have won 75 per cent. of the battle.

WELLINGTON, MONDAY, 23RD APRIL, 1934, AT 10.30 A.M.

First statement submitted by Mr. H. I. FORDE.

Non-monetary Factors in the Depression.

My object in placing evidence before the Committee is to draw attention to phases of the economic situation which are non-monetary. The point I wish to bring out is this: So long as there are non-monetary factors in any depression, a purely monetary solution will not be sufficient to restore economic and social equilibrium. In times of prolonged industrial depression, it is perhaps natural that men should single out some factor in the tangle of economic difficulties and make it the scapegoat of the world's improvidence. When times are good the average man does not concern himself with social or economic phenomena, but when times are bad he looks round to see what has hit his purse or his stomach, and, not being sure through unfamiliarity with human vicissitudes, seizes upon the first plausible explanation that comes his way. To-day the monetary theorists are in full cry, and their panaceas are attracting widespread attention. One does not wish to discourage them, but, at the same time, I think that it is only right to point out that there is a danger of their diverting the public mind from the harder and more complicated solutions of our difficulties. As the English economist, Mr. Dennis Robertson, has put it in his criticism of Major Douglas during the course of a B.B.C. Broadcast debate:—

> When I heard Major Douglas declare that if his proposals were adopted poverty and the fear of poverty would disappear for ever from this country, I felt as sorry as I should if I heard somebody who set up as a medical expert make the same claim about disease. For I believe that his assertion that the difficulties of the world are in essence mere book-keeping difficulties, which he knows how to solve, has done much harm in spreading false ideas and raising false hopes in the breasts of many sincere and well-intentioned people. . . . Though I am not myself a Communist, I have some sympathy with those who reject Major Douglas's proposals, because they hold that drastic changes in much more fundamental matters than the mere machinery of credit will be necessary to put things right.

Another pertinent comment on this point comes from the Socialist economist, G. D. H. Cole, who states,—

> Money, being by tradition something of a mystery, lends itself readily to mystifications and plausible jugglings with formulæ guaranteed to set the world to rights. There are, however, strong reasons for holding that, while there is plenty wrong with the existing monetary system, the evils of the present order go far too deep to be cured by any alternative method of monetary management.

It is not my contention that the economic depression is purely non-monetary and that monetary reforms are not necessary, but my endeavour is to place before you some of the factors that seem to have been left too far in the background during this inquiry. I wish to make it clear also that I have endeavoured to take a positive rather than a normative viewpoint, because I believe that it is better to find out all the facts before formulating any theory, rather than set up a theory and then fit in the facts. The only suggestion I am making is that there should be a central control for all the financial institutions (both public and private) for the purpose of achieving a unified policy for the Dominion. I will deal with this question later on.

One of the difficulties one encounters in studying economic phenomena is the lack of complete data in some of the vital aspects of the problems which are confronting us to-day, and this, plus the complexity of many of these questions, makes one very diffident about dogmatizing either as to what has really happened in the past or what will happen in the future. Even the Russians, who have more control of their economic system than any other country, confess that they have obstacles to overcome. Surely, then, a system like our own which is a mixture of control and free play, is even more difficult from the viewpoints of both the diagnostician and the prophet. Economics does not offer any complete formula for human activities, because it is only one of the social sciences. Thus it would seem the height of absurdity to take one aspect of economics, the monetary aspect, and contend that here is the missing link between poverty and prosperity. Such a contention would necessarily assume, for

instance, the infallibility of politicians, and I think that the members of the Committee would be the last to claim that attribute. For the purpose of illustrating the complexity of the economic situation I wish to place before the Committee a summary of some of the findings and opinions of some of the men who have made a comprehensive study of conditions around them. These men have various shades of political thought from individualism to Communism, and without exception they hold the view that there are salient non-monetary factors as well as monetary in the present unfortunate situation. Some even go as far as to say that the non-monetary factors are the basic causes of our troubles and that the monetary factors are only symptoms.

In his book "Planned Money," Sir Basil Blackett, a director of the Bank of England, stresses the importance of planning in the particular field of money and finance, and he contends that planning is hardly conceivable under a monetary system in which the general level of prices is subject to violent fluctuations. It is particularly significant, however, that in his opinion "a stable price-level is impossible without planning in other economic fields." In other words, Sir Basil Blackett recognizes that mere monetary manipulation is not sufficient to carry out his planned money proposals.

In an article in *The Times*, Hartley Withers, a former editor of the *Economist*, in dealing with the theory that our present difficulties are purely monetary, states,—

> This argument includes (*a*) the assumption that production has increased in an orderly and symmetrical fashion—which is very much open to question, since, if that had been true, the fall in all prices would have been approximately equal; (*b*) a statement—that there are no observable impediments, physical or moral, to the exchange of commodities—which ignores the existence of new and higher tariffs, economic nationalism, war debts, political disturbances, and many others that might be mentioned; and (*c*) another assumption, that gold went to the United States and France merely because the central banks failed in co-operation. The Federal Reserve Bank and the Bank of France were condemned as guilty of all mischief without any inquiry as to causes, possibly beyond their control, which may have sucked gold into their vaults against their will. If business men are always going to be alarmed and nervous when gold in any quantity leaves their country, central banks are forced, in spite of their better judgment, to indulge in that gold scrambling and gold-hoarding which may have contributed to the present crisis and accentuated the effects of the far deeper and wider causes that produced it.

Professor Friedrich A. Hayek, Tooke Professor of Economic Science and Statistics in the London University, has also some pertinent remarks on the same point. He says,—

> It is a curious fact that the general disinclination to explain the past boom by monetary factors has been quickly replaced by an even greater readiness to hold the present working of our monetary organization exclusively responsible for our present plight. And the same stabilizers who believed that nothing was wrong with the boom and that it might last indefinitely because prices did not rise, now believe that everything could be set right again if only we would use the weapon of monetary policy to prevent prices from falling. The same artificial view which sees no other harmful effect of a credit expansion, but the rise in the price-level, now believes that our only difficulty is a fall in the price-level, caused by credit contraction. There can, of course, be little doubt that, at the present time, a deflationary process is going on and that an indefinite continuation of that deflation would do inestimable harm. But this does not, by any means, necessarily mean that the deflation is the original cause of our difficulties or that we could overcome these difficulties by compensating for the deflationary tendencies, at present operative in our economic system, by forcing more money into circulation. There is no reason to assume that the crisis was started by a deliberate deflationary policy on the part of the monetary authorities, or that the deflation itself is anything but a secondary phenomenon, a process induced by the malajustments of industry left over from the boom. If, however, deflation is not a cause but an effect of the unprofitableness of industry, then it is surely vain to hope that, by reversing the deflationary process, we can regain lasting prosperity. Far from following a deflationary policy, central banks, particularly in the United States, have been making earlier and more far-reaching efforts than have ever been undertaken before to combat the depression by a policy of credit expansion—with the result that the depression has lasted longer and has become more severe than any preceding one. [This was written in July 1932.] What we need is a readjustment of those elements in the structure of production and of prices which existed before the deflation began, and which then made it unprofitable for industry to borrow. But, instead of furthering the inevitable liquidation of the malajustments brought about by the boom, all conceivable means have been used during the last three years to prevent that readjustment from taking place; and one of these means, which has been repeatedly tried though without success, from the earliest to the most recent stages of the depression, has been this deliberate policy of credit expansion.

He further states,—

> To combat the depression by a forced credit expansion is to attempt to cure the evil by the very means that brought it about; because we are suffering from a misdirection of production, we want to create further misdirection—a procedure which can only lead to a much more severe crisis as soon as the credit expansion comes to an end.

Professor Hayek also makes the point I made earlier that we must be painfully aware at the present time that we really know little of the forces which we are trying to influence by deliberate management. If some of us knew the difficulties in the way of commodity indices and other things that are glibly talked about by those who have never endeavoured to compile them we would be more guarded in our reference to them.

I would like also to draw the attention of the Committee to the resolution adopted at the annual meeting in July last at Lausanne of the International Commission of Agriculture, which claims to represent the combined views of national agricultural bodies in many countries. This resolution, which recognizes that mere monetary manipulation is not the way out of economic depression for the farmers, is as follows:—

> The general assembly considers that a judicious organization of production and exchange will constitute one of the most effective means for fighting the agricultural crisis and establishing the prosperity of nations on a new basis. The first step would be to substitute orderly marketing, through the agency of associated bodies, or by means of systematic State-controlled quota import arrangements, for present unregulated offers of large quantities on world markets.

This resolution may at first sight appear to be irrelevant to the inquiry. I submit that it has a direct bearing on the point I am endeavouring to make—that factors other than monetary must be taken into consideration in formulating a plan for reconstruction.

In a paper on world economic planning, Dr. Max Lazard, a French economist, laid stress on partial overproduction, and contended that this phenomenon was a substantial factor in causing a fall in price and a paralysis in trade. In a particular enterprise it can be explained as due to an error of judgment of the director or some other cause, but it is more difficult to give a definite diagnosis when it comes to general overproduction. Nevertheless, experience of recent years makes it difficult to deny that overproduction in more than one industry occurs from time to time and aids the movement from prosperity to depression. Particularly was this so in America prior to the 1929 crash.

One of the points stressed by Dr. F. C. Benham, of the London School of Economics, is the immobility of labour, and surely this is a factor in New Zealand where we have so much seasonable labour. It is certainly a problem in Great Britain where we sell most of our produce. Dr. Benham estimates that of every sixteen unemployed in Great Britain, the idleness of five is attributable to the familiar causes of maladjustment in the labour market; six to conditions peculiar to England after the war; and five to the general economic crisis.

An interesting view is that of one of the Russian economists, Mr. Valery Obolensky-Ossinsky, who, when addressing an international gathering stated:—

> Anarchy of production and the circulation of commodities, finance, &c., and the divergence between producing and purchasing capacity are not isolated phenomena. They cannot be removed separately, while the whole complex of conditions, which for the past hundred years has inevitably and constantly given rise to these, is preserved.

From this point he develops the Marxian theory of surplus value, and I think that at this point I will give you the version of G. D. H. Cole, who is not a Communist, but who holds that Marx's theory is valid. His contention is:—

> There are strong reasons for holding that, while there is plenty wrong with the existing monetary system, the evils of the present order go far too deep to be cured by any alternative method of monetary management. For, in the first place, despite the assertions of some of the monetary reformers, there is under capitalism no persistent shortage of purchasing-power in relation either to the volume of goods on the market or to the productive power of society. There is, on the other hand, a tendency to alteration between an excess and a deficiency of purchasing-power, corresponding to the alternate expansions and contractions of bank credit. In booms credit is expanded, so far as to raise prices without a balancing expansion of output, while in slumps its effective use is so far curtailed as to cut off demand and cause production and employment to be seriously reduced. That this is a grave fault in the present mechanism of the monetary system is clear enough; but whence does it arise? It is due at bottom not to a purely monetary cause, but to the inherent instability of the capitalist system. Bankers cannot effectively create money unless there is a demand for it; and the business demand, under Capitalism, can arise only from the expectation of being able to use it at a profit. For the most part the bankers in creating more or less money, are following, and not initiating, the rise and fall of profit-seeking demand for the capitalist entrepreneurs. It is, of course, true that, at the present, a deliberate attempt is being made to bring back prosperity in the United States by means of monetary reflation, and that bankers can do something, by the mere emission of additional credits, to give an impetus to business optimism and trade revival. But the events in America during the past few months sufficiently show that, if a forward movement generated by these methods is not speedily to collapse, other forces besides the emission of more money must be brought into play. . . . This endless cycle of capitalist boom and depression is often exaggerated by bad banking policy; but what lies at the root of the trouble is not the mismanagement of the monetary factors, serious as it is, but the inability of capitalism to provide at one and the same time a sufficient profit incentive to get all the productive power which will enable consumers' demand to expand in due proportion to the advancing productivity of the economic system.

Witness: Mr. H. I. Forde.

Mr. Forde: In my first statement I endeavoured to point out a number of non-monetary factors in the depression and to support those with quotations from various authorities who had made a deep and comprehensive study of the position. In the second statement I have gone a little bit further with that point, and after quoting further authorities have endeavoured to develop one of the non-monetary theories which are concerning us at the present time. My second statement reads,—

"A formula much wider than monetary reform is offered by J. A. Hobson, who, in his book 'Wealth and Life,' gives an economic framework for a conception of the progressive welfare of humanity. His conceptions are—'(1) Increasing productivity by improved control over nature and better human organization of economic activities; (2) an equitable and wasteless system of distribution of the product of economic activities; (3) improving arts and standards of consumption with their reactions upon productive processes; (4) such control over the quantity and quality of populations as is attainable with better knowledge of strains and racial values, and increased willingness to accept such controls.' Sir Arthur Salter in his preface to H. V. Hodgson's 'Economics of a Changing World,' states,—

> "At this period we halt between two systems, suffering from some of the defects of each and failing to get the full advantages of either. The old automatic system which effected adjustments through changing prices in a field of free competition has been impeded and obstructed by a hundred forms of control; but control does not include deliberate planning which is the alternative method of adjustment. We must either re-create the conditions under which the first will again operate without intolerable waste and injustice—which I personally believe to be impossible—or we must substitute the opposite system, as, for example, it is being tried in Russia, with both economic and political consequences which most of us contemplate with grave misgivings; or—which I believe to be the right course—we must construct a new system which will combine the advantages of both the opposite extremes. We must place private enterprise within a more intricate and skilful framework of control and planning. This I believe to be both practicable and advisable, and to constitute the distinctive and fundamental task of our age and civilization.

Professor A. C. Pigou says, 'Optimistic error and pessimistic error, when discovered, give birth to one another in an endless chain.' Professor Schumpeter declares that innovations—inventions and so forth—come in waves and initiate periods of activities and depressions. The late Professor Thorstein Veblen saw an inevitable circular motion in prospective profits, governing the actions of business men

who have in their hands the conduct of the money economy. J. M. Keynes holds that the price-level of consumable goods changes in the relation of saving and investment, as effected by the rate of interest, and he also adds, in his 'Essays in Persuasion,'—

"The pace at which we can reach our destination of economic bliss will be governed by four things—our power to control population, our determination to avoid wars and civil dissensions, our willingness to entrust science with the directions of those matters which are properly the concern of science, and the rate of accumulation as fixed by the margin between our production and our consumption—of which the last will look after itself, given the first three.

Professor Todd, in his latest book, 'The Fall of Prices,' suggests that this latest fall is to a large extent due to the Wall Street crash and its world-wide repercussions. Mr. R. G. Hawtrey has put forward the explanation that when the banks have large reserves they reduce discount-rates, and thus encourage borrowing and business expansion, which grows cumulatively until the banks find that larger cash requirements are impairing their reserves when they adopt a restrictive policy. This list is by no means complete, but it serves to illustrate the number and deviation of the various theories current. I have purposely not inflicted the Committee with the non-monetary factors enunciated in the Macmillan report, as I understand that they have already been placed before the Committee, but, as the Committee is confronted with a similar inquiry to that undertaken in England, I would like to direct attention to the final paragraph of the first chapter in that report: 'While the non-monetary causes which have contributed to the present distress, strictly speaking, fall outside the scope of our inquiry, we have found it impossible to avoid some discussion of them, for it is only by estimating their effect that we can arrive at some delimitation of the sphere of action of monetary causes properly so-called.' I will now proceed to outline some of the salient non-monetary factors which the currency reformers blissfully ignore in their fervent search for convenient facts to fit their theory. In the first place there is the political factor. One has only to read J. M. Keynes's 'A Revision of the Peace Treaty' to realize the big mistakes that were made by the politicians at Versailles: and these mistakes have not yet been rectified. The British notes to America were further ample evidence of the economic consequences of the war. The remaking of political frontiers and the redistribution of colonies has also had undesirable economic consequences, and it may be many years before these are obliterated. As I have stated above, politicians are not infallible, and if they make mistakes they can cause as much damage as even bankers. What is more, they hold their positions, perhaps less so than formerly, at the will of the people, and because they displease the people they are frequently displaced. Every change of Government whether for better or for worse causes disturbances, and no one can reasonably deny that these changes and disturbances have not been frequent during the post-war years. The war was also responsible for several other severe repercussions. It was responsible for a swift change in the relationship between debtor and creditor countries. Before the war London was the financial centre of the world, but after the conflict her place was disputed by New York, which had become the financial centre of a creditor instead of a debtor country. The losses and interruptions of the war had the effect of unbalancing industry and finance, and, owing to the comparative immobility of labour, there have been serious unemployment problems in the countries most affected. In my opinion the effects of the war are yet with us and cannot be discounted in any part of the world which has international trading relations. As Professor Henry Clay has pointed out, England's industries before the war were able to adjust themselves bit by bit to the 'new competitive conditions with which they were faced by the growth of modern manufacturing industry in other countries.' But the war 'interrupted this normal piecemeal and day-to-day adjustment to changing conditions.' The countries involved in the war were thrown out of line with the long-run trends of world-wide economic evolution. Moreover, the war and its consequences changed the direction of these trends, and the leading nations of Europe found themselves out of touch with world forces. The story of post-war international investment has been vividly told by Sir Arthur Salter in his book 'Recovery.' The sudden failure of international investment in 1929 was every whit as powerful a determinant of the subsequent economic catastrophe as the payment of war indemnities or the uneven distribution of gold reserves. Moreover, it exposed flagrantly the folly of some of the lending that had been made, since debtor countries were left with obligations which under no reasonably probable circumstances could they possibly redeem, and which forced upon them policies of deflation bound to prove disastrous to the whole world economy. These debtor countries had to adjust their balances of trade to new circumstances, and the adjustments had to be made by deliberate and painful devices like prohibitive tariffs, dumping, organized wage-reductions, and international price warfare. The different rates of recovery from the war have also deeply affected practically the whole of Europe. It will be remembered that the United States of America obtained a flying start after the cessation of hostilities, and for a while she practically had the markets of the world at her feet. Her industries were capitalized on a most optimistic basis, and the measure of prosperity she enjoyed led to an unjustifiable elation. America's desire to become the workshop of the world was one of the reasons for the tariff walls which were erected by those countries experiencing a more slow and painful recovery. During the war also the world consumed a great deal of its capital. There was a general shortage and high prices. This situation led to feverish activity, and in no previous period in the history of the world has science aided human effort to a greater extent. There were rapid technical changes in both the manufacturing industries and agriculture, and these have led to swift changes that no monetary system could cope with. New types of manufacture and new processes of industry have had a mushroom growth, and those countries in the best position to take advantage of these have made tremendous progress. The cotton and rayon industries are examples of this change. They gave an opening for Japan to become a world competitor. Japan was not hampered with past expenditure on obsolete or obsolescent plant, and was able to take full advantage of the new fruits of science which destroyed to a large extent the traditional ability of the operatives of the older countries manufacturing these commodities

and made the automaton as efficient as the skilled workman. With all these productive resources at their command, is it any wonder that the entrepreneurs in a number of industries overestimated their market? Let us take a simple illustration: There is a market for motor-cars at a profitable price. An entrepreneur sets out to supply that market and he meets with success. His good fortune attracts others into the field, and there is then a race for the market which begins to weaken because of the shrinking demand. There is a price war, and perhaps another stimulus of the market through advertising, more intense salesmanship, and lower prices. This gives further encouragement to the industry, and then the market falters again. The smaller output at the lower price results in losses and whole factories are shut down. The employees in these factories are no longer able to maintain their purchasing-power with the grocer, the butcher, and the draper, they become behind in their commitments, and the effects of their dismissal spread like a ripple on still waters. This case is hypothetical, but concrete instances of parallel cases are cited by various economists and others who have made researches into post-war industrial trends. There are illuminating examples in Stuart Chase's 'Men and Machines' and F. Henderson's 'Economic Consequences of Power Production.' The main trouble is that the entrepreneur is frequently governed by the price and not by the total effective demand, and such a situation cannot be cured by mere monetary manipulation. Suppose, for instance, that there has been over-optimism on the part of the motor-car manufacturers and they glut the market. The cure of the currency reformer would be to 'equate goods with purchasing-power.' He carries out the 'equation,' and what happens? The people who obtain the money buy radio sets. The cure is not so simple as it looks. However perhaps the motor-cars can be turned into 'costless' credit, because they will certainly be worth nothing if there are no buyers. Another aspect of the question that the monetary reformers overlook in hatching their plans is that purchasing-power is not merely tokens or notes. It represents goods or services. For instance we are often told of the superabundance of wheat in the United States and the starvation because of the lack of wheat in China. However, the point is this: The potential consumers in China can secure the required amount of wheat from the United States only by selling their own products in exchange for it or by obtaining the necessary credit with which to buy it in the United States. Both possibilities are closed to the Chinese, because the national production of China under existing conditions is inadequate and the international credit of China is nil. The same rule also applies to the exchange of goods and services within a country. I am not saying that there could not be a reorganization either nationally or internationally for a more rational and more balanced state of affairs, but what I assert is that it cannot be done by tinkering with the currency. The planning that is required is more far-reaching. This point has been stressed by those who would plan within the present system and those who would abolish the present system and replace it by something else. President Roosevelt has illustrated the necessity for changes far deeper than mere monetary reform, which might be termed a comforting but spurious philosophy for timid Socialists. Few will deny that planning is necessary, because the only alternative is the removal of all control and the revival of the doctrine of *laissez-faire*, *laissez-passez*, which is too narrowly removed from anarchy to be justified either economically or socially; but conscious planning is something more than messing about with nebulous purchasing-power and 'costless credit.' It is a question of controlling the whole of our economic activities, and it is the extent of the control that is the big political question of the day."

Pursuing that question of control, I would like to offer one suggestion to the Committee that I indicated in the policy part of my statement. In this country we have a large number of lending Departments, lending institutions, both Government and private, outside the scope of that of our central monetary system. When I talk about the central monetary system, we are endeavouring now to establish a central bank to co-ordinate our banking system, and yet we seem to have overlooked several important factors in that co-ordination. Take the Government Departments which have power to make advances: There is the State Advances Department, Public Trust, Rural Intermediate Credit Board, Government Life Insurance Department, Public Service Superannuation Fund, Teachers' Superannuation Fund, Government Railways Superannuation Fund, National Provident Fund, Land Development Board, Native Land Settlement Board, Small Farms Board, and Unemployment Board. The private institutions include the various insurance companies, investment trust and trustee companies, loan and agency companies, and there are several others. The list altogether is a fairly lengthy one. I will put in the list as it appears in the Stock Exchange:—

Insurance: Australian Provincial, Mercantile Mutual, National, New Zealand, Queensland, South British, Southern Cross, Standard, United. Investment Trust and Trustee: Dominion Banking, Dominion Investments, Perpetual Trustees, Wellington Investment Trustee. Loan and Agency: Abraham and Williams, Canterbury Farmers', Dalgety and Co., Equitable Building, Farmers' Co-op. Auctioncering, Finance Corporation of N.Z., Goldsbrough Mortgage, Mercantile Finance, National Mortgage, Newton King, N.Z. and River Plate, N.Z. Farmers' Co-op., N.Z. Guarantee Corporation, N.Z. Investment Mortgage, N.Z. Loan and Mercantile, N.Z. Mortgage Security, North Auckland Farmers', Reliance Loan, Traders' Finance, Wairarapa Farmers', Wellington Trust, Loan, and Investment, Wellington Deposit, Mortgage, and Building Association, Wright, Stephenson.

I think it is just as important that we should have unified control of our financial system as to have unified control of, say, our transport system, and if the Central Bank is going to be an effective control of banking and credit in this Dominion, then it must take those institutions into consideration.

Dr. Sutch.] You are speaking of the co-ordination of financial institutions. How would you suggest that the Public Trust be connected with the Reserve Bank?—I do not think that it should be linked up with the Reserve Bank, but the Reserve Bank should have some control over the lending policy of the Public Trust. For instance, an institution might lend contrary to the national economic policy of the country. If an institution has power to lend and can lend without reference to any other authority, it might upset the applecart, so to speak, if it is powerful enough. You had that instance in America. Several of the large corporations in America carried on big banking business privately with their

customers and employees during the boom, and many of them, by building up a large reserve of liquid resources in the form of cash and Government securities, were able to finance their own short-term credit requirements without having recourse to the banks, and that has undoubtedly been a factor in the American depression. We in New Zealand have a wonderful field for disastrous speculation in land, and if there was a sudden boom in products it would be necessary, I think, for the central control of the financial system to have some over-riding authority in order to stop that speculation.

There are one or two Government Departments you mentioned in your list, Crown Lands and Rural Intermediate Credit Board, State Advances, and one or two others. Do you think that they should be amalgamated ?—I have not gone into that question, but a question I have gone into is that of control. I think that the control should, as far as possible, be pyramidical, that all financial institutions should come within that pyramid. There should be no interlopers and no free lances.

We have a Loans Board at the present time. Do you think we should have a similar Board, or should the Reserve Bank be the Board ?—If the Reserve Bank can handle it, well and good. The central authority, then, has wider powers, and has greater scope for co-ordination.

That is true. The Reserve Bank would have to go very carefully I suppose for a year or two ?—Yes.

You mentioned some institutions there on that Stock Exchange list. Why would you co-ordinate investment trusts ?—For the same reason as I would co-ordinate the Public Trust and the State Advances. If they are not going to have national responsibility in their lending, then they can do just as much harm as, say, a State institution.

Have you looked into this point. If co-ordination took place in New Zealand it might be possible for people to borrow in Australia rather than have resort to New Zealand institutions ?—Yes. That is a point.

Is there any means of getting over that ?—The only means of getting over it would be to control investment generally. If you had control of investment, then you could divert investment from one channel to another. For instance, if we found that Australia was going to create a land boom in New Zealand I should imagine it would be quite competent for the Government to take the necessary action to prevent that. If the Australians were to invest in this country they would have to play the rules of the game, the same as our internal investors.

You think that is a Government responsibility—to direct investment ?—Not to direct it altogether, but to control it. I am talking now within the scope of the present economic system.

Yes. It is not any change-over from free competition or free monopoly ?—No. If I were talking about Socialism or anything like that I would be talking a different way.

There are one or two firms on that list, Abraham and Williams, Dalgetys, and firms like that, how would you link those up with the central institution ?—The same way as I would link up an ordinary trading bank.

By requiring it to have a percentage of those liabilities held with the Reserve Bank ?—Yes. I think it was pointed out to the Committee recently that, although the banks might desire to bring down the rate of interest, they were unable to do so because of outside competition. If they bring down the rate of interest they have naturally got to bring down the rate of deposits. Well, these people have the power to attract deposits and therefore you cannot get any co-ordinated policy for a general lowering of the interest-rates, and that was one of the reasons why I put forward this suggestion.

Do you not think that banks are powerful enough to reduce rates on their own ?—No. As long as they are meeting competition from people who are desiring deposits, then they have not got absolute control. The list is rather a formidable one when you put it all together, including the State Departments. Our State Departments are very big lenders. We have only got to look at the advances made by the Public Trust. We have an everlasting monument in the Chateau to that. The Unemployment Board is making big advances.

Those are not usual business advances though. The examples you have just quoted are ?—But they are advances for capital expenditure, and overcapitalization can be very detrimental to a country.

That would be the capital market, but the banks do not deal generally with the capital market do they ?—They generally deal through an intermediate institution if possible.

Could you give us an example of that ?—Stock and station agents.

The banks lend to the stock and station agents, and they in turn lend out ?—Yes. Although I think some of the stock and station agents accept deposits, and they can lend their own deposits.

Do you know the definition of a bank in the Bank Act of 1908 ?—I have seen it but I could not repeat it from memory.

It is a very loose one. Any business that does the business of banking, or something like that. According to our law at present, then, they could be included ?—Yes. The question of definition, of course, is important, but the most important thing is whether the definition will be acted upon. After all, you can define a thing and then wink at certain procedures.

Do you think that stock and station firms had anything to do with the land booms that have happened in New Zealand ?—I should imagine they had, seeing that they were the prime cause of financing the farmers, and one has only to look at their liabilities at present. A lot of those are in land, and that naturally leads one to the conclusion that they had something to do with it. A company like Wright Stephenson—I believe they have got an overdraft of about one-third of a million with the Bank of New South Wales. Those are advances to farmers that cannot be met at the present time.

The difficulty appears to be ability to control such firms without interfering with their other business ?—I would not be frightened of interference at all. After all, if as we mentioned here it is a question of how far we are going to interfere, and that is purely a political question, it is quite obvious that we cannot allow the free plan of economic features to operate in the future, if we are going to iron out booms and depressions.

That brings me to the quantity theory of money. Do you think that that is of much value in actual policy ?—No, but it cannot be ignored. For instance, take the price-level: It tends to equal the aggregate of the currency multiplied by the velocity of circulation and divided by the volume of trade. That in general is irrefutable; they are underlying features that modify it.

But you know the Keynes's analysis ?—Savings and incomes ?

Income deposits and business deposits ?—Yes; I have his formula here.

You think that would be more helpful as an exposition of the quantity theory ?—It may be, because Keynes points out that investments and savings are promoted by two different sets of individuals, and that so far we have not been able to co-ordinate those two sets of individuals. My proposal for the co-ordination of the whole of the banking and lending institutions goes a step in that direction.

If we assume that the quantity theory of money is correct, does that mean we can pump more money into circulation, and prices will rise ?—Other things being equal, the tendency would be that way.

Other things being equal seems to be the trouble ?—Yes. The quantity theory of money does not mean that all individual prices will rise in the same proportion: it is just a general trend.

I think it has a difficulty in it in that you cannot pick out which is the causal factor in a price rise ?—No; that is the difficulty.

If you cannot pick out which is the factor of causation, how would it be possible for us to control the price-level ?—I do not think it would be possible to control the price-level under our present economic system.

You do not think it is possible ?—No.

Mr. Clinkard.] Would you mean individual price-levels or general price-levels ?—General.

Dr. Sutch.] Do you think we could aim at controlling the price-level by some index number ?—The difficulty is in compiling the index. So far the science of index prices is in a very experimental stage, and while you can control a static index, an index at a particular date applying to a particular group of commodities, quite well, the thing is to compile an index which will move over a one-year or two-years period and still give you something like an equitable basis for your currency. Prices shifting, demand, and things like that are all the time upsetting a wide index. If your base is narrow, your index is subject to error.

A general price-level would have to be more than that, surely ?—Yes; then that would not give you a true reflex of the general price-level.

I had an interesting example of that. My friends were watching indices to see how production and price-level were going, and something happened that was not at all in accord with the trends, and they found that radios and refrigerators had come into public favour and were occupying a good deal of production and consumption, but were not included in the industries at all ?—A new commodity may come on the market and have mushroom growth and have to be weighted and put into the index. You may have a different one each month, and then there would be the question of what was to come in and what was to go out. It is quite easy to get an index for a particular date, but to get a moving index that would be equitable is a different thing.

Assume we try to get one for a particular date: If I want to find the general price-level in New Zealand (there is no such thing at the present time) what would you include ?—You would have all your commodities for a start, interest-rates and various things.

Rents ?—Yes.

Investment transactions and stock exchange ?—Yes.

The price of electricity ?—Yes; that in a way is a consumable commodity and would have to come in.

Interest-rates would come in. How would you weight them ?—I would not like to sit down and work it out offhand, but they would have to be taken into consideration. In a competitive society interest-rates are a charge on production and must naturally be weighted in in any costs.

You would have wholesale prices and retail prices ?—You would have to fix it on either wholesale or retail prices.

What about import prices and prices of semi-manufactured goods ?—You would have to take a general basis on either wholesale or retail prices; otherwise it would be too complicated. That is the difficulty, the complication of the thing. People talk airily about it, but when one tries to work it out it is a different matter altogether.

Do you think it would be of any value even if you did have a general level of prices—if you could get that index number ?—Yes, in a way. It would certainly be illuminating data, but it would be very difficult to peg a currency on to it.

Do you think there is any such thing as a general level of prices ?—No.

It is just an abstraction ?—Yes.

Similarly our cost-of-living index probably fits no man in the country ?—Oh, no. The *Abstract of Statistics* does not go so fully into it as it used to, but at one time they gave the different prices in the different centres. For instance, they had rent in Wellington down to ½d.—no one paid ½d. rent in Wellington; it was just an abstraction of general conditions in Wellington, and then it was a question as to whether his index was full enough.

Do you think your price-level would remain stable and conditions would also be prosperous ?—Yes; you can have prosperity and falling prices.

With a stable price-level, this Statistician's index number was stable but concealed two or three contradictory movements; for instance, the price of manufactured goods might be stable while imported goods were rising in price, exports falling, and wholesale prices perhaps only slightly falling. Do you think there would be much value in just watching that one composite index ?—No; the index would not show you those trends.

It would be better to watch many trends rather than one ?—Yes. If you had two opposite trends and they were cancelling each other out, it would blind you to that fact.

If you were Governor of the Reserve Bank, would you prefer to watch an internal price-level index or many indices ?—I would rather watch as many as possible. I think by that I would form a better picture of the general conditions.

So that it would be unduly limiting you if you were compelled by law to watch one index ; it would not be a good thing ?—No, not a good thing for the country at all.

Do you think we can have prosperity and yet the value of our monetary unit alter ?—Do you mean prices falling ?

Put it this way : Could a worker be better off than before despite the fact that his pound-note will buy less or more ?—Well, he certainly would not be better off if his pound-note would buy less.

But he might have more pound-notes ?—He would have to have a corresponding rise in the number of notes he was receiving. If his wages remained the same obviously he would be worse off. If his nominal income kept abreast of his real income, it is of course a different thing.

Do you think it advisable at the present time to cut down capital values to their real earning-capacity ?—It is certainly advisable if it can be done, because, after all, even if you are going to start to plan, you must get rid of some of the maladjustments. For instance, if an industry is overcapitalized and its output say is far beyond what any demand is likely to be or will be through competitive conditions, then that adjustment has to be made some way or other, and that is one of the difficulties of raising the price-level ; you do not make those adjustments. Those adjustments can easily be made either by some controlling authority such as Parliament or by allowing absolute free play of economic forces which may bring chaos.

Do you think our troubles in New Zealand are due to monetary manipulation or to forces on the side of production or marketing ?—I think they were predominantly non-monetary. I do not think the banks are any more infallible than any one else, but there are other fallible people as well. The banks will lend when there is an opportunity for some one else to make a profit. We are predominantly on a profit-making system.

What about the monetary system, leaving aside the bankers ? Is there something wrong with the system in New Zealand ?—How do you mean ?

We have the system of advances, deposits and repayment of advances against security—what the banks have given as their policy in the past. Do you think there is anything inherently wrong with that ?—There is nothing inherently wrong with the mechanism of it.

It is the absence of control that is the trouble ?—Yes ; but the control must extend far beyond the banks.

It is not sufficient just to control the banks ?—No.

Do you think in a predominantly competitive regime that banks should be wholly State-owned and State-controlled—I mean the trading banks taken over ?—I do not see any harm in State control at all. After all, the general trend is towards State control of banks. There are few central banks in the world that are not State controlled.

I will leave that. Have you in the course of your reading found out why Japan has been able to flood the world's market with low-price goods ?—Because Japanese industry has had the assistance of the Government.

How ?—I heard that discussed the other day by Mr. Beckerleg, and I looked up the question. The first point I got on that was from the League of Nations' latest publication, "The World Economic Survey, 1932-33." There it was pointed out that the Japanese Government debt to the Bank of Japan amounted in 1930 to only 15 per cent. of the note circulation, but at the end of 1932 it had risen to 45 per cent. From 1929 to 1933 financial years the Japanese internal debt had risen from 5,831,000,000 yen to 6,741,000,000 yen, and there has been further borrowing since. I got hold of a publication from Japan, "Present-day Japan : Her Goods in World Markets," and this gives an outline of Japanese political and economic policy.

Mr. Schramm.] Is the State in control in Japan ?—Yes, very much so. For the last financial year the Japanese budget had a record deficit of 962,000,000 yen, and to meet this deficit they have been borrowing, from the Bank of Japan mostly.

Mr. Langstone.] That is what we have been doing in New Zealand ?—They have been doing the same thing.

What is the difference between the Japanese situation and ours ?—In the Japanese situation they have a larger amount of inflation than we have—a deliberate policy of inflation. This article reads,—

> Japan has since 1931 undergone remarkable changes politically and economically. The Government has had to take up the so-called emergency measures to tide over acute financial difficulties. Our economic policy for some years past has been framed to meet a chaotic economic situation, as it will be in the future. The financial depression, however, has swept over the whole world to-day and our measures, in many respects, are like those of other nations under the capitalistic economic system. Although Premier Saito stated emphatically in the Sixty-fourth Session of the Diet that abuses of the inflation policy could be almost entirely avoided by the proper handling of the currency policy by the Bank of Japan, the keynote of our economic policy is no other than the carrying-out of an extensive inflation programme, whether or not there follow such abuses as the Premier fears. The suspension of the gold standard in 1931 led to a marked decline in the yen, sometimes to figures just under twenty dollars, which it was hoped would be the lowest point. To check a further fall the Government resorted to the law against the flight of capital. This law was a prelude to the Exchange Control Bill, which was submitted, as a Government measure, to the Sixty-fourth Session of the Diet, and was meant to exterminate exchange speculators, though not to end the so-called "exchange inflation." In view of the difficult financial situation, there was nothing for it but to go forward with the inflation policy even if it meant only temporary relief ; and for this purpose the Budget for the current fiscal year, amounting to the enormous sum of 2,309,000,000 yen was passed by the Sixty-fourth Session of the Diet. To cover the deficit loans amounting to 1,100,000,000 yen had to be floated. Thus in the 1933-34 fiscal year the inflation, as the natural and inevitable result of the reimposition of the gold embargo, is changing from an exchange inflation to a financial and bank-note inflation.

It goes on to say,—

In these days every nation under the capitalistic economic system is passing through a transition from a *laissez-faire* to a State-control policy, and measures for controlling trade and exchange have been adopted in many countries as an important means toward this end. In Japan, too, a Foreign Exchange Control Bill was passed by the Sixty-fourth session of the Diet, as a Government measure, the control of trade being thereby made somewhat possible through control of the backbone of international trade. It is a plain fact that during the past few years the keynote of our industrial policy has, as already shown by the example of the Control of Basic Industries Act, been the strengthening of controlled economy. All the important industries distressed by the former rigid deflation policy have been brought, through the Act, step by step under some sort or other of cartel or trust to get through the chaotic financial crisis.

Has not the policy in Japan, then, succeeded in keeping the price-level more or less stable when it otherwise would have fallen ?—I have not got a copy of the Japanese price-levels, so I could not answer that.

That has been the position largely in Sweden, as in New Zealand ?—The Swedish price-level, of course, is practically the English price-level. There has been very little difference between the two. The fluctuations have been almost as wide. I have Swedish wholesale price-levels here: From January, 1933, to January, 1934, taking 1913 as 100, the Swedish price-levels have fluctuated from 105 to 110. It has been a general upward trend, and English price-levels during that period have fluctuated from 97·6 to 104·6, so that there is not a great deal of difference.

In New Zealand there is still less difference in the fluctuations in the wholesale-price level ?—Yes.

Getting back to Japan, has the Government, through the banks, given to industry any credit which was not repayable ?—If they have done that, I think they have subsidized the interests to a certain extent, but the Government itself has had to take on the liability. In England in 1927, I think, the British Government subsidized the coal industry. As far as the coal industry was concerned it was costless, but as far as the taxpayer was concerned it was extremely costful.

The Japanese taxpayer in the future will be paying for this development of industry ?—As the League of Nations pointed out, the Japanese debt has risen from 15 per cent. of note-circulation in 1930 to 45 per cent. in 1932; that has got to be met some time.

Unless they have a financial collapse ?—Yes; it might, of course, be wiped out. There is a legal term, "force l'Dieu"—an act of God, you might call it.

You seem to be of the opinion that the cause of the economic breakdown is due to causes other than monetary ?—Predominantly, not wholly. Bad banking policy can aggravate it or good banking policy can alleviate it to a certain extent.

Do you think it is inherent in the capitalist system ?—Yes.

And that banking is a capitalist institution and only records the effects ?—Yes. I think one phrase that might be applied is the anarchy of production.

But there has not been so very much wrong with production, has there ?—As far as the science of production is concerned, it has been a marvellous progress. But what has happened, in America, for instance ? Production has been allowed to run riot.

What would you consider the keystone or the most important factor in our capitalistic society to-day ?—The control of the forces of production.

Yes. In controlling production and distribution, what is the strongest factor ?—The man who controls the credit and who is in a better position to obtain credit.

They hold the most strategical position ?—Yes.

The man who is able to command the credit is the person who is controlling the credit ?—Not necessarily.

Suppose you are director of a bank and you are also interested in other concerns, industrial, &c., and you want financial accommodation, and I am only an ordinary person and want financial accommodation, who gets in first ?—I would very likely get in first.

Yes, of course you would. Then, if you are in that position, you also control as well as demand it ?—Yes, but a man who can show a profit can, I think, obtain credit. You have that instance multiplied over and over again during the boom in America. Stewart Chase has given examples where industries have been vastly overcapitalized owing to the overoptimism of the entrepreneur. The glass industry grew to such an extent that they could supply the whole of their market capacity in seventeen days. If you are going to allow an industry to run roughshod to that extent, you are approaching the period of anarchy. These people obtained all the credit they wanted and built their industry up to such an extent that they were harmful to the community. I read in the London *Times* where Elliot says he wishes now to cut out the price war with retail firms. Take the transport system in New Zealand; they got into a chaotic condition because there was no control. It had nothing to do with the banks at all.

Are there not a lot of people in America and a lot of people in New Zealand to-day who would make more use of the transport system if they had the income to do it ?—If you have uneconomic transport no monetary system will cure it. You have to make the adjustments within the transport system itself. You are only aggravating it if you do that.

Are not all these things that you have submitted just evidence of the ability of the people to have them. There is nothing comes into existence unless it is paid for, even transport ?—But if a thing goes out of existence it might not be paid for finally. For instance, you could see transport companies going bankrupt every day.

Then somebody else helps to pay for it ?—Yes. The community pays for it in the long run.

Everything is paid for. There is nothing in existence that is not paid for, but you have got a lot of things in existence and they cannot be distributed. Why ?—Nobody wants them for one thing. Take the glass that I was talking about.

How many new homes are wanted in New Zealand to-day? We had evidence in Auckland where a sawmill had over 5,000,000 ft. of timber in its yard and at the same time there were two families living in a five-roomed house in Freeman's Bay which had been condemned, and they had to move out of it?—It would take more than a monetary cure to fix that.

I can assure you the sawmillers want to sell their timber, and I can imagine the families want to live in good houses, and it seems to me the only factor that is missing is the lack of the monetary factor?—No. You have to reorganize your community in order that these people can give economic service in order to obtain the timber to make their houses.

But the timber is in existence, and if we had the carpenters, instead of being on relief works, building houses, would not that be giving economic service?—You could certainly put the carpenters that are now on the Unemployment Fund to building houses, but it entails a reorganization much deeper than the mere manipulation of the monetary system.

I quite agree that there is not only the monetary system, but we have got to make a start somewhere?—I absolutely agreed with Cole's thesis on that.

Well, what caused prices to fall. Even in your letter to the Committee you do not give any indication of what caused prices to fall. You say that it was not the monetary factor, and it is left there. There is nothing definitely stated as an alternative?—I have not definitely stated an alternative because, as I pointed out in the first place, this is more of an objective study of it.

Did you say that it is positive rather than normative. You say you want to be positive in the matter, but you do not say what has been the cause. Now prices are purely the financial indicator of values?—Yes.

So that that is purely monetary. There is nothing else in it than monetary prices?—We will express them in money because it is the most convenient term.

And prices do not fall down from heaven do they? They are man-made?—Yes.

We have it on the evidence of Dr. Walter Leaf that the Government of Great Britain definitely pursued a deflationary policy and took approximately £500,000,000 out of circulation. That is purely interfering with the monetary factor. He definitely stated that, and he was a banker of no mean order. He was chairman of directors of the London and Westminster Bank. He was chairman of the clearing house bankers, and he was also chairman of the International Chambers of Commerce, and a man with very wide experience?—I should imagine if you are going to have a competitive society that you have to make those adjustments through deflation.

Through the banks?—Through deflation. That was purely a Government action because inflation does not get rid of economic maladjustments.

No. Even with plenty of money you would still have difficulties?—That is the point I am making. For instance, you have got fixed charges. You have those necessarily under your present economy. Well, inflation eases those: deflation makes them more difficult to meet.

In reply to Dr. Sutch you made a statement that the Japanese had a deficit of 962,000,000 yen. Do you know what rate of interest they are paying for that?—I know that they are in debt to the banks for it.

But what rate of interest are they paying?—I could not tell you that.

The Bank of Portugal is controlled, and their arrangements are that of their profits that they make they charge to the Government 1 per cent. for accommodation. Five-eighths of that 1 per cent. goes to pay off the loan and three-eighths of 1 per cent. is kept by the bank. That is fairly cheap money is it not?—Yes. As a matter of fact, short-term money practically all over the world is very cheap at the present time.

