# Glossary of Wireless Terms

From week to week we give here assection of the glossary of wireless terms from the "Listener's Guide."

SHUNT.—See "Parallel."

SIGNAL-STRENGTH. — Sound-volume of the received signals. For exact laboratory purposes measurement of signal-strength is often made of the actual current induced in the receiving aerial in order to gauge the sensitiveness of the

"SILENT POINT." When in searching for weak, distant signals, the reaction coupling is increased until the valve oscillates, the carrier wave of the distant transmission is heterodyned by the oscillations of the receiving valve and the "beat" is heard as a rising or falling Frequency in cycles per second divided whistle as the tuning is varied. When the receiver and the oscillations of the receiving valves are exactly tuned to the frequency of the carrier wave, there is no beat note this is known as the "silent- cycles. See "Wavelength." point." Silence of the beat-note, however, is not a sign that the receiver is not oscillating, but only that its oscillations are in phase with those of the transmission. Under no circumstances should should these conditions be allowed to persist in the receiver.

SPARK TRANSMISSION.—The earliest form of wireless communication is rapidly being superseded by continuous ence from static without a corresponding damped wave transmission.

SINGLE-VALVE.—In a single-valve set, the valve has simultaneously to amplify and rectify; and, if it he used to receive continuous wave Morse, to oscillate as well. Such a set is little better than a crystal receiver unless reaction is employed, when careful handling is necessary to avoid causing interference. If one valve only is used it is better to use acrystal in conjunction or to wire it un with a crystal as rectifier (detector), and a low-frequency transformer feeding back the rectified energy to the grid of the valve which thus operates as a dual ampliffer simultaneously at high and low frequency. Single valve receivers are most unsatisfactory nieces of annaratus for broadcast recention, both from the point of view of the user and his neigh-

SINDER.—A sliding contact by which the number of turns of a tuning coil in use may be varied.

"SOFT" VALVE.—A valve having small gas content or low degree of vacuum. useful for rectification (detection). but of little value for amplification.

SOLENOID.—A type of electro-magnet in which the armature is attracted into the central space in the interior of the windings, when current is passed through the coil. Used for operating mechanical contrivances from a distance by electrical

and thus makes good firm contact.

SPAGHETTI.—The term Spagherer, as used in wireless, is applied to an insulated sleeving for the purpose of covering busbar wire. Spaghetti has a very high resistance, and is easily threaded on to the busbar wire for wiring the set. Made in four different colours, this method of wiring is very efficient, neat, and rigid, besides making it a simple matter to trace any particular lead.

SPEED OF RADIO SIGNALS.—The waves sent out from a broadcast station maintain a constant speed of about 186, 200 miles per second, on any wavelength. This is the same speed as that of light. into this figure in metres (300,000,000), gives the wavelength in metres. Conversely, the wavelength in metres divided into 300 million gives the frequency in

vario-meter, vario-coupler, or the stationary plates of a condenser.

STATIC.—An alternative term for "atmospheric" disturbance. Natural or atmospheric static is a source of considerable interference with long-distance recepwave apparatus. Sometimes known as reduction in the signal strength of reception, except by the use of elaborate and most costly appliances.

"STRAIGHT" CIRCUIT.—The colloquial term for a straightforward circuit in which each valve is called upon to perform a single function only, and in which reaction is not pushed past the verge of oscillation, as in "super-regenerative" circuits.

SUPER-HETERODYNE, SONI HETERODYNE (usual abbreviation Super-Het) .-- A method of reception whereby signals are combined with local oscillations of a definite frequency deliberately set up (see "Heterodyne") are detected, and the third frequency set up on a long wavelength of usually 4000 metres is amplified and detected in the usual manner. There are many good features, such as ease of control and high selectivity obtainable. This method of reception should only be used with a T.C.C. CONDENSERS loop in New Zealand, unless special tests on the receiver have been made by the P. and T. Department.

TAPPINGS.—Variation of the number of turns of a tuning coil in use is some-times made by taking "tappings" from various points in the winding to the contact studs of a multi-contact switch.

TELEGRAPHY.—The system of the transmission of intelligence per wire or radio by means of the Morse or other telegraphic code.

TELEPHONE RECEIVER.—The ap- BROWNING-DRAKE paratus with which the signais SPADE-END.—A small forked piece changed back from the electrical vibraof metal to which the end of a wire is tions to which the initial speech or music clipped or soldered; the fork slips be- has been converted for the purposes of tween the nuts of pillar type terminals transmission to sound waves, and so made audible.

# RADIO DIRECTORY

## What to Buy and Where

### **AUCKLAND**

ATWATER-KENT RADIO ... All Radio Dealers.

ALTONA & HAMMARLUND. Frank Wiseman, Ltd. 170-172 Queen Street, Auckland. ROBERTS SETS.

AMPLION LOUDSPEAKERS. Johns, Ltd. Chancery Street, Auckland. BREMER-TULLY RADIO .... Superadio, Ltd., 147 Queen Street, Auckland.

STATION.—Stationary element of a BURGESS RADIO BATTERIES, All Radio Dealers. 

> FADA RADIO ...... National Electric & Eng. Co., Ltd. Customs St.; Radio Supplies, Symond St.

tion at times. Up to the present there is no known method of reducing interferis no known method of reducing interfer-

FERRANTI RADIO COM-A. D. Riley and Co., Ltd. Anzae \* \* \* \* \* \* \* \* \*\*\*\*\*\*\* \* \* \* \* Ave., Auckland, and all leading dealers. PONENTS

GILFILLAN AND KELLOGG. Harrington's, Ltd., 138-140 Queen Street, Auckland.

GREBE RADIO ...... Howie's, Dilworth Building, Custom st., Auckland.

MARCONI ECONOMY VALVES All Radio Dealers.

MULLARD VALVES ...... All Radio Dealers. RADIOLA RECEIVERS ..... Farmers' Trading Co., Ltd.,

Hobson Street. Auckland.

RADIOTRON VALVES ..... All Radio Dealers.

RELIANCE BATTERIES 1-x-5-1. Reliance Battery Mfg. Co., Ltd., 96 Albert Street, Auckland.

A. D. Riley and Co., Ltd. Anzac Ave., Auckland, and all leading dealers.

### **COUNTRY TOWNS**

BREMER-ANCHORADIO, TULLY, RADIOLA, BROWN-ING-DRAKE, AND WATER-KENT RADIO

AT- Radio House, Hamilton. G. S. Anchor, Manager.

SALES J. H. Sinclair, AND SERVICE .... Otane, H.B.

CROSLEY ELECTRICAL AND The Forrest-Crosley Radio Co. BATTERY MODELS ..... Ltd. Cuba Street. Palmerston North.

GAROD, CROSLEY, RADIO The Hector Jones Electrical Co. AND ACCESSORIES .... King and Queen Streets, Hastings.

GILFILLAN, FEDERAL, STAN-DARDYNE AND GARRARD ELECTRIC RADIO — ALL W. M. Pitcher and Co. ACCESSORIES ..... Hamilton.

**CROSLEY** GREBE, AND E. Dixon and Co., Ltd., RADIOLA SERVICE .... Hawera.

AND G. C. Carrad. RADIOLA DEALER 140 The Avenue, Wanganui. **SERVICE** 

PHILIPS VALVES AND APPARATUS All Good Radio Dealers,

W LOW PRICES. 7-Tube Sets from £1)-10-0; Complete from 7-Tube Electric Sets from £48; Complete from £54,

Agents Wanted Write for Details N.Z. AGENTS:

**ROYDS-**HOWARD CO. CHRISTCHURCH
