

DO YOU KNOW?

KNIGHT WITH TEETH OF IVORY—in 1585 it was recorded in Belgrave's "Mathematical Jewel" that the author's nephew, Sir John Belgrave "caused his teethe to be drawne oute and after did sett ivory teethe in agayne".

FIRST TO TAKE ETHER—in 1846 Eben Frost asked Dr. W. T. G. Morton to pull his teeth quickly and painlessly. Morton, discoverer of ether, explained the facts of ether and its dangers. Frost agreed, and lived to be the first to take ether.

Use 'DETTOL' sparingly . . .

Value each drop of 'Dettol', for supplies in present circumstances are necessarily limited. You who have a bottle of 'Dettol' in the home—make it last as long as you can. You who need more and find your chemist temporarily out of stock—please be

patient. We assure you that after vital needs of doctors and hospitals have been met, remaining supplies are being fairly distributed. We hope more 'Dettol' will soon be available. Until then, please use it sparingly.

I WAS DEEPLY ROOTED

(continued from previous page)

I couldn't remember either, but I suddenly remembered something else—that there was a very large mathematics section in the Library. And, having "done" Logic 1 last year, I reasoned thus: "I may possibly have lost caste through my display of ignorance. I do not wish to lose caste, especially in the presence of an intellectual female who wears such a cute little bow in her hair. I can regain caste by finding out the solution of this problem. I can find out the solution by looking it up. Therefore—"

"I'll go and look it up for you," I syllogised.

She looked awfully grateful. So I went over to the Mathematics section.

* * *

It was a pretty grim quarter. There were shelves and shelves of books full of symbols and figures and formulae. I didn't like to ask any of the people reading in the vicinity how to find the square root of a number, or what book they'd recommend me to look up, because I thought that perhaps they mightn't have known, and then they'd have been even more embarrassed than I was because that's the sort of thing you expect people to know if they read mathematical books in a Library. So I collected a large pile of big books that looked like compendia of mathematical knowledge—sort of Will Durant-Van Loon books that tell you everything you want to know—and I took them back to the girl with the bow in her hair. Her hair was slightly auburn, and I like auburn hair.

"We ought to be able to find out from these," I said. It was a big pile.

* * *

SO I started going through them. There was a *History of Mathematics* and an *introduction to the Philosophy of Arithmetic* and a *Principles of Mathematics* and even a *Principles of Relativity* which had got in by mistake, and lots of others. I thought I'd better employ the genetic approach, so I opened the *History of Mathematics* and looked up "square root" in the index.

Well, there was a lot about square roots in this book. I found that Archimedes in his "Mensuration of the Circle" worked out a number of them. Even Omar Khayyam, that worthiest of pagans, besides "elevating to a method the solution of algebraic equation by intersecting conics," worked out square roots. And an individual with the intriguing name of Tabit Ibn Korra worked them out in Arabic. But unhappily, this book didn't tell you how Archimedes and Omar and Tabit worked out square roots. It told you almost everything else, though.

The *Principles of Relativity* I discarded after a brief browse. For one thing, it hadn't got an index—which I always think is so thoughtless—and for another thing it ended as follows: "These are covariant tensors of the First Order," and I always feel that a book should have a nice comfortable "l'envoi" at the end and not finish up baldly and brutally with "These are covariant tensors of the First Order."

Foundations of Mathematics hadn't got an index either, and *Principles of*