I am not talking about yesterday. I am talking about 1924 and the years before that, so that it is the interest payment that is the dead-weight debt, not the debt itself?—That is so.

That means, then, that if this 962,000,000 yen have been brought into existence to square the Budget the money is there. Everything is paid for. The only thing that is left is a debt owing?—Yes. That is, if there is no interest. I do not know if there is interest or not.

But even if there is interest, that proves that the banks are able to bring into being a sufficiency of money to balance the Budget?—Yes. And there is a corresponding liability there, for instance, on the Japanese Government. For every credit you create you must create a corresponding debit.

But evidently they used the national credit to do it with?—Well, the national credit must pay for it in the long run.

If the Government did it itself instead of doing it through the bank, what would be the object of the Government paying its interest. It would only be unnecessary book-keeping?—It would be possible in New Zealand for the Government to issue Treasury bills of its own accord in anticipation of taxes. If it did that then the Treasury bills on the one side would be a debit and they would have to collect those taxes to cancel out those Treasury bills.

But if they did it instead of taxes it would be the same thing?—No; what would be the debit on the other side?

It would be a matter of creating the necessary amount of credit to make good the deficit, and the amount of deficit would offset the other. They would cancel out?—You cannot create credit without creating a liability on the other side.

But where does this credit come from? How has it originated, that 962,000,000 yen?—It has originated from the Bank of Japan.

Well, they created it. They monetized that much wealth in Japan?—Yes. They have a lien over that wealth.

Would it not be possible for the Government to do exactly the same thing—monetize it?—Do you not see that if they create a loan they have got to lend something. They cannot lend nothing.

Well, the banks have lent nothing, evidently ?—Yes ; but the banks lend in anticipation of a man making a profit. If he does not make a profit they take over his plant, and sometimes they burn their fingers over it.

But you have never heard of a bank taking over a Government ?—No ; because the Government's ability to pay is much more inexhaustible than that of an ordinary individual.

And then, of course, a Government has statutory authority and can either let the banks keep in existence or put them out of business altogether, so that they have got to be careful how they handle Governments ?—Very likely.

The point I want to come to is this : You read the statement by the Treasury given before the Committee. It was published in the papers that our banking system is linked definitely by usage, practice, and everything, to a sterling-exchange standard, and that New Zealand's monetary market is controlled in London, owing to that fact ?—Our ability to make advances is controlled by the sterling balances in London.

Yes. Therefore, New Zealand is only the echo of London. Whatever financial policy is pursued by the bankers in London reflects out here ?—No. Our policy is governed by the price we receive for our products on the London market—according to that.

But the price you receive for your products is determined by the amount of money that is in circulation ?—No. It depends on the demand, for one thing, at the other end.

But demand can only be backed up by money. Demand without money is not demand at all ?—But it goes much further than that. If we were getting 1s. 6d. for our butterfat and 1s. 8d. for our wool then our sterling balances would be considerably greater than they are at the present time.

And they would reflect here in increased deposits and possibly pay more for advances too. So we would get a twofold benefit. We would reduce the advances and we would increase the deposits and make money more plentiful ?—Money would be more plentiful, yes.

I think you were here the other day when Professor Tocker was before the Committee, and he showed us by a graph how there had been continual eccentric movements of price-levels. That is a definite record and a true record of our control from London. Is that satisfactory ?—Seeing that the price of our exports is so vital as far as we are concerned, it is very difficult to avoid it excepting through the manipulation of the exchange-rate. That is one way in which it could be levelled. For instance, we have levelled it to a certain extent by raising the exchange-rate, and I think that if the Government had the power to say that the exchange-rate will remain at 125 for the next ten years we would have a considerable amount of internal inflation in this country up to that level.

That would adjust itself ?—So we would still have a different price-level from that of England.

Only in so far as the 25 per cent. exchange affected it, but our export trade is only part of our total trade. Our internal trade is our total trade ?—Yes ; I think about 55 per cent. of our total trade is governed by our export trade.

No ; 39 per cent. of our exports and 60 per cent. is production that we do not export at all ?—But a lot of our industries in New Zealand are governed by export prices.

I know that ?—And finally you get about 55 per cent. of our internal trade that is governed by external trade.

That is because the policy is here. You try to stabilize exchanges and let the other go hang and fix itself. Do you not think it would be better to change our policy—to fix internal prices and let exchanges go hang ?—You can do that. You can fix an internal price-level if you let your exchange fluctuate. You cannot have it both ways.

Well, it is the best policy. We have tried to anchor everything to overseas trade, that being the governing factor, and we have been all wrong. Now that would mean a change of policy, to fix internal price-levels and let exchange look after itself. Which do you think it would be better to do ?—My answer would depend on the amount of control you are going to use for your economic system. If you are just going to fix internal prices for the purpose of perpetuating the maladjustments we have at the present time, I would say, No. I would rather see them liquidate out.

You said we had no indexes available ?—No. I said you could frame an index for a particular date, but the difficulty is to fix a commodity index that will move over a period of time. You have got one for a particular date, but the difficulty is fixing it to move over a period.

You know that the Government Statistician is continually publishing in his *Monthly Abstract* the index prices of groceries and milk and meat, and housing, and all sorts of things—that they got a record of it. Would it be a superhuman job to go and average those over a period ?—Yes. As a matter of fact, I do not place much reliance on the Government Statistician's present index figures. I did some research into those figures about two years ago, while investigating the purchasing-power of wages, and I found those indexes extremely unsatisfactory.

Because they are not sufficiently full enough ?—Yes. And because they are based, for one thing, on the cost-of-living inquiry that was held in 1912.

They make 1913 their base, and they have arranged alterations in the price-levels of goods accordingly ?—One of the difficulties is that the shifting character of demand upsets an index continually. The Government Statistician, as far as I am aware, has ignored that to a large extent, and that has nullified the value of his index.

Well, we will cut that out. But I suppose that in every industry and enterprise, even a farm, if it is run properly, they have got some statistical record of their costs of production. It would not be a very great difficulty to get somewhere near their cost of production ?—No. At a particular date it would be very easy.

And you could even make allowances and leave a margin, and you could fix the price surely ?—Yes. For a particular date. But the difficulty I see (and I have done some research into it, and I have also had a look at Professor Irving Fisher's attempts) is of fixing a reliable index that will serve for,

say, five years; even making compensatory adjustments from time to time is an extremely difficult thing to do.

But do you think you would be able to fix a price-point somewhere and regulate everything to it afterwards as it went along?—You could do it for a particular day, but it would be extraordinarily difficult to fix an equitable index for a period.

Would not that, coupled with fixation, straighten out any anomalies that occurred?—Not if the anomalies existed in the index itself.

The index could be altered then?—That is the difficulty—altering it.

Mr. Lye.] This issue by the banks in Japan for the purpose of enabling the Japanese Government to balance the Budget, I think it was 962,000,000 yen; now that becomes a debt does it not?—Yes.

Is there anything to show that that is not to be repaid and that the State, having power to tax the people, will ultimately repay that loan to the banks?—That is the way I should imagine they would repay it.

And in the meantime it is nothing else but pure inflation?—Yes. And whenever a Government continually borrows from the bank for the purpose of bridging a deficit in the Budget it puts more money and credit into circulation and creates an inflationary situation.

It is authoritatively stated that when a period of inflation takes place it is always followed by an increase in the price-level. Has that been the case in Japan do you know?—I could not tell you that. I have not got Japanese price-levels. I could certainly get it for you if you wanted it. I think the League of Nations publishes the price-levels for various countries.

It would be useful, because when you state the case of an issue by the banks to the Japanese Government of 962,000,000 yen, it would be very interesting to follow out the operation of that to see whether there was the usual corresponding phenomena of the rise in the price-level?—You would get it this way: The yen has appreciated. Then there must be, there has been, a tremendous appreciation of the yen.

I suppose that the factors that determine our general well-being in New Zealand are really costs and prices are they not, and the relationship between the two?—Yes.

Coming to the question of costs, the interest cost is a very powerful factor in determining the final cost, is it not?—Yes.

And from the reading of your paper you advocate co-ordination of the lending institutions, and it has been suggested that if that were done they would have greater power to reduce the interest-rates?—I noticed Mr. Fussell in his evidence said that the banks at the present time did not have the power in their hands to reduce interest-rates because of outside competition, and I suggest that if the Reserve Bank is going to be effective it will have to control that outside financial competition.

Do you suggest that that can only be done by legislation?—Dr. Sutch has pointed out that the definition of a bank under New Zealand law is so wide that it could be very likely done without legislation.

Do you not foresee a tremendous amount of difficulty when dairy companies and stock and station agents and many other companies accept moneys on deposit for the purpose of relending to shareholders, perhaps, of their own institution?—There is a difficulty that way.

And it might be necessary to legislate to bring about uniformity in lending-rates and deposit-rates?—Yes. If the Central Bank is going to control the financial situation, it should be in a position to do so, and unless these outsiders, the State institutions, and the various other lending institutions are brought under its control it has not got the absolute control necessary.

A short-cut to that desired end would be by legislation would it not?—Legislation would fix the thing for all time.

Apart from that, for ordinary purposes of lending for business enterprise, you do not propose in your evidence to interfere with private lending, do you, such as the lending of money on mortgages on real estate?—Do you mean between individuals? It would be practically impossible to stop that. I would confine it to institutions.

I am not suggesting that you should, but I want to get that point clear. You do not suggest that?—No.

The big lending institutions, having arrived upon a common basis of understanding of procedure, the fixed deposit-rate, and the lending-rate, that would largely determine the private lender's rate?—Yes. After all, a private lender only lends to some one he knows something about—a personal friend. I would not interfere with that.

We now come to the question of prices. You further, in your evidence, suggest that it is necessary to go in for a policy of the planning of industry, so that production will proceed along the lines of effective demand?—Yes, and I think that will be the economic trend of the future. Even a Conservative like Major Elliot is starting to plan production practically right throughout the whole of English economy. I saw a statement of his in the London *Times* (I have mentioned it before) where he is urging the retailers to cut out the price war and organize their own industry on a more co-operative basis; and you, as a farmer, would be well aware of what he has done with agriculture.

Do you anticipate that, as in future every effort will be made to induce people to produce according to effective demand, it will be necessary to enforce by legislation, to take away the right of the individual in the interests of all, in the interests of the common good?—I think the tendency in the future is towards economic planning.

I suggest to you that one of our difficulties in New Zealand has been brought about because there is no margin left as between the cost of production and the selling-price?—Yes, the margin has gone the other way.

Consequently there is a shortage of real purchasing-power over and above the cost of production. If we are to have a material rise in the price-level, there would be a margin left of what might be termed "purchasing-power"?—Yes.

When that takes place it would place in the hands of the producers who were getting a remunerative price the capacity to increase their power or ability to exchange goods and services. Would that be termed the velocity of circulation—the capacity to exchange goods and services? Would the rise in price-level which left the margin of purchasing-power in the hands of the people be speedy?—It would increase the velocity of circulation, because there would be more trade and money would go round more quickly, but the velocity of circulation is bound up really with the quantity theory of money. If you increase the volume of money there would be a tendency to decrease the velocity of circulation.

Do you attach a great deal of importance to what is known as the velocity of circulation?—Yes.

And the quantity theory of money?—Yes.

Sir Basil Blackett mentions that same thing?—Yes. The point is that maladjustments have grown up, and those have got to be controlled or eradicated before a monetary policy would be of any use. Dr. Hayek, the Austrian deflationist, believes that, and it is a certain line of philosophy that is fairly widely held. Professor Gregory adopts a somewhat similar approach.

Mr. Clinkard.] They hold that is by depreciation?—Yes; by allowing the price-level to drive the maladjustments out of existence. There are others, like Sir Arthur Salter, who want to control the economic situation from top to bottom. It is a less dangerous way, I should imagine. In the other process you may develop revolutionary situations. That is the difficulty of allowing free play of economic forces.

Further on you say, "There can of course be little doubt that, at the present time, a deflationary process is going on and that an indefinite continuation of that deflation would do inestimable harm." Do you really believe that a deflationary period as far as New Zealand is concerned is going on, when we have increased the exchange-rate to 25 per cent.?—No, I think it has been checked somewhat in New Zealand. I was talking of the world affairs there.

While many people hold that the present monetary system is at fault, and is very largely the cause of our difficulties to-day, do you know whether these same people claimed that the money system caused the period of prosperity in 1924–29? If the system is wrong to-day, must it not have been wrong all through?—Yes, it is the same system. In a period of depression you always get the cry of the monetary theorist, and it is easy to understand because things are expressed in money and we assume that the price-level is a purely monetary phenomenon and is governed by purely monetary phenomena.

It is only in times of depression that the public say the monetary system is wrong?—In times of prosperity very few people study it at all.

Mr. Beckerleg said the other day that the banks can issue £20,000,000 of notes. If that is correct it shows that the deflationary policy in New Zealand had no justification at all. Would you agree that what is known as "the just price regulator" would be a satisfactory means of injecting purchasing-power into the system?—I imagine that would be pure inflation.

And what would the effect be?—It would be just like a dog chasing its tail.

You would not consider that to be a sound solution at all?—No.

Do you believe that the policy of the banks in expanding credit when prices are high and then when prices are falling restricting credit played a very important part in helping to aggravate the position?—It has aggravated the position.

To any great extent?—Yes, to a fair extent; but the thing is that the banks are governed by the conditions in industry itself. If prices are falling and profits disappearing, the bank would be committing suicide to do otherwise.

Their action of restriction of credit from time to time is justified?—Yes. They would just go out of existence if they did not: they would not be able to meet their liabilities.

Their action of restricting or expanding credit from time to time according to what may be known as economic opinions is not a crime at all: it is a necessary protection and in the interests of safe-guarding their depositors' money?—Yes. The policy of the banks, after all, is governed by industrial and economic conditions, and for them to fly in the face of this would be suicidal as far as they are concerned; but if you can in some way iron out this economic difficulty, by some kind of planning, that is the way out. Then the banks would adjust themselves to the new conditions.

Planning for effective demand of industry would render unnecessary the restricting and expanding of credit from time to time?—Planning will not be an easy thing. There will be a lot of mistakes made but we are making mistakes now; and one of the political problems of planning is how much control are you going to exercise.

In your opinion, can we have an internal price-level without regard to world parity—without running very grave risks of inflation?—It would be inflation.

You say that is just a vicious circle, like a dog chasing its tail?—We could have any price-level we wished, and it might be in our interests to raise our price-level. The Government has already considered the question of raising the price-level to primary producers, but just to raise the price-level for the sake of raising it would not result in any benefit to the people of New Zealand.

What is the net result? By the raising of the price-level you automatically depreciate. Is there any ultimate benefit?—There might be a short-run benefit.

Does it work out unfairly?—It works out unfairly to those who are receiving wages and to those who are living on fixed charges. You get the extreme case in Continental countries after the war where the inflation went to such an extent that the whole of the rentier class was wiped out of existence. In Germany for instance they consolidated the industrialist at the expense of the financier.

Captain Rushworth.] You do not ascribe the prime cause of the depression here and elsewhere to the monetary factor?—No.

Lord Milner, in his "Questions of the Hour," says, "What has gradually grown in my mind is the conviction that it is of no use dealing with present-day economic problems unless one has a perfectly

clear conception of the money and banking factor, which under modern conditions is of such supreme importance." You do not agree ?—I agree that it is of tremendous importance, and that we should understand it. But by our understanding I think we would not place the whole of our reliance upon monetary manipulation as a cure for our present difficulties.

Has there not been monetary manipulation going on all the time ?—What do you mean by monetary manipulation ?

We need not go back beyond 1844. Has it not been going on since then ?—Certainly ; it was governed to a large extent by the conditions ruling, say, in industry and trade. We have had a lot of disturbance since 1844 ; that you cannot blame money for.

That is a matter for me to decide ?—Not logically. You could not blame money for the war.

You do not blame the monetary factor, is that it ?—Yes.

You did mention the originating cause of the trouble in the last page of the first document you gave us. You finish up by saying, " But what lies at the root of the trouble is not the mismanagement of the monetary factors, serious as it is, but the inability of capitalism to provide at one and the same time a sufficient profit incentive to get all the productive power which will enable consumers' demand to expand in due proportion to the advancing productivity of the economic system."—That is a quotation from Cole.

Is that your opinion ?—Yes, practically.

Could you make it intelligible ?—I thought I had done so in the second part of my paper, where I gave a hypothetical instance of the motor-car industry. That had actually occurred in America. It is what the Americans now call " the anarchy of production."

You agree that the quotation you finish with as it stands is unintelligible ?—No ; this is the quotation : " This endless cycle of capitalist boom and depression is often exaggerated by bad banking policy, but what lies at the root of the trouble is not the mismanagement of the monetary factors, serious as it is, but the inability of capitalism to provide at one and the same time a sufficient profit incentive to get all the productive power which will enable consumers' demand to expand in due proportion to the advancing productivity of the economic system."

Would you again go over the quotation from the words " productive power " ?—" . . . productive power which will enable consumers' demand to expand in due proportion to the advancing productivity of the economic system."

What productive power is required to enable consumers' demand to expand ?—You have got to go back to the fact that the figures are based on profit.

You say " to get all the productive power " ; What does that mean ?—Power to produce.

Factories, harnessing of power, discoveries of science, and so on ?—Yes. The difficulty is that the entrepreneur unregulated is often governed purely by the price factor and not by the total demand, and the particular depression through over-optimism can create in turn a general depression which is purely non-monetary. If this country could consume ten million pairs of boots per annum and five people with the capacity to produce that amount of boots had a race for the market at the same time—that is what happened in several of the key industries in America—you would have fifty million pairs of boots, and we could not possibly consume them. The result would be that the operatives of those five boot-factories would go out of employment, and they in turn would affect all those people with whom they had economic relations, and you get into a kind of spiral that may spread almost interminably.

That would have no bearing unless there is an under-production in some other commodity ?—If you glut your market beyond the desires of the people, then you have got to call a halt.

You consider that the desires of the people of New Zealand are fully met now ?—No, I do not consider that by any means at all, but what I do consider is that certain industries have fully met the desires of the people. The motor-car industry was a striking example ; the radio industry is another example.

What industries here or elsewhere have failed to meet the desires of the people ?—We could say the desires of the people are almost interminable, but they have got to be evened up by some demand, and have to have the ability to exchange something for those things that are offered to them. We talk about the markets of the East, but, as long as the Chinese are only earning enough in a week to buy a pound of butter from us, it is not much use trying to sell butter to the Chinese, and one of the reasons why the Chinese cannot have more money is that their national economy is such a primitive one. In order to become a buying factor in the world they would have to reorganize internally.

We cannot sell our butter to China because they have no money, and we cannot sell except for money ?—Because they have nothing to offer us in return—because of the primitive conditions of their economy. I remember reading a book by Lenin ; he pointed out then the danger of Russia having small farms like the Chinese and each one living on 1 acre and not being able to capitalize any of their returns. That was the reason why he advocated collective farming. Whether he was right or wrong in his general philosophy is another thing ; but he did point out a salient feature there.

Do you think a policy of deflation has been operating ?—Yes, brought about by the industrial and trade conditions.

You do not agree, apparently, with Professor Gustave Cassel, who said most emphatically that the deflation of the monetary systems is a deliberate policy designed to increase the power of the possessors of money ?—No.

There are many other well-known authorities on the subject who say much the same sort of thing ?—Yes ; it is questionable whether some of them are authorities. Gustave Cassel, of course, is, but I think he made a mistake also in his analysis of the gold situation. He was well out in his forecast ; he said that the world's requirements of gold increased at the rate of 3 per cent. per annum ; this was being met only by a 2 per cent. increase, therefore the price-levels would fall by the disparity.

That was about 1927 or 1928. We have had a cataclysmic fall of prices since then; so that his prediction has not been right.

Was he not following on the lines of the Gold Committee of the League of Nations?—Of which he was a member? Yes. He amplified that in an address to the Oxford University about that time. The Gold Delegation of the League of Nations practically adopted his arguments; he developed them some years previously.

You know that the Gold Committee reported that by 1926 the amount of gold that was discovered would only make good the wastage, and would not provide for any expansion at all?—They have been well out. We have had a bigger fall of prices than the disparity—between the price of gold and the supply.

Do you say the monetary factor plays no part at all in the depression?—No. There are so many factors.

It plays an important part?—Yes, it is an important part.

What I am trying to get at is that we must not ignore other factors that are perhaps more vital. If it does play an important part, why do you take such great exception to monetary reformers endeavouring to direct attention to defects?—One of the reasons is that they ignore other factors very conveniently.

It is an important factor?—Yes, but you must take a balanced view of the position.

At the same time, if it is an important factor and the other factors are dealt with, leaving this factor alone, surely you have no solution?—I have not ignored that factor at all. For instance, in the quotation from Hawtrey, he stresses the monetary factor, but I set out in this paper with the deliberate intention, as I stated in my introduction, of placing the non-monetary factors before the Committee in order that they would not be put too far into the background. I had made a study of them, and I thought the other factor has been stressed to such an extent that I might be of some service if I placed the non-monetary factors before the Committee.

You give a list of them: new and higher tariffs, economic nationalization. Are not those obviously effects of a defective monetary system?—Not at all. Take the efforts for recovery after the war. America got a flying start; other countries lagged behind because they had been shattered to a far greater extent by the war. These countries naturally did not want their industries crippled by America, who had held a superior position, and took measures to prevent that being done.

But America has the highest tariffs of all. Why?—She thought at one stage she could trade one way.

You gave us the illustration of the devastated, hard-hit countries, but why did the creditor countries require tariffs?—They had an idea that they could trade one way, that they could export and not import. They are apparently finding out that is a mistake. The latest policy is to bring down their tariffs.

As soon as they wiped them out altogether all the debtor countries would seek to pay in goods. What would happen to American industries?—They would certainly suffer the same as German industries suffered when France repaid her debt after the Franco-Prussian War. One of the mistakes was made at Versailles where they insisted upon reparations and war debts, and it has not been cleared up yet. Even a man like Keynes, who is predominantly a monetary theorist, recognizes that mistake in at least two of the books he has written.

The attempt to pay debts in goods causes the country that receives payment to get into great trouble?—Very often.

Monetary difficulties?—No, industrial difficulties.

But caused by monetary shortage, naturally?—No: the difficulty in the first place was political. It was the politicians who framed the Treaty of Versailles—not the bankers.

I am not talking about that; I am talking about the tariffs that prevent goods coming into a country?—That is a political business, too.

Why does the political business operate?—An industry will come along to Cabinet and say it can start as long as they get a 25 per cent. tariff.

That is to prevent other goods coming in; there is not room for both?—If the home industry did not get protection by the tariff it would never start.

We are talking of the United States at the moment?—That is exactly the theory that the United States adopted.

Let us assume for the purpose of argument that no country is able to purchase the whole of its own output. If that is the case every country would seek to export its surplus and obtain the shortage of purchasing-power from some other country?—No; it would obtain goods in return.

We are assuming that no country is able to purchase the whole of its own output. That being the case, it would have a surplus and seek to sell it to obtain purchasing-power in that other country to make up its own deficiency. Every country is apparently operating on that basis?—Almost every country.

The defence that is put up to that act of piracy is the erection of tariff walls?—That has the effect of stultifying it.

If that is the case, then the tariff barriers are the effect of the monetary defect and not the cause of it?—No. For instance, we could not consume all the butter we produce in this country.

But we must be able to purchase all the butter we produce in this country?—No; not necessarily. It would not do us any good if we could. We send our surplus butter to England and we get manufactures in return.

But do we not purchase manufactured goods that come here?—We purchase them with butter.

Well, we purchase our exported butter, in effect?—You can put it that way if you like. I do not agree.

I am saying that we must have the power to purchase the whole of our production if we exchange part of that production for something else ?—The butter we export gives us that power.

Quite so. But it does not give us the money ?—We do not want the money. It is a case of goods for goods.

We have to do that through the operation of money do we not ?—The money expresses the price of those goods.

We buy imports with our exports, and we must be able to buy the whole of our product ?—We buy our imports with our butter. It is goods for goods, but money is the common denominator of value. If we were on a barter system we would exchange butter for dynamos.

And if there were a barter system there would have been no depression, would there ?—It is quite possible there would have been a depression.

Why ? What are we short of in the way of barter ?—For instance, take a hypothetical case of barter between the Samoans and the Fijians. The Samoans might have a glut of coconuts and the Fijians might have a glut of bananas. Well, the Fijians might not be prepared to take all the coconuts that the Samoans would offer them, and *vice versa*. Therefore, there would be a glut on both sides and there would not be a complete barter.

But in that case, would they be poorer because they had too much ?—No ; they would not be poorer exactly, but the barter would not be complete, and they would just have to sit down and wait until the market was favourable again.

Sit down and starve ?—No ; they could live on their coconuts.

What is happening throughout the world is precisely that same thing is it not ?—Not exactly.

Is there any industry in the world that you have ever heard of that is working to capacity ?—The only country I know that is working to capacity at the present time is Russia.

I am not talking of a country. I am talking of an industry. Is there anything that we are short of ?—Well, the farmers here seem to be working at pretty high capacity. They are expanding all the time.

Is there not a quota on our meat already ?—But we have not stopped producing meat, all the same.

And are the farmers working to capacity, having regard to the possibilities of science and so on ?—They are working to the capacity of their present resources. If they increased those resources naturally they would produce more.

There is nothing that the world is short of apparently. If there were, surely the unemployed would be put on to producing it ?—Not necessarily. We might be paying for maladjustments in the past, and we have got to correct those before we can go on planning.

In the meantime, because we are surrounded with plenty, we have got to sit down and starve until we plan something ?—Not exactly. I think Salter has put the position correctly when he says we are at the crossroads between two systems.

I think that is obvious. Two systems of what ?—Two systems of economy ; one is a *laissez-faire* system and the other is control.

I agree as far as planning is concerned, but it is an ambiguous term. You can plan to make your monetary system fit your legitimate requirements. You can also cut down your legitimate requirements to fit a defective monetary system. The question is just which you are advocating ?—I am advocating a planning system which will give an orderly expansion.

Of what ?—Of the exchange of goods and services of the world.

That includes money obviously ?—No. It includes goods and services. The money is the means of facilitating that exchange.

Would you leave money where it is now ?—How do you mean ?

Based apparently on nothing ?—I do not admit that it is based on nothing at all.

What is it based on ?—It is just a medium for exchanging those goods and services.

But has the money unit any meaning at all at the present time ?—I would be sorry to say that it had not.

A little while ago it had a meaning for what it was worth ; in the British Empire 120 fine grains of gold was the monetary unit. One-twentieth part of an ounce of gold was a dollar in the United States ?—As long as money has purchasing-power it has some meaning.

But has the unit of money any definite meaning ?—At the present time it seems to be fluctuating.

It has no meaning ?—It has a meaning, but the meaning varies from day to day.

That is the same as no meaning ?—No.

If the meaning fluctuates from day to day, is there any meaning ?—It would have no meaning if you had a pound-note in your pocket and went down and could not buy anything with it. Then it would be worthless, but while you can buy something with it it has a meaning. The trouble is that its meaning fluctuates from day to day at the present time.

You think that is a good thing ?—No ; I do not.

Well, something will have to be done to the monetary unit ?—Yes.

So you agree that the monetary system will have to be planned as well as other things ?—Yes. I have already given a statement on that, as to how we could co-ordinate our monetary system in New Zealand in order to get greater control, and I think that the money system will have to come in with the general scheme of things.

Do you not think it would be a good thing to put the monetary system into direct ratio with the wealth that is produced ?—Do you mean the idea of equating goods and services with consuming-power ?

I mean putting the money into direct ratio with the wealth that is produced ?—I suppose that with a planned economy that is what would happen. It would fit in with the planned economy. Any planned economy that left out the banking factor would not be an economy at all.

So you think a reformed monetary system is necessary ?—I would fit it in because it is a necessary part of the general mechanism to facilitate the exchange of goods and services.

In your objection to the advocacy of monetary reform, have you changed your views recently ?—No ; I do not think so.

You are a member of the staff of one of the city newspapers ?—Yes. When England went off the gold standard in September, 1931, I wrote an article at the time saying that other things would have to be corrected before we could say we had got out of our difficulties. I mentioned then a large number of factors, and I stand by what I wrote then.

Mr. Murdoch.] I would like you to elaborate your proposal to control the credit, taking as the base the central bank. How are you going to control such lending institutions as the State Advances, say, which borrows its moneys principally from overseas at a fixed rate ?—I should imagine that in order to have effective monetary control in this country the central bank should have a say in the general lending policy of the country. Then, of course, comes the question of who is going to control the central bank.

Assuming you fixed your lending-rate for the central bank, say, at 2½ per cent. and the State Advances borrow at 4½ per cent., you have got to meet a deficiency of 2 per cent.?—Yes. In a way we will have to pay for past mistakes. We have got to recognize mistakes in the past and we have got to rectify them, and there is no rosy path towards rectification. After all, we have written down a considerable amount of money already because of mistakes in the past. We are doing it every year practically in our Budget.

Another point arises, about the lending of the stock and station agents—their system of finance. They may get their money from the bank and they may not. They may lend to those of us who are prepared to get stock from them by advancing stock and charging up the 8 per cent., and formerly a little higher. How would you get over that difficulty ?—The argument that I was pursuing was this : That if all the lending institutions were co-ordinated in some central authority the tendency then would be for interest-rates to be lowered, but, while you have competition for deposits, then some institutions might be in favour of reducing interest-rates but because of their competitors they are not able to bring down the corresponding rates on deposits, and therefore their policy is nullified, or their intentions are nullified.

We would require to fix the base and then a *pro rata* base for each of the other institutions ?—No. I only want to bring them under the control of some central authority in order to bring about more co-ordination of our financial structure. The details of the control I am not prepared to work out just offhand. They would take some considerable study, but they are not insurmountable. What I would like to see would be more of a pyramid of our financial structure, instead of a lot of people who are unco-ordinated and just working without consulting the other.

You referred to the fluctuation of exchange as a control in the fixing of local prices ?—You cannot have an internal price-level and a stable exchange unless you have a two-price system. In that you could have an internal price and absolute control of your exports and imports. You could fix those on a gold parity, but you would have to transfer them into your internal prices. The Russians do that, as a matter of fact. They exchange their goods on a gold parity, but internally they have another price system altogether, but they have an absolute control. As a matter of fact, they have two internal prices. It is a most complicated system.

The question of control of outward things has been mentioned here, and the suggestion that we have subsidies to industries. Would you care to express an opinion on that ?—I think subsidies are simply tantamount to throwing money away. They have never done any good in the past, and I do not think we can hope much for that in the future.

The Americans have a system of subsidy with their mail-boats. Now, there is a proposal by England to have a subsidy on their shipping ?—You can see the disastrous effect of that. The taxpayers of both countries are paying for a competitive war between two sets of shipping companies. It would be better, I think, for the British to take retaliatory action and impose the same conditions on American shipping as America imposes on British shipping. You would get a show-down quicker that way. If we prevented American boats from trading between two British ports they would begin to think about the wisdom of their subsidy, but just to simply give the British shipping interests a subsidy in order to carry on a shipping war is sheer waste.

Mr. Schramm.] You could not prevent American shipping trading between two British ports, could you ?—Yes. For instance, we have the Matson Line going to Auckland and then to Melbourne.

Pass a law to say they could not call there. But they would not stand for that, would they ?—That is what they are doing to us now. We cannot go to two consecutive American ports. We cannot take trade. We could adopt the same system as they adopt.

Let them call here and not trade ?—Yes. That is what has happened to our ships in America. A New Zealand ship cannot lift trade from Los Angeles and take it to San Francisco.

But she could call there ?—Yes.

And take trade and go on to England ?—Yes. But the difficulty is that the Matson Line is taking trade between New Zealand and Australia. That is what the shipping interests are complaining about.

They give better service. That is why ?—Then you are subsidizing an inefficient service.

Yes. There was some talk before about the position of Japan. It is very difficult to say what is the real position of industry there ?—Very difficult.

We are unable to ascertain with certainty what the real position is ?—I got hold of one of their official papers which is very interesting. It looks like something corresponding to one of our Chamber of Commerce journals or year-books.

There is no doubt that the Government is issuing credit to the manufacturers ?—Yes. And is also controlling them. There is a tremendous measure of State control of industry in Japan.

Does it look as if they are doing that for the purpose of getting control of the world markets ?—Yes.

And do you not think that under the present system of capitalism that that will ultimately lead to war ?—Very likely. There are the elements of a war situation in the East now.

You said that the Chinese state was such that they could not buy our goods. Of course, that is so at the present time ?—Yes. But if they improved their national economy, just the same as the Russians are improving theirs, then they would be in a position to buy from us ; but they must make those changes first.

You will agree that that is taking place in Manchukuo now under the Japanese domination ?—Yes. And it is also taking place in other parts of China.

And there is a chance, with the present policy of Japan, of it taking place all over China ?—Yes. But whether Japan is going to hold that market for herself is another thing.

She will have to fight it in the finish, according to her present policy ?—Yes.

You mentioned that the non-monetary causes were not the dominant thing to-day affecting the depression. Of course, it all depends what is the real definition of the first cause, does it not ?—Yes. I should imagine you yourself would accept the Marxian theory of surplus value.

I do. I believe it is correct ?—That arises through a particular economy in which we live, and you have to get rid of that economy before you can cure things.

That is the point. I say that the dominant cause of the present trouble is the capitalist system of profit ?—That is much wider than a mere monetary cause, and mere manipulation of money would not get you out of that difficulty, because you are trying to superimpose a monetary cure on something that you regard as unstable.

I agree that a reform of the monetary system will not do all, but do you not think it is quite a step in the right direction ?—There are other things to be done at the same time.

But would you not tackle it at least first ?—Along with the other ones. It is this piecemeal business that I am opposed to.

You believe in tackling the monetary problem and also other problems at the same time ?—Yes. The proposal that I put forward was from the point of view of a capitalist economy, because I do not think that this Committee is going to change the economic system.

I understand that there is nothing that a private bank does to-day under the present system that a bank to-morrow, controlled by the State, could not do ?—No.

You say that there are some things that banks controlled by the State could do that private banks could not do ?—The State could extend credit further, but that credit has to be met. It also incurs a liability, and, after all, if you are going to create capital you must forgo some current production. You cannot create it out of nothing.

For instance, if the State wanted to get money for productive purposes, they could issue credit against their own Treasury bills without interest, and they would be relieved of that debt of interest which has been weighing down Governments for years ?—Yes. I do not see any difficulty, for instance, in the State issuing Treasury bills in anticipation of revenue.

Free of interest, under a proper State-controlled currency ?—Yes. Of course, it is a matter of policy, but I honestly cannot see any difficulties in it. For instance, our income-tax comes in about February, and the money that is derived from that source of revenue is required right throughout the year. So I cannot see any difficulty in the way.

I would like to know, will the State Reserve Bank in New Zealand, in your opinion, help us as it is at present ?—I would like to see the State Reserve Bank under a greater measure of State control.

And I suppose you would like to see the private shareholders eliminated too ?—Yes. I think the orginal charter of the Commonwealth Bank in Australia would have done us.

Yes. There was no capital needed there to start it with ?—Because, after all, one of the arguments was that the shares would disseminate responsibility among the people ; but if you have the whole of the people as shareholders, that is going right to the limit.

Among those non-monetary causes that you set out as being in part responsible for the present depression, you say the first one, in fact, the dominant one, is the political factor, and you cite the Treaty of Versailles ?—That is one of the factors. We know the psychology that was operating then was to kill the Kaiser and make Germany pay, and we have not quite got that out of our heads yet, and the disturbances in Europe have had a big effect. After all, a man living in Germany would be wondering who was going to be on top next, and he would be very cautious about expanding his industrial activities. If he were a Jew he would be extremely cautious, and that must have a detrimental effect.

You talk about profits. Of course, if one person makes a profit some one else must make a loss ?—Yes. It is like buying in the cheapest market and selling in the dearest. Some one must get the other end of the stick.

You would agree with me that under the present system, if there is to be profit, there must be people who have to do without something that is due to them ?—Yes.

Mr. Clinkard.] Can credit exist without an obligation to redeem that credit ? Is there such a thing as credit unless there is that obligation behind it to redeem it ?—No. Every time you create credit you create a corresponding debit, and if you abolish interest you still create a debit.

It is a fact that the reliance on the stability of whoever creates that credit counts on their stability to make good the credit ?—Yes. A lot of people talk about the return of confidence and psychological factors, but those are only the reflex of the conditions around you.

AUCKLAND, WEDNESDAY, 14TH MARCH, 1934.

Statement submitted by Mr. H. W. U. HADDOW.

I. The well-known fact that prosperity for New Zealand follows prosperity among the farming community and slump conditions follow adversity to the farmer is no accident. It is proof that the economic structure of New Zealand is so constituted as to be peculiarly sensitive to variations in the gross income of the farming community, more so than would be expected from the proportion of the national income directly obtained from farming. This is due to the fact that the gross income of the farmer is determined—or rather has in the past been determined—almost exclusively by conditions outside New Zealand, whereas his costs are determined almost solely by internal conditions. Further, farming costs are highly rigid; even prior to the slump some 40 per cent. of farming costs consisted of rigid items fixed by contract, such as interest, rates, and insurance premiums. To-day the proportion, despite statutory reductions, would undoubtedly be higher. The result of the fixation of prices by overseas conditions and of costs by local conditions has been to cause a large portion of any rise or fall in gross income to be reflected in the net income of farmers. Thus the net income of farmers is exceptionally sensitive and variable—in good times being large and proportionately greater than in most other occupations, and in bad times being small (or a minus quantity if proper accounting is employed). This irrational and violent variation of the net income or spending-power of an important section of the community is a potent source of instability in the national economic structure, and consequently in the national income. Any fall in the farmers' income causes, by repercussion first on importers and then by diffusion among the rest of the community, widespread stagnation and unemployment, and a fall in the national income far exceeding in volume the original decrease in farmers' incomes. Similarly a rise above normal in farming incomes tends to cause a larger proportionate increase in the national income differing in no way from an inflationary boom. The flow of funds into new investment follows a similar cycle following variations in export prices, and the constructional industries consequently suffer severe changes in activity.

II. The problem immediately arises as to how much of the change in farmers' incomes and consequently in the national income is within our own control and especially within the control of our monetary institutions and system. It must be admitted at once that part of the loss of real national income is entirely unavoidable and beyond our control. This is the loss caused by the fact that in a period of falling prices the price-level of manufactured goods falls less and more slowly than the price-level of raw materials and foodstuffs. Thus the things that New Zealand sells fall, in a period of falling prices, more than the thing she buys; and a diminution of the real national income is then inevitable. Further, as a debtor country whose external debt is fixed in sterling, we lose by any fall in the general sterling price-level, even if the fall in the price-level of manufactured goods is not less than that of raw materials. I should estimate the diminution of the real national income during the present slump due to these unavoidable causes to be between 10 and 15 per cent. This might be termed a windfall loss. Similarly during a boom we secure a windfall gain in real national income. But even with the increased volume of exports the fall in the national income during this slump is nearer to 40 per cent. than to 15 per cent. I submit that this extra diminution in national income is avoidable, and that if it is avoidable, even only in part or at considerable cost, no pains or preconceived views or vested interests should be spared in the attempt to avoid it.

(*a*) Much of what has been said in paragraph I is a description of the normal course of the trade cycle as it affects New Zealand under the traditional policy of a fixed exchange-rate on London. The effect of a rise in the price of export commodities was to build up the banks' sterling balances and make credit easy. A fall in export prices had the contrary effect. The banks were apparently but passive agents in the flow of funds, following, not leading and not pretending to lead; but merely acting as dealers and intermediaries between borrowers and lenders and importers and exporters. Rates of interest were changed but slowly, and usually only as a last resort to protect the banks' liquidity. There was apparently no difficulty in maintaining parity of exchange with sterling within narrow limits despite huge year-to-year variations in the London balances. This seems to be highly significant, and knowledge of the means by which parity was so maintained would be of immense importance to the Reserve Bank. It is clear, however, that the banking system of New Zealand can maintain any desired exchange-rate in the face of most adverse factors such as an apparent large excess or an apparent large deficiency in the London balance. In short, it may be said that the traditional policy of maintaining the sterling exchange-rate at par permitted the variations in export prices to be transmitted to and reflected in the national income, and did not prevent or aim to prevent the aggravation of those variations by repercussion and diffusion.

(*b*) Latterly we have witnessed a departure from the traditional banking practice of maintaining parity of exchange with sterling in the adoption of the policy of exchange depreciation. The justification of that policy under present conditions, and the relationship between exchange-rates and the national money income, is adequately dealt with in the report of the Economic Committee. I propose, however, to outline the advantages to be derived from the adoption of a policy of a variable exchange-rate as a permanent feature of our monetary system, with the object of preserving our internal economic structure from the violent shocks of changing export-price levels. Before dealing with the positive points in support of this policy it is perhaps desirable to give reasons for abandoning—at least for some years—the traditional policy. Some of these reasons may be summarized as follows:—

(1) The absence of an effective international standard makes it no longer true that a fixed sterling exchange results also in a fixed rate of exchange with all other countries.

(2) The future policy of the Bank of England is unknown and unknowable, and it would be foolish to tie ourselves blindly to follow that policy whatever it may be.

(3) The rise of economic nationalism makes it likely that the Bank of England will tend more and more to adopt a purely domestic monetary policy. It would be merely a coincidence if the monetary and price-level policy best suited to a creditor manufacturing country, such as Britain, was always that best suited to a debtor primary-producing country, such as New Zealand.

(4) The people of New Zealand have no voice in the determination of the course of sterling prices.

(5) The transmission and aggravation of changes in the price-level of our exports on the London markets to our domestic economic structure cannot be prevented if we maintain the traditional parity of exchange or a fixed exchange-rate.

(6) Monetary policy throughout the world is in a state of flux, and it is prudent at least to preserve freedom of action.

The positive advantages which I submit would follow a policy of variable exchange-rates may be summarized as follows :—

(1) The money income of the community can be kept fairly stable and more or less independent of the variations of export prices due to overseas causes.

(2) The comparative stability of the farmers' income will be reflected in steadier trading conditions throughout the country in all branches of industry.

(3) The elimination of some of the element of risk from business due to irrational fluctuations in activity should result in a reduction of various costs—especially interest and bad debts.

(4) The maintaining of stability of the community's money income preserves justice between debtor and creditor, and will tend to make employment more stable, which in itself will tend to promote business stability and will prevent excessive rises and falls in house-property values and will preserve the house-owner's equity.

(5) The imposition of additional taxation at times of falling money income could largely be avoided.

(6) The necessity for State interference in private contracts will not arise—at least in not so acute a form.

(7) The violence of the variation in investment would be greatly mitigated following a more stable national money income which would preserve the value of existing assets. It is the fall in the value of old assets making it cheaper to buy than to build which makes new building fall off so much during a slump.

(8) Increases in efficiency in farming which have been very marked in the past fifteen years can be reflected in lower prices per unit by suitable exchange reductions, thus avoiding the capitalization of efficiency in enhanced land-values. The failure to reflect increased efficiency in lower prices undoubtedly led in America to the Stock Exchange boom. Similarly increased efficiency in farming, without reduction of price of the product, tends to produce a land boom in New Zealand.

(9) Changes in the rate of exchange do not result in equivalent changes in the wholesale-price level of all commodities. Roughly, the observed facts indicate that a change of 15 per cent. in the exchange-rate results in a change of less than 4 per cent. in the general price-level. On the contrary, a change of 15 per cent. in the farmer's gross income money may mean a change of 50 per cent. and more in his net income. It may be necessary to give the central bank a monopoly of foreign exchange transactions to implement this policy. It would also be desirable for the bank to quote a forward exchange-rate.

(10) The apparent loss on exchange on importing capital from overseas if the exchange-rate was below par would be a deterrent upon borrowing in boom times, and the apparent gain when the exchange-rate was above par would tend to stimulate the importation of capital during times of depression.

III. (*a*) No matter what particular monetary policy is adopted the changes in the national income due to external causes can be mitigated by variations in state and municipal spending policy. It has been customary in the past to see both the State and municipalities indulging in heavy capital expenditure at a time when private enterprise was also bidding strongly for capital and capital goods and the services of workers in the constructional industries. Private enterprise of necessity indulges in capital expenditure in a time of prosperity. The additional capital expenditure of the State and municipalities at such a time must inevitably aggravate the factors tending towards a boom, pushing up costs and interest-rates and swelling unduly the industries supplying capital equipment. When the downward phase of the trade cycle is experienced private and public capital expenditure have both dropped to remarkably low levels, causing widespread unemployment in the previously swollen industries. It may be a counsel of perfection, but there is nothing except strength of character required to make the public and private constructional programmes complementary and their demand on the factors of production alternative, and the Reserve Bank can lend its weight in support of this policy. Thus, when private capital construction is falling off, public expenditure on capital works should take up the slack, and *vice versa*. The saving in cost, if the State bids for the factors of production when private enterprise does not, alone justifies the proposal, but the effect on unemployment in preserving the internal economic activity in its accustomed channels are greater benefits. The Reserve Bank can greatly assist in the adoption of such a programme by cheap financing of public works in times of depression and by declining to finance such works at other times. An exceptionally low interest-rate on Treasury bills and municipal bills for financing public works in times of depression should be a permanent feature of banking policy. The central bank should be represented on the Local Bodies' Loans Board to ensure that local body spending is in consonance with its policy.

