

# To-day . . . put New Life into your Radio Set

*... by putting in the  
Radio Valves used  
by more than 200  
Leading Broadcasting  
Stations*

**Beware of Worn-  
out Valves!**

*Even a single worn-out valve in a set of new ones will cause crackles, distortion and poor tone! Besides, in order to make the worn-out valve work—you burn out the good valves. Remember—the eye can't tell the difference between a good valve and a worn-out valve. So take the valves out of your set and have your radio dealer test them. They're as easy to take out as a light bulb. New valves will put new life into your radio!*

**N**O one knows radio valves like broadcasting engineers. *They've got to know!* Inferior valves could ruin the thousands of programmes sent out each year! Hence over 200 leading broadcasting stations use RCA Radiotrons. So far advanced are those valves that 17 leading radio manufacturers build their sets around them. Remember, a set can't work better than its valves . . . insist on RCA Radiotrons when you buy a new set . . . or when you replace worn-out valves . . . look for the RCA trademark on the red and black carton!
