

Water. Something else you need protection from when you go abroad.

In most developing countries they can serve Hepatitis A in a glass. They might give it to you in an ice cream cone. Or toss the salad in it.

The fact is that water, and any food that's made with or washed in water, stands a chance of being contaminated.

How good a chance? Well, there's a one in 300 chance of contracting Hepatitis A if you're staying in a decent hotel.

The risk is six times greater if you're backpacking or travelling on a budget.¹

But you can avoid getting Hepatitis A by

getting a shot of Havrix two weeks before you fly.² Just one injection will protect you for one year.²

Ask your doctor about protection from Hepatitis A.

And remember, before you get on a jet, get a jab.