(*b*) The use of variations in the rate of interest as a factor regulating the economic conditions in New Zealand is almost unknown. The charging of 5 per cent. on Treasury bills during the present depression can only be explained on the ground of sheer greed or crass ignorance, and the offering by the banks of 5 per cent. for fixed deposits was a tragedy which has cost the community dearly in high interest-rates all round, and has delayed the reduction so badly needed.

(*c*) It is important that the community should have confidence in the leadership and policy of its central bank. Many an irksome change of policy, such as a rise in interest-rates, can be borne more cheerfully if the reason for the change is authoritatively published. The bank should take the community into its confidence and keep the public informed as to what it is doing and why it is doing it. Only a cynic would advise a sphinx-like silence as a means of inspiring confidence. I would suggest that regular pronouncement by the bank of its hopes and desires, its views and its policy, be initiated. The closest exchange of views between the trading banks and the Reserve Bank is of course essential.

IV. In presenting a policy to be followed by a monetary authority it must be remembered that it is much more easy to preserve an existing condition of economic equilibrium than it is to restore equilibrium when conditions are badly out of equilibrium. It cannot be too strongly emphasized that the problem of monetary control of the economic conditions is not a simple one. No automatic self-regulating device can cope with ever-changing conditions. Rules of thumb are little better. Cast-iron adherence to a preconceived policy is worst of all. The problem requires constant study, continued exercise of foresight and judgment; courage, but not obstinacy. Commencing with conditions as they are to-day, I now outline the broad points of monetary policy advocated for different phases of the trade cycle.

1. Policy during Incipient Recovery.—The conditions at the moment may be described as one of incipient recovery. Farmers' incomes are probably somewhat higher in the aggregate than last year, and costs are probably somewhat lower. The national income has probably touched its lowest point. Importers are slowly recovering confidence, stocks are low, building is picking up. Enormous sums of money are idle. In these circumstances the recovery can be hastened in the following way :—

(1) Maintenance of interest-rates at low level. Further reduction of fixed deposit and savings-bank rates.
(2) Ready and cheap financing of truly economic expenditure by State and municipalities.
(3) Maintenance of existing exchange-rate on London until price-level of exports has risen somewhat.
(4) Central bank to facilitate budgeting for manageable deficit.
(5) Encouragement where possible of private capital expenditure, especially by facilitating finance at low interest rates.

2. Policy as Recovery Proceeds to Normal Conditions.—(1) Reduction of exchange-rate on London by degrees at long intervals, at first proportionately less than the increase in export-price levels, and later in full proportion as soon as farmers' net incomes seem normal. Rate to be reduced even below par with sterling.

(2) Gradual tightening of terms of financing State and municipal expenditure by central bank.

(3) Perseverance in policy of maintaining low interest-rates until refinancing of existing land mortgages is complete, when funding of floating debt can be accomplished.

3. Policy under Normal Conditions.—(1) Minor fluctuations in the exchange-rate of 1 or 2 per cent., up or down, which have a greater psychological effect than the change actually warrants, combined with judicious open market operations and variations in interest-rates, will usually suffice to maintain stability under normal conditions.

(2) Refusal by central bank to finance or assist in financing public expenditure, except out of revenue or by public loan.

4. Policy as Boom Develops.—(1) Reduction of exchange-rate (below sterling par if necessary) proportionately to or slightly more than the rise in export-price levels.

(2) Sale of securities by Reserve Bank.

(3) Rigorous writing-down of all Government assets, strengthening of reserves and superannuation funds, creation of reserves—all from revenue.

(4) Closest scrutiny of all public and municipal expenditure, and refusal by central bank to finance such expenditure except out of revenue, and only in exceptional cases to assist in raising loans from public.

5. Policy as Boom breaks and Slump develops.—(1) Increase of exchange-rate as price-level of exports falls.

(2) Financing of public works by central bank.

(3) Low interest-rates, easy credit.

(4) Deficit budgeting facilitated by Reserve Bank.

(5) Bank to buy securities.

NOTE.—Several complementary but non-monetary steps which would materially assist in mitigating the effect of overseas booms and slumps on our internal economy could be adopted with advantage.

V. The State has not used its shareholding and voice on the directorate of the Bank of New Zealand in a suitable manner. The objective of the State Fire Insurance Department has not been to amass profits, but to keep the cost of insurance down for the benefit of the community. Whenever it has seen fit to reduce premiums it has done so, and all other insurance companies have had to follow suit, and all are still paying reasonable dividends. It is significant that no reductions have been initiated by private institutions. By contrast, the Bank of New Zealand has acted exactly as a private institution, and joined with its competitors in drawing monopoly profits from the community.

It has accumulated enormous profits, divided some as bonus shares, and consistently paid a dividend which judged by all ordinary standards is exceptionally high. The advantage it secures by having a monopoly of the Government Account is passed on not to the public, but to shareholders. It is obvious that the State's appointees on the directorate should not hold shares in their own right. Had a policy similar to that followed by the State Fire Insurance Department been followed, the profits obtained by all the banks in New Zealand would have been more reasonable and it is probable that the margin between deposit and lending rates would be substantially narrower, or the inland exchange and charge for keeping accounts abolished. The inland exchange is an irksome inconvenience to the community, and is a disgrace to a banking system which has been paying double-figure dividends for many years and distributing bonus shares. It is not too late to initiate a policy of lower dividends and cheaper banking facilities. The State directors on the Bank of New Zealand have had the power to do so all along, and the sooner they use it the better.

Witness: Mr. H. W. U. Haddow.

Mr. Haddow: Mr. Chairman and gentlemen, I will run through this statement very lightly. The first part is just roughly an outline intended to show that the point of contact between the New Zealand domestic economy and overseas economic units is the farmer, and the price-level of exports is of fundamental importance. I show you that the effect of changes in that price-level is diffused through the rest of the community and aggravated under present conditions. After that I deal with the question of how much of the fall—the loss due to falling prices in our export commodities—can be avoided, and I contend that some of it, of course, is unavoidable, due to the fact that primary products decrease in value more rapidly and to a greater extent than manufactures, so that the things we sell fall more than the things we buy. We have to give away more wool and more butter to buy the same number of motor-cars and the same amount of crockery. That is a loss we cannot avoid, but I suggest that the aggravation of this loss can be avoided. Then I deal with some of the reasons why it would be unwise to go back to the old policy of a fixed exchange with sterling, which in the old days was the fixed exchange with all countries on the gold standard, and I set out various reasons why it might be inadvisable, the chief of which is the uncertainty of monetary policy throughout the world; there also appears to be a trend towards nationalism and various countries setting up their own domestic monetary policies, so that the advantages of an international standard are no longer available. We must make the best of what we can with our own domestic policy. The advantages I have set out; the main object being to prevent undue fluctuations in the national money income of the community. It seems to me that by using the exchange-rate as the mechanism of control we can eliminate the violence of the ups and downs due to changes in the price-level of our exports. I do not suggest we should attempt to exclude the effect of these price-levels in the main; some of the loss is unavoidable, and we have to bear it; but we can, perhaps, spread it over the whole community. I think there is quite a difference in diminishing the income of the whole community by perhaps 10 or 15 per cent.—that is a burden which can be borne without undue trouble. I think in New Zealand every one's income in normal times will stand a cut of from 10 to 15 per cent. without ruin; but where, as we have at present, practically the whole of the loss falling on one section, and owing to the peculiar position of the farming industry it falls on his net profit very largely, you find that the income of a large part of the community is almost wiped out; and that has more serious effects than if the loss was spread over the whole community. I deal then with the co-ordination of monetary policy with public and municipal spending. If, as I have suggested, the exchange-rate should be moved to meet changes in the price of export commodities, it may be that that exchange-rate is not what we would call a true rate. There might be a piling-up of balances in London, or there might be a serious diminution of them. That can to some extent be overcome by a proper co-ordination of public spending with the exchange policy. Where, for instance, the London balance tends to become swollen and insufficient importing is taking place, then public works should be speeded up with a view to stimulating internal conditions and internal purchasing-power, which would result in a better demand for imports and a reduction of the balance, and a contrary effect would apply in times of boom. It would, as I point out, be a saving to the State in that the major part of the capital expenditure would be done when prices are low, and a smaller proportion done when prices are high. In the remainder of the statement is set out the policy that I would indicate as likely to be useful through the successive changes and ups and downs of the complete cycle. No one cycle is the same as another, but there is a certain similarity about them. I think the position of the State and its interest in the Bank of New Zealand is set out clearly enough, the idea being that the State directors should use their influence to initiate a policy of cheaper banking facilities rather than a policy of high profits and high dividends.

Captain Rushworth.] Your main object is to stabilize the prices in New Zealand money for our exports?—No; I would not put it quite that way.

You talk of a variable exchange-rate?—Yes.

For what purpose?—For the purpose of steadying the money income of the community. I wish to stabilize the money income of the community, but we must face the fact that some real loss of income results from the fall in overseas prices, and there is no point in trying to avoid that. You must put up with a loss of real income, and that should be reflected in a smaller money income.

The object of the variable exchange-rate would be to make things a little more profitable for the farmer?—It is not the objective, but is the mechanism. My point is that it is not good for the country to have one section of the community suffering a loss of income—perhaps a total loss of income—due to overseas causes.

If prices for exports fell further, the only thing would be to raise the exchange-rate even higher than at present ?—Yes, the main thing.

And if the prices overseas rise, diminish the exchange-rate ?—Yes ; I would not necessarily make that complementary.

You envisage a fluctuating foreign exchange-rate ?—Yes.

What would be the effect of that on the imports ?—We know the effect of the exchange on the importers at the present time. I think they overestimated the damage that they would suffer ; I think the effect was largely psychological, partly because the exchange-rate was raised too late and partly because it was not understood as a permanent policy. It would make a big difference, I think, if it was recognized as a permanent policy of New Zealand. For instance, when the Bank of England raises its interest-rate—its discount rate—the community does not get into a panic ; it is recognized as a normal method of regulating credit in England. If we adopted the exchange-rate as our normal mechanism, I do not think we would get very panicky at a small move, and I would not envisage a rise of 25 per cent. in one week.

Are you familiar with the experiments that have been carried out by Egypt and Sweden ?—Not with Egypt, but I have some knowledge of what they are doing in Sweden.

You know that, whilst stabilizing their income or price level, they simultaneously provided means for protecting the importer against a fluctuating foreign exchange-rate ?—I was not aware of that ; they have a forward exchange-rate ?

No ; they have a Foreign Exchange Equalization Fund. That fund takes up the oscillations in the foreign exchange-rate to enable the importers to enter into their former contracts. Would not something of the same sort be desirable in your scheme ?—It might, but actually in New Zealand we have already that mechanism. I think we have had surpluses of as much as £13,000,000 in the London balances, and apparent deficiencies of £10,000,000, and yet the exchange has been maintained at par. I think that was in 1925 and 1927. It is obvious that the banks held fair reserves in London which they used for the purpose, and I take it that the capital of the central bank and the whole of its assets will be in the place where wanted, in London, and will be available for the purpose.

You know that in 1931, when Great Britain abandoned the gold base for the second time, they did set up a Foreign Exchange Equalization Fund to enable producers to deal with New York, which was still on the gold basis, and they set up a fund of £150,000,000 to take up that oscillation. Would not something of the same sort be necessary here in a smaller way ?—I would put it that the capital of the central bank be used for that purpose.

Another point is, in arranging these payments through the higher exchange-rate to the exporters, is that to be regarded as a loan or as a straight-out payment ?—It would be a straight-out payment. It would be in exactly the same position as it is to-day.

But to-day, with the Banks' Indemnity Act operating, is it not in the nature of a loan ?—I would not say it was a loan. I am hopeful that the banks indemnity exchange will not result in a loss.

Of course, you are all the way through anticipating what is called an improvement, a rise in price-level ?—Yes.

Do you really think there is any justification for that ?—I do.

What justification is there, apart from the possibilities of war ?—I would say the fact that there are half a million more employed in Britain than there were a year ago, numbers variously estimated at between two millions and six millions more employed in America, and interest-rates are down to pre-war levels. After all, a suit of clothes wears out in time ; you have to get a new one, and I should imagine several million suits of clothes are pretty shiny by now. I think the figures indicate that recovery is approaching. I think also the abandonment of the gold standard has paved the way for recovery in America and in Britain, and also the normal effect that costs have had to give way and are being reduced so that profits are beginning to emerge, and that, after all, is the secret of the whole thing. Where you can produce with profit, you are on the way to recovery.

You do not think the trouble is in any way connected with the extraordinary indebtedness in which every nation finds itself ?—Do you mean internal or external ?

Either ?—I would say that the external indebtedness has had an indirect effect, particularly on tariffs and on exchanges. In regard to private indebtedness, its weight has become noticeable owing to the fall in the price-level. We were not conscious of it when we had a high price-level.

What has caused the fall in the price-level ?—I could not explain that in a few words, and am afraid it would take too long.

The reason I asked that is quite germane, because you have envisaged the possibility of a rise in price-level. I should like to believe there is some foundation for it. Personally I cannot find it. It seems to me that if there is any justification for a prospective rise in the price-level, it must be due to a reversal of the conditions which caused the fall ?—I would put it this way, that the high rate of interest was the main item. Interest, I think, is comparatively customary, and the whole world got accustomed to high rates of interest during the war. Then we had distressed borrowers after the war who were willing to pay anything, and there is no question that a high rate of interest causes stagnation.

It is generally held that if you put a greater volume of money into circulation you tend to cause an increase in the general price-level, a state of inflation. If you decrease the money in circulation, you cause the contrary effect. But, surely, if that is the case, whether interest is high or low has no bearing, because it does not vary the volume of money in circulation ; it is merely transferred ?—It varies the volume immensely.

Does it ?—Yes. I would borrow all the money available at ½ per cent., but none at 6 per cent.

But if you borrowed it at all, the interest that you would pay would be distributed to some one else. Whether the money is spent by some one else or by you is immaterial so far as the nation is concerned, is it not ?—Yes, but that is not the point, which is : That unless borrowed the money may not get into circulation at all.

It seems to me that some further thought is required on that particular aspect of the subject. Another point: You draw attention to the fact that in the past the State has had a majority of directors on the Bank of New Zealand, but they have not operated in the interests of the State ?—Not in the interests of the community, or in the interests of the State. They have operated purely as a means of producing big dividends to the State.

And do you think that the new Reserve Bank will alter that in any way ?—Do I think the directors of the Reserve Bank will adopt the policy of serving the community ?

Yes ?—I think they will. I think the limitation of dividends will have that effect.

Mr. Clinkard.] Before I start to question you, Mr. Haddow, I want to compliment you on your paper; it is something worth while. As I see it, the principle underlying your proposals are first that New Zealand's prosperity depends on (*a*) the credits received from the exports plus the amount produced for internal consumption—that is the basis, is it not ?—Yes.

(*b*) That if, owing to external price-levels, our exports decline in value, the exchange should be raised so that the credits in circulation should not be reduced in their total volume; is that right ?—I would not say that they should not be reduced in their total volume, but, rather, that they should not be reduced to the full extent of the fall in export values.

But that they should be raised with the intention of bringing about an equalizing in the total credits available for circulation ?—I would not say the total; I would say the exchange-rate should not be raised to such an extent that the total credits would be the same, but to the extent that the unavoidable—I find it very difficult to explain in a few words.

Hon. Mr. Downie Stewart.] To ease the position ?—Exactly.

Mr. Clinkard.] If prices rise above the normal, exchange should be reduced to such an extent as would maintain equality ?—As would maintain a reasonable profit in the form of industry.

Your object is not so much to give a profit to the farming community as it is to maintain a balance of the credits of the nation generally ?—To maintain the nation's money income; to keep income as near to normal as possible.

For instance, you are aware of the fact that our total exports during our better years went up to £50,000,000 and even £56,000,000 ? I take it you would not base your calculations so much on the individual prices as you would on the returns from the total exports, would you not ?—Yes, I would base it more on the net profit that the farmer was making. I would not raise the exchange to such a figure that would give him an excessive profit, because, if that were done, it would merely be capitalized and result in a land boom.

Do you not think we are liable to get into some such difficulty ? Would it not be better to view it in this way: We will say that in view of the low price of butter and the high price of wool, the returns should net something like, say, £45,000,000. On that assumption, even though one commodity might be down and another up, if the amount fell below £45,000,000 or rose above £45,000,000 (£45,000,000 is only a figure), that should control the position of whether your exchange went up or down ?—Exactly. I think you made it clear that the central bank should not deal with individual prices; it is to deal with the averages of prices.

That is exactly my point. There is one weak point in your contention and it is this: That when we had the exchange, all commodities were at very low levels. All sheep commodities have risen to paying prices while cow commodities are down below the paying price. The difficulty is that if you were trying to adjust the position by exchange, you would assist the one which was not requiring assistance just as much as, or more than, you would the one which needed it most ?—The monetary system cannot attend to every individual price and a non-monetary policy would have to be adopted.

Your object is not to reimburse the individual for his loss, but to keep up the even volume of credits coming into the pool ?—You cannot do more than average it.

Quite so. Would you agree that we cannot stabilize exchange and at the same time stabilize our prices internally ?—Do you mean, to maintain a fixed exchange with sterling ?

Yes ?—It cannot be done.

One or the other must fluctuate ?—Yes.

If you fix a price, you must allow for a fluctuating exchange ?—Small variations can be absorbed. With a large fluctuation like the present, either one or the other or both has to move.

When Britain went off the gold standard, would you regard that as a decided relief to debtors who had to pay in sterling ?—Yes.

It practically reduced our payments by over 30 per cent. ?—Yes.

And if America reduces or deflates her dollar as she is talking of doing, to something like 50, how will that affect Britain's war debts to America ?—It will lighten them correspondingly.

Divide them by about 4½ ?—Yes.

So that the operations that are taking place at the present time, though they are not achieving the, may I say, desirable object of wiping out war debts, are at least very materially decreasing their burden ?—Yes.

And the same applies to other debts, does it not ?—Yes. The weight of a debt depends on the price-level.

Will not that world-wide tendency to reduce indebtedness in that way have a very beneficial effect on commerce and spending-power of the people generally the world over ?—I think it certainly paves the way for recovery and I think it has had that effect in Britain already. British export trade has picked up.

I agree with you that a great improvement appears to be taking place in the position in Britain, in markets and in other ways. I think you have stated to Captain Rushworth that your view is that there is a great improvement. You have also seen the same improvement in connection with our local production. As I said before, not only are wool, lamb, and mutton materially improved to what they

were, but it is your opinion that that is an indication of the trend of events, that we have turned the circle and are on the up-grade of the graph, as it were ?—I think we have just about finished bumping along the bottom.

Captain Rushworth asked you the question what has caused the fall in price-levels. You would not put that to one cause, would you ?—No.

You would probably take the same view as the Macmillan Commission, that it was from a great variety of causes ?—Quite so.

With their foundations more or less in the effect of the war ?—Yes.

That was the foundation cause of these other causes and they proceeded from it. Would we say that for the time being the world's affairs were subject to mal-adjustment ?—Most certainly.

And the consequence is it takes time to bring those into working-gear again ?—It does.

Do you think that they have been approaching nearer to a working-condition ?—Yes. Very gradually.

You do not think that the minds of the world have all been trying to make things bad in order to scoop through a depression ?—No. I think it has been more due to ignorance than to design.

And would you go further and say that in many cases some of the difficulties were unavoidable for the time being ?—Some were. But I think the story could be written up in the words "Too late." Nearly every remedy has been applied too late.

And could we not say further than that, that as the world had provided no parallel in the past that the human mind was incapable for the time being of grasping the tremendous changes which had taken place ?—That is about the position.

Captain Rushworth attached a good deal of importance to the increase in circulation. Of course, we know that the increased currency available invariably puts up prices. That is so is it not ?—Provided the velocity remains the same.

That is so. But if you take it to a considerable extent, if you put in a large amount of increased currency, you invariably put up prices ?—Yes.

But there are other causes for putting up prices besides the increase in currency, are there not ? Increased demand, for instance, greater velocity of turnover of currencies, and so on ?—Yes.

So that we cannot say that because there is no increase of currency there can be no increase in price ?—Certainly not.

You would not consider that it was necessary to have a certain amount of currency tagged on to every commodity in order to dispose of that commodity ?—No.

Would you agree with me that in many instances money is not actually used for exchange, but rather to measure the commodities one against the other ?—Yes. That is so. It is money of account.

That is the correct term. I see that you have expressed an opinion which I have done for many years, that the directors of the Bank of New Zealand appointed by the Government should not be shareholders. That is your view expressed, I think, is it not ?—Yes. It seems to me to be the simplest way to ensure that the State appointees serve the community rather that their own interests.

The Chairman: I do not know whether you quite said that.

Mr. Clinkard.] I am taking the document ?—They would be more likely to serve the community rather than their own interests.

The Chairman.] Is that point clear that Mr. Clinkard is asking, that they should not be shareholders ?—Yes.

Mr. Clinkard: I wanted to emphasize that, because it coincides with an opinion I have expressed.

Hon. Mr. Downie Stewart.] I have very little to ask. On that last point about the directors of the Bank of New Zealand, I have forgotten the passage in your paper. I only want to ask you whether you are aware that some of the directors of the Bank of New Zealand have held that same view, and have refused to hold shares ?—No, I was not aware of that.

I do not know what the present position is, but some years ago the Chairman told me that he refused to hold any shares or apply for any shares because he took your view that by not holding dividend interests he could serve the public best. I do not know whether it is universally observed, but it is only fair to mention that ?—Yes.

It is a little while since I read your paper, but I understand that your main view is that the popular idea that you can control internal price-levels purely by exchange manipulation by itself is not sufficient. You must take account of other factors as well ?—Yes. I co-ordinate other policies with it, of course.

Would you agree that if you paid regard purely to maintaining an internal price-level without any regard to the exchange you might reach a point where your own money would become valueless externally. I think there is a limit to what you can do ?—Yes. Of course there is a limit to the rise and fall in prices as a rule.

My main object was to direct your attention to one or two passages that bear on your paper. Have you read the last chapter of Cole's new book, in which he discusses this question at great length ?—No, I do not think so.

I want to know whether you agree with one or two statements he makes here. He says, after a certain discussion, "This seems to show that the stabilization of the general level of internal prices, plausible as it seems as an ideal, is not, in fact, an object which can be pursued by a country either on or off the gold standard without very considerable dangers." Would you agree with that ?—Yes. But I have not advocated stabilization of internal prices.

But you admit there are evils ?—Yes. I am simply using the exchange as a buffer.

Yes. I understood that. But the ultimate object of that must be to try and equalize internal conditions to a great extent, and redistribute the national income. Cole seems to hold the view that you ought to adopt a third policy, and he is apprehensive of certain consequences from concentrating too much on the exchange. He thinks it must be rendered by either higher wages or increased taxation,

I presume to compensate for the regular rise in prices ?—Actually in New Zealand, or course, we have found a falling price-level. The price-level is down about 15 per cent. It is not as though our exchange depreciation has brought our price-level up. Of course, it is above the English price-level, but nobody would say that our currency has depreciated to the point of vanishing.

Have you seen a recent article on the Swedish experiment by Professor Ohlin of Sweden ?—No. I have not. It takes some time before these things reach me.

It is only out of interest to you that I was going to direct your attention to it. It is not necessarily hostile to your view. He has an article on the "Inadequacy of Price Stabilization," and it seems to me that in a time of depression it is very hard to carry out any policy with the objective of price stabilization successfully. He says, "To sum up, then, it may be stated that during this period, characterized by increasing and stagnating depression abroad, Swedish monetary and financial policy did not succeed in preventing a certain reduction in wholesale- and retail-price levels, still less in bringing about some rise in prices." That is simply picked out at random. However, there is not much point in this except in directing your attention to it ?—I should say that the proportion of overseas trade in Sweden is lower than it is in New Zealand, and I think it would have some bearing.

There would be more chance of success there than here ?—No. I think a price-stabilization policy would have a better chance of success in Sweden and an exchange-control policy would have a better chance of success here.

Dr. Sutch.] There are not many questions that I have to ask. It is more of a general nature, and, since the Swedish business has been brought up, I thought I might ask you something on that. In essentials it is much more analagous to the New Zealand policy that was generally realized on the surface. It is only a difference of emphasis. As you have just remarked, the proportion of overseas trade is different in Sweden from here, and hence their emphasis on the credit instruments they are using is different. Have you studied the Swedish situation at all ?—Not very much. I think the last I saw on it was the *Midland Bank Review* about eight or nine months ago.

The depreciation of the Swedish exchange has been just as deliberate in Sweden as it has been in New Zealand. They have depreciated 35 per cent. off gold in Sweden, but they have tried to keep an internal price-level by easy credit. They have tried to keep their wholesale price-level steady or to stop it from falling. I was wondering whether, if we had had a central bank in New Zealand before the depression, would we have had the controversy we have had over this exchange question ?—I do not think you would. I think we spent a year arguing about it and the evil psychological result was accentuated. In Australia they did not have the trouble.

That was similar in Sweden. In Sweden they consulted their economists and asked what the policy should be, and after discussion arrived at it, but they had a central institution and had a fund and purposely depreciated foreign exchanges in order to keep this wholesale internal price-level. If New Zealand had had a central institution, perhaps New Zealand might be hailed throughout the world also as Sweden apparently is ?—Quite probably.

You think so. Mr. Rushworth remarked that there was an Exchange Equalization Fund. I am inclined to think that he has not quite the exact terminology. It was a fund (if it was a fund) to depreciate the exchange in order to keep the wholesale price-level stable. Now in New Zealand our price-level has remained stable. Have you any idea of what has happened to the cost of living ?

Captain Rushworth : That is a queer sort of question. It is putting words into my mouth.

Dr. Sutch : I am sorry Mr. Rushworth. Would you correct me.

Captain Rushworth : The question that I asked the witness was related to the Exchange Equalization Fund that Sweden has set up, much in the same way that Great Britain set up the Exchange Equalization Fund. I was drawing the distinction between the operations both in Britain and in Sweden to that in New Zealand, where the exchange had been lifted arbitrarily and no Exchange Equalization Fund had been established.

Dr. Sutch : The point I am trying to make is that they are very similar, and the English Equalization Fund is different from the Swedish one. The English Equalization Fund is to iron out the rises and falls due to speculation rather than the general tendencies in the price-level. The Swedish one is not due to that, but it is done deliberately, and is used to depreciate the foreign exchange in order to keep their internal price-level stable. There is an essential difference. That is all I am trying to get at. I am not trying to put words into your mouth.

Captain Rushworth : Well, I suggest that you leave my name out. Otherwise some misunderstanding may arise.

Dr. Sutch.] My last question is this: What has happened to the cost-of-living index since the exchange-rate was increased to 125 ?—I do not know what has happened to the cost of living in general. To tell you the truth you gentlemen sat a bit too soon. If you had sat in about six months' time I might have been able to go into the statistics more fully, but I do not think the cost-of-living index has moved up at all, 1 or 2 per cent. down probably.

Yes. At the end of 1933 the cost of living in New Zealand—that is, the index—was 5 per cent. below what it was in 1932, so that, despite the increase in the exchange-rate our cost of living remained comparatively stable, in fact, it fell somewhat. Would you have expected that to have been the case ?—Yes.

You estimate the diminution of the real national income during the present slump to between 10 per cent. and 15 per cent. That is owing to these unavoidable causes. How do you arrive at this figure ?—It is very little more than a guess, perhaps, but I actually assume the pre-slump national income at about £150,000,000, and assume the average exports at about £50,000,000 sterling. They are all sterling figures at the moment. And our export price has fallen to somewhere near £35,000,000 sterling, perhaps £30,000,000 at the bottom of the slump. And that is a drop of about £20,000,000 sterling out of £150,000,000, practically unavoidable, because at that stage the price-level of manufactured goods had hardly begun to fall or they had not fallen out here.

What proportion of our production in New Zealand is exported ?—I do not suppose more than a third.

You mean a third, 40 per cent., or something like that. Do you think that if price-levels of our exported products fell 20 per cent. we would get a much greater fall in the value of national production in New Zealand ?—Undoubtedly.

It is undoubted, you think. You think our whole economy depends on the value of our total production, part of which we export ?—Yes. It tends to be concentrated in that way. It is the fall in the value of exports which is the originating cause, and then by aggravation it spreads to the other classes of production.

That is very clear. You say, "The rise of economic nationalism makes it likely that the Bank of England will tend more and more to adopt a purely domestic monetary policy." I realize that that is only hypothetical, but you go on to say, "It would be merely a coincidence if the monetary and price-level policy best suited to a creditor manufacturing country, such as Britain, was always that best suited to a debtor, primary-producing country, such as New Zealand." Do you mean that what we have in New Zealand is a reflection of monetary policy in England ?—It will be when we have a fixed exchange.

But if the price-level of butter and wool and meat fell independently of the monetary policy in Great Britain would we not have a different reflection in New Zealand ?—I do not quite follow the question. I do not quite appreciate what you mean.

The point I am trying to make is this: That if the internal price-level of Great Britain is one of deflation need we necessarily in New Zealand have also a policy of deflation ?—If we have a fixed exchange, of course, in effect we would have to.

Is it not possible that under a deflationary monetary policy the price of our exported products might rise ?—It is not likely.

You are assuming, then, that the monetary policy is the sole determinant of the value of our products ?—I would not say it is the sole determinant. It is one of the most important.

If we assume that the British regulation of milk-products went into force and that the price of butter, for instance, rose in England, here you have something happening quite independent of monetary policy that would affect the value of our sterling held overseas and we in New Zealand might have a boom while in England they might be assuming some quite independent monetary policy ?—That would be possible.

Would you say that we should have a different name for our New Zealand pound ?—I think it would help to avoid confusion of thought if we did.

In essence our New Zealand pound is different from the English pound ?—I think so.

The question has been asked, what of the effect on importers of the fluctuation in the exchange-rate ? If you assume parity of the exchange-rate, do not the importers suffer in the long run from our alternate booms and slumps ?—Yes. There is no question of that.

So that if we had a fluctuating exchange-rate it does not necessarily mean that our importers are going to suffer any more than they have with a parity of exchange ?—No. On strictly economic grounds they would suffer less.

So that under this scheme the importers are going to be better off over a long period ?—Yes.

That is what I wanted to get at. You say, "The failure to reflect increased efficiency in lower prices undoubtedly led in America to the Stock Exchange boom." Would you say, then, that there was really inflation in America, although they had a stable level of prices ?—Yes.

So that we can have inflation despite a rise in prices ?—Most certainly.

So that we are not aiming at any stability of price-level, if other conditions bring it about that we should have falling prices. Would you agree ?—Certainly. I do not think inflation should be related entirely to a price-level. I think it is rather just a way of speaking.

It is a very difficult term to define. Perhaps it would be better if you defined what you mean by inflation ?—I would say, roughly, that inflation is a condition where profits are above normal or where interest is below its natural rate, so that there is a tendency for the community to be borrowing more than it is saving.

Yes. I should go into that, but I want to give more attention to this scheme. You say, "The observed facts indicate that a change of 15 per cent. in the exchange-rate results in a change of less than 4 per cent. in the general price-level" ?—That is, the wholesale-price level.

Not the cost of living ?—No.

So you take those figures as indicative of something on which we could base future policy ?—I do not think the figures have been in existence long enough. Actually those figures came from just over the past year, the result of the last 15 per cent. increase in exchange, and, of course, in one year there has been a rise of 4 per cent. in the wholesale-price level. Whether it is entirely due to the exchange is a different matter, because I think there has been a slight tendency for wholesale prices to rise overseas.

And there may have been a tendency for them to fall ?—Yes, there may have been.

So that we cannot generalize just from the facts of last year ?—No. But the idea is to show that an increase in the rate of exchange does not result in an equal increase by anything like the amount in the price-level. And, moreover, you have got to consider that the policy I advocate would be raising the exchange-rate at a time when the general price-level overseas, particularly of imported commodities, would tend to fall.

You say it is necessary to give the central bank a monopoly of foreign exchanges ?—I do not say it is necessary, I say it may be.

What was your case for giving the central bank a monopoly ?—It may be necessary to.

We have the legislation now to enable us to do that ?—Yes.

Then why do you think it desirable to quote a forward exchange-rate ?—To enable importers to give definite quotes without having to take into consideration variations in the exchange-rate.

Would you say that the exchange-rate is to remain at its present level for six months ?—No, I do not say that. I mean that when an importer is asked to quote a price for so many tons of material in six months' time he can not rely on the exchange-rate being exactly the same in six months' time, but he can go to the central bank and say " I want to buy exchange in London in six months' time to a certain amount," say, £10,000, and the bank would quote him a charge for the forward rate.

Your Reserve Bank would take the risk ?—Yes, and probably charge more.

What I thought you meant was that you were going to say that the exchange-rate was going to change in so-many months' time. That explanation has cleared the matter up considerably. I am a bit worried about your ideas where you say in slump times you would carry on public works and in boom times you would recede them. You say, " There is nothing except strength of character required to make the public and private constructional programmes complementary." While I agree with you that that is one of the essentials, there is one school of thought that if you take a certain amount of money out of circulation in boom times you are not affecting the national wealth of the country at all. This question was discussed in America a good deal during the last few years as to whether in slump times you could inject currency into a system, but would you increase wealth ? Do you think it is possible to inject currency and increase wealth ?—It is possible to do it. It just is a question as to whether the community will use the extra currency or hoard it. If they used it you would make wealth.

One other thing is necessary, that the production continues to have a sufficient return to cover costs ?—Yes.

So that as well as strength of character there is that to be considered ?—That is so.

You say that public expenditure on capital works should take up the slack in slump times. You would operate on Treasury bills ?—Yes.

Are Treasury bills usually used for long-term financing ?—No.

You would depart from practice there ?—Yes. I would assume they would be for a period only. They would not be floating around for ever ; they would be funded ultimately.

So that if the Reserve Bank is going to finance on Treasury bills and fund them, then the Reserve Bank is going to have long-term debts in respect of Treasury bills ?—They would be sold to the people. Loans would be raised to redeem them.

So that means that during a slump you will finance on Treasury bills and when you hit prosperity again you will fund your debt ?—Yes.

You say " The use of variations in the rate of interest as a factor regulating the economic conditions in New Zealand is almost unknown." Do you think that we could alter the rate of interest, but vary the amount of credit that is exchangeable in New Zealand ?—To some extent, but I feel that New Zealand has not a suitable economic structure, is not responsive to the rate of interest to anything like the extent to which the British economic structure is.

You said that if all the money in the country was offered at ½ per cent you would borrow it ? Yes, I would.

That indicates that the rate of interest has some effect on the amount of money borrowed ?—Yes, but there is considerable difficulty in lending it.

Could you not have a situation where you could offer money at ½ per cent. and it would still not be borrowed ?—If the community had not the confidence to borrow.

Confidence, and if at the end of the production period costs have not been covered ?—Yes.

So the rate of interest need not be a strong factor in credit, particularly in New Zealand ?—I do not think it is. I feel that the possibilities of it are not very great.

It could be used more than it has been ?—There is no question of that. It should be used more rapidly.

You say you would reduce fixed deposits and savings-bank rates. That would require the co-operation of many institutions, surely ?—Yes. I suggest that the central bank should be in close co-operation with the trading banks and I think the savings-banks could be induced to change their policy and their interest-rates at the request of the central bank.

You also say, " ready and cheap financing of truly economic expenditure by State and municipalities." What do you mean by " truly economic expenditure " ?—I mean expenditure, of course, which will cover the outlay of capital, sinking fund, and interest.

That means that you would not go on with the South Island railway ?—I do not know anything about that railway, but the Auckland feeling is that it will never pay. In that case I would certainly not go on with it.

So you would make that the ability to pay, to cover costs ?—Yes, during its existing life. You should not take too narrow a view if the thing did not pay within the first year or two. If your capital has been lent for thirty years and over the thirty years you are sure it will cover the cost and pay interest, then I should say go on with it.

Could you say what was the best exchange-rate at any moment for New Zealand ?—Probably at the moment New Zealand is suffering from the effects of changes in policy. If you have a plan, however good or bad it is, it is better to keep to it rather than to change.

So the best policy in New Zealand would be to say : This exchange-rate is to be the exchange-rate for six months or a year, just to give the commercial community some knowledge of what is going to happen in the future ?—Yes, I would certainly, in the first instance anyhow, make it clear that it is permanent because of the general belief and hope of many interested parties that it is going to fall at the end of this month or next month, and, as a result, we might say the exchange-rate has never been a true one, has never been a natural one.

It could still be 125 and be what you term a natural rate ?—Of course, it could. What I mean is that the community is not accepting 125 as the exchange-rate for the purposes of all transactions. They feel that some transactions are better postponed, because it may pay them to postpone them.

The reason for that is these interested parties you mention ?—Yes.

Now, in regard to this banking indemnity; the banks have been paid nothing yet, have they ? They can only be paid something if they lose on the exchange-rate. If the exchange-rate falls to 120 and the banks lose on it the Government undertakes to make up the difference, so that we have not paid in New Zealand anything to anybody except a rate of interest for keeping the exchange-rate up ?—I do not know the position in regard to that, but I have assumed that to be the position.

I thought you knew, because, in answer to a previous question, you said that it may be possible that the banks' indemnity may not be paid ?—I meant there may be no loss. I do not know the actual position between the Government and the banks, but I do not think you need be worried about huge losses in the matter.

So it is quite possible that when the Reserve Bank takes over, the Government need not lose one penny to the banks ?—No.

That is quite possible ?—Quite possible.

And you envisage normal net incomes for the farmer. Do you not regard that as a rather dangerous phrase ?—I would not give the farmer the job of deciding what was his normal net income.

It is a difficult matter to decide; that is a difficult question ?—There is no question about that, but you can, I think, probably from practical observation and by statistics, get an idea as to whether a farmer is earning normal or abnormal or subnormal profits. It shows in his face too.

I have tried at various times to find out the cost of production of a pound of butterfat, and it has varied from 6d. to 2s., so what are you going to say is the normal net income of the farmer ? That is our problem. In talking about the profits that have been given to shareholders of banks, do you think that credit extended in New Zealand has been limited because of high overdraft rates ?—I suppose borrowing has been deterred somewhat by it.

You think it has ?—Yes.

It all links up with the question of the rate of interest deterring borrowers ?—It must, unless you are so distressed that you would borrow anyway.

We have examples of the overdraft-rates of banks being 7 per cent., and that of the stock and station agents 8½ per cent. or more, and at the same time advances have increased. It would seem that the rate of interest has had little effect on the amount borrowed ?—That is a slightly different type of borrowing—borrowing to carry stock—the farmer's working capital. He has to accept the customary position; it is customary and he never questions it; but borrowing for the purpose of capital construction is generally preceded by a careful investigation as to the rate of interest it can earn and may be deterred by high rates, and the overdraft rate tends to set the standard rate of interest.

But for capital construction you would not borrow on overdraft ?—You might temporarily.

Yes, just temporarily you might. Has the rate of interest charged by the banks in New Zealand on overdraft held up the development of this country ?—No.

You do not think it has ?—Not materially.

Mr. Munro.] I want to ask two or three questions. You mention "Maintenance of interest rates at a low level." I want to be clear as to what you mean. I know what you mean generally, but would you suggest that those rates of interest should be lowered by Act of Parliament ?—No.

Just by indirect suasion ?—Yes. The central bank will fix a low rate at which it will lend to other banks.

You also mention "Encouragement, where possible, of private capital expenditure, especially by facilitating finance at low interest-rates." Would that be done through the central bank ?—No. I do not think so. The central bank should not deal with individuals; it should only deal with the other banks.

That is a point I wanted to be clear about. Now, "Gradual tightening of terms of financing State and municipal expenditure by central bank." I presume you mean the central bank as already constituted ?—Yes.

Your idea in that clause would be for the purpose of maintaining low interest-rates. The tightening of terms would relate to the perseverance in policy of maintaining low interest-rates until refinancing of existing land mortgages is complete, when funding of floating debt can be accomplished ?—The central bank would not finance State and municipal expenditure on quite such easy terms, and as normal conditions were approached there would not be the need; they should rely on public subscriptions.

You also recommend "Perseverance in policy of maintaining low interest-rates until refinancing of existing land mortgages is complete, when funding of floating debt can be accomplished. I take it that the answers in regard to the reduction of interest generally answer that ?—I think it probable that the rate of interest on mortgages could be cut down to 5 per cent. If the present rate of interest on the Stock Exchange is 3½ per cent., if there is money available for investment, the refinancing of the existing land mortgages can be successfully accomplished at 5 per cent.

Going back to the question of lowering the rates of interest, no matter by what method it is accomplished, if we brought interest-rates down very low in New Zealand would not money or capital try to find investment in Australia ?—It might, but I think a more likely effect would be excessive borrowing here.

Supposing we could bring the average rate of interest down to, say, 3 per cent. in New Zealand and it averaged 4 per cent. or 5 per cent. in Australia. That would mean a transfer of the investments to Australia ?—Yes, but, on the other hand, by borrowing at 3 per cent. and investing in capital enterprises here you would probably show a rate of profit which might approach 20 per cent., and there would be a tendency to transfer funds from gilt-edged securities to speculative securities or shares.

Mr. Schramm.] You said that you consider we are just bumping along the bottom in regard to the depression ?—We have finished bumping.

Do you think that is a fair statement in view of the fact that we still have 75,000 unemployed ?—I think so.

Can you see any prospect in the near future for those 75,000 unemployed ?—Yes, but not for all of them.

What do you see ?—I can see a gradual reabsorption into industry.

What industries do you visualize ?—I think you will find even the importers will be taking on a few more hands soon.

You think so ?—Yes, and transport will absorb some; building will absorb some.

You understand the position is as bad now as ever it was in that connection ?—Yes; the population is a little larger, of course.

Not much ?—No.

Is that not a fair test that we are still at the bottom at the present time ?—It is only a question of the angle from which you view it. You do not expect in this country that the first sign of recovery will be a picking-up of the labour market; it will be one of the last things.

What would be the first sign ?—The first is an increase in the farmers' income. We have it in wool and meat.

Are the dairy-farmers not in a worse position now than ever they were ?—I do not know that they are any worse; they are as bad as they were.

Would that not be another sign that we have not bumped along the bottom yet ?—You can pick out items, but I am dealing with the general average, and I think you will find that the general average national income is a little bigger now than a year ago.

Do you not think the two most important things are the number of unemployed and the fact that the farmers' purchasing-power is getting less than before; they are as bad to-day as ever ?—Yes. You could not say that all the community are equally as badly off as before, neither could you say there was no progress made. You cannot expect everything to jump up at once.

I do not expect that; but the point is that they are worse now ?—I do not think so; I do not think they are any worse.

In connection with the Bank of New Zealand, you have followed these things for years ?—Yes.

I suppose you believe in the Bank of New Zealand being wholly and solely controlled and handled by the State ?—No. I do not think it matters much—not now that we have a Reserve Bank.

Do you think the policy they have adopted has been wrong—the policy of the division of profits ?—Yes, I think it has not been in the best public interests.

You quoted the New Zealand Insurance Co. as a good example of insurance ?—The Government Insurance Office.

In regard to the inland exchange in New Zealand, you think that is very unfair ?—I do not know about being unfair as being a nuisance. After all, banking should be as convenient as possible. I do not know what profit the banks make out of the exchange.

It is not in force in England ?—No, but they have other methods of extracting money from the unfortunate customers in England to take its place.

Do you not think the charge for keeping accounts should cover all that ?—If you like, but it does not matter a great deal how they charge provided it causes as little inconvenience as possible to the community and I think that the inland exchange causes more inconvenience than any possible taxation you could evolve.

The banks, of course, seem to have power to double the rate for keeping accounts ?—They are in the position of having a monopoly. They increased the charge by 100 per cent.

Have you had any chance of working that out to see what it means to the people of New Zealand ?—No, I do not even know how many accounts they have.

You mentioned the rate of exchange. You are sorry that did not come sooner ?—I think in the present depression if it was raised at all it should have been raised earlier.

You think that would have been a good move ?—Yes.

And you would keep it on now you have it on ?—Yes.

