The transformer has sufficient new valves carrying capacity to supply the re. In addition quirements for five or six UX222 high voltage will supply 60 milliamps ers, Batteries, Eliminators, Valves, etc. at 20 volts.

The Pilot Super-Wasp kit, which may be assembled by any amateur, covers both short-wave and broadcast band. It is claimed that this receiver does not suffer from any of the usual defects of either home-made or secondgrade kit sets. The circuit incorporates a stage of radio tuned frequency, an automatic aerial change-over, 222 screen-grid valve, a 201A, detector, and a 171A in the last stage. The stronger short-wave stations may be heard on the loudspeaker.

Both these exhibits will, no doubt, be of great interest to the amateur constructor.

BOND AND BOND.

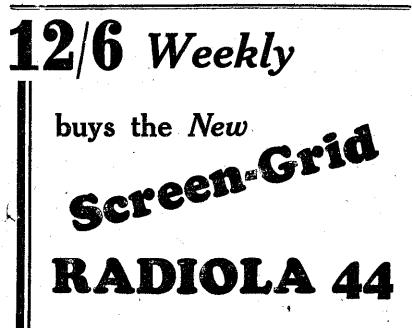

TWO distinct types of radio receiver are marketed by Bond and Bond, and these will be represented in the exhibition by the latest models. Great emphasis will be placed upon the new Silver Radio, This is the latest product of the Silver-Marshall firm. It comes to New Zealand in two distinct units; the chassis and the cabinet. By packing them separate by the manufacturers claim that damage to the receiver is impossible. The cabinet follows the usual lines of the modern receiver, and is distinct in two models, the Highboy and the Lowboy. Several unique features are claimed for the Silver Radio. It is sharply selective, and is yet very sensitive. Electrically the receiver consists of three stages of radio-frequency amplification, using A.C. screen-grid valves (Ceco). The detector embodies are hoping to have on show several of the very latest system of screen grid valve is resistance coupled to this detector. Following this is a pair of 245's in push-pull. The stages are connected by a 1-to-1 transformer. The power unit supplying A, B and C power is self-contained within the set, and consists of the usual tranformers and filters. The first R.F. valve is coupled to the second through a tune stage consisting of two separately tuned circuits. This produces a "humped" resonance curve of extremely steep sides and broad tops. Four ganged condensers tune the secondaries of the radio-frequency transformers.

The sensitivity of this receiver is such that Australian stations can be tuned in by using a piece of perforated metal as an antennae.

Apex receivers and speakers will be exhibited, and will command the attention of those who are looking for a small, yet powerful, receiver.

J. WISEMAN & SON.

J. WISEMAN AND SON have made their reputation in New Zealand radio world by designing and marketing the now famous Courier Radio Receivers. The first Courier was a small De- D.C. set, introduced over 18 months tection) enables the circuit to obtain ago. This was remarkably successful, an output from the detector equal to an and Messrs.