Mr. Lye.] I do not want to ask many questions, but I would like to pay this compliment to Mr. Haddow in saying that I consider that his paper is a very interesting one and will be useful to the Committee in its deliberations. On the question of currency, banking, and exchange, I want to ask this question: Dr. Sutch raised the point of the definition of inflation, can we take it to be an abnormal increase in purchasing-power, that when there is that increase it is accompanied by a rise in prices, or, in other words, depreciation of currency, and when deflation takes place the exact opposite obtains ?—That is a rough definition of it.

That is what is generally understood ?—Yes.

Would you say that supply of money and credit in New Zealand to-day is largely dependent upon the supply of sterling ?—I think so.

But that the relation between the supply of money to sterling is and has been largely dependent upon the policy of the banks in New Zealand by the giving or restricting of credit ?—Perhaps I should be quite clear what you mean by sterling. Do you mean the sterling balances ?

Yes ?—That has been the governing factor.

And that the amount of currency and credit has been determined really by the banks' policies in operation from time to time ?—Yes.

You say that in presenting a policy to be followed by a monetary authority—from now on it will be the central bank—the problem requires constant study, continued exercise of foresight and judgment; courage, but not obstinacy. In your paper you lay it down that it is necessary to reduce and maintain

interest-rates as low as possible. I may mention that I am in full accord with that and that is part of the recommendations contained in the Macmillan Report, of which you have no doubt heard and perhaps read ?—Oh, yes.

Now, will you admit, in connection with interest-rates, that in view of the many other institutions that grant credit in New Zealand it is largely a matter of agreement between the banks operating in New Zealand and the other lending institutions in New Zealand, such as stock and station agents, Public Trust Office, dairy companies, and insurance companies, as to what the rate of interest shall be, and that the failure of the banks to reduce the lending rate has been largely the inability of these institutions to reach a common agreement as to what the lending rate should be from time to time and what their borrowing rate shall be ?—I think they have all charged what interest they could get, which has been fairly high.

This is the particular point I want to clear up. You say the State has not used its share-holding and voice on the directorate of the Bank of New Zealand in a suitable manner. You then go on to say what the State Fire Insurance Office has done ; it has not been the policy to amass profits, but to hand on the benefits and profits to those who do business with them. You contrast the insurance companies with the banks, but I put it to you that whilst it is possible for an institution like the insurance companies or the State Fire Insurance Department to set a standard of premium rates which are so low and which necessarily keep down the rate of profits, when you have six particular banks doing business in New Zealand and a large number of private lending institutions other than the banks, it is a very difficult problem ?—Of course, with the central bank, it has practically full power to create any rate of interest it likes. It will take time, but it can be done.

Exactly, but what is the effect going to be ? They have to attract deposits. Some of these private lending institutions are willing to pay for money on fixed deposit at a higher rate of interest then what is laid down as the rate by the State lending institutions which also desire to attract deposits ?—If they pay too high a rate of interest, they will not be able to lend it out.

If the State lending institutions reduce the interest-rate, will their areas of lending be limited by virtue of the fact that, because their borrowing-rates must be correspondingly low, and therefore their flow of deposits from the outside institutions ? They will have the tendency to get the money on deposits rather than the banks whose rates for deposits is low ; is that not a fact ?—Yes.

In fairness to this statement you have made where you blame the banks for not having done a great deal in the direction of reducing interest-rates, you admit that there is a difficulty that the present banks, quite separate and apart from the Reserve Bank, have been up against a problem that, whilst there should have been every desire for co-ordination between the lending institutions, that has not been accomplished for one reason or another, and therefore there has not been a lower rate of interest ?—The fact still remains that the bank has been able to increase or reduce overdraft rates from time to time by $\frac{1}{2}$ per cent., from 6 to $6\frac{1}{2}$ per cent. and to 7 per cent. and then back again, but my objection is that those moves have been made too late to be of much use.

I put it to you that those movements have been made largely as the result of necessity and the result of experience ; is that not a fact ?—No ; I think they have been made as a last resource, not as a conscious factor in monetary control, but purely as a means of protecting the banks' resources.

I want to get that point clear : That if the State lending institutions, insurance companies, stock and station agents, the Public Trustee, wish to attract deposits, the savings of the people, they necessarily have to offer an attractive rate of interest. If the banks, the six banks that are operating in New Zealand to-day, agree amongst themselves without taking into consideration what the policy of the other lending institutions may be, to reduce the rate of interest for advances, they must, to make this secure, correspondingly reduce the rate of interest offered to attract deposits. The net result would be, if there is no corresponding drop in the rate of interest on deposits to the outside institutions, the banks would not get the money, but the outside institutions would ?—It would not last for long, because the outside institutions would find they were having difficulty in getting money lent out at a fairly high rate of interest ; fairly high because they would have to charge more than the banks if they were paying more for deposits. I think we have to look at it this way ; the banks are the major factors in the situation.

There are many thousands of people that are studying questions of banking, currency, and exchange in New Zealand to-day. In reading books on banking, currency, and exchange, do you consider it to be necessary that many of the writers, such as G. D. H. Cole, are reviewing the relationship of Great Britain with the rest of the world, whereas in your paper it is making recommendations and reviewing the position of New Zealand with Great Britain ?—There is a difference, of course.

There is that difference ?—Yes. Local conditions must be considered.

I quite agree. Many people to-day are reading literature and they are not taking into consideration the economic condition of New Zealand in relation to Great Britain, but they are taking what they read in a book, forgetting that the author of the book may be dealing entirely with a different set of conditions, the relationship of Great Britain and the world, whereas your paper is dealing with New Zealand's condition in relation to conditions in Great Britain ?—It is a domestic monetary policy.

And from that point of view, I think it is very interesting, and a great deal of it I can entirely agree with. There are, of course, places where a little explanation could be given, but I do not think it is necessary to ask any further questions.

Mr. Langstone.] Do you think that the present banking system, in the main, the policy pursued, has been quite a decent policy ?—I do not think there has been any conscious monetary policy pursued by the banking system in this country. I do not think they even pretended to. They have looked upon themselves as purely intermediaries between borrowers and lenders. It is quite a different problem.

They have not definitely taken action; the result of that action has been a rise or fall in prices?—No; I think they have merely faithfully reflected the changes in the sterling balance.

I notice you say that they have been followers and not leaders. What is the mechanism that compels a bank to increase or reduce its overdraft rates? There must be some reason for it, known to themselves?—There is a difference between the position of a central bank and a trading bank.

But you have had a central bank in England, and it has altered its bank rate?—Why does it alter its rate of interest? I think the Bank of England interest-rates have been altered as an act of conscious monetary policy, as a means of controlling the monetary situation.

It has been conscious? You said it had not?—I meant the banks here. The Bank of England's duty is to control the monetary position. The trading banks are only intermediaries.

What is the conscious thing, the basis that compels them to either increase or reduce their bank rate in England—the Bank of England?—In the past it has been entirely connected with the reserve of the Bank of England, to protect the gold reserve of the bank.

Why have gold reserves been affected? What has happened that has caused the gold reserves to be affected?—Such matters as international debts, the inflation of the war, the tariff policy, changes of the volume and nature of imports and exports; all affect the balance of payments between countries; and the balance of payments in the long-run has to be met out of the reserve of the central bank.

They laid it down that they were to keep £150,000,000 of gold, and at that it was at par. If it went below £150,000,000, they rose the bank rate; if it went above £150,000,000 they reduced the bank rate to encourage people to take it; was that not the position?—Yes; protecting their reserves and maintaining them at the desired level.

And the other banks operating in accordance with the rules set down by the Bank of England? When the money is cheap, people use more, therefore there is a greater amount paid out in wages, therefore a greater run on their cash reserves, which are mainly used for the payment of wages. They find that when their cash reserves fall below some standard, to which they have agreed, they call in overdrafts to remedy the position. That means people have got to sell and lose money, and to buy goods prices must fall. Then it is the monetary factor that comes into the question of prices?—Certainly. Prices are expressed in money.

Therefore, the main factor is not a non-monetary factor, but a monetary factor?—Yes.

I suppose that no one could state that prices fall just because of their own volition; something causes them to fall?—Quite so.

And that when prices fall, it means that one section of the community is adversely affected while another section of the same community is beneficially affected?—Yes.

It means, in other words, that the relationship, the value of money to things, because either more is available or less is available; do you not think, then, that the bankers want their particular substance or commodity to be more valuable in relation to other things?—The bankers have tended more towards inflation than deflation, because they make profits by inflation. They only get capital accretion by deflation.

Do you not think that they get bigger control? They may not make as big a profit in ordinary distribution, but they would have greater control over the assets and securities of the people in times of deflation. Do they not?—Yes, more properties fall into their hands.

And they have greater control?—Yes.

It is a very big factor. If you are going to do something you want to have control of it and you can determine what can be done?—Yes; the difficulty is that it is always the worst securities that fall into the hands of the mortgagees.

Yes, but of course there comes a time when even the good ones—the value of an asset or security is determined by what it will earn. The physical properties have not altered?—The last institutions to fall into the hands of the banks will be the strongest.

The banks themselves?—Yes, probably.

You talk about "flight of capital." What is meant by the "flight of capital"? How does capital fly?—It is exported.

That means goods; that means trade?—Securities are sent away.

How?—Bank of New Zealand shares and Government bonds are sold on the Sydney Stock Exchange.

There must be some reverse form of exchange this way?—Not right at the moment; it may be delayed some years.

If you could wire money across, you could wire wool and wire butter. Money is based upon some physical thing. I wanted to know about the flight of capital. It has always puzzled me. The question of the exchange-rate—the maintenance of the existing exchange-rate on London until price-levels have risen somewhat—what would you say they should rise to?—It is one of those things that have to be studied on the spot. You cannot tie yourself to a plan; you have to weigh it in relation to conditions as they obtain at the time. You cannot make a monetary system that will act automatically.

The exchange-rate does not alter the amount of money or credit available?—Yes, it can.

How? When our rate of exchange went up from 110 to 125, from where did the money come to pay for it?—It did not come.

So there was not more?—I think the effect was to increase our money in circulation, simply through the increasing of the gross return to the farmer.

But how did that come about? The credits in London to-day are bigger than ever they were as a result of the exchange-rate stopping the importer from importing. He is not going to import on a 25 per cent. exchange-rate, therefore we have an accretion of funds in London?—He will start importing as soon as people start buying, and I think that is now the tendency. Naturally they delay imports as long as they can, but I think you will find that stocks of importing houses are as low as they have ever

been, and I think they were surprised at the volume of Christmas trade and they are having to buy now. I think you will find that that swollen London balance has reached its highest point.

If the importer has to pay that 25 per cent., it comes out of the importers pocket to the exporter ?—I think you will find it is passed on.

It reflects itself in higher prices ?—Yes.

It means that the general public have got to repay the importer who pays the exporter ? It does not create an increased volume of money ; prices rise a little bit more than what you stated, but if you have a rise in prices with the increase of money, that is tantamount to inflation, is it not ?—It might be ; it depends on the velocity, and the former price-level.

The velocity is the average. If we take it over a period of years, it is the average rate ?—I do not think that has much bearing on the point.

The dairy-farmer gets paid once a month ; the wage-earner gets paid once a fortnight ; the farmer may have possibly two payments in the year, but if you take it all, there is some average of the velocity ?—I think that is taking velocity in far too literal a sense.

I think Mr. Keynes says there are six different factors grouped in the word " velocity," and speed is only one of them.

If you paid the farmer every morning, you would not need a quarter of the money. On our experience, there is the average. With regard to the question of the demand. You said there would be a good many suits of clothes ; what stops them from getting suits of clothes ?—The fact that they have not got the income to buy them.

As you rightly state here, we turned a 15 per cent. reduction in national income to over a 40 per cent. in national income ?—Yes ; we have permitted it to happen.

It has been the action of the people ?—It has happened.

That could have been avoided ?—It could, I think, with perfect foresight and judgment.

I do not suppose there is any country in the world where what they call the world price-level is the same as the internal price-level. They are two different things, are they not ?—The world price-level is for those goods which enter into international trade and are not greatly affected by such things as tariffs or freights. They are freely interchangeable.

The freight has to be paid on them. Take butter : I noticed in the paper where butter in London is 65s. per hundredweight. That is the world price-level. But in Berlin and Belgium it is 184s., and in other parts 238s. ?—London is your only world market for butter ; therefore it is the only world price-level.

If we sell goods on the London market at the world price-level and we buy goods in the London market on the world price-level, the relationship of prices in London cancel out to a very large extent, although there may have been a much heavier fall in raw materials than in manufactured articles ?—Viscount D'Abernon says that if raw materials had been cheap, then the manufactured article would have been booming. In the manufacturing districts of England you would have seen a tremendous increase in employment, whereas the opposite was the case ; they had greater unemployment and more idle factories during that period of disequilibrium between the manufactured articles and raw materials ?—We know undoubtedly that wool and rubber and cotton fell a lot more than manufactured goods.

That is right ; it did not reflect itself in an increased activity of those manufacturing industries ?—No.

You consider that 5 per cent. on Treasury bills was rather an exorbitant rate to pay ?—In the present sircumstances, I think it was a great mistake.

Suppose that the Government issue £1,000,000 Treasury bills. They are issued for a month or three months ; we will assume that they have had to renew them for a period of a year. Therefore they have discounted £1,000,000 worth of Treasury bills at 5 per cent. ; that means that the Government have had the spending-power of £950,000 ; where does that £950,000 come from ?—I think, judging by figures at the present time, it came from deposits.

When they lent that to the Government did they reduce their deposits by that amount ?—Probably not.

Well, then, it could not have come from deposits ; would it not then reflect itself in deposits ? If you were a contractor and received £150,000, it would increase deposits ?—Yes.

So that it is fairly difficult to say what amount of deposits in the banks to-day originates in the form of money ?—Quite so.

It might be even 90 per cent. of what we call deposits to-day. We are deeply concerned with the cost of money. If the cost of money—the way it originates in the bank—is just a very negligible quantity, there is no justification to charge 5 per cent. for it ?—No.

And a rate of interest, high or low, does not make the actual security, the physical properties, any better or any worse ? It might limit for the time being the amount of money in circulation, might make it more or less ?—Yes.

When we are talking of the competing concerns such as were mentioned—the State Insurance and Public Trust Office and building societies—there is a difference between the credit which they are able to lend and the credit the bank is able to lend ?—Certainly ; but it is a question of what it does lend as well as what it is able to lend.

If there was a bigger demand for the higher price of money, supposing that that does take place, people wanting money and willing to pay for it, still the banks would have the privilege over and above what these other institutions have ?—They have the power to create, limited, of course, by the need to reserve their cash reserves, and parity of exchange.

Reverting to the exchange, do you not think this is what has happened : that where there is a bonus given, every person (whether farmer or otherwise) wants to sell where he can get the highest price.

Although Australia's rate of exchange was not an artificial rate of exchange, owing to their balance in London, but they gave the Paterson bounty plan there—about 2d. a pound on butter—and the impetus is to export to that market ?—To which market ?

If the exchange is on the London market they would send the goods there, and the export bounty is on that market. Then the impetus is for the farmers to send to that market to get those bounties. is that not so ?—You mean to say that the bounty on exported butter in Australia tended to stimulate butter-production in Australia ?

Yes, for export to that market ?—Yes.

Well, if New Zealand followed suit and Denmark followed suit and we are all producing the one commodity and sending it to that one market, what is going to be the result of that ?—The result would be that the price would fall.

And then no benefit accrues from the exchange-rate ?—I think the price would have fallen less in New Zealand currency.

I am not talking about New Zealand currency. We will say that the exchange-rate on 1s. was 3d., but if the fall in butter has been more than 3d. per pound, then the exchange-rate is cancelled out, so far as those particular farmers are concerned, because the fall in the price-level has taken away any benefit of the exchange ?—Why not put it the other way round ? The benefit of the exchange was there. It has absorbed 3d. out of 4d. in the fall of the price.

You think that that is what happened ?—Yes.

Well, why is England trying to fix a quota ? I see by this morning's paper they are going to wait till 1935. But why is England fixing a quota ? Why have Belgium, Berlin, and Paris fixed their internal price-levels ? Why have they done that ?—I am afraid I could not tell you.

Well, it seems to me the reason why they have done that was to stop the imports coming in to their country and interfering with their own price-levels ?—Quite likely.

I notice that under your scheme you think that we are at rock bottom. Going through the headings of your paper, it seems to be a "ditto repeato." What we have gone through already you anticipate under this policy ?—I anticipate that there will continue to be throughout the world cyclical movements or variations. You will not have perfectly stable trading conditions throughout the world for ever.

I would like to ask this : It is competent, in fact experience has proved that it is competent, to fix an exchange-rate. Every country has that right. Now, that is fixing an internal price-level up to that standard of the exchange, is it not ?—Not exactly. There is a considerable difference, I think, between the fixing of the exchange and fixing the price-level.

It is a factor in fixing the price-level, then, to the extent that the exchange-rate operates ?—Yes.

It is only one step further, then, to fix the price-level ?—It may be a wrong step to take.

It may be ?—You could go to the edge of a precipice, but the next step might be ruin.

But it is far better to put a fence up at the top of the precipice than to have an ambulance down below, is it not ?—Yes.

And you think that under this policy, ultimately, if it goes long enough, it will be self-rectifying ?—No. I do not think any policy can work by itself automatically. The whole difficulty is you can lay down a policy to meet given conditions, but the difficulty is to define what the conditions are. It is all very well to point to a policy that is suitable for incipient recovery. You might not agree that there was incipient recovery. Now, there the difficulty comes. That is where the foresight and the judgment is required to judge existing conditions and therefore to apply the correct policy.

And largely the difficulties that we are in to-day are because of our lamentable ignorance, we will put it that way, by and large, of these economic factors of the trade relationship between one person and another, the relationship between England and the rest of the world ?—That is so. We do not know everything entirely, and at best our information is late. Statistics only tell us what has happened. It may be too late to apply the remedy.

Mr. J. N. Massey.] I do not want to repeat any of the questions that have been put to you by previous members, but on the question of interest I understand what you mean in your paper. I would like to compliment you on your paper. Regarding interest, Mr. Langstone put it to you that the reason why production increased enormously in Australia was by reason of the fact that they had the Paterson scheme. When that Paterson scheme was in operation I think you will agree the Australian exchange-rate obtained at 125 per cent., where ours for a time was 110 per cent. Therefore, the odds would be in favour of the Australian producer and, incidentally, the people of Australia as a whole ?—Yes.

In addition to that, the Australian dairy-farmer had the advantage of the Paterson scheme. Is that correct ?—Yes.

Amounting to about, at the time, I think 3d. per pound ?—I doubt whether it was that much at that time.

Approximately. It was really internal, not external, but they had the added advantage of the additional exchange ?—Yes.

I think you will agree that, as a direct result of that, the production of, say, milk-products in Australia increased enormously ?—Yes.

They had a distinct advantage over the New Zealand dairy-farmer in that respect ?—And over every other type of farmer in Australia.

I quite agree. I have said, as far as wool is concerned, they got the advantage there. They had the added advantage right through. You have agreed that the world's conditions have a tremendous bearing on the price-level in Great Britain ?—Yes.

The British authorities to-day, in fixing tariffs, are simply trying to preserve their market for our people as far as possible ?—I think for their own people on the face of it. So far as the farming community is concerned, I think their first consideration is the British farmer, British agriculture. The next consideration is doubtless the Dominion farmer, and finally Denmark and the Argentine.

Hence the reason for adopting the quota system ?—Yes.

What is your opinion of the latest move in Great Britain, and how will it affect New Zealand, where the British taxpayer is actually subsidizing the British milk-producer ?—I have not thought it out yet.

You have already admitted that with a high exchange in Australia, together with the Paterson scheme, milk-products increased enormously because the dairy-farmer could make a profit out of producing them ?—Yes.

When you talk of trade conditions in this direction and in other parts of the world, and you find the Imperial Government endeavouring to protect first and foremost the British farmer and drawing upon the British taxpayer to bring the price of whole milk in Great Britain up to a payable price, it simply means, in effect, that the production of milk-products in Great Britain must increase enormously ?—Yes, an increase will follow.

And you know the system in connection with quotas ?—Yes.

You know also that we have a trade agreement with Great Britain at the present time and you know also that the trade agreement will expire very shortly ?—Yes.

Well, seeing that the production of milk-products increased in the north of Australia, assisted by high exchange together with a subsidy, it is reasonable to assume that the production of whole milk and milk-products will increase enormously in Great Britain in the very near future ?—Yes. I do not know that the scope is quite so great there.

Why ?—Well, I do not know, I say.

May I put it to you this way: That in New Zealand, according to the Official Year-Book, we milked less than two million cows. In Great Britain I understand they milked over three million ?—Yes.

Well, if it can be made a profitable business in Great Britain, therefore, they will increase the number of cows that they will milk, and, consequently, when our trade agreement with Great Britain expires, we will be up against a more difficult problem then we are up against to-day, unless other imports relax ?—Yes.

So that, if you have any idea of what is going on in other countries, do you expect that the price-level for milk-products is going to improve ?—I have not been studying particular prices recently, and I would not like to forecast the position. Still, it does seem to me that there is a tendency in agriculture, when prices fall, not to restrict production, but to increase it, whereas in manufacturing, if prices fall, and work becomes unprofitable, the manufacturer shuts down or restricts production. But the point comes when the farmer is simply driven out of it, and I think it is possible that quite a number of European countries will find that other occupations will pay them better than exporting butter to the British market. In fact, even so far back as 1930, the League of Nations suggested that the European dairy-farmer was in a bad way and his production was falling off, and I think the position has got worse since then. So I think you will find that some of our main competitors will be forced, by sheer losses, to reduce their exports of butter and their production of butter, and, on the contrary, we can expect considerably increased consumption of butter on the Continent of Europe.

But how can we expect any decided advantage, seeing that the principal countries in Europe have placed a total embargo against the importation of milk-products ?—That is quite so, but I think the fact remains that in a number of countries their total butter-production is lower than it has been, but their total exports of butter are higher, showing that they are eating less butter themselves and sending more of it abroad, and that position will not continue beyond the period of the slump. They will consume a greater proportion of their own production and they will export a smaller proportion, so I think the tendency will be for the oversupply in Great Britain not to be quite so permanent as it is to-day, or as it seems to-day.

But you expect that under existing circumstances the increase in milk-products in Great Britain under this subsidized scheme will increase enormously during the next year or two ?—I think it will increase, but I am not sure that there is room for an enormous increase. I do not know what areas are available suitable for dairy-farming. But there undoubtedly will be a tendency to increase the production of milk-products in the old country.

Mr. Murdoch.] You mention you are going to resort to public works as a means of revival. Is it not a fact that the public works have been diminished in the last year or two ?—The public-works expenditure is below the average for the previous ten years.

But I understood you to say that you were going to utilize public works which would return some income for the expenditure, or otherwise works that would be payable works, and you instanced that you would not touch the South Island Main Trunk Railway line. What railway-lines can you point to in New Zealand to-day that are showing any profit ?—I could not point to any. As a matter of fact, I am not a student of railways.

Well, what other public works could you instance ?—I think I indicated this point: that you must not take the condition at the bottom of the slump. You must take the return on a public work over its existing life and there are a great number of public works that actually have no direct return. Take health services. You cannot say that they pay so-much per cent. and they pay their interest and sinking fund, but they may be good investments, particularly, for instance, the installation of drainage, which might be a saving to the community in medical expenses and to the State purse in reducing deaths of perhaps men with children who would be a charge on the State.

We can take it that what you mean is you would invest your moneys in works which would give a return to the community, but not necessarily a monetary return ?—No. I would simply choose those that would give the best return, and I think it would be a bit dangerous to dodge the accountancy issue, but I could point to works in New Zealand at the present time which would be very good objects for spending public works money on. For instance, I think the Society of Civil Engineers has gone into the question of roading. I think they say that our roads are depreciating at the rate of £5,000,000

a year, and that it would pay handsomely interest and sinking fund and more, to spend £3,000,000 or £4,000,000 a year or more on tar-sealing roads and save the depreciation.

Dr. Sutch.] Is that report available ?—I could get it for you, I think. I think you will have one of the witnesses who was a member of that Committee before you.

Would you say that in the past we have been too lavish with our money for public works ?—I think the trouble has been that we have spent it when times were good and returns fairly bright. Naturally in times of prosperity any work will show a bigger return than it will in times of adversity, and we were rather inclined to be too optimistic and assumed that the fancy profit of the good times would last throughout the life of the service or the work that we were making.

You would not condemn the policy, though, in the main ?—The public-works policy ?

Yes ?—No. I think there is quite a lot to be done, but I would certainly say that it should be increased in slump times and decreased in times of prosperity.

You were talking about cheap money. We know of the cheap money overseas at the present time in Great Britain and what it is doing to trade. In New Zealand a good deal of the money borrowed by mortgagors is from the State Advances. Now, can you tell us how the State Advances can reduce its rate of interest to the mortgagees ?—It cannot.

It cannot do it ?—No. Not on its existing credit.

It has been suggested that the State Advances could reduce those interests and that the Government would take over the corresponding liability which would improve on account of the money being borrowed overseas. Have you got anything to offer on that ?—I would like to give it some consideration. Do I gather that the idea is that the——

State would shoulder the liability. That is what it means ?—I do not think it is desirable.

The Chairman.] It is rather interesting to have your contribution as a city man upholding, of course, the position of the farmer at the present time, and of course you go on to state that the income of the farmer is determined on the conditions outside of New Zealand. Do you think that everything possible has been done in regard to the exploitation of new markets ? Has it occurred to you at all that we have been lacking very much ?—I think we could have done considerably more. It is a question whether it is a matter for the State or whether it is a matter for private enterprise.

But you do think that the exploitation of new markets would be advantageous to New Zealand ?—Most certainly.

In referring to the fixation of prices, to whom do you refer. Do you refer to the importers at Home or do you refer to the Dairy Control Board ? You are dealing with farmers' prices and costs ?—I simply mean " fixed " as a result of the market price.

The market price ?—Yes. Price-fixation was a bad word, I might say, and I should say because prices are " determined " by overseas conditions, not " fixed."

You know that the Dairy Control Board did fix prices some three years ago ?—They tried to.

And you know what a disastrous thing it was for New Zealand. Do you think that it would be advisable, if it was taken up again, because there is an agitation at the present time to do certain things ?—Well, that is slightly off my beat, I think.

You probably would rather not answer that ?—Yes.

And you attribute to the prime cause, the fall in the national income, the position of unemployment in New Zealand to-day ?—I think the unemployment is a direct result of that. In fact, it is one phase of it.

In your statement you went on to say that the Reserve Bank should take the community into its confidence. In what way would you suggest that they should do that ?—I think it would be advisable for them to attempt to issue periodical bulletins and whenever they had to either raise or reduce the exchange-rate or the rate of interest I think it would do more good than harm if they were to attempt to justify it.

You think that it would establish more confidence in the people as being a bank controlled by the State ?—Yes. I think that a lot of these things, if they were understood, we could bear. If something is imposed on you, and you do not appreciate the reason for it at all, you think it is done as an arbitrary means of perhaps "getting one on to you." You feel very annoyed, but if it has been explained to you as a necessary step for the national good you grin and bear it.

You think that regular bulletins should be issued ?—I think so.

Dealing with the Bank of New Zealand, I think that question has been referred to you. You have referred to what the State Fire has done in New Zealand ?—Yes. Of course, that is wholly a State institution.

Yes. That has been carried on for the benefit of the people, who insure, by way of giving reductions in premiums from time to time and not accumulating vast reserves ?—That is so.

You think, then, that the directorate of the Bank of New Zealand, instead of looking for larger profits out of the concern, that that money should be made available to the people in the way of reduced charges and interest ?—The reduced cost of banking ; cheaper banking facilities.

And then your argument would be that by doing that they would be a lead to the other banks, and they would have to follow ?—Yes, they would as a matter of competition. They would have to follow.

The question was raised about a director being a shareholder. I do not think you quite said that in your statement ?—I did.

Is that what you meant to convey ?—I think I put it this way : that it is obvious that the State's appointees on the directorate should not hold shares in their own right. Then they would be free to consider the question purely from the community's point of view, and they would not be in the dual position of having to consider their own dividend as well as the good of the community.

Seeing that we have had the control, as it were, of the bank, in the representation on behalf of the Government, do you think that the directors in the past have studied the shareholders or the people as a whole? Is that reasonable to ask you?—Yes. Quite reasonable. I do not know that I am qualified to answer, but I would say that the comparatively high profits of banking suggest that they study the shareholder more than the community.

AUCKLAND, WEDNESDAY, 14TH MARCH, 1934.

Evidence submitted by MR. H. VALDER, of Hamilton.

I am the Chairman of the Employee Partnership Institute (N.Z.), Ltd. In regard to those matters which come within the order of reference of this Committee I wish to make the following observations: The real wealth of the community is at least potentially sufficient to meet the legitimate needs of every individual consumer. The difficulty is simply one of distribution, and this is a matter of social organization. Whenever the machinery of exchange definitely prevents the producer and consumer from meeting, that machinery should be adjusted. At present there are two methods, and two only—other than by way of gift—by which the money reaches the consumer—viz., wages and interest (including rent). Quite clearly either new channels for the distribution of money must be found or the present ones enlarged. It will be seen, as I proceed, that my Institute is very strongly of opinion that, both on grounds of justice and social expediency, the interest "channel" must be restricted and not enlarged. The wages "channel" is therefore indicated as the first line of approach to the problem. The fundamental weakness of our present system is, very obviously, its purely "property" basis. This is quite clearly illustrated in industry. The Companies Acts of all countries, until the New Zealand legislation of 1924, have as their basis "property rights." They know nothing of human rights. This is so much part of our customary thinking that we see in it nothing extraordinary. Yet industry itself is nothing but an organization by which the material necessaries and comforts are provided for human beings. It is the human beings which are important, and property is subsidiary to their life and existence. There is no possible equation between human values and property values, yet it is essential that we should place them in order of importance. My Institute insists on the assumption that in industry human values come before property values. The first step, then, in dealing with the monetary question, must be a reorientation of values. Any new system to be satisfactory must, if I am correct, place human values first. "Interest" is a charge based on property and not on human value. I am not here advocating an immediate abolition of interest. That would involve many social readjustments. I believe that progress may be made through our present system by restriction upon the self-propagating quality with which we have endowed money.

1. The line of approach of my Institute is primarily through industry. It makes the following generalizations in regard to its special problem:—

(*a*) There is no harmony among those engaged, but in many aspects absolute conflict.
(*b*) Industry is conceived in terms of property and not in terms of human life, and must be placed on a human and ethical basis. Service must come before property.
(*c*) The difference between the property and the human view accounts for an array of false though customary social and economic values.
(*d*) Reforms should, to give maximum social benefits, be evolutionary in nature.
(*e*) The frame-work of any plan must be elastic, allowing for internal expansion and for development following trial and experiment.

2. The specific requirements of a practical plan conforming to these ideas are as follows:—

(*a*) Working from present system in regard to service and property it must begin with making wages and salaries a partial payment for service and not as at present the sole payment.
(*b*) It must limit the dividend for capital invested in industry, and restrict payment of interest by calculating it on a more scientific basis.
(*c*) It must pay a limited predetermined rate for capital and the balance of surplus profit to service. (At the same time it must extend control to those giving service, by virtue of that service).
(*d*) In providing a framework it must provide that present machinery may be utilized and *individual* initiative both encouraged and directed.
(*e*) In accepting, justice it must apply it in (*a*), (*b*), and (*c*), and thus infuse true partnership into industry.

3. The practical scheme which has been adopted by the Institute as its working basis has the following characteristics:—

(*a*) Payment of capital at predetermined rate. (Gilt-edged security rate plus risk rate or insurance premium.)
(*b*) Payment for service by an advance payment (current wage-rates), with subsequent distribution to service of all surplus profits by reserve accounts or dividends.
(*c*) Control distributed equitably among capital contributors and service contributors in proportion to their actual value to the enterprise, as that value is progressively ascertained.
(*d*) Machiney for applying the principles involved has been devised and is embodied in the Companies Empowering Act of New Zealand—*i.e.*, by issue of "labour shares," which provides a simple and elastic method of distribution of control and profits in any company or business.

(*e*) In applying the principles, justice is attained by paying property or capital its true market price, on existing usage, by giving service its just reward—*i.e.*, what it actually earns, by extending control from those who lend property to those who use it, by, in fact, putting the human in its true relation to the material.

(*f*) The plan is evolutionary. It takes present machinery, readapts it, revivifies it. It does not alter the form of capitalism in industry, but it provides it with a new start, a new orientation, a new spirit.

4. The following propositions, it will be seen, are fundamental to the proposals of the Institute :—

(*a*) That capital invested in industry should be paid for at a predetermined rate. The insurance of industrial capital would be a factor in definitely limiting the interest payment.

(*b*) That those who contribute service to industry should receive its surplus rewards and share the control.

There is no difference in principle between restricting the rate of interest of industrial capital and the rate of interest on other forms of investment as, for instance, bank shares. In the banking business, which is so vital to the community and so monopolistic in character, the sole duty of directors is to shareholders. I believe it to be in the interests of the banks, if they do not want direct State competition, to limit the payment to shareholders. There would then be no vital conflict of interest between the shareholders and the community, and the present organizations would remain with a better chance of satisfying legitimate criticism and fulfilling community needs without State management.

5. Possibly, at this stage, the Committee will concede the following propositions, already referred to :—

(*a*) Industry is simply the organization for the production and distribution of the necessities and the amenities of life for the community.

(*b*) The justification of any part of the organization is service to the community either in production or distribution.

(*c*) No service can be considered a real or an economic service if it is rooted in injustice or is based upon false values—*i.e.*, which places the material before the human.

6. It will be noted that, among the immediate effects of a system by which capital gets the unlimited rewards of industry are the following :—

(*a*) The production of those margins which form a very convenient basis for gambling and, in fact, are so used.

(*b*) Though the margins so used are merely property, the gambling reacts profoundly upon human life, very often, without economic reason, destroying the means of livelihood of human beings.

(*c*) The tendency for money (the medium of exchange) to accumulate in a few hands and so produce a block in one of the two possible means of distribution (*i.e.*, wages).

(*d*) Those phenomena known as bankruptcy, liquidation, and stock-exchange crashes, by means of which the system breaks down at intervals at its weakest spots and so saves the whole structure.

It will be noted—

(*e*) That a predetermined rate of interest, specially if capital were insured, would largely eliminate the gambling factor.

(*f*) That the distribution of the rewards of industry (interest and wages) upon a just and scientific basis would result in a wider and more even distribution which would react quickly and surely in the transference of real wealth.

(*g*) One of the effects of the present system is an inevitable emphasis upon money as money, apart from its proper social uses. Money becomes an end in itself, and psychologically a false orientation arises which can be corrected only by a readjustment of the property and human values.

It appears in connection with the money question that I advocate the enlargement of the channels by which the medium of exchange reaches the consumer. But, first, I wish to restrict one of the present channels. The Institute's plan of distribution of industrial profits would, I am convinced, greatly enlarge and broaden the second channel—viz., wages, without a revolution in our methods. I think that, for a very long period, it will be expedient to base social reward directly upon service—*i.e.*, human service—to the community.

Witness: Mr. H. VALDER, representing Employee Partnership Institute (N.Z.), Ltd., Hamilton.

The Chairman: The proposals that you have to put before us are hardly in keeping with our order of reference, and I do not know that they affect the position very much. I think I can say for the Committee, however, that they are all interested in your proposals, and I am sure every member of the Committee will see it is a very admirable scheme. However, there may be some things to which you would like to refer and which may be of use to the Committee in its deliberations. I merely mentioned that to you because, as your scheme reads at present, I do not know that it is altogether a scheme which concerns the present order of reference from the Government. If you would care to amplify your statement, which has already been circulated to members of the Committee, we would be glad to hear you.

Mr. Valder: In regard to the question of whether it comes under the order of reference, I myself had very grave doubts as to whether it did, but, when I noticed that the interest question was one of

the subjects which you were inviting evidence on, I came to the conclusion that it did. I should just like to preface my remarks by saying that the industrial plan which I have evolved has been solely the result of my experience; that I have not started out on any theory and tried to work up to that theory. On the contrary, the theory has been built out of practical methods which are in evidence in industry to-day. I do not claim to make use of any novel methods whatever. All the methods advocated in the plan are in use in some form in industry to-day. My only claim is the application of those methods. Referring to the question of interest, my plan hinges very largely on the limitation of payment of interest, and that is where I think it does come within your order of reference. In regard to the question of interest, I think if we analyse what interest really is we may take a slightly different view of the place which it occupies in industry. My belief is that interest is composed of two separate and distinct factors which practically have no relation whatever to each other. Those two factors are the risk which industry and which capital undergoes and what I might call the utility value of capital. That, I think, is where we go wrong in assessing the value of capital by interest as a whole. In this scheme which I have laid before you you will notice that the payment for interest on capital is stressed very strongly as being one of the factors which has brought about the present economic disaster in which we are all involved. I think if a more scientific method of assessing interest were evolved it would probably show us a way out. My suggestion is, as far as this plan is concerned, that there should be a scientific method of assessing the rate of interest which should be paid for capital, In the first place, by ascertaining the risk which that capital undergoes; and, in the second place, the utility value of capital should be fixed by a standard which would be quite outside the control of industry. In regard to the risk, I hold that in the near future—and it will not be very long—capital will be insured against risk of loss. Now, that may seem a rather far-fetched idea to-day, but I have here a notice from one of the biggest companies in Great Britain—The Armstrong Whitworth Company—whose capital is £21,000,000 showing that they have adopted a method of insuring payment of interest on that capital and they have actually taken out a policy with one of the large insurance companies of Great Britain and under that policy the insurance company undertakes to pay to the shareholders a minimum rate of payment: that is one instance.

The Chairman.] A minimum rate of interest?—Yes. That is one instance of insurance of capital and I hold that if insurance became largely general the rate of interest would automatically recede and the rate of interest, of course, has a very great bearing on our economic system.

In regard to that instance, can you give us any idea what rate the insurance companies pay? You say there is a guaranteed amount. What is the percentage?—This is an extract from the notice in question to the shareholders of the company: "Arrangements have been made for the Sun Insurance Office, Ltd., to issue a policy whereby if the proceeds of the new company in any year during the first five years do not amount to £900,000, then a contribution not exceeding £200,000 will be made for that year." That works out at 4¼ per cent. on the capital.

That is what I wanted to know?—That is one instance. Another instance of insurance of capital is the insurance of trustee investments. The A.M.P. Society informed me that it is quite a common practice for companies to insure trustee investments so that the trustee is relieved of the liability of there not being anything for the beneficiaries. They not only insure that the investments will produce a certain amount of interest, but they insure that the capital will be paid on the due date of redemption. I give that as an instance of how it is possible to insure capital. On that principle hinges very largely the industrial plan which I have evolved. Quite recently a further instance of insurance of capital came under my notice, and that was the Glass-Steagall Act of the United States of America. There it is now compulsory for the capital of banks to be insured. There is no option about it; they have to insure their capital. I presume that was largely brought about by the enormous number of bank failures there in recent years. These are three definite instances of how it is possible to insure capital.

Dr. Sutch.] In connection with the Glass-Steagall Act, it is not the total capital the banks have to insure?—No; it is the capital subscribed by the shareholders. That is one of the first things set out in this plan that in order to get back to a normal economic state it is necessary, in the first place, to reduce the payment for capital and to ensure that all capital must be paid for at a limited pre-determined standard. In the paper which I have given to you, you will see that I claim that under the existing system—in fact under any system—there are only two methods by which the wealth of the community can be distributed, one of those being through the channel of interest or dividends and the other through the channel of wages or salaries—the payment for human service. Under the existing system human service is now paid a pre-determined rate and capital is paid for by results. That is placing the material factor, capital, on a higher status than the human contribution, service. This, I think, is the beginning of our trouble, and it is largely what has brought about the present economic crisis. I hold, and hold very strongly, that if a plan is not ethical it is not economical; and I hold, further, that there is no line of division between ethics and economics; that one hinges entirely on the other. Now, the mere fact that the present industrial system is not ethical is to my mind one of the causes of the present trouble, and until we get on to a more ethical basis, then we are not going to get on to a better economic basis. With a view to getting on to a better basis, I suggest that we have to reverse the position of the two factors in industry—capital and service. At the present time the ownership of capital is almost the sole means of control of industry—that is, those who contribute capital have the sole control of industry; those who contribute service have no control at all, and they have no legal standing in the organization of industry. I came up against that fact when I evolved the scheme under review and tried to put it into operation. I found that the Companies Act took no cognizance of the contributor of service. The Companies Act, prior to the alteration which I was instrumental in getting in 1924, dealt only with property rights; it was not concerned in the slightest degree with human rights. Now, I hold that a system of that sort is utterly unethical, and that the machinery we have to evolve must put industry on to a more ethical basis.

Now, having suggested that there must be limitation for the payment for capital, it follows that there must be some other means than those at present used to distribute the profits of industry. After searching around in an endeavour to find some means of distributing profits, I hit upon the method of shares. The share system is one of the most elastic methods of industrial organization that can be imagined. The share system came into operation when the first Companies Acts were instituted about the middle of last century, in the "sixties" I think it was, and I have no doubt whatever that the originators of the Companies Acts had not the slightest idea of the wide implications which have since arisen from the introduction of the Companies Acts. The share system has proved to be a most admirable means of distributing the profits of industry, to those who contribute the capital. My view is that if that is such an admirable means when applied to capital why should not the same means be used to distribute profits to the contributors of service. Here we have a system which has been tried out under innumerable methods of organization and it has proved equal to every demand that has been made upon it. The share system is so elastic that it can be applied to any incident of capital distribution that you can imagine. If the share system applies to the distribution of the profits of industry to capital with such facility, why should not that same method be tried for distributing the profits to the contributors of service—in other words, to "labour." I always hesitate to use the word "labour," because directly one uses it there seems to be an idea that it applies only to the man in his shirt sleeves. That is quite a wrong conception of labour; labour includes every human activity, whether it is physical or mental. If it is right that there should be a limitation of payment for the use of capital, then some means must be devised to distribute the profits of industry to the contributors of service. I have tested every step of this method in my own experience, and I have found that it applies just as readily to the distribution of profits to the contributors of service as it does to the contributors of capital. One of the great difficulties we are up against is that we have these two factors in industry—capital and labour—and there is no equation between the service of labour and the service of capital, one being purely a material thing and the other human effort. There is no equation between life and property, and yet we are trying under the present system to make one; but nothing we can do will equate those two factors. Consequently, it is necessary to devise a payment for each. Under the present system of dividends to capital, the assumption is that the dividends not only pay for the use of money, but they also are looked upon as paying for the use of service; and it is that method which is very largely the cause of a great deal of industrial trouble. There is a hard-and-fast line drawn between the payment for the use of capital and the payment for service, and if that line is in any way broken the conflict begins at once. We all know that under the present system there is no real harmony between the two parties—those who contribute capital and those who contribute service—and it is only some such endeavour to put service in its proper status that is going to bring about harmoney in industry.

Hon. Mr. Downie Stewart.] When you put the two in possession, capital and human labour, does not capital result only a little more indirectly in human labour?—Capital is only a material thing.

Its origination was human labour?—It is the product of human labour.

Captain Rushworth.] Capital of money, or real capital?—Any capital.

Is there any distinction between the two?—Money is the token of capital. I do not look upon it as being any real wealth itself. To give you some idea of the influence of interest on the economic system you may be interested to know that an actuary pointed out to me that 1d. invested at 5 per cent. compound interest in the year 1 to-day would be worth £36 followed by no less than thirty-five noughts in pounds sterling. If that process is going on all the time as it is, of course you cannot conceive what that amount is. The following figures are convincing arguments against the accumulations resulting from compound interest. The old Jews knew something of the matter when they had the writing-off of debts at the end of every fifty years. Then the writer tries to give a comparison of what the sum is in blocks of gold. It is almost staggering—the figures that he gives—but the point I want to make is this: that if interest is going on accumulating at that rate, is it any wonder that nations are not able to pay the debts they owe, let alone the interest on them? And is not this one of the reasons which has brought about the world-wide economic disaster?

Captain Rushworth.] Are not the recipients of the interest taxed?—Probably they are.

To meet the nation's debts?—Yes; but my point is this: Industry in the first place has to pay this sum. Whatever happens to it after, I do not know, but I do say the influence of interest on industry is so enormous that it cannot bear the burden, hence the breakdown which has occured and which is causing all this economic problem.

Mr. Schramm.] We are still paying the interest on the Battle of Waterloo?—According to this, I should think we would be paying for something that Adam did! Another point which I think probably will come into vogue is the compulsory amortization of loans. As the writer of this letter points out, if that were in evidence, in use, we should not be troubled with these loans which, as has been pointed out, are hundreds of years old and we have not paid for them yet. In that connection I have a description here of civilization—a definition which I think is very apt and to the point: "Civilization is that state of affairs where the present generation pays the past generation's debts by issuing bonds for the next generation to pay." I think that is a very apt description. Is it not true?

Mr. Schramm.] Yes, undoubtedly?—If that is one of the foundations of our industrial system, is it not one reason we are in the mess we are in to-day?

Captain Rushworth.] But it might be a foundation of our monetary system, not our industrial system?—I think the industrial system is so closely linked up with the monetary system that you can scarcely separate the two.

Mr. Schramm.] You would not call the Battle of Waterloo an industrial affair?—I think all war is industrial, and a very extensive industry, too, sometimes.

In the final analysis you are correct?—I am not going to weary you with wading through the matter which has already been placed before you in writing, but I would ask you to view it in a

close a manner as possible. The method which the Employee Partnership Institute advocates is payment of capital by predetermined rates—everything hinges on that, on getting capital at a predetermined rate. Unless that is done, you cannot distribute fairly the balance by means of the shares which under the Companies Act are termed "labour shares." The suggestion is that capital, having received its full payment (1) for risk, (2) for utility value, capital is not entitled to any more. Under the present system it is taking for its risk premium the whole of the surplus profits, to cover the risk it undergoes. I maintain that the risk which the service of labour undergoes is very much greater than the risk which capital undergoes, and that, instead of capital being paid by results, labour should be paid by results. Then comes the question of how to divide up the profits amongst the service of labour. We cannot ignore present-day standards altogether, no scheme of this sort will come about suddenly—it is only going to come by gradual evolution; and the first step in the direction of distributing wealth should be a means of distributing it to those who make it, in proportion to the quality of the service which is given. The only means by which we can assess the quality of service is to take present-day standards. I have no doubt most of us have read that book by Bellamy "Looking Backward," in which he states that the highest paid labour should be for the dirtiest work, and that the man sitting down in his office should be the lowest paid. Certainly what is required is a means of distributing the profits of industry amongst the contributors of service; and it can be evolved through the share system to which I have referred. I have tested that out in actual practice, and there have been practically no more difficulties arising than arise from the distribution of the payment for capital in proportion to the amount contributed. No doubt there will always be a certain amount of jealousy between the man getting the smaller pay and the man getting the high pay, but, taking present civilized standards, there is no great difficulty in making the distribution on those lines. So far, I have referred only to the profits of industry, but I hold that if an individual is entitled to a share of the profits, then he should also have some say as to how those profits are made, and that, of course, brings in the question of control of the contributors of service. My view is that the contributors of service—the men who are actually doing the work—should have just as much say, if not more, than those who contribute capital. Who knows most about the inner working of a business—the man who is actually engaged in it day in and day out or the shareholders who might live 1,000 miles away and who are very largely concerned only with the dividends which they may obtain from their investments? I hold that there is an enormous potential power of production in the knowledge of those who contribute service, and so far we have scarcely begun to exploit the channel. Shortly, the scheme which I advocate is nothing more than a system of payments by results, with a share of the control to the contributors of service. I believe I am right in saying that payment by results is the greatest incentive for any worker—not only the monetary results, but the results of the incentive of being a partner in the business—and the method suggested would make partners of every man in the concern, real partners. To-day we hear something of the partnership between capital and labour. I have never been able to ascertain what the conditions of that partnership are—what the basis of the partnership is, and until we get down to something definite as to the conditions between the two partners, I do not think we are going to get very much further than we are to-day. It is with that aim in view that this scheme has been put forward by the Employee Partnership Institute. I should just like to say here that it has created a great deal of interest not alone in this country, but in every English-speaking country. Comments have been made from America, Great Britain, Australia, Canada, and dozens of other countries. I continually get inquiries as to the particulars of this plan. I might say that only last mail I received a letter from Mr. Wickham Steed, the well-known publicist, and he informs me he gave the Halley-Stewart Lectures in 1933, and took as his central theme "Employee Partnership." The Brookings Institute, one of the foremost economic institutions in the United States, has issued a pamphlet on it. The Principal of one of the Oxford Colleges, Professor MacGregor, who was chairman of the British Association, wrote me last mail saying that he had become entirely converted to the principles advocated by this Institute, and he was issuing a series of articles embracing them, and at the same time he said that a friend of his who was a member of the South African Parliament was introducing a Bill on absolutely similar lines to the Companies Empowering Act of New Zealand. Incidentally, that Act has now been embodied in the 1934 Companies Act, so that it shows that the work of this Institute is spreading, and I think it is no small credit to New Zealand that she has given a lead of this nature in industrial organization. I anticipate that it will not be many years before the Parliament of Great Britain will also have on its statute-book a similar measure. Nothing, I think, will hold back the forces which are now driving us to give greater recognition for human service and a lesser recognition to the material thing, capital, and that eventually the principles set out in the paper which I have given you will become universal throughout the world. I do not think I am making an extravagant claim, from the correspondence which I am continually receiving in regard to the working of this Act. I hope I have not put too much before you, when I supplied you with the printed detail in the booklets and leaflets which have been issued by the Institute. I think one of the most concise statements that has been made in regard to this plan was made by Lord Haldane. He covered everything I anticipated in half a sheet of note-paper. The whole of the principles to which I have been referring are included in this letter in which he says,—

> One source of class consciousness in labour is the exclusive domination of the owners of capital, who take all the profit after paying the minimum of cost—this would be abrogated if the principle were that of payment for services rendered—the owners of capital would be paid at the market rate for the service of their capital—a payment proportioned to the risk run. This would leave the profits remaining to be shared between the management and the workers again in proportion to the value of their individual services. The remuneration of management might have to be high, but it would be well worth while for the business as a whole to provide this. As to wages, the trade-union standard would determine the minimum, the surplus would be divided among all services, except the owners of capital, who would have received their full reward.
>
> I have been careful to put the proposal not as a rigid statutory scheme, but as an ideal, to be worked out by business organizers who seek tranquility—it thus prejudices nothing, involves no final programme. My belief is that it would be possible to negotiate a basis of distribution in each undertaking by common consent.

I think that is one of the most concise and straightforward statements in regard to the principles I have laboured for for a good many years, and I think also it is a tribute to the reasonableness of the scheme I am advocating. There are, of course, a great many different details to discuss in a question of this nature, and that is why I have found it necessary to issue a number of pamphlets dealing with the different items of industrial organization as they arise, but I would say this: That up to the present there has not been one single incident that I have not been able to meet after considering the bearing that this method has in industry. I think, perhaps, a great deal more information could be obtained by the Committee if they would ask questions on the various issues raised. I have always found it easier to give information through the medium of questions than by giving an address of this nature. The field is so wide that it seems almost impossible to cover the many issues which are raised in a discussion of this nature. I shall be very glad to answer any questions which the Committee may put.

Mr. Lye.] I have listened with considerable interest to your address, and I happen to know that your plan of share partnership is in operation in various places in New Zealand, particularly in Hamilton. What I am interested about is this: The question of predetermining the rate of interest that should be paid for the use of capital. I want to put it to you this way: It is a very easy matter to enunciate a principle, but do you not think that in having enunciated that principle of predetermining the rate of interest, owing to the competition for the use of capital and by virtue of the fact that there are so many conflicting interests who are practically concerned in borrowing and lending, it would be a very difficult matter to get co-ordination. Have you any idea of how it would be possible, having enunciated the desirability of getting that fixed rate of interest, to proceed to establish that predetermined rate?—Eventually I think it will be established by compulsion.

By Act of Parliament?—Yes.

I presume that that would be about the only way in which you could enforce the condition of affairs at which you desire to arrive?—Unless the owners of capital have sufficient common-sense to see where the present system is driving them to; they then might agree to introduce a more reasonable method of payment of interest.

Have you got sufficient faith in human nature to know that, when their interests are involved, they are not going to take advantage of every fresh set of circumstances?—I have that faith, and I believe that it is not beyond the wit of man to devise a means which is a fair means, and not one that will drive the whole community to destruction, which is the point we are drifting to now.

You would agree that, having a knowledge of human nature, it would be necessary to make a compulsion by Act of Parliament?—Evidently President Roosevelt is finding it so.

I have some knowledge and a good deal of admiration for your scheme, but there is another question I want to submit to you, and it is this: To-day some people say that the human factor is the wealth of the capitalistic system. Under your plan and proposal, you want to alter that, that man shall use capital and direct and control it for man's use and benefit, and that man shall not be, as it is claimed under the present system, that capital is using labour—human labour—and taking too great a tax, collecting too great a tax, as you say, for the use of that capital; in other words, that capital may be called to-day the master of the man, whereas the man should be the master of the capital?—Might I just say here that I am not alone in my views in regard to the position of the relationship of capital and labour.

Exactly?—I have a statement here by the author of the Young plan for the settlement of war debts, in which he says,—

> I hope the day may come when these great business organizations will truly belong to the men who are giving their lives and their efforts to them, I care not in what capacity. They will then use capital truly as a tool, and they will all be interested in working it to the highest economic advantage. Then an idle machine will mean to every man in the plant who sees it an unproductive charge against himself. Then we shall have vision in labour, provided the leadership is competent and the division fair. Then we shall dispose once for all of the charge that in industry organizations are autocratic, not democratic. Then we shall have all the opportunities for a cultural wage which the business can provide. Then, in a word, men will be free in co-operative undertaking and subject only to the same limitations and changes as men in individual businesses. Then we shall have no hired men.

Really, what you are aiming at with your plan is a fairer distribution of the profits from the use of capital and labour, as a reward to human effort. That is really the basis of your plan, and I am going to finish by reading this little extract that I have noted here, which I think sizes it up very nicely. If your plan were put into operation, we would rapidly approach a condition, as Lord Milner prophesied many years ago, when it would not be a case of capital hiring management and labour, but of management and labour hiring capital at the lowest possible price and dividing up the benefits between them. That sets it out in a nutshell, does it not?—Yes; but that is rather a generalization.

And securing to the human element in the process of making profits a fairer distribution of the profits, the general earnings of both?

Hon. Mr. Downie Stewart.] I was interested in the question of control. I think I have discussed it with you before. On what terms do the workers get shares, according to length of service, or when do they acquire the right to have shares in the company?—That would be entirely for each business to decide for itself. I suggest that no business man would go out into the street and bring a man into his business and say, "You are a partner." I think it would be necessary to have a period of probation; and when the owner of the business was satisfied that the man whom he had brought in was suitable for partnership he would then be given it according to the quality of his service.

Assuming he was in service for twelve months or two years or whatever time you like, and had acquired a right of shares, then a depression comes and you cannot afford to employ him, what happens to his shares? Can he sell them?—No. You will understand that the shares have no nominal or capital value.

But they receive dividends on them ?—Exactly. If there is any reserve which has been put aside during the period in which that man was working, he would then be entitled to his equity in the reserve proportionately to the number of labour shares in the company.

Assuming the man had been in for five years and they were all dropping out one by one, would you have to make a recalculation of the reserve interest every month, if some new worker dropped out ?—No. There are two methods by which you can pay out the reserve. One by paying the cash value of the reserve due to that individual according to his contribution of service. The other would be to pay him in capital shares of the company.

But would it not be better to say that a man must wait for a half-yearly period or some time ? Otherwise you would continually be making payments ?—Yes, provision could be made for him to be paid at the nearest balance-sheet period.

Assuming the workers have a majority control, as you indicate you would like them to have more control than the employer, do you not anticipate any difficulty owing to a different point of view as to what is a wise policy looking to the future. I have this in mind, that you may see a storm coming and you may want to build up your reserves and be in a safe position. The man to whom every pound is of moment wants to meet a dividend and he is in control. Might he not seriously jeopardize the company by forcing a distribution when you thought that it was not wise to make a distribution ?—That has been pointed out as a danger. My own view is that there is no danger in it. In the first place, you spoke of the employer. In a company there is no employer. Every man contributing service to that company is an employee and as such he is entitled to labour shares. Now, the leaders of that company, the directors, managers, heads of departments, would all receive their relative proportion of labour shares. It would be rather far-fetched to imagine a company where what is called the staff owned possibly 50 per cent. of the labour shares, and in addition to that the capital shareholders would have their voting-power. It does not look very much as if there would be much chance of what you call the labour element getting control, but even if they did, are they going to act any differently to those who have contributed capital ? Take the present capital shareholders. What influence do they bring to bear on the policy of the company ? I should say very little. They look to the leaders. Now, the rank and file of the workers would also look to the leaders. They are not going to upset anything that is carried on in a legitimate manner. They are going to try and contribute to the knowledge of the concern as a whole and benefit by so doing.

Their control would go no further than the control of the shareholders would it ?—Exactly, and then again it is within the power of each individual business to make its own regulations. We must remember that the power to-day is in the hands of the employer class and it is only some move from them that can introduce this measure. Now they very naturally I suppose would make some safeguard whereby the control would not pass out of the hands of the present directors, perhaps, for the time being. In the course of time, as it was found out that benefits were being received from this method of control, then that control would be enlarged. I do not look upon this plan as being a measure which can be suddenly introduced into any business in its entirety or that it would be good policy to suddenly switch over from one form of control to another.

But it was your remark that you would prefer to see the majority control. Assuming the present directors had to make an instant decision on a contract, say, abroad, and they made a wrong decision and lost heavily ?—Then the labour shareholders would have to put up with that in the same way as the capital shareholders do to-day.

Then the limit of their interest really is the dividend. They do not have any share in the management of the company. They do not manage the policy of the company ?—No, I think that is what we have to educate them to do, and this is a means of doing it.

But you say that safeguards will be provided to prevent that happening ?—To some extent that would be the case. A business has to propound a policy which presumably will bring profit. They may make a mistake. This is not going to be a panacea for all the industrial ills that you can imagine. It is a step towards bringing in a better industrial order.

When you say that compound interest accumulates at a fabulous rate, are there many businesses that pay compound interest ? I mean, they pay their current interest year by year and distribute it, but there is no compounding of interest going on, is there ?—Not as far as individual companies are concerned, perhaps, except where they are working on overdraft, but it must have an influence on industry as a whole.

But even there is does not accumulate, because they have got to keep up their interest payments ?—Yes. But they have got to pay the interest in some form.

Not under compound interest ?—If they had not had to pay that interest out they would have received interest on it, so to that extent they are paying compound interest.

I have never heard it put that way before. Say a man was starting an industry in which capital of £10,000 was involved, what percentage of his operating costs would repay interest ? And then, if you allow for all the other factors he has got to pay out, would interest form a big percentage of his payments if he borrowed the £10,000 ?—Is the whole of this capital borrowed money ?

Yes. If you consider wages and material and all the other things he has got to pay, interest is a very minor factor, is it not ?—Yes. It would not be a large factor, I suppose. Nothing like as large, for instance, as the payment for labour. Or even a payment for materials, depending, of course, on the class of business. But I think all those things will be left to the regulation of each individual business.

You say that the interest charge must be limited or predetermined to a certain standard. What happens to a very highly speculative business ? A man wants to start a fishing industry and nobody knows what it is or what its prospects are except his own judgment is backed by somebody. You might have to pay a high interest and yet be a wise venture to start ?—Yes. You might have to pay a high insurance premium for it. I imagine that an increase of the rates would be ascertained on an

actuarial basis in the same way, for instance, as the rates of insurance on motor-cars. When insurance on motor-cars was initiated the insurance companies guessed what a fair premium would be. They had no data to guide them. Now that is the case in regard to industrial risk premiums to-day. There is no data. That would be accumulated in course of time.

And suppose a man has what he thinks is a splendid mining venture and his friends are willing to pay a high rate of interest on the capital to put into that mining venture, would you prohibit that altogether ?—No. If he likes to pay the risk rate, which of course is a fluctuating rate, according to the industry in which it is invested, there would be no limit to the premium for insuring that risk.

But would everybody be able to borrow at the same rate of interest ?—No. They would have to pay different premiums and rates according to the risk.

Would that not be a very difficult thing to fix by law ?—I do not think it would be difficult. If a man wanted to invest his own capital, of course, nothing could prevent him.

I thought you were going to prevent him by law. Supposing he wanted to borrow and was prepared to pay the interest would you say it was a usurious rate and prohibit it ?—No. I hold that the interest rate will be fixed by two factors. One should be the premium for insurance against loss, and the other should be the utility value of money which should be assessed by some gilt-edged security such as the interest on Treasury notes. I cannot imagine anything lower than the interest-rate on Treasury notes.

You mentioned Armstrong, Whitworths. Do you know what they paid for the guarantee of their interest ?—No. I have not been able to find out.

It was not a very serious guarantee. As I understood your figures, they expected to earn £900,000 a year and all that the insurance company guaranteed them was to insure them that they would earn £200,000. That was not a very great risk, was it ?—No. But it is a step in the direction of illustrating that it is possible to insure industrial capital.

At the present time interest-rates are falling all over the world. There is quite an apprehension that in times coming there will be practically no interest at all ?—It may be a good thing for the community as a whole, if there were no such thing as interest.

There is quite a school of thought on that. The matter is working in your direction by natural processes ?—Quite so.

You say that our troubles are brought about by securing rewards with no fixation of profit on capital. Assuming your scheme was carried out in its entirety in New Zealand, it would not touch the central problem, would it, that our main interest is our exports and they are on a very depressed market in London just now. It would not be any great help to the farmer, would it ?—I have never approached this problem from the point of view of New Zealand only. I think it is broader than that.

You are approaching it, surely, from the point of view of New Zealand industries ?—No. There might not be any immediate relief.

Mr. Langstone.] What you are trying to do is to proceed by way of giving demonstrations as to the efficacy of this scheme of yours, and that by allowing the workers in the industry to be represented on the directorate, that the knowledge which they would bring to bear on the capital directors would be nothing but beneficial in the main ?—That is so.

Now, you have got a balance-sheet here showing where the profit has been £11,992. That is divided up so that for the interest at 5 per cent. on the £80,000 capital they get £4,000, and the labour shares are 3,112. That is given to those workers in the industry, I presume, almost on the basis of the amount of salary or service they receive ?—That is taken as the basis for distributing the labour shares.

That just creates new share capital, what you call labour shares ?—It does not create capital. The shares having no capital value would have no connection with capital.

But what you are going to do is—these shares accumulate. You are not going to pay the amount of money over to them. You are giving them share value, scrip value ?—They would be entitled to a dividend if a profit were earned less any reserve which the company might think it wise to make. I do not think it would alter the policy of putting aside reserves by bringing in labour shares.

But what I mean to say is, there are 3,112 shares that, under ordinary circumstances, would have gone to private shareholders under your scheme ?—When you say private shareholders, do you mean capital shareholders ?

Yes.—No, they would not. They would not have any labour shares at all unless they contributed service.

I say, assuming that the business is run not under your scheme. To-day that 3,112 that has been set aside for labour shares would have been distributed to the other ordinary shareholders ?—That is so.

Now, you are paying interest. Then, these labour shares would be interest earning ?—No, they would not. Why should they be interest earning when no capital has been paid for them ?

If they accumulate, we will say, if you transfer three thousand of them in the form of labour shares, ultimately your labour shares will become bigger than your others ?—But that is not the idea, to continue the issue of labour shares to the workers without limit. You would issue the number of shares a man was entitled to and unless there was some alteration in the quality of his service, that would be the number of shares he would be always entitled to.

But you would issue each year, would you not ? After you had limited the amount of dividend to the ordinary capital and made all your provisions, all of the surplus would be distributed by way of labour shares each year ?—No. Not by labour shares. There might be a dividend on the labour shares.

You would pay a dividend on them ?—Yes. The main object of a share is to provide for a means of dividend and a share in the control of the business.

What would you limit the labour shares to ? What amount ?—There would be no limit. They would be paid by results the same as capital shareholders are to-day.

In the event of one worker leaving an industry he would be able to sell his shares to some other worker coming into the industry ?—No.

How can he monetize them then ?—He cannot.

What is the good of them, then ?—Except that if he leaves the business he is entitled to his share of the equity on the reserves.

You will monetize the reserve up to that amount ?—You would pay him out or give him the equivalent in capital shares of the company which he could sell on the market.

But in the event of there being no capital shares to dispose of, if the people who held them did not want to distribute them and you had your capital fully subscribed, you would increase your share capital ?—Yes, for that purpose.

You would have to alter your articles of association ?—You would have to alter the articles to make provision for that. That has been done in several companies.

So that these shares would never come on the market at all ?—No.

Now, what representation would the workers have on the board of directors ?—That would be entirely for each individual company to decide for itself. At present the power is in the hands of the capital contributor. He is presumably not satisfied with the present position of affairs, and he says, "I am going to take my mate in as a partner," and he defines the terms of partnership.

And alters his articles of association accordingly ?—All he has to do is to put in the provision for the Companies Act for issuing labour shares. It is quite a simple matter, and could be done at an ordinary meeting of shareholders.

You think it would give an impetus to those working in the industry ? Seeing that they were getting something in addition to their wages, that they would give greater co-operation in the industry ?—There is no doubt whatever of that.

Greater results. Of course, the difficulty is to get those who own and control industry to-day to take the initial step ?—That is the great obstacle that I am up against. In the past the owners of capital have had the whole of the surplus profit after payment of all expenses, and that, I hold, is where we have gone wrong.

Would you suggest that a law be passed where they have got to adopt this same legislation framed to bring it in ?—It would not be the first country that has adopted a law of compulsion. Italy, for instance, and the United States.

When a war breaks out they do it ?—Yes. If it can be done in times of war why cannot it be done in times of peace ?

But do you not think that in just leaving it voluntary for each company to act as they are guided by their ideal, it would be a fairly long-drawn-out process ?—Yes. I think it would. I think it is only by slow evolution, unless, as I say, the present economic position makes the owners of capital realize that there is a danger of losing the whole of their capital. That process is going on to-day. Now, they want to adopt some means which will preserve their capital, and I hold that the proper means would be to say to the men who are using the capital, "You pay me so much out of the profit and you can have the rest." I cannot imagine a more efficacious way of preserving capital than by evolving a system of that nature, whereby the contributor of capital would receive his wage for capital and the givers of the service would get the rest.

Let us take two cases. You know a lot about sawmilling. You have got hundreds of men working in an industry which to-day is having a very difficult period, and we take an organization like a bank or an insurance company. I do not know that you could give labour shares to-day in the sawmilling industry because there would be no profit ?—But profit is only incidental to a larger incentive.

But a sawmilling company to-day could not, out of its profits, donate labour shares, because there are no profits ?—That would not prevent them issuing labour shares.

They would give them as a matter of scrip ?—You give them profits when they are there.

They would have to wait until the profits materialized ?—Just the same as the capital shareholder does. He has to wait.

Take a concern like an insurance company, where they are doing pretty well. The workers in that particular industry, not because they are any more efficient or any more useful to society, they would get the benefit ?—Yes.

Do you not think that there would still be a line of cleavage ? That those who are in the profitable industry to-day would still do everything that they could to maintain their advantage over the other fellow ?—Yes, I think that would always be the outcome of individualism.

But I mean to say, individualism would be transferred into a company individualism, where the conflict of interests, instead of being individual in its incidence is grouped, and you would still have the same conflict ?—I do not suggest that this is going to level out all the wealth amongst the community. I do not think it will, but I do suggest that it anticipates a better order than there is to-day, and we have to make some move to get away from the present troubles.

The claim that you are putting forward applies mainly to fairly big industrial organizations, where there is a fair number of men and a fair amount of capital operating in a congested area. For instance, a clothing factory, a firm which would be an individual thing, or casual labour, it could not very well operate under this ?—No the plan can be applied to any concern irrespective of size. Regulations can be adopted for casual employment. For instance, if casual labour resulted in some profit that could go towards unemployment relief.

You suggest that the rate of dividend should be on the ordinary capital of the company. Would you like to state any specific rate ?—I think every company should decide that for itself, subject to any law which may be made by the State.

It would not be like the Reserve Bank, where it is definitely limited to 5 per cent. ?—I think it should be limited to a certain percentage.

That may be applied to all industries ?—Yes, but not at the one rate, because the risk in each company would be different, consequently the premium for payment of that risk would vary accordingly.

Then if this scheme became more universal and the value of money as against the value of human effort—I mean money went down and the value of human effort rose, money would become cheap, therefore the return for the capital would also fall with it?—It would fluctuate accordingly.

Mr. Clinkard.] Your proposal is really one for large industrial concerns, in the first instance any way?—It applies to small industries as well as large.

Well, you could hardly apply it to industries that are using their employees very casually, could you—that is, to be of any effective use?—For payment of casual labour?

Yes?—Not the payment of the permanent employee? Is your question in that direction?

What I have in mind is, as Mr. Langstone said, the timber companies. Their employees are very casual, as you know?—I do not think that statement is correct.

Because it is so. There are a few permanents, but the bulk of the employees are casual and, more than that, for years past they have earned no profits to divide?—I do not agree that the bulk of the employees are casual but it is correct to say that no profits have been earned.

In that case, then this principle would not be of much use to any one?—It would be a step towards educating them in the use of capital, and that is what we want.

I went through your book on Sunday and I was very interested in it. I think the idea a good one, but it is very largely a question for, I think, evolution. The more companies you get to take it up the better. Where I am puzzled is to see where you are going to improve the position very much in connection with your interest proposals. You say that interest is to be divided into two portions—that is to say, that if you have to pay interest for use, plus premiums on insurance, does that not bring you back to the same position as you are in now?—No. I hold that the premium for risk to-day is the whole of the surplus profits, whatever those profits may be.

It may be that there is no premium paid at all because there may be no profits to pay the premium out of. You have to anticipate possibilities of losses as well as possibilities of profits?—That would be part of the charge against capital.

But only against capital in the case of capital receiving the premium?—No, it would be part of the risk which capital investment undergoes.

Quite so. Well, at the present time capital takes that risk and it is included in their interest. Your suggestion is to divide that risk between the use of capital and the premium on the risk?—No. I think you have not taken me quite as I intended. I said that the scientific means of assessing interest would be divided into two factors, one of which is a risk of loss and the other a payment for the utility value. I suggest that is an analysis of interest.

I should say that the principal factors are owing to the risk of loss or the hope of gain?—May be that is so.

I am all the way with you in your object, but I myself cannot see how you are going to gain much in the question of interest. Put it this way: Supposing you wish to start a new industry; well, you know exactly what it is going to cost you for cash—that is fixed—but you want to know what it is going to cost you in premiums for the risk. If, as you suggest, you go to an insurance company they may charge you any old premium or they may refuse to take your risk at all. Where are you going to get, then?—I do not think any risk is uninsurable at a price.

At a price?—Exactly; and if the premium is too high it would be for the insurers to say that is too big a risk.

But, as the Hon. Mr. Stewart pointed out, there are many instances in which you could have a proposition to put up as an industrial venture and there might be five or six of us who have a little capital and who are prepared to lend it to you at a fairly substantial rate of interest because we have confidence in your judgment, but if you went to an insurance company you would not get that same consideration. I am afraid you would not?—You would suggest that it would be uninsurable?

I do not suggest it would be uninsurable, but the difficulty would be to get them to insure it at even the rates we would be charging you for the capital, which would be a fairly high rate of interest?—My reply to that is that the risk might be high, but it would be for those who were supplying the capital to decide whether it was too high to put it into the investment.

At the present time we have exactly the same thing, only you have two services and one set of individuals—that is, they find the capital, including the use and including the risk. Under your proposal one party supplies the capital and the other party insures the risk. You have two sets of individuals to look for something in the shape of profit, whereas in the first case you had only one individual?—I do not agree that that makes any difference.

Well, that is as it appears to me, though I am not at all antagonistic towards your scheme?—I do not object to your suggestions in the least.

Again, you are not proposing to apply this to society generally; it is only to company management, I take it?—What will apply to companies will apply to individual businesses.

Oh, yes, I see. I had some notes taken here on a mistaken supposition. In regard to compound interest, you have shown that you consider that capital is worthy of use and worthy of a fee in the shape of interest for its use from year to year; for this year any way?—That is to-day's custom.

Leaving out to-day's custom?—Unfortunately, you cannot do that.

But taking it on an ethical basis, would you reckon that capital was worthy of an interest or use rate?—I have never been able to make up my mind what interest on capital should really be, but I have gone as far as this, as believing that payment for capital should not be less than the rate of payment for the risk of loss. I cannot conceive any objection to advancing an argument that capital should at least be paid for the risk of loss which it incurs. If I lend £100 I want to make sure of getting it back; the only way to make sure is to insure it.

You would not suggest that if I had £100 worth of accumulations that I should lend it to you simply on the understanding that I should get a return of that capital?—Why not?

Well, in that case you would say that the savings were not worth anything in the shape of use ?—You are getting down to fundamental principles.

I am not trying to do that. What I am asking you is whether you recognize that if I have £100 to lend you I am entitled to something for its use, which at present we call interest ?—That is the custom to-day, and you cannot get away from it.

That is not the point. I want to know whether you consider that that is all right ?—My reply is that the payment should be limited by the risk which that capital undergoes.

I see. In that case I can quite understand your objection to the annual repetition of interest. I was going to ask you, if you hold that it is reasonable that the banks should be paid interest for this year, why not next year and the year after, and, if for three years, why not for ever until such times as the loan is repaid. If I borrow money from a man I reckon that it is a fair thing that I pay him for the use of the money until I return it ?—It depends upon what you assess as the payment for the use of the money. If it is only sufficient to cover the cost of the premium against loss I go as far as that with you.

Mr. Schramm.] This scheme of yours is just a bridge in the meantime to get over the trouble ?—I think it is something rather more than that. It offers scope for the men who give their services to industry.

And would the workers in the industry have any say, under your scheme, in the control and management of the business ?—They would have a franchise which would give them a measure of control not on a par with a political franchise, because in this case it would be a variable one according to the quality of the service that they render, but it would be definitely an industrial franchise.

They would have a say in the management ?—Yes, to the extent of their voting-control.

So that if this scheme is in force for any length of time the workers in industry would be well educated up to the management of industry, and would be able to take control of industry, if necessary ?—That is the idea.

Would there be any preference shares under your scheme ?—It would not interfere with the present arrangement of capital shares ; they might be preference, deferred, or ordinary.

You would have the present company law in force as it is ?—Yes.

Plus these provisions that you bring forward ?—Yes.

You think it would benefit the workers to have the labour share rather than the dividend ?—I think the labour shareholder would look on dividends pretty much in the same light as a capital shareholder to-day. He would realize that in some instances it would be to the benefit of the shareholders as well as the company to retain the profits in the company to earn further profits. I do not think the labour shareholder would want to draw his dividend any more than the capital shareholder would want to to-day.

He would only be able to monetize the share in case he leaves the business, is that so ?—No.

Why not ?—Because the labour shares have no capital value ; but if a certain amount of the profits have been placed to reserves during the time he holds those shares he would then be entitled to his equity in the Reserve Account, which could be paid out by the company either in cash or by the issue of capital shares.

If there were no reserves he would get nothing ?—That is so.

In your scheme you have not touched on the present banking system. Would you like to say something on that ?—I would rather keep clear of it.

Captain Rushworth : I have no questions to ask, Mr. Chairman. I have had the advantage of discussing this scheme with Mr. Valder on previous occasions and I hope to have further opportunities.

Dr. Sutch.] There are one or two questions of a general nature. In your typewritten statement you say that the real wealth of the community is at least potentially sufficient to meet the legitimate needs of every individual consumer. Do you think that is so under our present system ?—I judge that it is so from the accounts one hears of the surplus volume of commodities which are to-day being produced, and there is no doubt whatever that the potential power of production is apparently more than we are able to distribute.

That may be so. Potentially we could be a great steel-producing country, but the physical costs of getting that steel-production are such that if we went ahead as a steel-producing country we would materially lower our standard of living in doing so, and that is why I asked the question, because you say " to meet the legitimate needs of every individual." If my supposition is correct you would have to define " legitimate needs " ?—That would be so.

So that you do not necessarily mean that we can produce everything we want in New Zealand ?—I am not confined to New Zealand.

The whole world ?—Yes.

I took it to mean New Zealand ?—I am not confining it to New Zealand.

You also pass some remarks about private property. Do you not believe in the private property system ?—Yes, I do.

Do you think it an admirable system ?—I think it is a system we cannot do without.

So that when Karl Marx says, along with you, that wages do not get enough of the product of industry, your scheme is one that would perhaps put into operation some system whereby Karl Marx's theories would be nullified ?—Yes, I would not go all the way with him.

You would not ?—No.

What objection have you to the Marxian theory ?—I think he carries individualism too far. I think that what we have to evolve is a system which is a balance between collectivism and individualism, and when you go too far in either direction you are aiming for touble.

Can we take an example ? Suppose we had an industry with thousands of employees and perhaps thousands of shareholders and the profits were divided up at the end of the year and you had, say,

one or two pounds only to pay out to each employee, do you think that would be sufficient stimulus to the employee to have regard to that company rather than his own interests ?—Yes, I do, provided he was assured that it would be distributed according to the earnings of the company.

So even if it was as low as 10s. a year you think it would operate as a factor to ameliorate the conditions of labour at the present time ?—I think that the average individual would feel that he was a partner to the production of that 10s. a year, and if he realized that he would be content.

You do not think the wage-earner would rather see an increase of a couple of shillings a week in his wages ?—Under present conditions he might, but we have to educate him to a different idea.

It seems to me that your scheme has the legal basis ready, and all you need to do is to educate the community to the ideals that you have and the thing can come into operation ?—Yes. I have often said that whilst I have devised the machinery I cannot put the spirit into it to make it work.

It is just a matter of education ?—Yes. That has to come from the owners of capital themselves.

Do you think that Karl Marx's appeal to the worker is more or less the appeal of your system ?—No, I do not. I think the psychology of this system is ahead of anything he has produced.

You were talking of interest, and I wondered if you had collected any statistics on the problem. Have you any idea whether the amount of interest paid in 1933 was greater than that paid in 1929 ?—No. I have not seen any statistics on that point, and I do not think they can be obtained.

It would be very difficult to obtain them, but if you could get them they would substantiate your idea that interest payments are increasing disproportionately ?—I do not think such figures would bear the light of day.

Otherwise, it would be difficult to verify any ideas on the subject of interest ?—I realize that, but at the same time I do not think it possible to collect statistics of that kind and rely on them.

And, talking of interest, you say that you would divide it into risk and utility value. That is the utility, I take it, to the borrower ?—Yes.

You would not say that a factor in the rate of interest was the deprivation value of it to the lender ?—Yes. I have always had that doubt whether it is ethical to make a charge for the use of capital other than for the risk factor.

So that the utility value is not necessarily the only factor operating ? Apart from risk, it may be the deprivation value ?—It is the same thing.

It is not necessarily the same thing. If I have £100 it might mean a lot more to me if I lend it to you. I might say I will lend it to you at 6 per cent., but you might say it is only worth 4 per cent. to you ?—You are looking upon capital as a means of deriving income. Is that the purpose of capital in the first place ?

I am not suggesting it is the purpose of capital, but at the moment we have to have a rate of interest to attract capital sometimes ?—Yes, under present conditions you have.

And some people who save for the proverbial rainy day will save less if you have a greater rate of interest, whereas others will have to save more if the rate of interest falls ?—That surely is an argument against interest ?

I am just wondering how you are going to so change the system that these people are not affected. They are a factor in any scheme, and you have to include them. I am not saying it is ethical to do that ?—I started out by saying that any scheme that was not economical was not ethical.

So that if your scheme does not provide for the seventy thousand unemployed, would you say it was not ethical ?—I say that this scheme is more likely to distribute the wealth which is being produced than the scheme of the present system.

It is a little more forward than the present system. You do not think the payment of dividends is a spur to investment ?—Yes, I think it is.

Well, if you had a definite rate predetermined it would mean either that some speculators were not going to invest or that some industries were not going to be undertaken, probably it would mean both ?—Yes. I do not think you can get away from that.

So that we may not have an enlargment in our industries with this predetermined rate of interest. Some industries are built up, first of all, because they offer a speculative rate of interest to the investor. They may turn out well or badly ; in New Zealand more often than not they turn out badly ; but the ones that turn out well we would have to lose under your system, because it was only the incentive of a high rate of interest that produced the investment ?—I do not follow that, because I think that if there were scientific means of arriving at the value of interest that would show a return in an increase.

Can we assume some hypothetical scheme ? Angora rabbits were once put before the public as a good investment ; 10 per cent. was offered. Some people invested at 10 per cent. There were other conditions operating outside New Zealand and it so happened that that proposition did not turn out a good investment ; but the point I am making is that we would never have had that scheme started but for the attraction of a possible high rate of return ?—Would that not have been a good thing for the community ?

In this particular instance it would, but if that had turned out a success the reverse would have been true. I am only suggesting that that type of investment will be cut out ?—I think there must always be an opening for the investment of capital.

You would allow a high rate of interest ?—It would depend on the risk which it is undergoing.

You say this risk can be calculated before hand. Could you calculate the risk in the example I quoted ?—Yes.

You think an insurance company can do that ?—Insurances have always started on a basis of guessing what the risk is likely to be, and generally they guess on the right side.

They make their charges such that they can cover all contingencies, so that we may have a rate of interest perhaps higher than now ?—As long as it makes capital more liquid would that not be an advantage ?

It may be. If the State ran all production do you think that we would need to pay interest?—I am not a believer in the State running all production. I think you would do away with individual incentive which, to my mind, would be fatal to the success of a great many businesses.

There are some systems, at least one, being tried where they educate the public in a different way from the way we have, and they seem to manage to bring their production up by other methods?—There is such a thing as patriotism, of course.

Your scheme provides for that, for that matter. Your scheme cuts out a little of the individual enterprise, does it not?—I think it increases it by spreading it wider.

Earlier you told me that your scheme aimed at some balance between collectivism and individualism?—Yes.

I take it that you are cutting down some of the individual part?—Cutting down on the existing individualism side.

You also mention Treasury bills as being a good guide. They would not be a good guide in New Zealand for the rate of interest?—Plus exchange.

The Treasury bills in New Zealand were 5 per cent.?—That is too high, if I might say so. If they are only about 10s. in England they should not be £5 here.

In England they have varied in the last year from as low as 4s. 6d. in the pound up to 18s. 6d. There is a great variation. If you have to have a predetermined rate of interest you cannot base it on something that is going to vary at that rate?—Why not?

You do not know ahead how it is going to vary and how would you vary all your bonds and contracts, such as Treasury bills?—According to the average annual rate.

You think you can predetermine it?—I think so.

I would suggest that the British Government does not know to-day whether it is going to pay 4s. 8d. per cent. this year or £1 5s.?—No one knows, but it could be calculated on the average rate for the last four or five years.

Would you make it some proportion of this rate so payable?—As long as you had some standard which was beyond the control of those employing the capital, I do not think it would matter.

We will assume we have set standards such as Treasury bills: what proportion would your rate bear to them?—Between the rates paid for Treasury bills and the utility rate which I mentioned.

Yes. Would it be exactly that rate?—That actual rate would be a fair statement.

It might be down to 4s. 8d. per cent.?—It is getting to finishing-point, and it is questionable whether that is not the true point.

At the moment in industry we have reserve funds which equalize return of capital; that also is done; how would your scheme differ from that?—How would it apply to it?

Or differ from it; would there be any necessity for you to change the constitution of that business?—No, I think you would carry on just the same. All you would do when you initiated that plan would be to capitalize those reserve funds and start with that capital.

You would bring them into your scheme?—Yes, undoubtedly.

You say that nowadays human service is paid a predetermined rate; do you think it is?—I do.

You think that it is predetermined?—It used to be under the arbitration system, but service nowadays takes what it can get. It is generally predetermined.

Perhaps from week to week, but not for a long period?—No; but it is predetermined, and that is my point.

How predetermined?—By the arrangement between those who give service and those who buy it.

Say I am engaged from week to week: it is only predetermined for that short period?—That does not et away from the principle of predetermination.

Your rate of interest is going to be predetermined for some long period ahead?—Subject to the average mentioned.

You do not want to predetermine an average rate of wages?—Generally, I think wages would be predetermined for the period of employment. We do not alter the rate weekly.

Are you going to make the return to service a matter of competition, or are you going to say that the return to service shall be fixed also, through the Arbitration Court or some other means?—I do not propose to fix return for service, because wages and salaries would only be an advance payment against the interest of the individuals in the business.

So that £1 a week would fit in with your scheme; you would not fix a rate of wages which would cover the cost of living?—That would be the only means of keeping a man's family.

You would have a predetermined rate of wages?—Yes; that would be an advance payment against his equity as a partner.

The Chairman.] I was interested when you were speaking at the beginning; you referred to Armstrong Whitworth's, with their huge capital and also the amount of interest. There was to be a share income of a stated amount, I think £900,000, and by insuring the profits, £200,000 would be added by the insurance company?—They would not be added.

They would be paid or guaranteed?—If the return was only £700,000.

They would make it up. That, of course, was just an extract out of that circular you read, but what would be the position if the profits were minus, say, £400,000?—They would still have to pay the £200,000.

They would pay only £200,000?—They would pay it for anything less than earning-power. If they made £900,000 there would be no payment at all.

They could not give 4¼ per cent. if they were down in their profits?—Oh, no.

I was just wondering how it was made up, or whether conditions were employed?—There are some conditions in regard to return of any amount paid over a certain average profit in future years.

If we follow that on further, if a dividend in connection with your scheme to the holders of capital shares is to be fixed and the balance to be divided among the employees—we speak of the labour shares—it is clear that the employees would reap all the benefit with the special reward for the operation of the year; is that not so?—I do not follow you. I would not say the employees would reap all the benefit because a portion of the benefit would be paid to capital in the shape of dividends.

Over and above that?—Yes.

Does your scheme make any provision for the converse side of the picture? In years when business is not good—suppose you had a loss—what do you do then?—The answer to that, I think, is that labour at the present time takes its share of the loss in any business. Directly the business begins to make a loss it looks around for a means of reducing its expenditure and the first method is to discharge some of its employees. I want to suggest that seventy-five thousand people who are unemployed in New Zealand are losing money over it all their life, money which they have no opportunity to replace, and that is a greater loss than the loss of capital. I do not think it is right to say capital is bearing all the losses.

I am not opposing your scheme; I am only asking for information. It is customary in all business to build up reserves to be ready for losses; what do you propose to do about them?—Still continue the same policy.

Of building up reserves to meet losses?—Yes.

So that the actual profits over and above the dividends payable on the capital invested would not all be paid out?—It would be a very wrong policy to pay it out. I said that labour shares were entitled to any of the surplus profits, it was not necessary that they be paid out.

After making provision for a reserve?—If you will notice the example given in the leaflet, you will see a Reserve Fund is established out of the profits.

In some countries, America, for instance, we know that labour-unions have strenuously opposed profit-sharing, the reason being that it has interfered with superannuation funds and it is also a means of speeding up and getting more out of the worker than he would ordinarily give?—Yes. I am inclined to agree with that view that profit-sharing as profit-sharing alone is not a good expedient for industry. If profit-sharing carries control with it, that alters the whole aspect.

When does an employee become eligible to get shares in a company?—That matter was raised already. The answer was that a period of probation is necessary.

Suppose a man was unsatisfactory, after he had been there three or six months; what about his shares; he loses them?—The shares automatically disappear, but he has an interest in any equity earned during the period which he held those shares.

I want to put a personal question to you: I take it that you have been interested, or are interested, in some profit-sharing business, are you?—I do not like the term "profit-sharing." I think it is very much larger than that. It is partnership. I am concerned in that.

You are interested?—Yes.

Let me put this question to you: Suppose, for argument's sake, that you had a capital of £10,000 of liquid assets, and you were beyond the age that you should still continue to work, and you had nothing else but that money. What would you do with it? Would you put it into the partnership concerns or would you take 5 per cent. for it in Government bonds to make sure that you would not be left high and dry later on?—That would entirely depend on the attractiveness of the investment, as to whether it was likely to earn more in the industrial investment than in the Government investment.

But would you not still consider what your position might be, and that of your wife, with money invested in industrial concerns which might go into liquidation and you lose the lot?—That is the risk you take, but there would be no risk if the capital was insured against loss.

The average man would take the gilt-edged investment to make sure?—I think we are all doing that under the present system.

Captain Rushworth.] Would you be sure the Government would not reduce the interest on those bonds?—That would be the trouble.

The Chairman.] But you would still be in a better position than if you had lost the lot; you would still have something to live on?—I hold the view that fundamentally the purpose of capital is the saving to provide for the time when you want it, and that you should anticipate the use of that capital, and not anticipate lending it out to some one else to earn money for you.

I did not feel that I should put that question to you?—There is no reason why you should not.

Are you interested in the Waikato partnership concern?—Yes.

Would you like to tell us something about the working of it, for about ten minutes?—I am afraid that I have not the detail here, but the rough outline is that, taking the *Waikato Times* proposition, that has a capital of about £60,000. They instituted this scheme and it is only a partial employment of the principles to this extent, that before the employee partner receives any payment, 7 per cent. has to be paid on the capital shares. After 7 per cent. the profit is divided equally between the employee partners and the capital shareholders up to 9 per cent.; after 9 per cent. the whole of the surplus goes to the employee shareholders, and on winding-up of the company that would be roughly the position; if it went into liquidation, the capital shareholders would be paid half their capital and then there would be a division between the capital shareholders and the labour shareholders of the balance. I think the basis is three-fifths to the labour shareholders and two-fifths to the capital shareholders.

Dr. Sutch.] Have you ever reached this 9 per cent. on capital?—Yes, in good times they did reach 9 per cent.

And has it made a difference to more harmonious working?—The managing director will tell you that there is quite a different outlook; the men feel that they have an interest in trying to earn profits, because they know they would be benefited. They are getting it either in the shape of dividends or interest in the reserves at some future date.

Do wages in that particular firm compare favourably with other institutions?—I understand, very favourably. They are working under the award, and they pay a higher rate than the award rates.

Mr. Lye.] About two years ago one of the chief reporters left after a number of years; was that scheme in operation then?—Yes.

I understand that his interest in the reserves was paid out in accordance with the number of labour shares he held?—I am not connected with the active management, but that should be the case.

I understand that that was the case, and that it worked out quite harmoniously, and to the satisfaction of the *Waikato Times* and to the reporter. That is a practical demonstration of your plan being in operation.

The Chairman: I think I would say, on behalf of the Committee, that you deserve to be congratulated upon your scheme, which is an excellent one, and you appear personally to have given a great deal of time and thought to it. I have already pointed out that it does not come within the scope of this inquiry, but, nevertheless, if there are any points in it which the Committee can use, they will, of course, take advantage of them. We wish you success in your efforts to bring about, as you have been attempting to do, a better understanding between capital and labour.

AUCKLAND, MONDAY, 19TH MARCH, 1934.

Statement submitted by Mr. W. A. GRAY, Auckland.

Planning and Control of Public Expenditure.—Whatever monetary system is adopted by this country, so long as New Zealand exports primary produce to meet her obligations for overseas indebtedness and for imports of manufactures, any appreciable variation in the prices of our exports will cause undesirable disturbances to our economy. Any action, therefore, capable of reducing the effect of variations in the export-price level should assist towards efficient working of our monetary system, and one of the actions best calculated to counterbalance such disturbances should be the planning of public expenditure, particularly that devoted to constructional works. Increase or acceleration of public expenditure in times of slump, coupled with decrease or retardation in times of boom, should tend towards stability of employment and hence towards stability of purchasing-power, taxable capacity, and national revenue and income. It is suggested that variations in the rate of public expenditure should not take the form of hastening or slowing-down works in hand so much as starting or postponing new works, and it should assist towards this end if a Board of Works were set up to consider and recommend to Cabinet the amount and kind of expenditure that should be embarked on year by year by the various Departments of State. Local-body expenditure contributes an important share of public expenditure and that is already subject to the control of the Local Body Loans Board as regards loan-money. The powers of this Board are naturally more effective in curtailing than in encouraging local-body expenditure, and it is unfortunate that the Board was not set up some years earlier than it was. I have been unable to form a reliable estimate of the amounts actually expended on construction of public works year by year since 1920, but I believe it is correct to say that costs of construction rose comparatively rapidly every year until about 1927, although wholesale prices have been falling with minor interruptions since 1920. Since 1928 costs of construction have fallen even more rapidly than they rose. The rise in costs of construction up to 1927 was due partly, of course, to the rise in wages lagging behind but following the rise in cost of living during and after the war; but it seems reasonable to expect that postponement of some of the public works carried out from 1920 to 1927 would have led to a reduction in their cost and to a reduction of total public indebtedness. It also seems reasonable to expect that some of the works then undertaken would never have been carried out if they had once been postponed; for, although works of doubtful value may be and are undertaken to relieve unemployment, more careful scrutiny of expenditure may be expected when neither boom conditions nor widespread unemployment are present. At the present juncture, while admitting that examples of unjustified public expenditure are not difficult to find, it is submitted that there is work of economic value to be done on roads and bridges, schools, and other public buildings sufficient to justify an expenditure of, say, £5,000,000 annually for many years; it is also submitted that this amount could reasonably be increased for one or two years in the expectation that the building trade would recover some of its activity, after which the amount should be reduced. Such a recovery in the building trade could reasonably be expected, for the direct employment provided would lead indirectly to further re-employment by the expenditure of wages, and should encourage a gradual return of confidence, especially if there is reasonable certainty that public expenditure will be curtailed as private enterprise regains its ability to expand.

Finance for such expenditure, it is submitted, could be arranged temporarily by the sale of debentures coupled with the issue of Treasury bills, while Professor Bowley's proposal should work satisfactorily for the future establishment of a permanent method of financing public works; his proposal being that a fixed amount should be raised annually to be devoted entirely to debt redemption when unemployment is absent, entirely to augmenting public expenditure at the height of a crisis of unemployment, and otherwise to be divided between the two purposes according to whether employment were increasing or decreasing.

Finally, it is submitted that while the evil moral effects of prolonged unemployment is incapable of assessment in monetary terms, it is so undesirable that the only valid objection to a policy aimed at relieving it, is the fear that temporary relief may be followed by a more severe reaction. With a Board of Works set up to co-operate with the Local Body Loans Board it should be possible to expand public expenditure to an extent that would provide a return to regular employment for appreciable

numbers with a reasonable certainty that such public expenditure will not be allowed to continue after the slump has passed, so as to heighten the bext boom and deepen the next slump. While in the event of the present slump continuing to deepen it is submitted that the risks of the policy of avoiding public expenditure are greater than those involved in expanding it.

Witness: Mr. W. A. Gray.

Mr. Gray: Mr. Chairman and gentlemen, perhaps I should preface my remarks by giving you my qualifications to speak on this subject of public expenditure. I am a civil engineer by profession; in 1910 I graduated at the Auckland University with honours in mathematics, and, since then, with the exception of the war years, I have been engaged in the practice of my profession, mostly in municipal works, roads, water, and drainage; but I have made some study of the economics of road transport. Three years ago I published a small pamphlet on roads and railways, a copy of which I will leave with you. I could let you have other copies if you desire. In the same year the New Zealand Society of Civil Engineers set up a Committee to consider and report on the economics of rural roads. I have been a member of that Committee for the last three years, and we are still continuing our work. I propose later on to make some detailed references to the reports which appear in Vols. 18 and 19 of the Proceedings of the New Zealand Society of Civil Engineers, which books would be in the Parliamentary Library. The question that I wish to discuss is the using of the control of public expenditure as a factor in evening out the disturbances caused by booms and slumps in the trade cycle. The question crops up here, as I think in every other proposal which has been before you, of the distinction between the long-run problem and the immediate problem. In the long-run problem, I believe that, on general lines, a reduction of public expenditure while prices are rising, while trade is good and employment is plentiful, will help with other factors, such as possibly a rise in the rate of interest or possibly a fall in the exchange-level, in preventing or mitigating the excess of a boom, and that as a corollary or as a converse, an increase of public expenditure when prices are falling, when trade is losing confidence, and when unemployment is beginning or increasing, should help, with, say, the variation in the rate of interest in the direction of lowering it and the variation in the levelling of exchange in the direction of raising, to prevent—if not entirely—at any rate the worst excesses of unemployment, loss of profit, loss of revenue, difficulty in balancing budgets. It seems to me that it may be useful to consider the experience of the years since the war in the light of what we know now not with the intention necessarily of criticizing what was done then when the later knowledge was not available, but in the hope of learning something that may be useful when the next trade cycle comes. Assuming that in the course of time prices will rise, employment will return, conditions will arise possibly in the not distant future when the possibilities of a boom occurring in the country will have to be considered, and the magnitude of the boom is a fairly certain guide to the magnitude of the slump which will follow it. Looking at it that way, it seems to me that, concentrating on the question of public expenditure and referring to the fact that costs of construction rose almost continually and fairly steadily after the war up till about the year 1927 and fell from 1928 onwards; bearing that in mind, and also remembering that the Local-body Loans Board was only set up in 1927, it seems to me probable that if the Loans Board had been set up, say, five years before, and if a Board of Works taking a more general survey such as is proposed in my typewritten notes had been in action then, a reduction of public expenditure by the Central Government and by local bodies would have reduced the boom conditions that did exist in the building trades in the years approaching 1927, and that if the money had not been expended then, a lot of it could have, with advantage, been spent later, both by the Central Government and by local governments, with beneficial results in the direction of evening employment and reducing costs to both the national and local governments. The building permits, which are a very clear guide to unemployment or to a large extent of the volume of unemployment, continued at a fairly high level for two or three years after the change in the costs of 1927; building permits did not fall off appreciably until 1931. They averaged about £9,500,000 per annum in the principal towns, private buildings, from 1924–1929. In 1929 the figure had fallen slightly to 8·9, in 1930 it fell to 6, and in 1931 to 2·5. I have not seen the figures recently. These are the figures from the report of the Economic Committee. The 1932 figures were, I think, actually lower, but last year there was a slight rise.

Mr. Clinkard.] The same thing was even more pronounced in America, was it not?—Yes, and in Australia. In Sydney they dropped, I think, to under 10 per cent.

Mr. Langstone.] Can you give us the expenditure of local bodies and public works for the same period?—The figures for public expenditure I find very difficult to get in full. The most recent Public Works Statement does not give all the activities. It gives a guide to the position. I attempted to get the figures for 1930–31, and it made a total of £8,400,000, and I think that figure was exceeded somewhat in the previous two or three years. It is difficult to get the exact figures. The figures of the increase in indebtedness are given in the Year-Book, but they are not a complete guide to the amount actually spent in construction, and with local bodies the figures I have here only refer to the years after the Loans Board was set up, and the falling-off in local-body expenditure did not occur immediately. For three years after the Local-body Loans Board was set up the loans sanctioned averaged £3,500,000 a year. That does not mean, of course, that the money was spent. It is impossible to get the actual amount spent year by year from the statistics available, but they give a very good guide to the rate. In most cases the loans sanctioned were spent in the next two or three years or twelve months. Portions of it might be spent over ten years, but the bulk in the following two or three years. In the fourth year after the setting-up of the Loans Board, the amount fell to £1,750,000, and in the fifth year to £750,000.

The Chairman.] What year would that be?—1931–32. I think that in local-body expenditure there is a very clear case for advocating and attempting to encourage it at the present time—I do not think you can force it—and you can with the present machinery actually prevent them spending in

boom time. Ten years ago conditions were such that local-body expenditure, I think, should have been curtailed, not stopped.

Dr. Sutch.] That would have meant less overseas borrowing?—Most local-body expenditure was done out of local loans; only a few of the bigger municipalities raised money overseas; most of the smaller ones raised their money locally.

Do you think that took money away from expenditure in other directions?—I think it unquestionably helped to force up the cost of building, but while prices were rising and costs were rising I do not think it did; I think everything was moving together. I think it would have been advisable to curtail the amount in order to discourage the competition and tendencies which occurred in certain features, like subdivision of suburban lands.

Mr. Clinkard.] Is that not the reason why the banking institutions usually increase charges at those times—to discourage expenditure?—Yes, and I think the raising of the rate of interest at a time like that is the right move to make.

Dr. Sutch.] It has not had much effect in New Zealand?—It was not accompanied by other features. It seems to me that in taking one feature—if you ignore interest and exchange and everything else—it makes some slight improvement by controlling expenditure, but if you work this with the other features—the three features that we have been discussing—the public expenditure, and the rate of the interest and exchange, in opposite directions according as prices are rising and trade is feeling optimistic, and according as prices are falling costs are falling and trade is losing confidence more improvement would be seen. That covers the ground generally on the point of the more general problem of making or setting out a long-term policy for mitigating the effect of booms and slumps caused by variations in the prices of our exports. The immediate question, of course, is, Should anything be done now? I propose a little later to give what I believe to be a list of works mostly connected with roads which are thoroughly justified from a strict economic or accountancy standpoint; but, before doing that, I want to refer to one or two objections that are almost certain to be made. One is the point of view that in the past public expenditure has been carried out on foolish projects and that the solution of the slump must be left to private enterprise. I think one of the objections that will be made to any proposal to spend public money is that in the past money has been wasted on some projects, at any rate, and that the country is in no mood for wasting further public expenditure. I think that objection will be put up.

Mr. Langstone.] Would you call the war waste?—Certainly.

That is a most profitable venture?—I would not advocate any war. The answer I propose to that objection that money has been misspent in the past and that if public spending starts again it will only lead to another boom, is the proposal to set up a Board of Works for the purpose of aiming generally at an increase of expenditure only in slump-time, coupled with a decrease of expenditure in boom-time. I think the setting-up of a Board of Works should eliminate much of the objection that would be felt by private enterprise, and would eliminate much of the hindrance that it might cause to a return to confidence. At the present time private enterprise is still feeling the lack of confidence.

Dr. Sutch.] But could private enterprise carry out the works you have in mind?—No; what I am getting at is this: that industry and commerce now, private enterprise, are suffering partly from effects such as the lack of income caused by the fall in overseas prices and also partly from lack of confidence. That spending of public money would increase the lack of confidence—that some private enterprise would be deterred or would be frightened, and its return to confidence would be delayed by a wild proposal to start spending money in any and every direction; but with the setting-up of the Board of Works with a definite policy to see that public expenditure is curtailed later when private enterprise is getting on its feet this would be avoided.

Are there any types of works that it would pay us to undertake now rather than leave them to later?—That is the point I am coming to later. Some of the works I refer to are urgent, apart altogether from any other question.

Mr. Lye.] We have a Public Works Department, but no Board. Is the history of the operations of Boards eminently successful?—I think the Highways Board has done good work, and the Public Works Department, I do not think, is quite in the position to control. It would be the most important factor dealt with by the Board of Works, but the Post and Telegraph Department, the Railway Department, and other Departments of State, too, spend money; local bodies spend money; at the present time the Local-body Loans Board is working, the Main Highways Board is working, and I think they are both doing excellent work. I think they have actually helped us considerably.

Why another Board?—To co-ordinate the activities of the Loans Board, the Highways Board, the Public Works Department, and the Railway Department.

Whilst I know that a good deal of criticism has been hurled at the Public Works Department inasmuch as the estimated cost of various undertakings has been considerably lower than the cost when completed, but there was a reason for that inasmuch as many of our public-works jobs have been undertaken at a time of rising prices, but why not make use of the Public Works Department Engineers?—On the Board of Works I take it for granted that the Chief Engineer of the Public Works Department would be a member; but my point is that there is spending carried out not only by the Public Works Department, but by other Departments and by local bodies, and that by co-ordinating all these activities there is a possibility of varying the sum total of public expenditure in the country. The second objection which I think will be raised is the difficulty of financing, and, as an answer, I thought it might be advisable to bring along an authority who would carry some weight, and with your permission, Mr. Chairman, I will read a few lines from a report by Professor Pigou, who, with others, recently considered the question of unemployment. He refers to the practical obstacles which limit the range of the remedy he has been discussing—that is, the variation of total public expenditure.

There is, however, a particular application of it which is much more important practically than any other. This concerns the policy of central and local government authorities in ordering things which they normally require more largely in times of boom than in times of depression. Many writers hold that, by transferring

a part of their demand from good times to bad, such bodies could make a very important contribution towards the stabilization of industry. It is pointed out that there is a very large amount of expenditure on military equipment, schools, roads, street-paving, tramways, electric-lighting plant, and innumerable other things, which is not urgent to a particular moment, but might easily be spread evenly as between good times and bad, instead of being concentrated chiefly upon good times. There can be no doubt that, if this were done, the amplitude of the trade cycle would be in some degree lessened. There are, however, certain practical obstacles which limit the range of this remedy. Of these, the one with which chief play is made in popular discussions is financial. It is pointed out that in bad times the proceeds of taxes, and, in a less degree, of local rates, are apt to fall off, and that, consequently, national and local authorities cannot afford to undertake improvements or erect new buildings so freely as they can in good times. If they do undertake these things, it is said, they can only do it at the cost of raising more money from the public, and so causing private expenditure to contract as much as public expenditure is expanded. This argument, however, is defective in two ways. First, it ignores the fact that in bad times governing bodies, central and local, are compelled, in one way or another, to spend large sums in supporting people whom the bad times have thrown out of work. It may reasonably be presumed that an increase in the demand for labour, brought about by Government and municipal orders, would lessen the number of those persons, and that, consequently, a portion at least of the funds required would be provided by the reduction of this other form of Government expenditure. Secondly, it ignores the fact that, in so far as new funds were wanted, they could be obtained by creating new bank credits, or, rather, by preventing the net volume of these credits from being cut down so far as they would otherwise have been. In view of these considerations, the purely financial difficulty in the way of this stabilizing policy does not seem to have great weight.

The third objection—and the one which I intend to deal with, with your permission, in some detail—is the question of absence of useful works. In some of this discussion, or some of this matter which I intend to put before you, I am quoting the Committee set up by the society of which I am a member. In one or two places I will be giving my own opinion on matters which have not been dealt with here, or where I think the matter can be carried a bit further. I consider that the source of work which probably outweighs, or is equal in weight to all others at the present time, is expenditure on roads.

Mr. Lye.] You think that is the principal, do you ?—Yes. If I may quote one or two round figures. Three years ago the expenditure on roads was approximately £5,000,000 in construction and maintenance, £2,000,000 in interest on loan indebtedness ; but the total cost of road transport for the year was £30,000,000. Now it may be said that that indicates that we are spending for too much on roads or, rather, road transport ; but I do not think it is necessary for me to argue the very obvious fact that the motor-vehicle has made its way in the face of existing facilities, and while there may be some difference of opinion as to its advantages, the advantages of the motor-vehicle must be such as to give general justification. Now, if we consider those figures, it seems to me that it is a suggestion which naturally arises that it is conceivable that an increase in the expenditure on roads from, say, £5,000,000 on construction and maintenance to £6,000,000, might reduce the total cost of road transport below £30,000,000, that the saving in running-costs might outweigh the increase in road costs.

Mr. Clinkard.] No doubt it would, to an extent, in any case ?—The figures are difficult to get at.

Mr. Langstone.] But would that not detrimentally interfere with traffic on railways and destroy the asset in that way ?—No. I think that while the motor-vehicle would probably kill the rail if cut-throat competition were allowed, that there is no need for that competition to be given free rein, that the reasonable development of motor transport can be carried out so as to co-ordinate the road and rail transport.

Have you looked into the matter of the costs of road transport versus railway transport, and the volume of the upkeep of those two Departments ?—I think so. I have considered most of those points. The point I am getting at at the moment, however, is this : that there are cases in New Zealand where, with the existing traffic on a road, spending capital sums on the improvement of the roads would reduce the cost of transport. The question of who is to pay the interest on that capital expenditure is an important one, but it may be considered after the other question has been settled. But while the expenditure on roads with the object of reducing total transport costs provides the most important factor in my proposals, there are others which appear to me to be a good deal more urgent. It is fairly common knowledge that a gravel or metal road that is not maintained will soon reach a condition in which it may go to pieces if expenditure is not carried out on it, and there are lengths of road in the Dominion at the present time on which failure to expend money now will lead to the necessity of spending, say, three times as much later on. It is a difficult matter to actually estimate, but I have taken the case—not an extreme case, but a border-line case—and have worked out estimates which can, of course, only be regarded as estimates ; but I think they are a fair indication of conditions which may commonly be found. "Consider a mile of gravel road carrying a hundred vehicles a day, costing £150 per annum for interest and sinking fund on loan and efficient maintenance, and assume that maintenance has fallen short to the extent of £25 in 1931, £25 in 1932, £50 in 1933, and that the same shortage is likely to occur this year." Perhaps before I go further I should refer to the figures in the Public Works Statement for last year to justify those assumptions. There is a table of expenditure in the Public Works Statement (page 121) which is referred to in this way, "The outstanding feature disclosed above is that the expenditure during 1932–33 on the highways system, 10,800 miles in length, is less than the expenditure in 1925–26 on a system 6,200 miles in length, in spite of the fact that the average intensity of traffic is, at the present time, nearly double the intensity seven years ago." That simply is putting in words what appears in the table above in the Public Works Statement, as to the falling-off in expenditure on the existing roads. These figures can be regarded, if not as average figures, certainly as typical of quite a lot of cases. At the end of this year, ignoring interest, the saving would be £150, but the cost of repairing the road to bring it back to an efficient condition would probably be considerably greater than £150. While the maintenance has been neglected, running-costs will have risen, and, taking 6d. per mile as the average (eighty vehicles at 4d., and twenty vehicles at 1s. 3d.) costs with the road properly maintained, the running-costs would probably be 7d. in 1932, 8d. in 1933, and 9d. 1934, and the losses (*i.e.*, the increases above 6d. per mile) would be in the neighbourhood of £150 in 1932, £300 in 1933, and £450 in 1934—*i.e.*, a total

of £900 for the mile. Of these running-costs approximately 1s. 6d. represent taxation; therefore the net loss would be reduced to about £750. Neglect of maintenance, therefore, provides the local body with the problem of making good out of rates in one year all, and probably more than all, the savings made in previous years, while the losses in running outweigh the savings heavily. Now those estimates of running-costs can only be round figures, but estimates have been made in this country and in other countries of running-costs, and it is accepted that the difference between a rough road and a smooth road (of course, you cannot define a rough road and a smooth road), but there are actual cases where in one district the running-expenses will be 9d. a mile and in another district they will be 6d. a mile. These figures I have given are only of value as a general idea, and if the figures of savings and losses were at all close there would be justification in using them. But when you see a probable loss in running-costs of £900 against a temporary gain of £150 in maintenance, but no real saving at all, an error of 10 per cent. or 20 per cent. or even 30 per cent. in the estimates does not vitiate the argument that it is very bad business to allow a road to get out of condition. There is the problem which faces a local body also of trying to make good out of rates in one year all that it has saved in the previous years. It seems to me conceivable that a county which lives on wool might think it justifiable to spend nothing on maintenance while the price of wool is low, knowing that it can be made up, if a little uneconomically, when the price of wool is high, and because of the divorce between roads and the users of roads (the roads are maintained by the County Council as a municipality and used by the farmer as an individual), because of that divorce—there always has been a very strong tendency to regard road costs without any consideration of running-costs—whereas from the national point of view the obvious way to regard the thing is to regard it as a combination of road costs and running-costs, knowing that running-costs are very much heavier. I have a table here which gives some indication of the figures of running-costs as against road costs. I have worked out for different types of road what may be regarded as typical expenditure. It is very difficult to say whether it is average. "Typical" is a better word than "average," because costs vary so much even in the same county.

Traffic: Vehicles per Day.	Type of Road.	Costs per Mile per Annum.		
		"All in" Road Costs, Interest, Sinking Fund, and Maintenance.	"All in" Running-costs.	Transport Costs—*i.e.*, Road and Running Costs.
		£	£	£
10	Earth	50	105 (7d. per mile)	155
100	Gravel ..	150	900 (6d. per mile)	1,050
1,000	Bitumen ..	500	7,500 (5d. per mile)	8,000
10,000	Concrete ..	1,500	75,000 (5d. per mile)	76,500

N.B.—Road costs per vehicle decrease as number of vehicles increase. Running-costs are more important than road costs. Reduction in running-costs obtained by improvement in road-surface may be considerably greater than increase in road costs.

At the lower end of the scale the road costs form a very big proportion, because with an earth road—a little-used road—the effects of weather have got to be met quite apart from any traffic, and whereas at the bottom of this table the road and running costs are in the ratio of 2 to 1, at the other end of the table they are in the ratio of 50 to 1. I think it might be well at this stage to quote the recommendations of this Committee on the Economic Development of Rural Roads, written three years ago and published two years ago.

The length of main highways now declared (and including subsidiary main highways) is 10,408 miles, and of this length, 1,066 miles, or 10 per cent., has been made dustless. Without having the necessary information such as would be disclosed by accurate tallies, it would appear that a sealing programme of up to 500 miles per year may be justified as and when road crusts and alignment have been brought to a proper condition, and it is probable that in order to overtake the present position approximately 3,000 miles might be included in an immediate programme covering a period of the next six years."

Now, that report was made over two years ago. The proposal there was to tackle 500 miles a year for six years. In the last two years the roads have gone from bad to worse. It might be an exaggeration to say that of some of the highways, but they certainly have not improved. They have gone back. My proposal would be to tackle 1,000 miles a year for, at any rate, three years. That would not be tackling any more than the length recommended by the Committee, but it would be making up for lost time to the extent of three years. Of course, if that finished the job, then we would have to consider what to do at the end of three years. . . . As a matter of fact, if the tallies which have been requested by this Committee were obtained, preferably with the help of the Unemployment Board, the economic position as regards every stretch of the main highway would be known and the programme mapped out with a very considerable degree of certainty. Now, this work has been proposed as economic work on the supposition that 5 per cent. would be paid for interest, but there are very strong reasons, apart from the road question, why the rate of interest should be distinctly lower. I merely mention that to show that this work is not simply work which should be regarded as relief work. It is not. It is work that should be done if the country were on an even keel and employment were normal. A lot of this work should be done as a normal economic work, work which would well pay the expenditure. In elaboration of that recommendation, the Committee prepared a graph (Proc. N.Z.S.C.E., Vol XVIII,

p. 128). It is too small to be seen at a distance, and it would take some time to examine, but it includes in a small space information showing the state or the position at which it becomes economical to carry out capital expenditure on roads. I have prepared a note to accompany that graph.

The graphs show average costs of maintaining gravel road for different intensities of traffic and varying costs of gravel. It also shows the interest, sinking fund, and maintenance costs of these roads after they have been sealed—(*a*) making no allowance for saving in running-costs, and (*b*) making a very conservative allowance for saving in these (less than half the estimated amount).

(*a*) Ignoring saving in running-costs, a reduction in road costs alone may be expected when traffic exceeds—

250 vehicles a day and gravel costs 15s. per cubic yard.
400 vehicles a day and gravel costs 10s. per cubic yard.
600 vehicles a day and gravel costs 7s. 6d. per cubic yard.

If gravel costs 5s. a cubic yard or less, no saving, at any stage, will result in road costs alone.

(*b*) Allowing for a saving in running-costs of £50 per mile per annum for every hundred vehicles (actual estimated saving being £127) a reduction in combined road and running costs may be expected when traffic exceeds—

150 vehicles a day and gravel costs 15s. per cubic yard.
200 vehicles a day and gravel costs 10s. per cubic yard.
300 vehicles a day and gravel costs 7s. 6d. per cubic yard.

There are very few rural highways in New Zealand with a traffic of six hundred vehicles a day. There are quite a lot with five hundred, and still more with three hundred and four hundred, but where gravel is 7s. 6d. a yard or less no saving in actual road costs will result. To look for saving you must count in running-costs. But where gravel costs 10s. and 12s. 6d. and 15s. you will reduce actual road costs by spending money after allowing ample sinking funds to pay off the loan in the estimated life of the payment.

Dr. Sutch.] In short, you mean it is better to keep a road up than to repair it?—No. Take this contract that is being carried out between Papakura and Mercer. There is a road, the first two miles six hundred or seven hundred vehicles a day; the next fourteen miles about three hundred and fifty to four hundred vehicles a day. That traffic intensity has been near that figure for a very long time, and what I am getting at is that ten years ago it would have cost less in road costs—ignoring the saving in running-costs—it would have cost less in road costs to the county or the Highways Board or the country. I mean the actual total cost, however it was divided, would have been less if it had been sealed—that the interest, sinking fund, and maintenance on the sealed road and the interest on the old loan combined would be less then the present cost of the road.

The Highways Board knows that, does it not?—Yes. The Highways Board there is not to blame. I think it is a long-standing argument. The county wanted the road concreted all the way. They wanted a big subsidy and they also wanted the road concreted, and the figures did not justify it. I think the Highways Board, on the general argument, was correct. The second group of figures have been made allowing for a saving in running-costs of £50 per mile per annum for over one hundred vehicles. That figure is extremely conservative. That is the committee's report, but in another part of the report the saving is worked out at £127, and it is reduced to £50 purely on conservative lines. Possibly there are factors which have been overlooked, but the figure of £50 is a most conservative figure, and, taking that into account, the reduction in combined road and running costs may be expected when traffic exceeds one hundred and fifty vehicles a day with gravel costing 10s. a yard and traffic exceeding three hundred vehicles a day with gravel costing 7s. 6d. There are very few places where gravel costs much less than 7s. 6d. a yard. It means that wherever the density of traffic exceeds three hundred the roads should be sealed as a matter of pure economic results, quite apart from helping unemployment, quite apart from every other factor. With interest at 5 per cent. the traffic costs would be reduced and efficiency would be gained. Now, of the amount involved in this work I can give some rough idea. Taking first the maintenance, I think a previous witness, Mr. Haddow, mentioned £5,000,000 as the estimate of the falling-off in the capital value of the roads. Now, that figure was obtained between three and four years ago by officers of the Transport Department, by measuring the thickness of roads throughout the country at selected points, and it was estimated that thousands of miles of roads which were thought to be 6 in. thick in metal were only 4 in. thick, and that even where the running-surface was good the roads had deteriorated and the worn parts had not been replaced to the extent of 2 in. thickness over the greater part of the highway system in New Zealand, and we have 30,000 miles of gravel roads in New Zealand.

Mr. Langstone.] What would that cost?—To replace that it would cost £5,000,000.

A year?—£5,000,000 to make that good; but if it were done once the annual amount to keep it in order would be more like £1,000,000. Those figures can be checked from the table in the last Public Works Statement for 1933, page 121. Another figure which may be quoted as giving a general idea of the magnitude of the work is this—I will read an extract from a report prepared by the Engineer to the Highways Board: "To bring up the primary highway system to a standard approximately the same as the present road between Wellington and Napier, via Palmerston North, and to provide two-way bridges thereon, will cost approximately £25,000,000 and will take twenty-five years to accomplish at the present rate of expenditure." That was at the rate of three years ago: it would take a hundred years at the rate they are going now. "Even then there will be very many places on the primary system where a speed of thirty miles per hour will be unsafe." That figure of £25,000,000 can be taken as a rough indication of the work which is economically justified. Although that Highways Engineer was not saying that the whole of the highways system should be brought to that standard, the greater part should be done immediately, and, if a programme were made out, by the time the urgent works were finished an increase in traffic may be expected—at present it is actually falling off on roads, but within five years I think an increase may be anticipated. Bearing that in mind, before the urgent work is done the remainder of the present primary system of 10,000 miles will require sealing if efficiency is aimed at in getting the most economical road transport, and also in five years' time a further proportion

of the mileage of New Zealand will have been included in the primary system. One of the other items which I had included in the construction proposals was bridges, and I think I shall refer quite shortly to them on somewhat different lines. I have not made any attempt to work out the economic justification of the bridges, but that can be done. At the present time, according to the latest figures in the Year-Book, there are bridges in New Zealand built of native timber, 163,000 ft. in total length. With an average width of 12½ ft., that works out at 2,000,000 square feet; that is roughly the area. Now, these native-timber bridges are practically all old, as for some thirty years past the policy of the country has been to use either hard wood, steel, or reinforced concrete. I believe it is no exaggeration to say that the whole of those native-timber bridges should be replaced and that a number of them are in a highly dangerous condition now. Some are actually falling down. Those bridges have done their work, but the replacement of them is an urgent work that should be carried out. It is work that cannot be put in hand immediately, because every bridge has to be designed separately and considered —designed by the County Engineer and checked by the Public Works Engineer or the Highways Engineer. There is work of that sort in hand now, but it should be multiplied: it could be multiplied to the extent of bringing it up to £500,000 a year, and that would provide a programme for five or six years. There are some bridges wanted to eliminate railway level crossings, and, although I have no statistics there, I know of a case where insurance companies paid on fatal accidents in one year an amount sufficient to build a bridge.

Dr. Sutch.] The fatal accidents were due to faulty bridges?—No, to level crossings.

Mr. Murdoch.] Do you suggest that the railways should carry that load, or would you spread it over the Railways and Roads Departments?—I think the Railways should contribute something, but motor traffic should certainly contribute something, too. I am not sure that insurance companies could not contribute also. Obviously, on account of their losses in the last ten years on account of fatal accidents, they are interested. It is not a big matter, but it seems to me that as far as it goes it is a fairly urgent work in some cases. There are also cases where bridge-construction would shorten the roads, and, taking into account bridge-construction and road-deviations to shorten roads, there are cases where economic expenditure is justified on a strict accountancy basis, allowing 5 per cent. If the money were obtained by Treasury Bills at 1 per cent., so much the better. This expenditure on roads that I have been discussing should be handled by the Committee on the basis of aiming at economical expenditure allowing 5 per cent. interest.

Mr. Langstone.] In regard to the matter of booms and slumps. You anticipate that we are always going to have booms and slumps?—While human nature remains as it is.

You are an engineer, would you stand for a variation in the length of your link from day to day or month to month?—Not if I could avoid it.

Is that not as much affected by human nature as the measuring of the value of things?—No, because in measuring length it is possible to compare the length of steel bars over a distance between two blocks in the ground, and unless you have an earthquake those two blocks will stay put; but in measuring the value of money, which I take it is what you are referring to——

Money is a measure. You can measure something. You use a chain or a link for your measure. My money is the same as your measure. You would not stand for a variable measure?—Not if I saw any way of avoiding it.

If the human mind can conceive some just system of weights and measures, making it non-variable and do the job, why can we not measure other things as well?—In the past man has not been able to prevent general prices from rising and falling at any time, and as far as I can see he is not likely to prevent that completely, but what I am doing is suggesting one of a number of things, each of which will tend to make the variation less. I do not know any system which can be relied on to eliminate that altogether. I am putting this forward as something to mitigate it until the time when the value of money can be kept constant. I do not know any money system that can. I think there are a number of factors that can be worked to limit the variations at the present time.

We have always looked upon work to a very large section of the community as the basis of income?—Yes.

But we recognize that in regard to a few people it is not a question of work because they get incomes from other sources. I mean that those people who are considered to be wealthy would not have work as the basis of their income?—In many cases, no.

You cannot get anything unless it is produced by human effort in some form?—That is so.

On the question of meeting obligations, we say that we cannot do this and cannot do that because we cannot pay for it. It means that there is a lack of income somewhere, not a lack of commodities, just a lack of income?—Yes.

How is that lack of income brought about?—I think it would take a long time to describe what I think to be the numerous causes and I am not sure it is worth while.

That is what we want to find out?—My plan is intended to show that one cause is public expenditure going on quickly when private enterprise is busy instead of going on slowly.

Under your plan, if the amount of expenditure for one year was to be £10,000,000, you would keep it at £10,000,000. Some years it would be all public works and local-body works and in other years it may be private enterprise and public works and then perhaps in good times it might be all private enterprise?—Yes. When private enterprise is putting up blocks of buildings, houses are being built and factories are being built, go slow on the roads and bridges; and when those offices and shops and houses are not being built, do a bit more work on roads and bridges.

That is what we are trying to do to-day. When we had prosperity, or what we alleged was prosperity, in public-works and local-body expenditure and private-building expenditure, there was possibly £20,000,000 a year being spent?—Yes, something like that.

To-day that public-works expenditure is reduced to about £3,500,000?—I believe so.

Buildings expenditure to about £2,000,000 and £4,300,000 on unemployment ?—Yes.

So we have £9,000,000 of expenditure in various forms to do the job that £20,000,000 was doing formerly, and that is very largely responsible for the unemployment trouble to-day ?—The falling-off in building-permit values from £9,000,000 or £10,000,000 to £2,000,000 accounts directly for a very large number of the unemployed.

When you are going to deal with buildings under your Board of Works, we will assume that they take into consideration the question of building homes for people or possibly the erection of a big block of buildings because some insurance company wants to invest money that way and it will be a better commercial proposition than building homes for the people, what would be the means of adjudicating over a position like that ?—I would prefer that the Board of Works did not touch private building at all. I would advocate that the Board of Works should co-ordinate public expenditure only for the purpose of speeding it up or increasing it at a time like the present, and decreasing it when private enterprise starts again. I would allow private expenditure to find its own level.

Do you think we should allow private expenditure to be foolish in the expenditure of their money if they choose to do so ?—Yes ; but I should say that the Board of Works would reduce the probability of folly on the part of private enterprise by going slow. There was a case in America ten years ago when Hoover was asked by Coolidge, who was then the President, if he would recommend spending public money freely, and the report is given in a book entitled "International Labour Office, Unemployment and Public Works," pages 58 and 59. Hoover reported to the President that private enterprise was going very strongly, and he did not recommend the Federal Government to take active steps to spend freely, because he reckoned that would precipitate a boom. The book also gives a description of how, at Hoover's advice, the Federal Government slackened up on public expenditure and it was considered that for a couple of years after that action was taken private enterprise was so busy that there would have been an unhealthy boom development in 1925. As it was, there were slight boom conditions in 1924 and conditions somewhat of a slump nature developed in 1925. The Federal Government then spent its money, got better value, and to a large extent maintained employment on an even keel.

In doing all this work, such as building bridges to save lives and so on, seeing that is of value to the community and is a national asset, you would favour the creation of the necessary money to build that asset ?—Yes. I think at the present time the central bank would be justified in providing funds at a low rate of interest by short-term loans.

There would be no interest at all ?—I think there should be later. I think later on when times improve those short-term loans at nominal rates should be replaced by a long-term loan.

Why do you want that ? The asset is going to be there and we have the material and the men and everything in New Zealand to do the job and we cannot do it because we lack money. Would it be a wrong policy for the central bank, which has the right to issue money as the banks do, to issue that money against that particular work and get the work done ?—I think it would.

Would it be dangerous ?—I think it might. It might be a bad precedent. I think it might lead later to inflation.

Is it not inflation that we want ?—We want some, but we want inflation of a type and to the extent that it can be controlled.

How much deflation have we had in New Zealand ?—A good deal more than we want.

About £70,000,000 since 1929 ?—I think that is right.

People should not be scared—even 1929 was not anything exceptional—to spend another £70,000,000 and create money to make that good. If they have extra assets to represent that as well, would that be good business for the State ?—It would not be good business to force incomes back to £150,000,000 because of the fall in income from overseas exports. I think that if we tried to get back to £150,000,000 we would be getting into inflationary conditions which would lead us into trouble later, and that seems to be the only valid argument against such action.

I suppose if that meant better conditions for the workers who are receiving a miserable pittance on relief works to-day, they would not worry about inflation ?—No. I reckon that we could go some way in that direction, but we should not attempt to replace the income that we had when our exports were fetching good prices, as though nothing had happened.

Of course, I quite agree with you that the best road is the only road we should go for. Here is a question that is possibly arising : We know exactly what railway transport has cost, it is watertight ; we can get exactly what the cost of construction, maintenance, wear-and-tear is. It takes about £9,000,000 a year, and we collected about £7,500,000, therefore there is a debit of about £1,500,000 in our railway. About 90 per cent. of our material is carried by railway transport. We have got about £61,000,000 invested in railways. We know the whole thing, but when it comes to roads we have possibly got £60,000,000 invested in roads ?—More than that.

We have got about £7,000,000 invested in garages and various other things for the upkeep of motor-cars. We have about £40,000,000 invested in motor-vehicles of various sorts in New Zealand. If we take the capital cost, about £120,000,000 invested in roads, motor-cars, and for the upkeep of road transport generally ?—Yes.

And they do about 10 per cent. of the transport compared with the railway ?—That is not quite a fair comparison.

No ; we cannot make a comparison for this reason : a railway runs for many years ; a motor-vehicle runs for a few years, five or six years ; depreciation is ever so much quicker ?—What I meant is that it is hard to compare the road mileage or ton-mileage of roads and railways without some comment, because most of the stuff that the railway carries could not be carried at all if it were not for the road at the other end, and, of course, most of the transport on the road now is motor transport ; the two have got to be co-ordinated.

In your bridges—I have noticed repeatedly where you have railway and road running side by side—road and railway bridges beside each other. One bridge could have done both jobs ?—That is not the form I would recommend for co-ordination.

When all that money is saved, that means it is not going to be spent in that form ; it must be spent in some other form. The man who has got a motor-car has less money to pay in running his car and has more money for other things ?—If you take £2 out of his pocket at the beginning of the year and spend it wisely, you will get £3 into his pocket by saving him running-expenses.

Where does the other £1 come from ?—If it cost him £150 to run his motor-car one year——

Then you mean he would need less repairs to his motor-car ?—Yes, his tires would last longer.

Some one would lose a job. If that is going to go all over New Zealand, you will not want so many motor mechanicians ?—They should be doing something else ; they could be making the roads.

In the metamorphosis, the change-over, how are you going to spend that other money ?—That £1 ?

Yes, or the various other things ?—He may spend it on employing labour direct. When all is said and done, the farmers do employ labour and people in town do employ labour direct.

Do you not think there is a very big need in New Zealand to-day for not infusing money into society in that form, but to go the other way about it and to give the people who have no income, an income so that they have the effective demand for goods ?—I think the best way to get money into circulation is to see that a man has a job which he can feel some pride in carrying out, and let him earn his pay, and this is the type of work that is required. There is a lot of relief work done on which men cannot help feel that they are wasting their time.

On a farm you get routine work ; if you are milking cows the job has to be done night and morning ; in a factory it is a routine job, but when you come to capital expenditure such as you are suggesting, once you have done it, other than maintenance you do not need to have expenditure again ?—This roadwork will not be done in a year. I just gave an idea. There is probably £25,000,000 of work to do ; say at £3,000,000 or £4,000,000 a year, that will last an appreciable number of years.

Mr. Clinkard.] I very largely agree with you, Mr. Gray. The deflation that came about in New Zealand, was that owing to our overseas trade ?—I think, unquestionably.

And you are not so much in favour of inflation as reflation ?—Yes. I think you have got to fight deflation with some inflationary factors.

I quite agree with you. At the same time, you recognize the danger of going from that into the inflationary policy ?—Yes. In my typewritten notes I said the only valid argument against spending freely at a time like this is that possibility which must be borne in mind.

No doubt you have had the same experience that I have had, that whenever the time comes to slow up, there is always a very strong protest against doing so. The public—particularly the unemployed—are always in favour of a development policy, but no matter what the other conditions were there would be an objection when the time comes to slow up ?—That unquestionably has got to be faced. It seems to me that we should recognize that the standard of education in this country is such that if you have a policy designed to last for a number of years, the thing is obvious that some good may result from slowing up in good times and speeding up in bad times.

I have favoured that for many years. In connection with your proposals for road development, I daresay you have considered improvement in grades and also road tunnelling to obviate grades ?—In one of these reports that matter is referred to and a rough rule was worked out that an expenditure of £1 is justified for every 1 chain reduction in length for two vehicles a day. That is a rough working-rule.

There is another activity that might be very well carried out, and that is tunnelling to divert water-channels in order to obviate bridges and their reconstruction ?—Yes, there are a lot of individual works of that sort which would require more detailed planning than the maintenance and sealing referred to.

I presume you would advocate in the first instance materially improving feeder roads which would help railways rather than injure them ?—Yes.

In fact, most of our roads that are competing with the railways are in fairly good condition. It is those which are leading away from them in many instances where work is required ?—I may say that these reports of this Committee have so far dealt with main highways ; they have not yet tackled the secondary system.

Quite so. Have you any acquaintance with the Parapara Road, from Wanganui towards the Chateau ?—No.

There is room for quite a lot of your energies on that road, and the question of tunnelling and so on to obviate acute angles and heavy grades ?—That is where traffic tolls are wanted.

My colleague, Mr. Lye, raised the question of the Public Works Department as against your proposed Board of Works, but I take it that your Board of Works would have as its objects a Board free from what you would call pressure to carry on certain works ?—As far as possible. The Main Highways Board has dealt with a special job ; I think it has dealt with it well in the main. The job of the Board of Works would be different ; it would probably be more exposed to pressure, because it would be dealing with the total amount of expenditure, but because there is so much expenditure outside the Public Works Department——

I think you would know that in any undertaking of that sort, whether it is under the Railway Board or the Government, engineers and their staffs build up a connection and are usually loath to reduce expenditure, that is so ?—Yes.

That is the usual operation, and consequently a non-influenced body when it came to a question of determining that they were going to reduce expenditure for the reasons given above would be better ?—But there is this about it : Every year there are certain new works coming on, and my proposal is not so much that regular works like maintenance (which goes on all the time) should be varied—that

there should be a routine expenditure expected—but that in the number of new works coming in most of the slack should be taken up. At a time like this that is not sufficient. The present times are exceptional, I think.

You would say your proposed Board would assist the Public Works Department in controlling the period of expenditure ?—Yes, I would suggest that the Head of the Public Works Department should be a member of the Board, and that the duties of the Board should be to advise not only the Public Works Department, but the Railway Department and the Post and Telegraph Department and any other Department that spends at all freely on constructional work, and to co-operate with the Local Bodies' Loans Board. It would be useless if the Local Bodies' Loans Board were encouraging local bodies to spend and the Board of Works discouraging them. They would work also with the Central Bank Board.

Mr. Munro.] I want to get at what is in Mr. Gray's mind as regards this advisory Board. Would you give them arbitrary power such as the Local Bodies' Loans Board has got ?—No ; I had not cleared my mind to the extent of trying to draft out their powers, but my idea was that in the main that should not be more than advisory, because it must be the duty of Cabinet to say what the policy of the country is to be. There are times when, in my opinion, there should be a go-slow policy in spending, and there are other times when work should be speeded up, and it should be the duty of the Board of Works to keep in touch with all the Departments and advise.

As regards local bodies and public works, would you simply have them as an advisory committee to the Local Bodies' Loans Board ? You say you are co-ordinating those two organizations ?—I would expect the Board of the central bank, the Board of Works, Local Bodies' Loans Board, Highways Board, to be in touch with each other. The Main Highways Board has so far been in the position of spending what it is given, but it is in a position to advise as to whether expenditure on the roads is urgently needed or not.

You would only set up this Board as an advisory Board, both as regards Government public works and local-body public works ?—Yes ; I do not think you could give the Board the powers over the Departments. I do not think that is advisable.

That is a point I quite realize, but how about in connection with local bodies ?—I would expect it to work in with the Local Bodies' Loans Board. That is already in existence and doing good work, and that at the present time the Board of Works should confer with it and ask it if there is any way in which it can encourage local bodies to undertake useful work.

Under certain conditions ?—Yes.

Then under certain other conditions, normal conditions, you would expect this Advisory Board to advise the Local Bodies' Loans Board to refuse the loans if applications came in ?—Yes ; refuse some of them.

Do you realize you would be taking away the prerogative of democratic local government ?—That is already in existence in the Local Bodies' Loans Board.

Up to a point ?—I would not go beyond the point ; I think it has quite sufficient deterring powers.

The Local Bodies' Loans Board has power now, but they do not take into consideration the economic times we are passing through ?—The only consideration they take up is : Are the work and the loan justifiable from a monetary standpoint ?

Is it not a fact that by fixing the rate of interest, they can practically refuse ?—That is what they do. And that actually by having the Secretary of the Treasury on the Board they have been doing some of the work that I propose should be done by the Board of Works.

Were you going to step in and give to some other Board some arbitrary power that would defeat the prerogative of the people ?—I consider that the Board of Works, while dealing with the bigger total, would probably have somewhat lesser powers than the Local Bodies' Loans Board has now.

The Chairman : That stands to reason.

Mr. Munro.] It would need to. As you know, this is a Monetary Committee. While I have been very much interested in your explanation of the position as regards our roads from the civil engineer's standpoint—I think you have given very valuable evidence there—what we particulary desired is some monetary reform suggestions or plans. You have quoted Professor Pigou this morning, and in your statement you refer to Bowley. I presume you are quite conversant with the Reserve Bank Act and the Reserve Bank that has been set up ?—I have studied it fairly closely.

Do you think that that central bank would be able to finance satisfactorily local-body and Government undertakings ?—Yes, if it so desires.

That is, if it is administered for that particular purpose ? Yes. You do not believe it is necessary I take it, that some new form of monetary control should be brought into existence ? Have you given that any study at all ?—As a matter of fact, I have discussed this matter with Dr. Finlay and Mr. Haddow for a long time, and I am in very close agreement with the proposals which Mr. Haddow put before the Committee. I consider them evolutionary. I do not know any new scheme I have heard proposed that I think would work better than the present one with emendations. At the present time the trouble is due partly to faults in the system, and partly inability to know what is going to happen next year.

Captain Rushworth.] You suggest the opening of extensive public works in times of depreciation and closing them down as times of prosperity come along ?—As a matter of fact, that is assuming a bad depression and a bad boom. If this governor combined with other governors mitigated the severity, it would simply be a case of slowing down a bit and hastening up a bit.

You would finance them by internal loans ?—In the long-run, yes ; but at the present time I think by Treasury bills.

Is not that an internal loan ?—Temporarily.

Those internal loans would involve extra taxation ?—Yes.

So that in times of depression you would get a rising taxation ?—Not if the borrowing is carried out with the assistance of the central bank. At the present time in England the rate for Treasury money has been ½ per cent. or about that for over twelve months.

Do you mean the Treasury bills we are accustomed to deal with here in New Zealand ?—The same kind of thing, but only ½ per cent. on them.

You know these Treasury bills are issued in anticipation of revenue ?—Yes.

Is it not a fact that if you increase these Treasury bills or increase the governmental borrowing, you must of necessity increase taxation ?—Yes, but for that reason I have advocated work, and this Committee of Engineers has done so, only in which savings would be made which would more than offset the expenditure. If you take £2 taxation out of a man's pocket and save him £3 in expenses, he is not less able to bear it, but better able to bear it.

The net result would be that in times of prosperity you would have a falling taxation and in times of depression, a rising taxation ?—No, I do not think so. Suppose during the time of depression you finance your works substantially with short-term money at 1 or ½ per cent., and when your prosperity came you floated those into long-term loans ; that could be done. It is a banker's business more than mine ; so as to work in with the regulation of the economic machine.

Do you suppose that the Treasury bills for the short-term loans would not carry interest and sinking fund ?—Yes, but very much lower interest. They would actually increase taxation in the sense that it is an additional loan, but they would not increase it a great deal, and in times of prosperity this would be floated and then your taxation would increase. If the work were worthless, it would be a dead loss, but if the work is selected on the business principle of paying 5 per cent., the country will be actually paying more in taxation, but will be better able to pay it. Its transport will be more efficient.

Public works should be revenue-producing ?—More cost-reducing that revenue-producing. The transport costs are £30,000,000 ; £7,000,000 road costs and £23,000,000 running-costs. Increase the road costs to £8,000,000 and reduce the running-costs to £21,000,000 and the total is £29,000,000, instead of £30,000,000. The figures prepared show that there is a great deal more direct saving to be made. In ten years' time this particular argument may have ceased to have great effect, but there are thousands of miles of roads in New Zealand upon which capital expenditure should be made from the point of view of business efficiency.

We might agree with that, but my colleagues might suggest to you, where is the money to come from, and your answer to that is Treasury bills which are funded.

Mr. Murdoch.] I am very interested in Mr. Gray's evidence, and there are one or two points that have occurred to me. With regard to the question of grades, is it not a fact that with your present surface system that does not affect you very much ?—Not a great deal. I had not mentioned the question of grades.

Mr. Clinkard mentioned it ?—The grade does come into it, but you are quite right that with road transport grades are nothing like so important as with railway transport.

You are more inclined to sealing than to concrete ; will you tell us something about concrete ?—In this Committee's report (I cannot give you the reference at the moment) the opinion is expressed that a road does not justify concrete until it has got 3,000 to 5,000 vehicles a day on it—that is the Committee's report, and I signed it. I would have been prepared to see a lower figure of, say, 1,500 to 2,000, but the argument is not affected. Outside the cities in New Zealand there are very few miles of highway that carry as many as 600, so that whether the true economic point is 1,500, 2,000, 3,000, or 5,000 for concrete does not matter. Outside the cities there are no roads in New Zealand which economically justify concrete.

Look at it this way : You have here cement-works—quite a number of good ones—by using concrete you have your labour here and money in your own country. As against that a lot of your money goes out of the country when you have tar-sealed surfaces ?—In that connection the figure is worked out here. This point was considered and quotation is made from a report by an engineer who furnished figures comparing the length of a road 18 ft. wide which could be surfaced for an expenditure of £10,000 worth of bitumen compared with the length that could be surfaced with an equivalent amount of cement : 4·03 miles of concrete road ; sixty-seven miles of sealed road. He worked it out for varying types of bitumen, asphalt, concrete, and so on ; but while they are all very well for city roads, the important comparison is on rural highways which comprise the vast bulk of the mileage of the country. I would not have made the figures quite so outstanding. It is a question of estimating, but I do not think you can alter the figures a great deal.

Is your sixty-seven miles inclusive of laying down ?—No. That figure, £10,000, is for bitumen only. The point is this : That that works out at £150 a mile for bitumen on work that would cost £3,000. That means that of these millions that we propose to spend on roads 5 per cent. would go for importing bitumen. That figure might be raised to 6 per cent. or 7 per cent., but it would not go beyond that. Five per cent. is a shade on the low side I think, but it is substantially accurate.

I do not think we are quite on the same mark. What I am trying to get at is this : We have a lot of what we call country roads to-day. I am not referring to Auckland City or anything like that. In the South Island running up from Christchurch to Blenheim they have a lot of these roads that they have done up with their scarifiers, and they have miles and miles of gravel, but what I want to get at is this : We have in the North Island here many roads which it appears to me it would pay to put a dressing of say 9 ft. of concrete and have a permanent road. Now, assuming that we put down, say, 4 in. of concrete, I know it will be said that that will not stand, but we know that it does stand. Would it not pay us to increase our actual capital costs, our initial cost, even if it were £6,000 to the mile against £4,000 to the mile bitumen ? Would it not pay us to increase that cost in the initial stage and so get a greater length of time that the road would carry, and employ our people and material ?—I think the best thing I can do is to refer you to the Rural Roads Report (Proc. N.Z. Soc. C.E., Vol.

XVIII). That thing is threshed out there, twenty or thirty pages of it, and I agree entirely with the report. I think that there is too big a difference in the costs, and when you say that a 4 in. concrete road would stand, the consensus of engineering opinion that I am in contact with is that a concrete road must be made to a high-class specification or not at all.

Have you seen that new Skram method ?—Yes. As a matter of fact, there has been a bit of work done over the other side of Birkenhead here, that I thought was very promising for a start.

That is more expensive though ?—Yes. But the 9 ft. road I do not think is desirable. One of the advantages which is commonly overlooked is that the sealed road lends itself to continuous development. When your traffic is one hundred vehicles a day you cannot think of concrete. Your gravel or metal road does, and your maintenance costs so-much. When your vehicles get to two hundred a day your gravel or metal road still works, although if you are paying 15s. or £1 for your gravel it may be cheaper than to put sealing on it, but you can have one-coat sealing if your road has been kept properly. £3,000 a mile need not be spent at all. I mean, not much over £1,000 a mile will seal your road. I have not got the exact figures, but recently the local Public Works Department did a bit of one-coat sealing on that Bombay deviation, and I think it cost 8d. a square yard. Now, concrete alone costs 8s. a square yard on a standard road, so it is twelve times the cost in that case. Now another comparison : The figure is not in the relation of 3 to 6. I mean, the £3,000 a mile includes a lot for work that very often is not required. There is a road not far from here where concrete was laid where it was not justified, and there was a railway crossing in it and because of the railway-crossing a length of 12 chains was laid in bitumen. That was a job done in one contract at one time. The costs were as clearly comparable, as you could see. There is no question that the concrete was laid to a very high specification, the Main Highways Board, Type 1, but they have only one specification for concrete, and I think they are right, and that is the best. The figures I was going to mention on that road are the bitumen surface cost £18 a chain and the concrete cost £90 a chain.

I notice your statement here is a plan to control public-works expenditure ?—As well as other public expenditure.

Yes. Have you ever tried to work out any plan about the banks ?—On general lines. I have discussed the general monetary problem with Dr. Finlay and Mr. Haddow at great length, and I subscribe to the plan which Mr. Haddow put in.

I thought you said you discussed it with Dr. Finlay, too ?—Yes. The three of us have discussed it.

You do not adopt his view, do you ?—In part, but not generally.

Dr. Finlay said this the other day : He said the administration of justice was not in private hands. That was a State matter. The banking and finance and credit systems he said he would not leave in private hands either. You would not go as far as that ?—I would say this, that the present Reserve Bank, if properly handled, is very nearly a fully democratic institution as carried out.

Let me see what your idea of a democratic institution is. The Government have £1,000,000 paid into this bank and the shareholders put in £500,000, and after the first appointment of the Governor or Deputy-Governor expires the control is in the hands of private individuals. Is that democratic ?—Democracy consists of private individuals.

You say it would be democratic to allow the control of central banks to be in the hands of private individuals ?—It depends on the number entirely. You say it should be in the hands of all the private individuals. I say if it is in the hands, of, say, 50 per cent. of the electorate it is very democratic. If it is ½ per cent., no.

You know, of course, something about banking shares. How many of the working-people of the electorate have shares in banks ?—These are only £5 shares. The present times are abnormal, but I think that in normal times most workmen in New Zealand would be able to buy a share.

You think this Reserve Bank Bill is all right for the control of finance ?—Yes ; I like it.

Mr. Munro.] If it is properly administered ?—Yes. It depends very largely on the personnel of the management. It must, and it always will. It does not matter what your constitution is.

Mr. Schramm.] And you say the other banks are all right too ?—No. I think the position is quite different. I agree entirely with what appeared in Mr. Haddow's report about the Bank of New Zealand. I think that we, as a country, have made a mistake for the last forty years. The State has nominated four directors, and it has omitted to tell them that they should regard themselves as trustees for the people. I think that is the position : That they have allowed them to go on the directorate of the Bank of New Zealand regarding themselves as commercial directors, and I do not think there is any need for any change in the legislation. If they had merely said to them, " This appointment, of course, is that of a trustee," I think if that had been said for the last forty years the control of the bank would have been very different from what it has been.

This scheme of yours, you say, is to control booms and slumps ?—To mitigate the effects of them.

Will you agree with me if I say that in my opinion the booms and slumps are caused by the present financial system ?—Not entirely.

Well, to what point do you agree with me ?—It is very hard to define, but if, by the present financial system you mean the present condition of education of yourself and myself and everybody else, I would say, " Of course, the whole thing."

But do you think that this present system has been produced by the banks by deflating money ?—Only partly. It is partly due to war debts and the last war. You need not go back beyond the last war, but you can make a long list of causes that have nothing or very little to do with the banks. The banks did not make the Versailles Treaty, and there are quite a lot of things in that that seem to me to have a very big bearing.

When the war was on there was plenty of money about, was there not ? Things were prosperous ?—Yes. But there was inflation.

What caused the deflation after the war ?—As I say, various causes.

The banks calling in overdrafts ?—Partly. I should say that the Cunliffe report unquestionably had a lot to do with the monetary policy of the Empire from 1918 onwards.

In connection with the public-works policy do you say the Government should borrow money by Treasury bills or otherwise ?—During a slump, yes.

They should borrow ?—Yes. From the central bank. It is another name for creating credit.

But they would not pay any interest would they ?—½ per cent. is not much. I think I would pay ½ per cent.

Would you go outside New Zealand for money ?—I do not think I would. It seems to me that on general lines there should be money invested in New Zealand from Britain in the future, but not through the Government.

You think it is not necessary to go outside New Zealand for any money at all to carry on our public works in New Zealand ?—Not now. When we were buying railways and engines and hydro-electric machinery I think there was a lot to be said for buying some of that on credit.

Mr. Lye.] Mr. Schramm has asked you a series of questions. I take it you mean that the causes of the present depression were largely non-monetary factors, and that as far as the banks are concerned and the policy of the banks, that has been largely the reflection of non-monetary factors, which were incident during the war and after ?—Yes. I do not know enough to say whether the non-monetary were more important than the monetary, but I am sure there were a lot of both.

Would you say there was no shortage of money in New Zealand to-day, having regard to the deposits in our banking institutions ?—I should say that they give the impression that there is no shortage.

I put it to you, it is not a question of the people who own these deposits not spending it. Is it not rather through a want of confidence that people are not prepared to borrow from any institution at current rates of interest, because of the low price-level ?—I think so. And that is why I consider that as an objection to public spending. I think lack of confidence is a big factor at the present time.

Your method of planning and controlling of public expenditure, could it not also apply to land-development. In times of depression or slump periods, the cost of development of land would be correspondingly low, and your proposals could be the basis as far as public expenditure is concerned for almost any State activity ?—Yes. I would say this: That any activity of that sort which shows a prospect of paying 5-per-cent. interest could be undertaken.

In other words, many of our public activities in times of prosperity and high prices might well be left to private enterprise, but in times of great difficulty the planning and controlling of public expenditure would only O.K. suitable undertakings, and that would be the time to offset a period of low prices ?—Yes.

I think that is sound. I entirely agree. Now, what I want to get clear is: Can you give us an idea what the constitution of that Board would be. Would it be an amalgamation of the Highways Board, Public Works, and Loans Board, and, say, the Railways Board, as far as national undertakings were concerned ?—No.

Or a representation from the lot ?—I am not sure that I would have representations from anything but the Public Works Department, and possibly the Railways Board. The job seems to me a different one. The job of the Railways Board and the Public Works Department control is the actual spending of money. The job of this Board would be to discuss the total amount that should be spent.

It would act really in an advisory capacity, but would not be in the position of preparing plans and estimates ?—No; it should be in the position of passing opinions.

With power to veto or prevent any of what they considered were uneconomic undertakings ?—I put it to Mr. Munro that I did not think you could give this Board the power of veto. It is too closely connected with public policy, and all it could do would be to advise.

Purely an advisory capacity ?—I think in the main it would have to be.

Dr. Sutch.] In your scheme you are going to vary exchange-rates slightly to mitigate the effects of booms and slumps. Would you devalue the currency at 125 per cent. as a permanent normal about which this variation should take place ?—I would be in favour of that.

WELLINGTON, TUESDAY, 6TH MARCH, 1934.

Proposals submitted by Mr. F. W. MOORE, Wellington.

Borrow £10,000,000 by bank overdraft or Treasury bills, re-employ fifty thousand men on all kinds of necessary public works, roads, bridges, drainage, building, and maintenance of all kinds, where necessary, at £4 per week average, 50,000 for fifty weeks = £10,000,000. These men spending this money would reabsorb the balance of the unemployed, about thirty thousand, back into their ordinary vocation at an average of £4 per week. Impose a wage-tax of 10 per cent.; this would return £1,600,000. Restore the 20-per-cent. cut to all other citizens. A wage-tax on these people of 10 per cent. would produce about £9,000,000, so the loan and interest would be more than provided for the first year, this good cycle going round would continue by its own impetus; if not, the wage-tax could be retained at 5 per cent. or 10 per cent., this would keep all people employed. The people having been provided with the spending-power, this would mean they would purchase their usual amenities. This would also mean a large increase in importations resulting in improved returns from Customs duties. The increased importations will mean more employment for workers in Great Britain, enabling them to purchase more of our exports at a more satisfactory price to the producers here. The increased and improved trading conditions here would mean increased returns from all sources for the Government. The Government would receive interest and rents from the many thousands of tenants who now can pay nothing, larger returns from income-tax, &c. Sales tax could be withdrawn.

Witness: Mr. F. W. Moore.

Mr. Moore: Mr. Chairman and gentlemen—As you see by my proposals they are not very difficult to understand, I think, and I am not going to trouble you with anything very difficult. You may think, from the reading of the newspapers of the last few days, that I might have something to say derogatory to the banks, but I can assure you that I have not. My personal feelings about the banks are that they are very necessary institutions and organizations, and I do not think we can possibly do without them. I do not suggest for one moment that they are faultless. They are just like ourselves. I do not know that you can introduce any better banking system than we have got to-day. The banking system has been evolved for some hundreds of years, and as I said before, it might just have a few faults, but if we carry on we might be able to remedy them as we go along. I would like you to allow me to give you my idea of the cause of the slump, to start with. My idea of the cause of this slump is that the cause of the slump started in 1929 in the United States of America. You possibly remember that in 1928 President Hoover was reported to have said something like this, "We have succeeded in defeating adversity and we are on the road to permanent prosperity." That was in 1928. And in 1929, as you know, something struck the financial condition of America. It was something like this that happened: People had gone to the extreme, and, as you know, extremes are never good in anything, in nature or anything else. You get into trouble if you go to extremes. Now, they had been going to extremes in speculating and financing in the United States of America, and the big financiers at the top said something like this, "We will have to stop this or else there will be ruin." So the big man put the lid on the man below. That man put his lid on the man below again, and so it came right down to the small banks and from the small banks on to the small traders. Small traders then had to put men out of employment. The men got out of employment and they wanted to know what was the matter with the country, and they jumped to the conclusion it was on account of the importations coming in from Europe and Great Britain, and they said something like this, "We will have to go down to Washington and tell those people down there that they must put on tariff barriers to stop this stuff coming into the country." Well, something like that happened. They went down to Washington and the people at Washington put on the tariff barriers, as you know, but they did not realize when they put those tariff barriers on that they were stopping exports as well as imports, because, as you know, imports are only bought with exports, and by stopping imports coming in and the exports going out of course the situation got worse and worse. Of course, the stopping of the imports from Great Britain and Europe had a great effect on Europe and Great Britain. Then, you will remember, there was a Disarmament Conference about the same time, and what happened? The Disarmament Conference decided that they would discontinue constructing armaments and building ships, and decided to reduce the navy, and as you know Great Britain reduced her navy by 47 per cent. Now, you do not require very much imagination to realize what it means when there is only one ship put out. The personnel of one ship of about a thousand men means about £5,000 going out of circulation per week. But she reduced her navy by 47 per cent. Well, it meant these seamen and officers all going on to the relief work, to be numbered amongst the unemployed. No armaments being made; no warships on the stocks. Such a thing had never happened for many many years. And, as you know, European countries have followed suit, and they stopped building armaments and buying armaments, with the result that the great armament trade of Great Britain just practically stopped and all those thousands of people went out of work on to unemployment, and it was the lack of their currency and then the lack of confidence or the fear that people got, that created the unemployment in Great Britain and Europe. Then it followed to New Zealand. You know as well as I do what happened in New Zealand. The Government said something like this, "We will have to be careful. Look what is happening in America and Great Britain. We will have to be careful. We will have to stop this and stop that." All functions were stopped, Sunday school picnics and socials, and everything was stopped to economize. Most of these things were stopped, and then what do we find. We find the Public Works Department putting off men. All the public works in the North Island and South Island were stopped; the railway from Napier to Wairoa, from Rotorua to Taupo; ease down on Tawa Flat; ease down on Stratford to the Main Trunk. All these public works were stopped, with the result that all these men who had been brought into this country for nothing else but pick-and-shovel work were thrown amongst the unemployed and their currency was all stopped, with the result that one helped to put the other out of work. One bank in particular advertised, "Put your money on fixed deposit," and, as you know, people took the advice, with the result that we have millions of money on fixed deposit, so this money now is locked up and people have lost their confidence.

Mr. Schramm.] What bank was that that advised the people to put their money on fixed deposit?—Well, you know the bank. The less said about it the better. Then, we have the sad spectacle of a Minister of the Crown taking a lot of praise that the Government had saved £6,500,000. This is about last March. He was speaking at a dinner, and he said, "We have saved £6,500,000 on public works in two years." Well, I could hardly keep my seat because I thought, instead of being pleased about it, he ought to have been ashamed of it, because that was one of the causes of all the unemployment in New Zealand, the stoppage of the public works. One of our Ministers boasting about it; thought he had done something great, when, as I say, he ought to have been ashamed of it. Then we have the Government interfering with exchange. Well, I do not want to bring up a lot about the exchange. The manipulation of exchange is neither more nor less than playing pak-a-po, and the Government gaols the Chinese for playing pak-a-po. When you play pak-a-po the few win, the majority loose, the bank gets the rake-off. When you manipulate the exchange the farmer wins, the general public pays, and the bank gets the rake-off. I have gone to the trouble on two or three occasions to speak to some of our leading men on this question, thinking that I might get them to see my way of thinking.

A Member.] Would you mind telling us who the leading men were?—Well, I can give you the names afterwards. I do not just like to bring them up here. The man I am going to speak of, first,

is a man whom the Government consults, one of the leading business men in New Zealand—not only in Wellington, but in New Zealand; and I know the Government consult him on these questions. I went to see this man last June, and in the course of conversation he said that he had been addressing teachers at the teachers' refresher course in Auckland in May last. He had his address printed and he gave me this book to look at. And I looked at it and I saw this, "New Zealand is the most dependent country on other countries of any country in the world." And to prove this he goes on: "You have only to look at our enormous exports and imports." I had to tell him that to my mind he was diametrically opposite to me, and I made the opposite deductions. New Zealand is the most independent—not dependent—the most independent of any country in the world. At that particular time every stitch I had on me had been made in New Zealand—boots, clothes, underclothes, and everything else—had been made in New Zealand. We do not have to go out of the country for our food. We have the best food in the world. We make as good clothing as anybody—that is, for comfort. You will get the best clothing and boots, &c. We have no need to go out of this country for anything, so therefore I claim that we are the most independent country in the world, and to prove that I say you have only got to look at our exports. What are our exports? Our surplus. And what are our enormous imports? Our second necessaries, or our non-essentials, but our requirements; what we want, but not what we need. If it came down to tin-tacks, as the saying is, we could do without most of our imports, but we do not want to do without them. We want to import as much as ever we possibly can. That is one. Now, here is another. This happened when the riots were on in Wellington about two years ago. I am just giving you these instances to show, to my mind, the wrong thinking of our leading men, our leading citizens. I went to this man the morning after the riot occurred about two years ago, and I said, "This is a shame to see these men destroying innocent people's property, smashing windows, &c." He said, "Well, what would you do about it?" I said, "I would see if I could not induce the Government—a man like you, you are in a position to get a number of the business people together and wait on the Government—I would see if I could not induce the Government to make these men contented. I would give a single man £1 15s. a week and married man £3 5s. as a minimum." He said, "What would you give a single man £1 15s. a week for?" I said, "To pay his landlady, and buy a few necessaries—cigarettes, &c." He said, "Would you give a single man enough money to buy cigarettes?" I said, "I am a non-smoking man myself, but I know that the average man to-day looks upon smoking as a necessity." He said, "I think it is a bad habit." "But," I said, "you have just lit a cigarette yourself." "Yes," he said, "but I think it's a bad habit all the same." "Well," I said, "the average man enjoys it like you are and he is going to have it if he can. If you are going to stop everybody smoking, are you going to improve the economic position of the country? Certainly not. You are going to put the growers, the factories, the distributors out of work. There are thousands of pounds spent in the growing, manufacturing, and distributing of cigarettes and tobacco in New Zealand. That sort of thing will not help the community." Then, another leading citizen. He said something like this. I was speaking at a public meeting and afterwards he said, "Mr. Moore said that this depression started in America in 1929. I would like to tell Mr. Moore that this depression, as far as New Zealand is concerned, started forty years ago when the Arbitration Court gave artificial wages to the workers." Now, that kind of stuff from public men—you can quite understand why it would lead us all into the workhouse.

A Member.] We are not considering that here to-day.—Well, I want to lead up to what I am going to say. This man said artificial wages given to workers forty years ago. Less than forty years ago you could go into Jacob's Place, off Tory Street, and you could see the women going to the pump to get their water, the community pump for the whole street. Now what did it mean? It meant no drainage, no water, no plumbing, no electric light, no amenities at all. It meant no work for anybody. If we come down to forty years ago, why we would have everybody out of work, practically. We want to have all the amenities possible. In speaking to a lawyer here in town about a couple of years ago—he was speaking on this economy business—he said he had a client in the other day who said he lived on 1s. 6d. a week. I do not know whether any of you gentlemen have been in Ireland. I have seen them in Ireland myself eating potatoes off the bare table, not a fork, not a spoon, or a cup. They would have a mug of buttermilk and the potatoes tipped on the centre of the table. And the second Head Constable of Liverpool came out of that same cottage where I saw his father and mother and sister and brother eating a meal like that. Now, this lawyer's client was a Shetland Islander, and if any of you gentlemen have been in the north of Scotland in the Shetland Islands, you know how frugally those people can live. But we do not want people to live down to that. We want to bring them up. We want to let them have every amenity we possibly can. I have come here to tell you how to do it. We want people to have all the amenities because it is luxuries that make trade. You may remember last year you saw in the Wellington papers where American women spent £36,000,000 on beauty culture in one year and £12,000,000 on millinery. A lot of people would say that is an awful waste, but it meant the employment probably of a million people at £1 a week for one year. It is providence that makes wealth. A lot of people cannot understand that. They seem to think that it is money. Well, as you know, gentlemen, you have heard it time after time, that money is not wealth. Money is only the means of exchange. Now President Roosevelt, as you know, was blamed for the breaking-up of the London Economic Conference. President Roosevelt was not to blame at all, because I will give you my reasons, and this is all leading up to what I am going to say is the remedy. When the London Conference was sitting something like this happened. We had our delegations from New Zealand, and delegations from other countries. President Roosevelt was in telephone communication with his men and he said something like this, I expect, "What is happening over there?" "Nothing." "No new suggestions?" "No." "Nothing constructive?" "No." "Well, you had better come home. I am satisfied that the remedy for this is internal first and not external first." As you know, gentlemen, he got his delegation back, and he was blamed for breaking up the London Conference.

What is he doing ? He started off by employing the people, by raising billions and billions of money. He got condemned for that, but what does it matter. The billions of dollars that he is raising he is only raising in his own community, and he has put, so we are told, about seven million people to work. We are told there will be an awful financial smash. Supposing there is an awful financial smash. Where will the money go ? With all the smashing, the money will still be there. It will only mean that one financier has got it and the other fellow has not, and it will still mean that six or seven million people who were down on the bottom floor or below the bottom floor are now getting maintenance. They are getting work, and is it not better to feed seven million people even if a few financiers lose their money ? Of course it is.

The Chairman.] Mr. Moore, in your statement you have made certain suggestions to the Committee. I do not want to see you cut short, but I want to point out to you that the Committee will want to ask questions, and I am hoping that we will be able to get through in the time ?—I will just give you another illustration of what I was saying. A fortnight or three weeks ago you gentlemen may have heard Mr. Schofield over the air. He gave an address on Venezuela, and he pointed out that Venezuela was in the best financial position of any country in the world and all through her President, who, he said, was illiterate. He had done what I am going to propose New Zealand does. Start employing the people on work amongst themselves with the money and the finance raised from other countries from the surplus exports. My proposal, which you have before your is this, that the Government will raise £10,000,000 of money either by overdraft or Treasury bills. They then start off all the necessary public works—the necessary public works, understand—throughout New Zealand. When they start those men working with that £10,000,000 of money, that currency must automatically put practically all the other unemployed people back into work. Now, when those people are brought back into work the merchants and the capitalists and everybody else will be doing well, like we were all doing about 1924 or 1926 ; and, as I suggest, in order to do that you first of all restore the 20 per cent. to all those people who were cut and then you charge every one a 10 per cent. wage-tax, liberating over £10,600,000. You have got that money paid off, and you have got a cycle of prosperity going, and all the people working. If you find that you require some more money, you can still retain the wage-tax and you will get the money. The solution of this problem of the depression is so simple that it is the simplicity of it that confuses and confounds most people. I do not come before you and say the banks are to blame for this and for the other, because I do not believe they are. It is the lack of intelligence of our own selves to see the cause and the remedy. That is practically all I have to put in front of you. I will be pleased to answer any question.

Mr. Clinkard.] You say we must get away from the idea that the Great War is the cause of this economic depression ; that is quite wrong. You have read the report of the MacMillan Commission in the Old Country, have you not ?—I have not read the report, but have read extracts in the newspapers.

You are aware of the very complete capacity of that Commission ?—That is quite possible, but I still adhere to my statement.

Of course, if you have not read their report you are not aware of their finding. On page 93 they say, " In particular, war and post-war non-monetary causes led to the great and unwanted flow of gold to the United States from which such vital consequences have ensued. Further on they say, " First, the unusual instability in the demand for capital resulting from the losses and interruptions consequent on the war ; second, to changes in the established relationships between debtor and creditor countries consequent on the war debts ; and, third, the rapidity of technical changes in manufacture and agriculture."

And yet you say that you are firmly of opinion that we should drop the war altogether as the cause of our troubles ?—Yes, I still adhere to that, and I will give you my reasons. As I told you before, President Roosevelt sent his delegation to London because he thought there might be something in the statements of these economists and very capable gentlemen. As I say, he sent his men to London, and when they got there they did not find any one with a constructive idea that would help them. Has not President Roosevelt told us time after time that he is just about tired of all these experts on economy. He has tried to follow them for years, and where have they led to ? They have led America to a worse position than she has ever been in. When Dr. Campbell came back to New Zealand from Ottawa he gave an address at the Victoria College and I went to hear him. One of the audience said, " I presume you met some great economists in Ottawa ? " he said, " I met some of the most eminent in the world." " Did they have no suggestion to make for a remedy for this depression ? " " None whatever." That was Dr. Campbell himself at Ottawa. If after about four or five years (it is nearly five years since the depression started) we have been faithfully and patiently waiting for these economists to do something and they have not given us a constructive idea. All they can tell us is something about the cause being the sending of all the gold bars to America. America has all the gold that she needs.

Mr. Clinkard.] A great deal more than she needs ?—She does not need gold at all. We do not need gold at all ; we want the exchange of services ; we want the man in Featherston to make a pound of butter for the man who will make him a pair of sox in Wellington. That is all we want.

If you income was declining, would you continue to increase your expenditure ?—If my income was declining, would I increase my expenditure ? As a business man, I would take all things into consideration, and it is quite possible I would. What happens to a business man is this : if business is bad, does he pull in all his travellers ? No, he says to them, " You get after it." Perhaps he puts on an extra one. That is increasing expenditure.

Could you continue your expenditure indefinitely if your revenue failed ?—I would endeavour to see that my revenue did not fail, by increasing my expenditure. We want the Government to start men working on public works in making amenities for us, and the men will then give an order to the man in the country to grow mutton and beef.

That is beyond my point. I am asking you this because you complain of the fact that when the Government found their revenue seriously depleted, they began to cut their cloth accordingly. Is it not the case that, when revenue falls, you are bound to reduce your expenditure? On this you plunge further into debt?—You do not seem to be able to understand me.

Oh, yes, I can understand you?—I am arguing from a service point of view, not a revenue point of view. Money is only a means of exchange for these services. The man who is going to work on the railway does not care whether he ever sees any money if he can get a pound of butter and clothing for his youngsters.

You suggest, Mr. Moore, that the people of this country make a great mistake in assuming that money is the only form of wealth, and so on? Surely, in view of our education, our people are not so ignorant as all that?—I thought you were arguing on those lines.

Thank you. Your view, Mr. Moore, is simply to borrow £10,000,000 of money either by Treasury bills or so on, and to reinstitute public works. Are you aware that at the time that our revenues were so seriously falling we were spending £7,000,000 a year on public works, and our falling-off took place in spite of that fact?—Yes, but will you follow on? I explain how it can be paid in twelve months; surely that ought to be sufficient for you.

I see that you explain that you put money into your right pocket and take it out of your left pocket, and are going to make yourself very wealthy in that way, but I cannot follow that?—I have explained in the statement that money is simply the means of exchanging services. Will you point out to me where that scheme is wrong? I have pointed out to you that by borrowing that money just to get the use of it, to enable these men to start their service, they would pay you back. Do you see where the man in the country would be wrong?

I can see that you are simply going to land another £10,000,000 on to the posterity of this country in the form of additional borrowing. That is your proposal?—No, it is not.

Well, if you can explain to me how that is not going to add to the indebtedness of the Dominion——?—I think you must have got a wrong copy. I start off here by borrowing £10,000,000 on bank overdraft or Treasury bills, re-employ, say, fifty thousand men on all kinds of necessary public works, on roads, &c., fifty thousand for fifty weeks at £4 per week, say, £10,000,000. These men spending this money would reabsorb the balance of unemployed, which is about thirty thousand, back into their ordinary vocation, at £4 a week. Impose a wage-tax of 10 per cent. on these people and this would return about £1,600,000. Restore the 20 per cent. cut to all the citizens, and a wage-tax would produce £9,000,000, so the loan and interest would be more than provided for the first year.

In the first place, what are you going to pay the 20 per cent. out of? When you say, restore the 20-per-cent. cut all round, that is not to be paid out of the £10,000,000; what is it to be paid out of?—Out of increased prosperity. I am a business man—possibly I have been in business longer than you think. I have been in business for fifty-four years. In my business I would be delighted to give all my men and see every other man restored the 20-per-cent. cut, because it would give them more spending-power, and my turnover would go up proportionately, and I would get the increased turnover to pay the 20 per cent.

Here is a poser: How are you going to pay that £10,000,000 in wages? One would require materials to carry out public works; not more than 40 per cent. is taken out in wages; you would only circulate about £5,000,000 instead of £10,000,000?—Supposing we did that.

It knocks all your other figures into smithereens?—I am sorry for you.

I am sorry for you; it is your proposal, not mine?—I will guarantee that there are other intelligent men who might be able to see it.

Mr. Holland.] In your remarks you mention that the banks are advertising urgently to replace their money on fixed deposit. You state that that money was locked up. You suggest that the banks take money on fixed deposit and pay interest on it, and lock it up?—We are told that they have £11,000,000 or £13,000,000 locked up. You do know that they called in as much money as they possibly could that was on overdraft, and if that money was on overdraft, what was it doing? It was employing people and they called it up.

You suggest that the Government should borrow £10,000,000 and put all necessary public works into operation. Now, as a business man and as a citizen, you know that the Government is constantly being blamed for having borrowed too much in the past?—I know that, and it is just why I am here; if every one was of the same mind as I am, I would not be here. About three years ago a Ratepayers' Association was formed in Wellington, simply to impress upon the City Council that they should not spend money, that they should stop spending and reduce our rates. They condemned George Troup because he was such a waster. They said, "Look at the tunnel going through Hataitai; look at Glasgow Street, and the money wasted there." I said, "Tell me where the money was wasted in Hataitai tunnel; did the workmen dig a hole and put the money into it? No, he took the money home and that money was circulated in the community because the tunnel only consisted of labour and the mixing-up of grit from Lyall Bay and cement from Nelson." The money was still in the community; it never was buried or burnt; it only circulated. I said to these men, "If you talk like that, you will commit commercial suicide as sure as you are living men." Four of them are bankrupt to-day; they were shopkeepers in the main streets.

Prior to 1930 you are aware that there was only a limited number of men unemployed, and all men were receiving standard rate of wages up to that time. Then, as a consequence of the drop in the prices of our exportable commodities, our revenue for four years fell by £67,000,000, and in 1932 it dropped by £27,000,000. Is not that the cause of so many men being thrown out of work? If I put it as an individual: I am employing 67,000 State officers; my income is cut down by 40-odd per cent.; something must be done?—You must find the cause.

The cause is overseas ?—No, it is not overseas altogether. When the public works were stopped in New Zealand, their currency was stopped ; those people were not able to purchase the amenities of life which came from overseas. When we stop our imports, we are taking the currency out of the hands of the people in the Old Country. The thing works automatically, as I want to show. We live each on the other. Our imports are down by millions. If these millions were being spent, say, in Bradford, look at the thousands working in Bradford who would then be in a position to buy our commodities. It is our lack of purchasing that is causing them the lack of purchasing-power.

Is it not the war debt that is causing the lack of money ?—The war debt has nothing to do with it. I thought you gentlemen would have got past that by two or three years.

Mr. Lye.] I am going to ask questions in connection with the war debt ; will you admit that the war debts have been a determining factor ?—No.

You will not admit anything ?—Nothing unreasonable.

Let me ask this question : First, the cost of the war has to be paid ; is not the payment of the war debts a first charge upon the industry of the people who are in debt as the result of the war ?—How are you going to pay the war debt, only by service.

Exactly, that is a payment. It is no use dodging round it ; have the war debts to be paid ? Are they a first charge ?—It is not a case of yes and no. I have had some experience in that. The position is this : If the circumstances had not happened in America, as I explained at the outset, business would have gone on in a normal and natural way, and Great Britain and the other European countries would have paid out of their surplus income. They would have paid this war debt ; I do not say we should repudiate it.

In view of the fact that America demanded payment in gold and refused to take goods and services to meet the debt obligation that was owing to her by Great Britain, and Britain eventually reverted to the gold standard, did not that increase the dead-weight of indebtedness ? I am wanting to arrive by a series of questions at what I believe to be the present cause of the lack of purchasing-power that we all agree on ?—Yes.

The fact that America demanded gold and refused to take goods and services in payment of the war debt, and Britain's reversion to the gold standard ; did that increase the weight of war debt ?—The artificial manipulation and the interference with currency and trade will get us all in the same condition as you would be in physically if you started to take drugs instead of food.

It appears to me that it is impossible to get a definite answer one way or the other ?—I want to explain it. You have asked me whether these interferences make the thing worse.

Yes, and did it bring about a period of deflation which placed us all in the position that between the cost of purchasing and the selling-price there was no margin left ; otherwise, there was no purchasing-power ?—It is the stopping of the exchange of these services which brings about that position.

Do you agree with the suggestion I make that, when the period of deflation set in through the reversion to the gold standard and America demanding gold, that brought about a fall in prices and left the people no margin between the cost of purchasing goods and the purchasing-price ?—Of course I do.

You said, I think, that we are the most independent country in the world ?—Yes.

What would happen if we lost our export market ? Do you attach any importance to the export market we have in Great Britain if we are so independent ?—Of course I attach a great importance to it because, as I said before, we want our people to have all the amenities they possibly can have, and by increasing our exports and increasing our imports we are placing the people in Great Britain in a position to buy our exports.

Do you rely upon your scheme of the raising of the £10,000,000 loan and the restoration of the two cuts to Civil servants ?—Not only to the Civil servants.

Well, all the people in New Zealand. Do you rely upon that plan as being the method which will restore purchasing-power to the people of New Zealand ?—As an intelligent man, sir, I expect you to realize that I came here for that purpose, and believe that.

Would you deny that the London price-level does determine the amount of credit ? That the London price-level is a very powerful determining factor in the increase or decrease of the amount which is made available from month to month ?—My answer is that, as a business man, we mind our own business first, and do not worry about what the other fellow is doing in London or elsewhere. If we get on with the job here, as I have explained it, we then may improve our position. We will improve our purchasing-power and improve the purchasing-power in the Old Country by increasing our importations.

You talk about "increasing our purchasing-power." Is it not a fact, New Zealand being an exporting country, that our purchasing-power is largely determined by the exchange value which our produce brings in the markets of the world. Our purchasing-power is largely determined by conditions governed outside New Zealand ?—Yes and no. The position is : First of all, we get on with our own job here, not worry about what is happening in England. We must realize that we have eighty thousand people here who are not getting 100 per cent. of nourishment. Will you admit that ?

Yes, I will admit that we have probably got over eighty thousand, and many millions invested in production, and that unfortunately, owing to the price-level in London, there is no margin of purchasing-power left after meeting our liabilities ; no margin between the cost of purchasing and the selling-prices in the markets of the world. You admit that eighty thousand people in New Zealand are not getting sufficient nourishment, clothing, and amenities ?—Yes.

Is it not really our business first of all to see that they get that, seeing that we can give them that out of our own soil ?—Yes.

Would the borrowing, according to your plan, of another £10,000,000 and increasing the wages-tax 100 per cent. materially help to supply the purchasing-power of the people, by making the burden of

indebtedness heavier and the rate of taxation heavier ?—If you carry out the scheme which I propose you are going to give everybody 100 per cent. of the necessaries of life. In the spending of that £10,000,000 the whole community will be benefited, the revenue will be increased on the importations, the margins of shopkeepers and traders and professional men will be increased, and they will be able to pay more income-tax and you will have quite sufficient revenue and you will be in as happy a position as you were in 1926.

A beautiful theory ?—Just a moment, tell me what is wrong with my proposal. You said "a beautiful theory"; tell me what is wrong with the scheme.

The Chairman.] That is hardly our job. It is for you to uphold your proposal ?—I do that.

Mr. Lye.] Let us agree to be as calm as we can be and agree, if necessary, to disagree, and get on with the job ?—I did not come here for you to disagree with me; I came here for you to agree with me.

And we came here to listen to your proposals. There has been a rise in the price-level lately and will you admit that that has gone a step along the road to restoring purchasing-power ? The rise in the price of lamb and wool, I mean ?—I agree that that has some effect.

If there happened to be a corresponding rise in the values of dairy exports, that would be another move in the direction of restoring purchasing-power, would it not ?—Yes.

Do you not think that by the steps that have already been taken in keeping down administrative costs—that does not necessarily mean wages cuts and so on—keeping a close watch on public finance that eventually, with a rise in the price-level, there will be a very material improvement in the general economic conditions of the people of this country ?—Yes. I do not believe in waste in administration or waste in anything, but it appears to me that you seem to be confining yourself to the increased prosperity of Great Britain and the increased purchasing-power of Great Britain. The position is that we are waiting for the man to get a job to lay some bricks in Birmingham to get some money to buy our butter instead of employing the man in Wellington to lay some bricks to buy our butter. That is what it amounts to. What is the cause of the improvement in the Old Country. We are told that Great Britain has more spending-power and things are better. That is because she is building armaments for herself and all foreign countries and manning her ships. She is restoring those men and that money is going into circulation; she is building armaments for every foreign country in the world and increasing her armaments.

Mr. Langstone.] You started off with the war-time. Is it not a fact that during the war years those were the most prosperous years we ever had ?—Yes.

Is it not also a fact that everything was paid for as the war went on ?—Yes.

Everything ?—I understand so. There was some debt created.

All done for destructive purposes—to destroy wealth ?—Yes.

We have a civil war of unemployment and we cannot use the national credits to end the civil war and make the people prosperous and happy ?—That is what astounds me, the lack of our intelligence.

A question was put to you about prices going up. Where did the money come from for the price of wool to go up in New Zealand. Did any one fetch any money to New Zealand ?—They had some credit, I understand, but no actual money.

If it is possible for the banks in New Zealand to find the money to sustain a higher price for wool cannot they do it for every other commodity ?—My proposal is on the lines which you are pursuing with these questions and my proposal is 100 per cent. sound, and I have never found a man who can put up a sensible argument against it.

The farmer who advocates a 25-per-cent. local exchange-rate does not believe in the London price-level, does he ?—No.

He repudiates the London price-level ?—Yes.

And if it is pegged at 25 per cent. there is no reason why it should not be pegged at 100 per cent. or 200 per cent. ?—No, not as I understand exchange. Exchange is much like pak-a-po. There is no asset created.

In regard to your scheme, I do not think the borrowing of £10,000,000 will do the job for this reason: Our first wages cut on Civil servants was £1,390,000; our second cut was £1,100,000. The 10-per-cent. wages cut imposed on all other workers by the Arbitration Court was at least £10,000,000, so, altogether, we had a reduction of over £12,000,000 in actual wages and salaries in one year. Had that wages-tax gone on instead of a wages cut, we could have given that £12,000,000 to the unemployed workers, giving them £4 a week, 50,000 of them. That could have been done ?—Yes.

But now we find that the national income to-day is £70,000,000 less than it was in 1929. The fall in London price-levels that we hear so much about from the farmers is actually £24,000,000 on the maximum. The difference between £70,000,000 and £24,000,000 how is that created ?—It is one of the difficulties I cannot understand.

Through internal deflation, reducing every one, creating unemployment ?—Yes.

Now, if we had used the credit of New Zealand to make up that difference, notwithstanding the fall in overseas price-levels, we need not have any fall in local price-levels at all ?—Not necessarily at all.

If it is reasonable for us to link New Zealand price-levels to London, would it not be more reasonable to link them to Bengal or Shanghai or Tokio; that would be a lower level still ?—Yes.

And the mere fact of New Zealand for many years ignoring the Eastern standards of living and competing in the same world markets with them is *prima facie* evidence that they can ignore the London price-level too ?—Yes, they can do that.

As I see the position, what is wrong with your scheme is that the £10,000,000 could not meet the £70,000,000 deficiency that there is to-day ?—Well, I would suggest giving it a trial for a year and

see how we get on, and we will be in a better position in twelve months, and if it is not quite what you think it is, well, we can try something better, but give it a trial for twelve months.

Do you propose to pay interest for this money?—Yes, I was providing for interest in the £10,600,000.

What rate?—The usual bank rate, 4 per cent. I have no fault to find with the banks; they are entitled to something because the money is circulated through the banks; they are entitled to something.

Do banks lend depositors' money or where do the banks get money from to lend it?—It is a matter of book-keeping with them. They accept deposits from depositors and give credit to borrowers.

What I want to know, if I can possibly do so dealing with the monetary system, is: If a depositor, we will say, has £5,000 in the bank, is that the class of money that the banks lend to the Government and to other enterprises needing finance?—I presume it is, as long as they keep a certain balance in the bank themselves.

When they lend that class of money there is usually a reduction in its deposits?—But they have certain reserves.

But I am not talking about the reserves. I am talking about the deposits?—There would be a reduction in the deposits.

But there is no bank balance-sheets showing a reduction in deposits?—I must not say that I thoroughly understand banking, because I do not.

If you do not thoroughly understand banking, then why do you say that the banks are all right, and not responsible for the deflationary policy we have had?—As far as I am concerned I have no fault to find with the banks.

Because you do not understand them?—I understand them to this extent: As a merchant they suit my purposes. I do business with an engineer, but I do not understand the engineering business, but he suits my purpose. I do not understand a doctor's business, but if I want a doctor for my family I go for his services.

There is a good deal of faith in that?—There is a good deal of faith in lots of things.

In regard to the question of handling the slump as we see it to-day, the financial stringency, the only constituted authority that can handle it is the Government itself. It has the right to do it. There is no local body or firm or any one else?—It must start with the Government.

It is a national question, and must be dealt with from the fountain head of the national control of New Zealand. They are the only authority?—Yes.

And if we spend £10,000,000 in paying wages it would reflect itself within a very short time in £10,000,000 worth of additional wealth, either in the form of extra goods or extra services rendered?—Yes.

So that you would have the goods and services to back up the £10,000,000 that had been spent in wages?—Yes, but there would be no debt in existence.

There would be if you paid interest?—No. You pay the interest off the same year. Simultaneously with the paying-off of the principal you would have the interest paid off.

All interest money is debt money?—If I borrow £1,000 off a man to increase my turnover and I borrow it at 6 per cent and I pay him £1,060 back, there is no debt remaining.

No, but if you go to borrow money you cannot borrow it unless you have some security, can you?—No, you cannot.

Therefore, money can only be the representative of your own security?—That is all.

Then, why should you have to pay for it. If you monetize your wealth why should you have to pay for it?—I have been prepared all my life to pay interest and perfectly satisfied, because I say that if a man is going to lend me £1,000 of his savings he has gone to the trouble to save his money to enable me to expand my business and I am quite prepared to pay him for that service.

Although it is possible for us, as individuals, to make profits, either by way of interest or rent or anything else, between one another in New Zealand, if some person was to run New Zealand as a great big co-operative concern with various departments like farming and mining and transport and all that sort of thing, in the sum total of things would they be able to make a profit?—If they went out to make a profit.

How can they? They can only make a profit while others are making a loss. You cannot have one without the other, and if you had the thing centralized and running it would be impossible in the sum total of things to make a profit?—In the sum total of things everybody would get what they wanted in the way of amenities of life, and there would be no need to make a profit.

Hon. Mr. Downie Stewart.] Were did you get your figures from suggesting that Mr. Roosevelt had re-employed seven million people?—I saw that in the newspaper.

In the newspapers I have seen it is suggested as two million people?—No, it was in a paper last week that I saw seven millions.

However, that is not important for our purposes?—No.

So far as the cuts were concerned you think they were a mistake?—Yes. The whole policy was a mistake.

Take your own individual case, if you were carrying on a business and times were bad; you were running at a loss and you had two alternatives, either to sack your men and close down or by cutting them 10 per cent. you could keep them all employed, which would you do?—Under those circumstances I would cut them 10 per cent., of course, but in regard to the Government it has the thing in its own hands because they are in a position to——

Borrow?—Not so much to borrow, but in the position to place these men, or in the position to enable them to exchange their services with the other fellow. I do not attach much to borrowing. The Government is in a position to place the men in work, in a position to enable them to exchange their services.

And you think the Government is never justified in reducing wages ?—I would not go so far as that.

At any rate, a different rule applies to a Government as to an individual ?—What I am saying is that the Government is in a position to see that men are employed, to give them the amenities of life, and they are in a position to keep up the standard of living and the standard of wages.

I gathered that you had no great opinion of the economists ?—I do not believe in detracting from anybody, but the position is this: we have had the advice of economists for about five years, and to my knowledge no economist has come forward with a constructive idea.

Do you not think that some of the eminent economists in the world have advocated what you are putting forward. A bold public-works policy is one of the main channels for relief ?—I refer you to a statement made by Dr. Campbell when he was asked a question in regard to the economists he met in Ottawa. He said he met the most eminent economists and he was asked if they did not have any constructive suggestions or ideas to give, and he said they had not.

In adopting a bold public-works policy is that not a means of helping just as you do ? No doubt you know that the British Government tried to carry out such a policy as you are laying down and it was said last year that they had spent some hundreds of millions on public works and had to abandon it as it was not helping to solve the problem at all. No doubt you saw that statement ?—I saw that, but they did not attempt to create a sinking fund like I suggest.

That is the cardinal feature of your plan ?—Yes.

Mr. Schramm.] You said the banks are all right because they suit your purposes. Would you say that everything is all right because it suits your purpose ?—That is rather a general kind of question. I suppose I might say I am very fond of anything I like.

It would not prove it was a right institution all the same, would it ?—I can see nothing really wrong with the banks because they are institutions which have been in existence for years. They have performed the services required of them for trade and commerce, and I think they are satisfactory.

Would you not say that the banks had called money in that they had out on overdraft, and advised people to put it in bank deposits, thereby adding to the deflationary policy that was going on. Does that not show that the banks have contributed to the present position ?—As I said before, although I have nothing extraordinary wrong to find fault with about the banks, they are like ourselves, they are not 100 per cent. right. As a man, I give you credit for having the best ideals in the world, but the question is: Do you live up to those ideals ? I know I do not.

At the present time you are not dealing with me; you are dealing with the banks ?—Well the ideals of the banks are all right, but sometimes they might just not carry out their own policy to 100 per cent.

Do you believe in the control of finance and money by private individuals for their own profit and gain ?—I would be quite satisfied if trade and finance were carried on in the same way as it is to-day.

You believe in the present banking system being carried on by private enterprise for private profit, as at present ?—Yes, because in 1926 when times were good there was not a wrong thing thought about the banks, we were all doing so well that we were smacking each other on the back.

I put it to you. You seem to think that lots of us have not awakened up to the present position. I put it to you that you have not awakened up to the position regarding the banks ?—I am sorry to hear you say so.

You do not agree with me ?—That is so.

You say that extremes are no good in all cases ?—That is so.

You adhere to that bold statement ?—I adhere to that statement. I would not call it a bold statement because it seems so patently true.

Sometimes we have to go to extremes. Supposing some one had an accident and it was necessary, in order to save his life, to cut off his leg, that is an extreme ?—Well, one swallow does not make a summer. You are going to extremes now.

I was going to show you where the banks had fallen down on it and that part of the system was not functioning properly, so that it was necessary to go to extremes to rectify the position ?—If the banks make a 1 per cent. failure you would not shoot them for it, would you ?

The position of the banks to-day is that they are the octopus controlling the situation, and I submit that credit and finance should be taken out of their hands and controlled by the State for the people ?—I am sorry I cannot agree with you. No, I am not sorry, perhaps I should not say that; but really I cannot agree with you.

You said you believed in interest. You believe in interest under the present system ?—Yes.

You know that interest was debarred in the olden days. It is only of recent growth ?—That was in the days of usury and people went to extremes.

Do you think it would be better, instead of borrowing £10,000,000 from the banks and paying interest on it, to issue your own credit without interest at all ?—The Government can do that, but then that currency has to go through the banks for the convenience of the people.

If we had control of our currency we could do that ?—You could have your own banking concerns.

The assets at the back and the credit at the back is the country's ?—The only credit here is the people.

At the present time you have given that to the banks ?—We have up to a point.

Mr. Massey.] Several members of the Committee have put questions to you about the world's prices. I presume that you agree that the world's price-level is a decided factor in the present situation ?—The position, as I said before, if we stop worrying about price factors overseas and get on with the job here ourselves, is that we can give our people 100 per cent. of the necessaries of life, irrespective of what is happening at Home, and by putting men in work and putting them

in a position to buy the amenities of life we are going to increase our imports and by increasing our imports we are going to increase and improve the price-level at Home.

I put it to you that up till, say, 1929 the world price-level was reasonably good, and there were very few unemployed in New Zealand then ?—That is so.

Then is it not reasonable to expect, seeing that the world price-level of wool and meat is increasing, that there will be more money coming into New Zealand during this year than last ?—We expect there will be more coming in.

Probably wool and meat will realize about £9,000,000 or £10,000,000 more than this year ?—As I explained before, there is an improvement in Great Britain on account of the extraordinary activities in naval requirements and armaments and that sort of thing. We can do our share by increasing our importations; we would be helping to improve the conditions in New Zealand.

The Hon. Mr. Stewart drew your attention to the fact that in other countries they had tried out a public-works policy. I notice in your statement that you have drawn particular attention to it, and you say "necessary works." What do you class as necessary work ?—Necessary public works, I presume, roading and draining and breaking in new country for helping settlers and public buildings, keeping our public buildings in good order, maintaining our public buildings.

I presume, then, that you agree with the policy of the Unemployment Board. The Unemployment Board at the present time is subsidizing building ?—Yes, I believe in that.

Well, you can only go to a certain point with that ?—Yes. That can be overdone of course, and they are limited, of course, for money. But still, it is one of the best schemes, to my mind, that the Government has produced, because it is enabling tradesmen to get back to using their tools; instead of the carpenter using a shovel and pick he is getting back to using his plane and hammer.

I think you will admit that that is only a temporary improvement ?—Yes. If the Unemployment Board had the amount of money to spend which I have suggested, they would be able, first of all, to put the skilled worker in his proper place at his proper work at a proper wage, and that would automatically start all the works of trade and commerce going.

The Unemployment Board's policy is that they operate on a tax on wages to the extent of 5 per cent. How much do they collect per annum ?—I have seen a statement in the paper, about £4,500,000.

Well, you would simply be doubling your tax, making it 10 per cent. ?—Yes. And then you would collect on the 20 per cent., too, and collect it from the unemployed which are not paying the tax at the moment.

Mr. Munro.] You claim that this scheme that you present to the Committee will cure our economic depression ?—I do.

You will borrow £10,000,000, you will put all the unemployed at work, give back to the workers of this country the reductions made by the Government in salaries and wages, and that purchasing-power will practically cure the depression ?—Yes, that is what I believe.

You know that the farmers of this country are possibly in the worst position of any. What effect will it have on the farmers ?—It will have this effect, that the people—the eighty thousand people, who, at the present time, have not got 100 per cent. of nourishment or clothing, instead of being able to buy a pair of boots made from New Zealand leather made from New Zealand hides are coming round to our back doors and begging our old boots and clothes—they would be able to go to the shops and buy new ones. In the purchasing of new boots and new material they then will be helping the farmer and they will be able to buy 100 per cent. of the farmer's wheat and meat and butter, &c. That is how they will improve the farmer. And then what they spend over and above the necessities of life they will spend on amenities that will be purchased from overseas. That credit will go overseas and enable the people in Birmingham and Sheffield to buy more of our produce and give us a better price for it. That is how it will help the farmer.

That is the point I wanted to be sure about. You believe that the extra orders given to the manufacturers in England, because of our increased purchasing-power in our secondary industries, would have the effect of bringing up the balance of world parity prices to such a point that it would reimburse the farmers in that way ?—Only in proportion to the amount that we send over. We are only a small community, but just as the world is made up of units, if we do our share we will be helping to improve the economic condition in England, which is improving at the present time through the extra purchasing by foreign nations of armaments which they were not purchasing two years ago.

If your plan, as proposed to the Committee, was put into operation to-morrow, the effect on world parity prices of the primary producers' exports from New Zealand would be infinitesimal, would it not ?—It would be small, but we would be doing our best, and as I said before, what we have to be concerned about at the moment is our people here. I am not worrying about the people in England so much. What I am saying is: Start a scheme like this, employ our eighty thousand unemployed, give them the spending-power, and you will see that the improvement will extend just like a ripple. It will extend right out to Great Britain.

I agree with that, but I cannot agree with you that it is going to have anything but an infinitesimal effect on the world parity prices of our farmers' products in the world's markets ?—Well, why worry about that infinitesimal improvement ?

Because it is our farmers' want of spending-power to-day that is part of our economic depression ?—But we would not have the economic depression if we employed our eighty thousand people.

But we would have the farmers just the same ?—No. The farmer's position would be improved to the extent of the purchasing-power of that eighty thousand plus the increased purchasing-power which we would be sending Home to the Old Country for the manufactures which we would import.

You still claim that this scheme will cure New Zealand's economic depression, farmers, unemployed, business men, everybody ?—I claim this, that it will improve the economic conditions in New Zealand to the full satisfaction at least of eighty thousand unemployed at the present time, and will also assist considerably to the benefit of the farmers.

Mr. Murdoch.] This scheme of yours has been tried in England ?—Oh, no; it has not.

Yes it has ?—With a sinking fund provided ?

No ?—You see, only partly tried.

Well, put it that way, partly tried. And it has not proved a success; in fact, they have decided to drop it. In spite of that, you still think that it would pay to try it here in New Zealand ?—Well, as I just said, they had only partly tried it. You see, the scheme is that you raise the money and you pay it back again yourselves because you pay it back in your services one to the other. Instead of the tailor working alongside the bootmaker at digging clay on Brooklyn Hill, the tailor would be making trousers for the bootmaker and the bootmaker would be making boots for the tailor, but here these two tradesmen are looking at one another and using all the foul language they can about the Government, while they are standing on their shovels looking at the clay bank. And here we are in a position to put those men in a happy frame of mind, and you can do it by that scheme.

The money which you provide for here, is it proposed to spend that entirely in wages, or have you made provision for the cost of materials ?—As long as it is circulated it does not really matter which way it goes. It is the circulation—the distribution of this money that is going to improve the condition.

I noticed in your working out you base your necessities on wages-tax. But I presume that if you borrow £10,000,000 you will want to spend half of that on materials, and that will not come back in the tax ?—Yes, it will, because these men with their spending-power would help to increase the farmer's position. The farmer would be able to export a little bit more credit Home in the way of butter, and you could bring any material back.

Now, this point arises: It is a fact that at the present time the consumption of butter in England is better than it has been for some time, and there is a short supply of New Zealand butter in England. Yet the price of butter in England is very low and it only pays out here at 6d. So how do you account for that fact ?—As I say, I am not concerned so very much about the position at Home. My argument is, first start the business here of employing these people. But to answer your question, there is more butter being consumed at Home, but those people are consuming less margarine and it does not say that they are still getting the 100 per cent. of that kind of nourishment that they need. They are still in a position to buy still less margarine and more butter, and if they had more spending-power, which we would send Home by purchasing the manufactures, they would be able to buy more of our butter.

That is the point that is concerning us at the present time, to help the farmer here ?—If you adopt a scheme like I suggest you are going to make eighty thousand unemployed people happy. You are going to enable them to buy 100 per cent. of boots, clothes, meat, fish, vegetables, and fruit, all found in New Zealand, and you are bound to improve the farmer's condition.

You suggest here in your statement that the increased importations would mean more employment for workers. Do we assume from that that the bulk of our imports will be from Great Britain ?—Well, we should endeavour to induce the trade to go where our exports go.

Dr. Sutch.] This is hardly a question, but you mentioned Dr. Campbell when talking to the Hon. Mr. Downie Stewart. I know Dr. Campbell slightly, and asked him that same question when he came back from the recent World Economic Conference, "Had the economists any constructive plans ?" And he said, "Yes." I said "Well, why was there not any result ?" And he said, "Because none of the politicians would agree to them." I asked who were the economists of note in England. He mentioned Mr. Keynes. You have heard of him ?—Yes.

He has a scheme similar to yours, except that he would say that New Zealand should borrow abroad rather than borrow at home. That is the one difference. And have you heard of Mr. G. D. H. Cole, of Cambridge ?—I have seen his name mentioned in the papers.

He has constructive schemes. And Mr. Ambrose Dodd, of Cambridge, another economist with constructive schemes. Sir Josiah Stamp ?—I have heard of him.

Another economist with constructive schemes. There are several others, of course. I just brought that point up because the Hon. Mr. Downie Stewart also brought it up. Now, assuming that your argument is correct here, and I do not want to argue about it, why not spend £100,000,000 rather than £10,000,000 ?—We do not want to go to extremes, as I said before. We want to get into our natural and normal stride, and the natural normal stride at the moment is to get our eighty thousand unemployed working.

But, assuming that this will do that, and assuming that all your arguments are correct, would it not be advisable, a good thing, to spend £100,000,000 a year and raise our standard of living ?—Well, what I suggest is, get on with the job in a reasonable manner to start with, and then, if you think you can keep on improving your standard of living, there is no harm in adopting it.

But if this is correct, there is no need for us to worry about the future. We could go straight ahead and spend £100,000,000 a year, surely ?—But I have said before, let us do the thing step by step and see how we get on.

So there is a possibility of error in this ?—No. No possibility of error.

But, logically, we could spend £100,000,000 ?—No. We would be going to extremes.

Why should that be extreme ?—Well, we would be raising our standard of living.

But why not raise our standard of living ?—Well, you have to grow, you see. I might tell you that butter was a wonderfully good nourishing food, and if an ounce of it was good for you why not have a pound.

But we would vary our standard of living if we had more radios and motor-cars ?—Well, that would all gradually come.

With this £100,000,000 ?—No. Gradually come. Educate the people up to it.

I see. Well, still assuming that this argument here is correct, I have heard suggestions, particularly recently, that we build roads all through the Tararuas. Could we go ahead with that do you

think, as a Government scheme ?—What I should suggest is, we get on with the maintaining of the roads that we have and putting in the roads that we feel absolutely necessary for transport and utilizing our eighty thousand men in the normal way. If we did all that, plus the roads through the Tararuas, we would want a wonderfully increased population and we would have to import them.

Well, that would help us to solve the British problem. They could send the population here and we have got the work to be done. We could bring the population here to do it ?—We are in the position in New Zealand that we are in now through immigration.

That is interesting. It would not be a bad idea if we built pyramids and attracted the tourists ?—I refuse to be drawn on what I call silly questions like that.

But that is no different at all from the roads through the Tararuas ?—My suggestion is that we have eighty thousand people at the present time thrown out of employment, and my suggestion is just at the moment to see that those people are put back into employment in the normal way, because we are not getting on with the normal requirements. There are thousands of pounds' worth of further public buildings required at the moment.

I grant you that, but I was assuming that we could bring the people from England and help solve their problems. For instance, we are putting certain roads through the Milford Sound district. It would be quite an advisable plan, assuming that this is correct and we had the workers to do it. It is just a matter of getting the money is it not ?—I suggest that we grow normally and steadily, and we shall get all that in time. When the first settlers arrived in New Zealand they did not start to talk about building roads through the Tararuas. They said, "Let us make a road along Lambton Quay so we can get along from one spot to the other." Then they grew a bit more, and they made such roads as Wallace Street and Boulcott Street, and the Terrace.

I follow the basis of your argument. Referring to one or two questions that were asked earlier in the debate, do you think that tariffs have had anything to do with the world depression ?—As I stated before, when America put up her large tariff barrier she shut out the exports of Europe and Great Britain, with the result that they could not export and they blocked the imports and exports.

So it has had a big effect. And would you say that changes in the demands of people for articles, has had an effect on the world depression ?—Of course it has, because the money has been so short.

I mean a change in demand like this : Women wear shorter skirts, therefore they are not going to going to wear so many woollen garments. That kind of demand ?—The money that they spent on the heavier garments, if they have any surplus over they find a way out for it, the same as I spoke about beauty parlours.

Yes, I grant you that ?—We have women in New Zealand who spend money on beauty parlours to-day who never spent money on beauty parlours before.

I grant you that. But if you throw a big industry out of operation because you are going to dispense with the use of hairpins, that industry is nevertheless out of operation ?—Yes. But the spending-power which went to buy those hairpins is going in some other direction.

I agree. And technical changes in industry, would they affect the world depression too ?—Just exactly what do you mean by that ?

Machinery for instance. The invention of machines will eliminate fifty men here and a hundred men somewhere else. If a good deal of that came at once, would that affect industry and the employment of men ?—It would affect the employment of men possibly in those particular industries, but you would find some other industry springing up.

So that you would not put our troubles down to machinery at all ?—No. May I give you my reasons ? When the mechanical navvy was invented and men were taken off shovelling dirt with the hand, at that time we had no aeroplanes, no gramophones, no wireless. You see the demand for these amenities is increasing with the decreasing of man labour. We are having thousands of people manufacturing aeroplanes, wireless sets, who were not manufacturing them twenty years ago. Twenty years ago you would find that people were shovelling dirt and coal with their hands.

The reason I asked those last few questions was that you said the sole cause of the economic depression was the restriction of credit in New York in 1929. Following on a question of Mr. Munro's about additional purchasing-power in New Zealand, affecting the farmer, how much would the additional purchasing-power drive up the price of butter in New Zealand ?—I cannot say.

It would rise, would it not ?—Of course it would if demand increases.

So the price does rise ?—Yes. But our butter price varies daily with the butter price in London.

Well, we will grant you that ?—Perhaps the important argument is this : If we as New-Zealanders would spend more time in worrying how to employ our eighty thousand unemployed instead of worrying about the market price at Home, we would find very quickly employment for those eighty thousand men.

But what I am worrying about is the butter price in New Zealand ?—Well, the butter price would improve with the increased demand. You have no idea, possibly, of the decrease in the consumption of butter with all these thousands of people out of work.

I have a slight idea. You mentioned the Navy in England. The Navy is kept up largely out of revenue is it not ?—Yes.

So that if they cut down their expenditure on navies and armaments they have released so much purchasing-power from buying bayonets for buying dresses and other materials ? They have stopped the circulation of the currency of the personnel of that ship, but they have increased the circulation of the currency of the people who supply electrical goods and artificial-silk materials ?—No. You see, if we were to put out of employment another hundred thousand men in New Zealand by perhaps closing down some works, we would be very much worse off.

But the position I am putting to you is this: You have a certain amount of purchasing-power in England. You take some of it and build a warship or some armaments for England. You could

spend it on goods for the people?—But you are putting that money out of circulation from that particular class of people who would be buying the necessities of life and not the amenities of life.

I put it to you that we are taking the purchasing-power from the armament firms and giving it to the firms who are supplying the amenities of life?—The people who are working for the armament firms are the people who are living on the necessity line and they are buying necessities, and once you put those people out you are putting the farmer out.

I know that, but you may be giving a job to somebody else, somebody who works in an electrical factory or a textile factory?—No. When you take the purchasing-power from the working-class you are going to disorganize the whole economic position.

Well, do you agree with me, then, that there was a reduction in purchasing-power in England when naval expenditure was cut down?—Yes. I quite agree with that.

I am not saying that I agree with that, but you do?—Yes, I agree with it.

What proportion of our production in New Zealand is exported?—You have probably got the figures, but anything you say I will agree to because I am not particular about that.

The reason I ask is this: You said that it did not matter about what we exported. Let us get down and do the job at home?—First things first. What we have to worry about is our unemployed here. Get them employed. Get them put in the position to buy the necessities of life. A man's first duty is in his home.

You have talked about President Roosevelt to-day. He admits that some of his problems are due to the low price for wheat in the world's markets, and the low price of cotton in the world's markets. Do you agree with that too?—Yes.

Yet those low prices have nothing to do with our prosperity?—All these things reflect on one another. Once you start to allow your own body system to get into ill health you will be bound to have all kinds of germs attacking you and all kinds of sickness. Keep the body whole politically, and you will be starting to get the world all right.

So that world prices have an effect on our economy just as much as they have on the American economy, or perhaps more?—Well, world prices will have an effect.

You did not admit it to Mr. Lye. That is why I am asking?—You want to go to the extreme. What I want to impress upon you gentlemen is, begin at home; start and see that our eighty thousand people get the food and clothes which we produce here in New Zealand.

You stated that we could do without our imports if we liked. Do you think we could go on exporting if we did without our imports and did not increase our overseas debt payments?—Certainly not.

But you made that statement. That is why I am asking you?—Of course we can do without wireless sets. We could do without motor-cars. But I say we do not want to do without them. We want all the amenities we possibly can, and the more amenities we bring in the more exports we will be able to send out.

Exactly, but seeing that you have made that statement, if we did without our imports we would either have to increase our foreign debts or we would have to cut down our exports?—No. You could go without boots if you wanted to. But you do not want to. But the position is this: When you come down to tin tacks we could go without a lot of things. We could get down to where I said the Shetland Islanders got down to, living on 1s. 6d. a week. But we do not want to get down to that. We want to get into the position that we can improve our importations and by improving our importations we will improve our exportations, because we are putting the people who make our imports in the position to buy our exports.

It is really a difficulty which comes first. Are we going to increase our imports, and that will mean that our exports are increased?—Work them simultaneously, so that they will be balanced.

AUCKLAND, 20TH MARCH, 1934.

Statement of Mr. H. G. R. MASON, M.P.

It is the pain, misery, and injustice arising from the defects of the present monetary system which prompt thoughtful men to devise a better. Men do not seek to paint the lily, to gild refined gold.

Recently certain defects of our monetary system have obtruded their unhappy result with great insistence. Two palpable defects are outstanding ones, viz:—

1. That the system in ordinary circumstances leaves the great bulk of the people without sufficient money to purchase and enjoy the immense wealth of the modern world; and
2. It creates only money of which the real value varies through a wide range from time to time, with the result that there is injustice as between classes, and in particular as between debtor and creditor.

To consider the first of the foregoing defects of the present system—its inability to supply the bulk of the people with purchasing-power—it is to be noted that a great change has been brought about in the world by modern methods of production. We now hear of the problem of overproduction. Previously the vast poverty of the world was explained as being due to insufficient wealth. Theories were invented to explain this supposed phenomenon of which perhaps the most famous was that of Malthus, which asserted that population always tended to grow faster than the means of subsistence, and hence that there must in the nature of things always be great numbers of miserably poor and destitute. When such doctrines could be accepted it was natural to accept a financial system which

created money to enable commodities to be produced, and disregarded the need of money to enable commodities to be consumed and enjoyed. With to-day's surplus production glutting every market of the world, with restrictions, quotas, quantitive regulations on every hand, the need becomes clear and urgent of creating money for the purpose of the consumption and enjoyment of what is produced.

The present system cannot create money for that purpose. Its money has its origin in bank overdrafts. That money is created by the banks, is the explanation given by the head of the banking world, the Deputy Governor of the Bank of England, Sir Ernest Harvey, giving evidence (page 22) to the Macmillan Commission on behalf of the Governor and the Bank. The method appears clearly in the procedure used in raising the war loan in New Zealand. The banks arranged to advance £85 to any customer taking up £100 war bond. If the customer had £15 credit, his cheque was honoured, leaving him £85 in debit, and the £100 was credited to the Government. Thus the overdraft produced the credit. The credit was the end, the result. Had it existed in the beginning there would have been in this case no overdraft.

Reference to page 23 of the last (January, 1934) issue of the *Monthly Abstract of Statistics* issued by the Government Statistician shows by far the greater part of our money is created by the banks. We there see that on 22nd January the deposits not bearing interest—that is to say, available as ready money (which are in law and in fact nothing but debts owing by the banks)—amounted to £21,250,000. Bank-notes in circulation were £6,250,000, and even if £3,000,000 be added for silver and copper, the bank deposits are thus much the most important part of our ready money. It is thus clear that we are dependent upon the banking system to create the money we need.

It is clear that the money created by the bank is created in the course of a loan transaction. This involves a debt and interest. No debt, no money, is thus the rule, and thus no money is created without interest. It is clearly not feasible to use for enjoyment the money thus created by the bank. A consumer who buys an article for consumption and enjoyment, say, a loaf of bread to eat or a pair of shoes to wear, exchanges his cash for an asset which vanishes. His debt, however, does not vanish. On the contrary, it grows by the addition of interest.

Hence it is that, although banks readily and invariably intensify the depressions which occur on the cessation of expenditure of money for war purposes, it is not easy for banks to raise us from the depression, for consumers are required, nor would it make any difference who owned the banks so far as this is concerned, for money lent at interest, whether much or little, cheap or dear, to one man or to another man, must of necessity be for what is called "reproductive purposes," as opposed to the enjoyment of what is produced. That is why the Governor of the Bank of England, as reported in a well-known statement, could see no daylight ahead.

There is a second limitation imposed upon us by the creation of money in the present system. If the bank's customers use an increased amount of money to provide for increased production, they must in the aggregate raise it on overdraft. In the prices of the goods they sell they must include the sums paid to the bank for interest. As the bank's shareholders have not yet the joyful news that the bank's earnings of interest have increased, and will not have till next annual general meeting, this extra interest is not expended or otherwise put into circulation by them by the time the goods come upon the market. Even if the goods are not sold till after the next annual bank meeting, the shareholders will probably be so impressed by the Bank Chairman's invariable speech to the effect that only hard work and thrift can save us in this age of plenty that the extra interest will be saved, not circulated.

The money required by the manufacturer as the price of his goods thus exceeds the amount distributed and available to the community. This must result in some goods remaining unsold. A cessation of production must follow, with unemployment and all the other evils of depression.

Any improvement in our financial system therefore which proposes to confer practical benefits must deal with the two great evil products of the present system, viz :—

(*a*) Instability of price-levels ; and

(*b*) Tolerance of the existence of warehouses and shops everflowing with unsold goods, of unemployed ready to render every service—while at the same time the people are hungry, unclad, suffering and worn with anxiety for lack of that money which would be all sufficient to enable them to come by that which they so much need and which exists in so much abundance.

That these defects are inherent in the present system is seen by a reference to the history of the last hundred years. A period of falling prices lasted from the close of the Napoleonic Wars till 1849. Another such period, the so-called depression of the "eighties," lasted from 1875 to 1895. Another marked sudden fall occurred in 1908–9, another in 1922. In between these falls there were rises. The prolonged misery and degradation of the people in the first of these depressions is a well-known feature of history. The gloom of the second is remembered by many yet living. It is interesting to notice the similarity between the monetary phenomena of the depression of the "eighties" and that of to-day, showing that the monetary system behaved in those days as in these, and that its present behaviour is not due essentially to war debts, reparations, customs barriers, quotas, economic nationalism, moratoria, or any of the dozen or score of present-day problems which separately or collectively are put forward as the explanation of its misbehaviour to-day. The system does not stand the test of time.

It has to be observed that what enables the banks to create money is the fact that they are substantially the sole reservoir to which money can go. If in the case of the war loan the Government wished to draw its whole £100 at once in cash, the operation could not be performed, for the only cash in the transaction was the customer's £15 deposit, or so much of the deposit as was covered by cash. But as the Government's £100 was spent the persons to whom it was paid had only the same banking system to deposit it with again. Only a small percentage of it was out of the bank in cash

at the one time. Thus it comes about that with a little cash a bank can create a large sum in its books and find itself able always to honour all demands made upon this sum in practice, for the money paid out in respect of it has no other permanent home to resort to save the bank. Where there is a central bank the trading banks are bound to deposit with it a fixed proportion of the moneys deposited with the trading banks and that takes from the trading bank and hands to the central bank the power to create money. So by requiring the banks to hand a fixed proportion of their deposits to the Dominion Treasury, the power to create money can be taken from the trading banks and handed to the Treasury.

If the power to create money be so transferred from the banks to the Treasury, money can be created for enjoyment of the world's wealth. The Treasury is not concerned to make interest on the money it creates. As the banks at present can create money without limit if sufficient justification appears—namely, security and interest—so could the Treasury for a sufficient but different justification—namely, the purchase and consumption of the world's abundant wealth.

I suggest that money so created be disbursed as follows :—

(1) To all citizens over fifty-five years of age, an annuity giving an ample living according to the standard of average citizens without restrictions on account of property or income. From the Population Census of 1926, Volume IX, Industrial and Occupational Distribution, page 94, it would appear that there are 82,299 males over fifty-five years of age. This approximates to the number of unemployed, and is less than the war-time Expeditionary Force. If we can afford to have that number of men of mixed ages unemployed, or could afford to have that number of young men overseas, we could afford to have that number of older men retired from remunerative employment. Such retirement would provide the opening young men now desire. Leisure with happiness would take the place of unemployment, want, and anxiety.

(2) To increase the amounts payable to the blind, and other pensioners, to widows, to increase family allowances, and to make payments to cripples or other incapacitated citizens, all conformably with the standard of the foregoing superannuation payments.

(3) To pay to all producers such sums as raise their income to the same figure as if the price of each wholesale commodity produced in New Zealand were the same as the average during the seven consecutive years prior to the depression.

4. To prosecute necessary public works.

There is a saying that 95 per cent. of the problems of business are problems of salesmanship. The purchasing-power distributed by the foregoing method should dispose of the greater part of these problems.

As always, taxation would require approximately to balance disbursements. In days of prosperity, when much money circulates, nominally low rates of taxation produce large gross sums. Any adjustment would require to be made in the light of results and experience, as at present.

If any difficulties were experienced with exchange it might be dealt with by rationing the exchange, and in such rationing preference might be given to imports by classes. For example, essential raw material, such as phosphate, might have a preference over what could be locally made, such as clothing.

Witness : Mr. H. G. R. Mason, M.P.

Mr. Mason : Mr. Chairman and gentlemen, I do not propose to enlarge upon my statement. I have tried to set it out as clearly as possible, and I have tried to confine it to what I believe to be the vital elements which one must consider if one is thinking of the monetary system and possible changes from the practical point of view. I have tried not to go far into theories of any sort, but to base everything upon those facts which are within the knowledge of every one ; and if the Committee has read the statement, then I think I might simply leave it to the Committee to put any questions to me which they please.

Dr. Sutch.] I have one or two questions, Mr. Mason. You say that under ordinary circumstances the monetary system leaves the great bulk of the people without sufficient money to purchase and enjoy the immense wealth of the modern world. You do not mean the economic system ?—No. I mean the monetary system.

You do not think it is the fault of the economic system ?—The two cannot altogether be separated, of course ; but in times of depression, it is the monetary system.

So you admit the booms and slumps ?—Undoubtedly. I conceive those to be essentially the product of the monetary system, and the proof of its evil, or one of its evils.

Booms and slumps would not possibly be a function of the economic system—" function " in the mathematical sense, I mean ?—I do not know that life can be divided into watertight compartments.

Our financial system is part of our private enterprise system, is it not ?—It is.

You say that, under ordinary circumstances, there is not sufficient money ; but these things have obtruded themselves just recently. Do you think that in the past they were not evident ?—They have obtruded themselves recently with more insistence than previously. We know, of course, that we have cycles, and this is not the first cycle. We have had that sort of thing frequently enough in the past.

Do you think there is a chronic deficiency ?—Chronic deficiency ?

Why I use that is this : the Douglas terminology claims that there definitely is ?—I know that. But I have not based anything on that proposition.

You do not believe in the A plus B analysis ?—I am not basing anything upon it.

Do you think it is a correct analysis ?—I do not feel called upon to discuss that which I may not understand exactly as it is intended to be understood.

Yes, that is everybody's difficulty.

Captain Rushworth : Not everybody's.

Dr. Sutch.] I was suggesting that it is difficult for many people to understand what is propounded ?—I have seen the A plus B theorem set out in one of Douglas's books, and I believe that as it appears there the statement is correct enough ; but I do not think that the proof that there is given is so complete that the matter does not need to be followed up further before one can see that the subject has been exhausted.

I see ?—But still, I am not basing anything upon that.

I realize that ?—In this phase of the economic cycle that gives us trouble there is that lack of purchasing-power which is claimed by the A plus B analysis.

You state that the extra interest—that is, the way annual bank dividends are paid out—is not expended or put into circulation in time to meet the goods that are coming on the market ?—Yes.

In view of the fact that purchasing-power is a flow and that goods are a flow, do you think that matters ?—Yes, decidedly it matters. They may all be flows, but the flows vary in volume all the time.

Yes, but in this particular case, if I know that in a couple of months' time I am going to draw a bank dividend, and I wanted something now, I would not hesitate to buy it ?—But the point I am making is this : I do not know that I am going to draw an extra bank dividend in two months' time.

You mean that—— ?—The extra goods are there, but I do not yet know that there is going to be an extra dividend.

The man who invested in the shares did so on the assumption that bank shares would give him a fairly steady return ?—True. But the point I am making is that the goods will increase in quantity before it is known to shareholders whether that fairly steady return on bank shares will increase.

That is typical of our economic system ?—Of course it is.

We produce goods now. We do not know even whether we are going to sell them. I was wondering why you especially took that bank share example ?—There was no special significance in that. It was simply to make the thing concrete, that is all.

And you would definitely support the statement that the money required by the community does exceed the amount distributed and available to the community. You would say that this was true, and always true ?—I do not wish to say that that is always true. I say that it can be and is often true.

That is a different matter ?—And it is when it is true, then we have trouble ; in times of boom it may be different.

Yes. You say the system does not stand the test of time. Here, again, you have a well-known fact that the system did ?—I would not say that. My statement was meant to express the contrary.

It is a definite statement. Have you to say that it is the conjunction of the economic and financial systems which will not stand the test of time ?—As I say, I am not dividing life into watertight compartments.

In the next paragraph you say that the banks can and do create money, that the banks do not create credit against the cash they hold, but against produce which is going forward to the British market on the assumption that it will reach a certain price. The amount of cash they advance varies with the English rates rather than with the amount of cash they hold ?—I think the cash varies very little.

No. I just wanted to reverse that point to get greater accuracy. The cash does vary from time to time. The cash held by the banks ten years ago was probably greater than to-day ?—Yes.

You say that money has no other places to revert to than the banks. Where else would it go ?—Anywhere.

That is not blaming anything on the banks, is it ?—There is not a word of blame in it.

What I want to get at is this : Do you think it stays in the bank ?—No, it comes out and goes back. That is what I say.

But the fact that it goes back to the bank does not mean that it stops there ?—Not at all. The point I am making is that it cannot permanently run out and leave the bank system dry, because it has no other place to run to.

You say in discussing this question,—

> To citizens over fifty-five years of age an annuity giving an ample living according to the standard of average citizens without restrictions on account of property or income. From the Population Census of 1926, Volume IX, Industrial and Occupational Distribution, page 94, it would appear that there are 82,299 males over fifty-five years of age. This approximates to the number of unemployed, and is less than the war-time Expeditionary Force. If we can afford to have that number of men of mixed ages unemployed, or could afford to have that number of young men overseas, we can afford to have that number of older men retired from remunerative employment. Such employment would provide the opening young men now desire. Leisure with happiness would take the place of unemployment, want, and anxiety.

Well, we carried on without a great deal of discomfort during the war ?—I realize that we were very prosperous during the war, but that means that we did not pay for it. We borrowed to do it. We had to let England pay for it.

We certainly did increase our debt to a tremendous extent ?—In what way ?

Our overseas debt. From £8,000,000 you increased it to £27,000,000 overseas. We really could not afford the war ?—The overseas borrowing was not tremendous.

Also in New Zealand we were getting extremely high prices for our produce. You forget that element in the situation ?—No, I do not. All prices went up during the war owing to inflation.

But the farmers were receiving 2s. 6d. per pound for their butter during the war ?—But imports also rose in price. I can remember £100 per ton for roofing-iron where previously it had been £22. I can remember copper wire used by electricians went up to £80 from £56, then I think it went to £120, and even higher.

I agree with that. We can cite these examples for ever ?—I remember some of those figures.

The position in New Zealand is this, that it is the export price that matters ?—And may I be permitted to point out that these high prices for imports may explain the increase of our overseas debt during the war, and it may be that we did carry on during the war in such manner that on pre-war prices the overseas indebtedness would not have been increased.

I do not think so, but we will never be able to find out. Export prices vary in this country according to import prices ?—Well, if the export prices go up we cannot discuss the matter of how far we might pay our way unless we also discuss the extent of the import price rise.

If export prices go up, New Zealand is more wealthy because of that fact ?—Yes.

So that my point is correct; the fact that when our exports went up, even if our import prices went up to the same extent, New Zealand was better off ?—That is only on account of interest payable overseas by New Zealand. When all prices rise the amount of that interest expressed in goods becomes relatively less.

That is the general principle. As I intended making this point, I tried to get some information from the Government Statistician. I tried to get those facts, but I could not get it. I am going to pursue that further when I get back to Wellington ?—I was saying that roofing-iron at £22 a ton went up to £80 and £100 most of the war-time. I can remember that. Those factors are far higher than the factors by which prices of our products were multiplied.

You would have to get the total on each side before you could make any generalization on the facts. It was just the general principle I wanted to get at. Have you made any computation as to how much money your proposals will need by the issuing authority ?—No.

You have made no calculation ?—None at all.

I notice you say that taxation would require approximately to balance disbursements. By that you mean that the money would have to be paid back ?—Yes. To prevent inflation it would have to be paid back. At present we do not do that. We borrow from time to time, but at any rate taxation would be approximately the same as expenditure to keep the price constant.

Just one other thing; a definition of necessary public works. What would you mean by necessary public works ?—That would be determined by what the Government and the people considered to be necessary public works.

What elements of cost come in ?—I do not understand that.

I mean, you have got the Midland Railway, and it costs a lot in capital equipment. Its returns are doubtful—that is, its costs may not be covered. That is what I mean. Would the cost element come in ?—I am not putting forward my suggestions as supplying only money enough for reproductive purposes. If public policy decided that a public work was necessary there is no reason why it should not be gone on with. For example, a Courthouse. I do not know that one ever thinks whether the fees paid would pay for the Courthouse. For present purposes, from my point of view, I am not differentiating. That is a matter of public policy.

But you would get the return in taxation any way ?—Or otherwise.
